The word “friends” was crucial. The laboring men were not prepared to act on their own—as the Workingmen had in 1829—but they were willing to work with the Friends of Equal Rights, a party recently founded by veteran Workies and dissident Democrats. The new group’s leadership, after all, included such labor activists as Alexander Ming Jr. and Levi Slamm. Ming, a printer, had been prominent in freethought circles, a close associate of Thomas Skidmore, and a candidate of the Workingmen’s Party back in 1829. Locksmith Slamm was a delegate to the General Trades Union. The new party, moreover, backed repealing restraints on organizing unions, instituting a mechanic’s lien law, expanding the public schools, adopting a metallic currency, and curtailing banks.

Yet the Equal Righters were not a strictly labor party. They believed rather in a united front of all “producing classes”—including sweated journeymen, small manufacturers, shopkeepers, and professionals—against parasitic bankers, aristocrats, monopolists, corporations, and undeserving paupers. Most Equal Righters were grocers, tradesmen, editors, lawyers,

small masters, or Tammany politicians disgruntled at the preeminence of bankers in their party. While open to unionist concerns, their core convictions were a hatred of “monopolies” and an insistence that New York City’s economic life be democratized.

The man who had inspired the Equal Rights movement was William Leggett, assistant editor at the *Evening Post*. Leggett, a native New Yorker, was a dashing and tempestuous firebrand, as passionate in his hatred of despotism and oppression as were his favorite poets, Byron and Shelley. In 1823, when a midshipman in the navy, Leggett’s railings against a tyrannical captain got him court-martialed and cashiered. Back in New York in 1825, he published verse, tried and failed to become an actor like his friend Edwin Forrest, got a job (in 1827) writing theater criticism for the *New-York Mirror*, then branched into writing about literature and established his own magazine, the *Critic*. In 1829, his journal having proved an intellectual success but a financial disaster, Leggett took the *Post* position as William Cullen Bryant’s second-in-command.

Leggett’s fiery editorials against banks and monopolists won him enthusiastic supporters. So did his reputation as a duelist and his street-trouncing in 1833 of editor James Watson Webb. In the summer of 1834 Bryant departed for a lengthy European sojourn, and Leggett, left in charge, escalated his war on “monopoly.”

Leggett argued that growing municipal inequality and declining working-class fortunes were alike the result of special privileges that the rich and well-connected extracted from government through cronyism and corruption. These privileges gave their holders an edge over smaller competitors, while injuring consumers by boosting prices artificially. To bring down this state-supported “order of American Barons,” Leggett demanded government cease all regulation of the economy and replace case-by-case chartering of companies with a general incorporation law. This would allow “the humblest citizens” to combine their small savings into “a vast aggregate of capital,” which could compete “with the capitals of the purse-proud men who now almost monopolize certain branches of business.”

For all his blistering denunciations of “monopolists,” Leggett was no anticapitalist. His principles were, in fact, widely accepted by many “purse-proud” businessmen: Whig organs like the *Journal of Commerce* cheered

when the *Post* attacked usury laws (restraining interest rates banks could charge) as “arbitrary and unjust.” Yet Leggett pushed his antimonopolism with such ruthless consistency that it transmuted into an almost revolutionary challenge to New York’s traditional political economy, which had long fostered mutually profitable links between magistrates and merchants.

Leggett attacked the monopoly on ferry service to Brooklyn as a prime example of “exclusive privileges.” City authorities, by refusing to license new ferry operators, enabled existing ones to jack up the price of crossing the East River, generating fat profits, which they then shared with the city. Not surprisingly, affluent ferry operators and their supporters on the Common Council were as one in branding Leggett a dangerous radical. But his rationale was essentially the same as that which the Supreme Court used to dismantle the Fulton-Livingston combine, and the limits of Leggett’s radicalism quickly became apparent when the *Sun* advocated public ownership of, and free access to, all ferries. Leggett indignantly denounced the idea. “Why not free omnibuses, markets, and houses?” he sputtered. The city, he insisted, should simply allow “unrestricted competition with no other restraint but the laws of supply and demand and we will have enough boats.”

Leggett and his followers tackled such powerful corporations as the New York and Harlem Rail Road, the New York Gas-Light Company, and the New York Life Insurance and Trust Company. They went after the fire insurance industry and denounced the auction system that had made Philip Hone’s fortune. They lit into banks, particularly those that secured their charters by bribing politicians. And to forestall further corruption of legislators by would-be monopolists, they demanded incorporation be thrown open to all.

Equal Righters also tore into the ancient network of municipal regulations, dismissing the notion that government had any moral obligation to intervene in the economy on the public’s behalf. Society was “too much governed,” they thought, and they demanded root-and-branch deregulation. They sought to abolish inspectorships and end Common Council interference with trade. They wanted to scrap the licensing system, which fattened the purses of butchers and grocers and cartmen by protecting them from competitors, while filling the city’s coffers with fees from the

protected. Licensing constituted an indirect tax on consumers. “We cannot pass the bounds of the city,” said the new party in 1836, “without paying tribute to monopoly; our bread, our meat, our vegetables, our fuel, all, all pay tribute to monopolists.”

Leggett and friends also chopped away at municipal backing for literary and cultural institutions, which privileged the established vis-a-vis newcomers. They criticized government aid to asylums for the insane poor, preferring care by kin. They decried regulation of the medical profession as a ploy by conventional doctors to drive homeopathic, botanicalist, and patent medicine rivals out of business.

In 1835, after a year at the editorial helm during which he’d managed to alienate most of the city’s elite, Leggett proceeded to outrage the leaders of his own Democratic party. He denounced President Jackson for banning abolitionist literature from the mail: the editor disapproved of the antislavery group’s tactics, but he detested government censorship. Tammany in return cut off the paid announcements that the *Evening Post* received as a party organ, and the post office—which Leggett had urged be stripped of its monopoly and turned over to private enterprise—likewise canceled its advertising.

In early October the Hall read Leggett out of the party altogether, which galvanized Leggett’s antimonopoly supporters into action. They had been meeting as an informal faction at the Military and Civic Hotel (on Bowery and Broome). Now they decided to wrest the Democratic party from the faction led by bankers Gideon Lee and Preserved Fish, by taking control of the general meeting. On the appointed evening, however, canny Tammany men arrived early, entered by the back door, quickly organized the meeting, nominated a bank president as chair, and were about to ram their ticket through when the antimonopoly forces burst in and forced the Tammanyites out. As they left, departing Tammany men turned off the gas lights, plunging the hall into darkness. But this was an old trick—it had been used against Fanny Wright years before—and the antimonopolists had come prepared. Whipping out their “loco focos,” the new friction matches, they lit candles and completed their business, winning the nickname of “Loco Focos” in the process. In February 1836 they formally established the Friends of Equal Rights Party and started their own paper, the *Democrat*.

In the April 1836 mayoral elections—which the new organization considered a test of “whether the rich or the labouring classes, the few or the many, are to rule this wide Confederation,” the Equal Rights Party ran Alexander Ming for the mayoralty. He was opposed by the “Bank Democrats,” who chose the incumbent, Cornelius Lawrence, and the “Bank Whigs,” who selected Seth Geer. Both, in Loco Foco eyes, were agents of the “souless [*sic*], cadaverous, unmanly aristocracy of Wall Street.” A fourth entrant, Samuel F. B. Morse, entered on behalf of the Native American Party.

Democrats worked hard to recapture Loco Foco supporters by incorporating their issues and personnel, Tammany came out for government control of the banking system. It supported the GTU’s former president Ely Moore for congressman. Democrats also appealed to party (and local) loyalty, noting that favorite son Martin Van Buren was running for the presidency. In addition, the pressure for independent action by journeymen slackened when another upstate conspiracy trial reversed direction, acquitted some accused unionists, and ushered in a more prolabor climate.

The election, quiet and orderly, proved a triumph for the Democrats. Lawrence won easily, with 60.2 percent of the vote. The Whig, Geer, got 23.5 percent. Ming and Morse pulled down a mere 10.4 and 5.9 percent respectively. Whigs and Democrats split the Common Council equally, eight and eight. The Equal Rights movement had failed to establish itself as a serious rival of the major parties, but it had succeeded in pressuring the Democrats into adopting some of its positions. For the next half century, Tammany Hall would represent itself as the *de facto* party of New York’s working classes, even while providing a haven for bankers and merchants with quite different interests and sensibilities.

Certainly the newly reelected Mayor Lawrence was not prepared for the enthusiasm of his followers when, on New Year’s Day 1837, he opened his house to the public in the traditional manner. To the delight of Philip Hone, who recorded the proceedings in his diary, the Democratic masses treated Lawrence’s house like a Five Points tavern. “Every scamp who has bawled out ‘Huzza for Lawrence’ and ‘Down with the Whigs’ considered himself authorized to use him and his house and furniture at his pleasure; to wear his hat in his presence, to smoke and spit upon his carpet, to devour his beef

and turkey, and wipe his greasy fingers upon the curtains.” Served Lawrence right, Hone thought. Having pandered to the lower orders, he’d have to put up with them, lest they throw him out of City Hall in favor of one of their own class, who would be even “less troubled than him with aristocratical notions of decency, order, and sobriety.”

“TO HART’S FLOUR STORE!”

Over the next several months, as the speculative binge continued at a frenzied pace, inflation ravaged the populace. By February 1837 the price of flour had shot up to nearly \$12.00 a bushel—from \$4.87 back in December 1834—and pork went from \$13.00 to \$24.50 per barrel over the same period.

Rumors circulated that the city’s flour merchants—firms like Eli Hart and Company and S. B. Herrick and Son—were hoarding great quantities of flour and grain, hoping to drive prices even higher. New York’s commission merchants had traditionally bought farmers’ crops, stored the grain in huge warehouses, and waited for the most profitable moment to sell. Such behavior, perfectly in tune with the new market universe, was utterly at variance with the old but not forgotten moral economy, and it touched off a spate of angry editorials. “An atrocious and wicked conspiracy by rich speculators” was underway, the *Herald* claimed, and the *New Era*, a new penny press, castigated “monopolists” as “veritable vermin who prey upon the community.”

More than food was surging in cost. Coal prices were going up, and the *New Era* suggested forming cooperatives for the purchase and sale of fuel. Rents too were climbing rapidly, and the same paper called on the city to build small one-family dwellings, a pioneering proposal for what would come to be called public housing. Bennett counseled (in the *Herald* on February 3) that tenants who could not meet the exorbitant demands of the “real estate monopoly” should refuse to leave their apartments after leases expired May 1, thus forcing landlords into court. He proposed a mass meeting in the Park to consider such propositions.

A week later, with the city enveloped in snow and icy winds, placards went up around town, over the signature of several Loco Foco leaders, calling for a four P.M. rally at City Hall on Monday, February 13, to air

grievances. "BREAD, MEAT, RENT, FUEL! THEIR PRICES MUST COME DOWN!" it blared. "The People will meet in the PARK," it explained, to "inquire into the Cause of the present unexampled Distress, and to devise a suitable Remedy. All Friends of Humanity, determined to resist Monopolists and Extortioners, are invited to attend." The *Post* and *Herald* urged participation.

Monday the thirteenth was winter's bitterest day to date, with wind whipping through the Park, but roughly five thousand people showed up. Loco Foco speakers, among them Alexander Ming, argued the connections between the flood of paper currency and the inflationary spiral. They read off and won assent to resolutions demanding hard money and an end to ferry and market monopolies and to municipal interference in trade. But what really got the crowd's blood up were those speakers who bluntly blamed landlords and flour merchants for the outrageous price of shelter and provisions.

The last speaker, a man whose identity was never ascertained, tore into Hart and Company, ending with the peroration: "Fellow-citizens, Mr. Eli Hart has now 53,000 barrels of flour in his store; let us go and offer him eight dollars a barrel for it, and if he will not take—" at which point someone touched his shoulder, and he concluded: "We shall depart in peace."

A voice in the crowd bellowed, "To Hart's flour store!" Over the protests of Loco Foco leaders, the crowd headed to Hart's, on Washington Street between Dey and Cortlandt, where they found the large brick building barricaded in anticipation of their arrival. Mayor Lawrence arrived to remonstrate with the rapidly swelling multitude. He was shouted down, barraged with stones and barrel staves, and "compelled to retreat for his life," according to the *Post*.

A furious assault now carried the building. After entering the counting room, where they smashed desks and scattered papers, rioters hurled hundreds of barrels of flour and sacks of wheat to the street below. There—although a "tall athletic fellow in a carman's frock" shouted, "No plunder, no plunder; destroy as much as you please"—women (in the words of one hostile account) "like the crones who strip the dead in battle fill[ed] the boxes and baskets with which they were provided, and their aprons, with flour, and ma[de] off with it."

At dusk, a detachment of rioters marched to the South Street store of E. and J. Herrick, but spared it when a company representative persuaded them the firm had sold off its flour at low prices. The crowd carried on to S. H. Herrick and Son, at Coenties Slip, where it broke in and began a similar process of destruction but agreed to desist when an agent promised to give every barrel in the store to the poor. Meanwhile, the mayor had called out the militia, the marshals and watchmen having proved ineffective. The troops took several hours to assemble, but by nine P.M. they had cleared remaining rioters from the vicinity of Hart's, and the affair was over.

The flour riot was a throwback to the colonial (and beyond that the English) tradition of crowds enforcing the moral economy by punishing those who profited from economic hardship. It constituted a violent petition to the city's elites, a demand they act responsibly for the common good. But the appeal fell on ears more attuned than ever before to the ethics and logic of the marketplace. Conservatives, not surprisingly, denounced those who had deluded the "pillaging canaille, the colored people, thieves and Irish" into stupidly trying to lower the price of flour by making it scarcer. But the radical William Leggett concurred with their analysis. With perfect consistency, he denounced unionists who would combine to raise wages "yet attack Capital for raising flour prices." The crisis was due to a deficient crop and inflated paper money. Violent interference with the laws of trade was useless and indefensible.

The riot did not, therefore, produce a restoration of the assize on bread. What it did do was galvanize those who had been pushing for a strengthened police force. Within twenty-four hours of the riot a hitherto becalmed plan for adding 192 more watchmen sailed into law.

It was clear to at least some of the gentry, however, that repression would not be a sufficient response to the crisis. Philip Hone, foreman of a grand jury investigating the flour riot, agreed it had been an outrageous event. But Hone couldn't help sympathizing with the "poor devils," at least in the privacy of his diary. "What is to become of the labouring classes?" he asked himself on February 18. "It is very cold now, if it continues so for a month, then will be great and real suffering in all classes." Presciently, Hone added the thought that "the present unnatural state of things cannot continue."

“THE VOLCANO HAS BURST AND OVERWHELMED NEW YORK”

On the ides of March 1837, the granite office building of J. L. and S. I. Joseph and Company caved in with a crash that shook every building on Wall Street. Two days later the firm itself collapsed, frightening the financial district far more than had the tumbling stonework, for the fall of the House of Joseph presaged general disaster.

The firm failed because New Orleans merchants, caught short by a drop in the price of cotton, had defaulted on vast sums they owed their Manhattan creditor. Soon hundreds of other New York City brokers, commission houses, and dry-goods jobbers also found their bills to southerners coming back unpaid. Many of these companies were far weaker than the defunct Josephs, who had been agents of the mighty Rothschilds. One after another, dragged down by the foundering cotton economy, they sank into default.

Mayor Lawrence’s firm—Hicks, Lawrence, and Company—suspended payment on its debts and closed its Wall Street office. Brown and Hone defaulted too. It was “a dark and melancholy day,” former mayor Philip Hone informed his diary. “My eldest son has lost the capital I gave him, and I am implicated as endorser for them to a fearful amount.”

Failure after failure jolted Wall and Pearl streets. By April 8, *the Journal of Commerce* reported, ninety-three firms had gone under. Three days later the total reached 128. “The merchants are going to the devil *en masse*,” wrote George Templeton Strong, a student at Columbia College who had begun keeping a diary as meticulous and opinionated as Hone’s.

Demands from overseas creditors escalated the pressure. “The accounts from England are very alarming,” Hone noted; “the panic prevails there as bad as here.” At April’s end a businessmen’s committee informed newly inaugurated President Van Buren that there had been “more than 250 failures of houses engaged in extensive business” and that the merchandise in New York’s warehouses had lost a third of its value. As their fortunes melted away, some desperate merchants set fire to their own stores, seeking insurance payouts worth double and treble the value of their stock.

The disaster rolled on. On May 1 Arthur Tappan went belly up. The Liverpool packet had brought heavy demands from British creditors, demands his once flourishing silk firm could not meet. Weakened by the

great fire, the boycott by irate southern antiabolitionists, and now the default of country and city retailers, Tappan's debts had mounted past the million-dollar mark, a sum few merchants grossed in a year. The devout merchant's evangelical brethren were bewildered to find God scourging saints as well as sinners. Local antiabolitionist enemies were gleeful. "Arthur Tappan has failed!" gloated George Templeton Strong. "Help him all ye niggers!" But most men on Wall Street shuddered, for if Arthur Tappan could break, a complete collapse of wholesale merchants seemed inevitable.

Other sectors of the city economy reeled and staggered. The overheated real estate boom of the 1830s abruptly iced over. The price of lots plunged. Landowners near Bloomingdale Village had been getting \$480 an acre in September 1836; by April 1837, Hone noted, they were lucky to clear fifty dollars. Stunned merchants calculated that the value of their real estate had "depreciated more than \$40,000,000" in a scant six months. Hundreds of Manhattan landowners and builders defaulted on mortgages and lost their property through foreclosure.

Grand development schemes—like Samuel Ruggles's Gramercy Park and Union Square—were put on hold. Brooklyn suspended construction of its City Hall, leaving an unfinished basement in a weed patch. Greater Williamsburg winked out. So did John Pitkin's would-be metropolis of East New York. On Staten Island, New Brighton's developers crumpled; their hotel and houses went to the block.

Far more damaging for the city's future was the virtual cessation of wholesale speculative building. New York's supply of housing fell behind the growth of population. Crowding in working-class districts worsened rapidly, setting the stage for future social disaster.

The stock market fell apart too. The value of locally held shares declined twenty million dollars. The average number of shares traded daily dropped from 7,393 in January to 1,534 in June. Hot new rail stocks nosedived as their companies collapsed. On April 5 work was halted on the Long Island Rail Road with only fifteen track miles laid between Jamaica and Greenport; it would remain stalled for years. Other projected lines—including one intended to connect Brooklyn with Fort Hamilton—died and were not resurrected. The Erie Rail Road survived, thanks only to a three-

million-dollar loan extracted from the state legislature by influential directors.

The crisis of the railroads sped the disintegration of city manufacturing. Cutbacks in orders for iron and engines crippled foundries and machine shops, wounding even the giant Allaire works. Failed locomotive builders defaulted in turn on notes due metal dealers like Hendricks and Brothers. The economic storm flattened less industrialized operations as well: virtually all of New York's major clothing firms foundered in 1837.

The ruin of merchants and manufacturers alike had been hastened by, and in turn exacerbated, a crisis of the financial system. To protect their reserves of specie—gold and silver coin—banks virtually ceased lending, turning away even the most respectable merchants. Leading brokerage houses were equally tightfisted. When the well-connected sugar merchant Moses Taylor applied to Brown Brothers, he was told they would not accommodate even “the U.S. Bank with J. J. Astor to back it as security.” Interest rates skyrocketed to 24 percent. “Money is exorbitantly dear,” wrote Hone in March. “The bloodsuckers are beginning to be alarmed, and keep their unholy treasures locked up.”

Worse, banks began calling in outstanding loans, pushing more merchants over the edge into default. In turn, businessmen, who feared the banks might not survive, rushed to convert their deposits and bank notes into precious metal.

So did the citizenry. The Loco Focos, who all along had been denouncing banks and paper money, called a mass meeting in City Hall Park on March 6. Over thirty thousand people turned out, more than had attended the February rally preceding the flour riot. The assemblage urged noteholders to cash in their banknotes, “and thus make these soulless corporate extortioners pay their debts to the people as promptly as they compel payment from the people.” In April, with the panic spreading, angry crowds of the “poor and laboring classes” (Hone noted) gathered at the banks, demanding the return of their deposits “in a most alarming manner.”

On May 3 milling crowds besieged the Dry Dock Savings Bank. Mayor Lawrence managed to convince them that their money was safe. But the next day, the president of the Merchants' Bank was found dead—“Some say prussic acid,” Strong reported—and the bank runs began again. Captain

Frederick Marryat, a noted English writer, arrived to find that “suspicion, fear, and misfortune have taken possession of the city” and that “the militia are under arms, as riots are expected.”

Early next morning, the Dry Dock stopped payment. A score more merchants promptly failed. Throughout the city, people began jamming toward bank tellers shouting “Pay! Pay!” By May 9 \$652,000 in coin had been drained from Manhattan vaults. Then, on May 10, all twenty-three of Manhattan’s banks announced they would henceforth refuse to exchange specie for paper. An infuriated crowd boiled into Wall Street. But the city had summoned up the Twenty-seventh Regiment—“the monopoly aristocracy of New-York garrisoned their fortresses with arms and men,” as one Loco Foco put it—and the day passed with much tumult but no bloodshed.

“The volcano has burst and overwhelmed New York,” Hone told his diary, and the repercussions spread swiftly throughout the country. Within twenty-four hours, most banks in the Northeast had stopped gold and silver payments. More distant states followed suit as soon as the news from Wall Street reached them. In most places—and certainly New York—suspending specie payments was blatantly illegal, but metropolitan bankers prevailed on the Albany legislature to suspend the law. This saved them from bankruptcy and enabled them to continue doing business. Indeed, now freed from having to redeem their notes in specie, banks issued them in abundance. James Gordon Bennett, noting that the banks still had millions in coin, denounced this as “legalized and chartered swindling, without a parallel in the annals of crime and imposture.”

Merchants in debt were delighted: though legally obligated to pay their debts in specie, it was now impossible to do so, and this saved them from collapse. Some businesses carried on using notes and checks. Others resorted to barter and promises. Stores, hotels, and oyster cellars issued their own scrip, called shimplasters. “Go to the theater and places of public amusement,” wrote Captain Marryat, “and, instead of change, you receive an I.O.U.”

But the city’s overall economy, tied as it was to international markets, could not so easily finesse the crisis. At the end of May, Hone wrote, “a deadly calm pervades this lately flourishing city. No goods are selling, no business stirring, no boxes encumber the sidewalks of Pearl Street.” Barges

and boats lay idle at the docks. “Many of the counting houses were shut up, or advertised to be let,” wrote a British traveler. “The coffee houses were almost empty, the streets near the water side were almost deserted; the grass had begun to grow upon the wharves.”

Panic had given way to depression.

CAUSES AND REMEDIES

What had happened? This was the prime topic of conversation throughout the city. Explanations came in many sizes and shapes, but three predominated: some people blamed the government, some the banks, others the English.

Whig businessmen indicted Andrew Jackson. He had destroyed the Bank of the United States, the financial system’s only regulator, and then, in July 1836, decreed the government would accept only gold or silver as payment for public lands. In requiring hard coin, Jackson had hoped to halt the runaway inflation, and also the monopolization of land by northeastern speculators who had been using borrowed paper money to gobble up millions of midwestern acres. The real consequence, Whigs argued, had been to deepen the monetary crisis, and *the Journal of Commerce* savaged Jackson for “permitting government to investigate and direct the affairs of private business.”

From Jackson’s perspective, the panic was a necessary corrective—and deserved retribution—for the inflationary expansion generated by bankers and their paper money system. It would pass once all the “speculators and gamblers are broke.” Jacksonian politician A. Z. Flagg agreed that New York City bankers had blown up “land bubbles and stock bubbles” and now were “reaping the bitter fruits”—an animus strengthened when investigators found that bank officers had filched perhaps \$1.5 million from various Manhattan institutions. Jacksonian Senator Silas Wright gave this analysis an anti-Semitic spin when he wrote that the failure of the Joseph brothers —“Jew brokers of New York”—was cause for rejoicing.

Jacksonians and Whigs agreed, however, that the crisis also had international roots. “The barometer of the American money market hangs up at the stock exchange in London,” one Democratic congressman said,

and Philip Hone believed that the Bank of England was “arbiter of the fate of the American merchant.”

They were right. Both boom and bust had originated in Europe. British and Continental investors had poured capital into U.S. canals, railroads, and lands, first cautiously, then at a frenzied pace. In addition, Old World creditors let New World merchants import goods on credit. New York City had been America’s link to these money markets. Anglo-American merchant bankers like the Barings and Rothschilds had funneled capital and credit to Hudson River firms like Prime, Ward, and King, and Alexander Brown and Sons, who relayed them to the Continent, stoking the boom. New York wholesalers, and through them country storekeepers, ran up an enormous tab. State governments accumulated huge debts, then borrowed more to pay the interest. Gold and silver imports enabled banks to issue more paper money, facilitating speculation and generating inflation.

In the summer of 1836, what the English had given, the English decided to take away. The Bank of England raised its discount rate and reined in British bankers it thought too accommodating of Americans. The transatlantic flow of capital was suddenly and severely restricted. Eurocreditors demanded U.S. merchants remit their balances due, just as cutbacks in cotton purchases were driving down the price of America’s staple. This forced U.S. businessmen to pay in gold. Specie sailed back to Europe. New York City, which had facilitated the boom, now helped terminate it. Its hardpressed banks and merchants called in *their* debts. When New Orleans cotton factors and country retailers couldn’t pay, Pearl Street failed, Wall Street suspended, and a vicious contraction radiated out along the same trade routes upon which credit and capital had earlier traveled.

Proposed remedies varied dramatically with ideology and interest. Whigs called for reversing Jackson’s policies and bringing back a national bank. President Van Buren and the Loco Foco Democrats wanted to *extend* Jackson’s policies by severing all connections between the banking system and the government.

Debtors, for their part, wanted to suspend or scale back what they owed. They favored inflating the currency so they could repay their debts with dollars cheaper than those they had borrowed. Above all, farmers, producers, and thousands of businessmen across the country—including

many Pearl Street merchants, leagued in the New York Board of Trade—wanted to postpone resumption of specie payments, which they feared would force them into bankruptcy.

Creditors wanted to put the country through the wringer of deflation and depression. They favored restoring the gold standard, which would force debtors to repay them with dollars more valuable than those they had borrowed. A phalanx of New York City financiers, led by the venerable Albert Gallatin and the firm of Prime, Ward, and King, called for resuming specie payments as soon as the banks were strong enough to withstand runs. Restoring paper money's interconvertibility with gold would regain the good graces of overseas bankers—something deemed crucial for a country dependent on imported capital—while also deflating the economy.

Gallatin and the New York bankers succeeded, with some crucial governmental assists from the Erie Canal Fund (which lent beleaguered banks over two million dollars) and the Bank of England (which chipped in one million pounds sterling). Their vaults now stuffed with metal, New York banks resumed specie payments in May 1838. The country, including Philadelphia, reluctantly followed Manhattan's lead. Wall Street, once a lionized lender, now became a hated creditor. The hard-nosed policies of New York's banks were complemented by the tough tactics of its land speculators. Arthur Bronson, acting for himself and for eastern and English interests, lobbied vigorously and successfully against all western and southern moratoria and debt reduction schemes.

For a short time, it seemed that resumption had indeed resurrected the economy. Credit and capital flowed again from east to west. Businesses revived. States and corporations sold their bonds on the London market and launched new projects. The price of cotton rose. But when a bad harvest in 1839 forced England to export gold in order to import wheat, the Bank of England clamped down again, and the story repeated itself.

The depression deepened through the early 1840s. Imports fell. Real estate values sagged. Railroad construction fell by two-thirds between 1838 and 1843; canal construction plummeted 90 percent. Deflation replaced inflation: prices declined 46 percent between February 1839 and February 1843. Recompense for craftsmen and unskilled workers—for those lucky enough to find work at all—dropped about onethird between 1836 and

1842, often falling faster than prices and rents, thus driving real wages down.

FROM BOOM TO BUST

The panic wrought startling reversals of condition at all levels of city society, noted the Common Council, making many “who but two years since considered themselves rich, poor.” General Winfield Scott had been invited by a group of leading New Yorkers to a public dinner in his honor, but after the crash he tactfully withdrew his acceptance, deeming celebration unseemly when so many of his hosts had gone broke.

The New York elite had long been more volatile than that of other American cities, as its members’ fortunes were more closely tied to mercurial mercantilism and speculative enterprise. But the novelty and thoroughness of changes in fortune wrought by the Panic of 1837 fascinated observers, generating a novel lore and literature of bankruptcy.

One visitor, Francis Grund, noticed that the commercial insolvency of New Yorkers “changes at once their friends, their associates, and often their nearest relations, into strangers. How many ties are thus broken by a single failure in business!” Some, Grund reported, positively relished news of others’ misfortune. One lady, on hearing of the return from London of “the wife of that vulgar auctioneer that wanted to outdo everybody,” remarked with satisfaction: “Well, she will find a sad change; her husband has failed since she was gone, and is said not to pay ten cents in a dollar.”

New York writer Charles Francis Briggs, who in 1839 penned perhaps the first depression novel—*The Adventures of Harry Franco, a Tale of the Panic of 1837*—followed it up, in 1843, with *The Haunted Merchant*, a study of ruination. Briggs compared the sudden collapse of a businessman to the shutting of a wild bird in a cage while its fellows soared above. The real horror, Briggs suggested, was less the loss of luxuries than the way former associates shifted their tone from familiarity to suspicion, from deference to insolence.

Such observations caught the brittleness of social ties within New York’s upper class but missed a deeper change in attitude toward failure ushered in by the panic. New York businessmen—and American capitalists in general—began shuffling off the stigma and shame once attached to insolvency. In

the summer of 1839 city merchants started a campaign to allow them to discharge their debts through bankruptcy proceedings, freeing themselves to start up business again with a clean financial and moral slate. Reformers won passage of the Federal Bankruptcy Act of 1841, which, though repealed in 1842, lasted long enough for twenty-eight thousand debtors to shed \$450 million dollars of debt.

Focusing on examples of the high-brought-low also overstated the collective vulnerability of the New York rich. Their ranks were far from decimated. Some had the wherewithal to survive even such a substantial setback. In 1838 Philip Hone declared that he, like half his friends, was deeply in debt, with no prospect of ever getting out. A year later, Hone was free and clear—albeit shorn of two-thirds his fortune—and had taken up his accustomed lifestyle again.

Hone did have the grace to wonder “how the poor man manages to get a dinner for his family,” as well he might have. Mass bankruptcies had produced massive layoffs. By April 1837 collapse of the real estate industry had already devastated the construction trades; one paper reported that “six thousand masons and carpenters and other workmen connected with building had been discharged.” A citywide survey that month estimated that one-third of all New York workers had lost their jobs and that in addition to these fifty thousand unemployed, another two hundred thousand were without adequate means of support. In May Captain Marryat observed that “mechanics thrown out of employment, are pacing up and down with the air of famished wolves.” Newcomers were particularly hard hit: “The Irish emigrant leans against his shanty, with his spade idle in his hand, and starves.”

when the chants switched to “Hot corn! Two cents!” Others camped out at the grogshop, downing homemade liquor at three cents a glass. By the end of 1837 many were panhandling outside oyster-cellar doors. Others had joined the throngs of women—many of them mothers with children—who begged in the streets or went door to door seeking alms.

For a time, the working-class movement of the 1820s and 1830s retained some collective energy. Laborers packed into a series of Loco Foco-orchestrated demonstrations. To cries of “Our families are famishing around us,” they backed calls for hard money, economy in city government, jobs on public works, and removal of destitute immigrants to the country. One protest meeting in Greenwich Village threatened to march on the banks unless given work. Respectable observers shivered, with one witness reminded of the “Jacobins, and the Guillotine.” No heads or tumbrels rolled, however, and the agitation came to little. Loco Foco Democrats soon effected a rapprochement with their Tammany Hall counterparts, winning concessions on the monetary issues that most agitated them. Their departure left workers leaderless, because by then their unions had been destroyed.

In May 1837 *the Journal of Commerce* had bugled an antilabor offensive. “Now is the time to deliver mechanics and their families from the cruel oppression of the unions,” the paper urged. “The rules of the unions as to hours, pay, and everything else ought to be thoroughly broken up.” Employers should lengthen the working day. “The ten-hour system is one of the worst deformities of their deformed code,” *the Journal* ranted.

Given the availability of thousands of desperate unemployed, the employers’ offensive to increase hours, reduce wages, and rid themselves of union troublemakers proved highly successful. By the end of June, as one journeymen’s association noted, bosses had effectively leagued together “to take advantage of the present depressed state of our trade and business in general, in order to reduce our present prices, and to render us, if possible, obedient vassals to the nod of the oppressor.” By midsummer the union movement in New York City was dead, the National Trades Union interred alongside it.

37

Hard Times

As the city's shattered labor force headed into its first depression winter, Horace Greeley—publisher and editor of the *New-Yorker*, a weekly paper—warned that at least ten thousand of the jobless were “in utter and hopeless distress” and not likely to survive the frigid season. Greeley had urged the poor to “fly, scatter through the country, go to the Great West, anything rather than remain here,” but few had heeded him. Now he believed that only massive charity stood between the poor and utter calamity.

Many New Yorkers agreed. As in prior downturns, civic relief groups sprang up in each ward. In December 1837 a Central Committee for the Relief of the Suffering Poor was organized to coordinate these volunteer efforts, the mayor serving as chair. The committee raised money by sponsoring lectures and concerts, solicited donations in kind or cash, and established depots for receiving and dispensing aid. Greeley himself was active in the Sixth Ward's Citizens Relief Committee, and it was there that he discovered both the terrible suffering of the poor and the hopeless inadequacy of eighteenth-century measures for dealing with nineteenth-century problems.

The relief committees were quickly overwhelmed by the numbers of the needy. Twenty-five hundred requested and received aid in the Seventh Ward (roughly one in every ten residents). In the Fifth, six thousand were assisted, approximately a third of the ward's population. Soon hundreds were being turned away each day. Provisions dwindled at local soup kitchens. In mid-February, the Fifth Ward's money gave out. Almsgiving stopped. People starved, froze, or contracted fatal diseases through exposure and privation. The ad hoc, civic-minded approach was discredited. In the subsequent hard winters of 1839-42, ward committees were not revived.

Some of the relief burden was picked up by the churches, especially evangelical Presbyterians. Even during good times, American Tract Society visitors, horrified by slum conditions, had begun to offer “temporal goods” along with tracts and prayers. Acting as individuals, they had paid the rent

for families about to be evicted, brought clothing and food to the hungry and ill clad, and sought jobs for those without work. When hard times struck, tractarians continued and expanded these efforts. But the dimensions of the crisis engendered a growing sense of helplessness and a hardening of old convictions that most of the poor had only themselves to blame for their misery.

In February 1838 the evangelical ladies of the New York Female Moral Reform Society, having discovered the great and growing destitution among the laboring classes, began distributing charity to those deemed virtuous and receptive to the word of God. But most of the poor proved neither, in their judgment, being either intemperate or Catholic. As one visitor to Ann Street put it that year: “Alas! few were found deserving of relief, [as] nearly all were reduced to their present suffering by a course of vice.” Their mid-1830s optimism about the perfectibility of man gave way to renewed pessimism about the intractability of poverty, a gloom deepened further by the bankruptcy of many of their staunchest supporters. The Protestant Episcopal City Mission Society also found donations hard to come by. Saddled with debt for churches built and clerics hired in the halcyon thirties, it soldiered on through the depression years—growing more and more convinced that the poor were an alien and inferior class, mostly incapable of salvation—and by 1843 it was facing bankruptcy.

In July of that year the New York City Tract Society, also buckling under its charitable burdens, decided to spin off almsgiving to a separate organization. After investigating contemporary European approaches to poverty, it established, at the end of 1844, an Association for Improving the Condition of the Poor (AICP). The new organization proposed a centralized and scientific approach to managing the city’s now seemingly permanent underclass of indigents. (A Brooklyn AICP was established the same year, with Seth Low as president and a plan of operation identical to Manhattan’s.)

The directors, who included some of the richest bankers, merchants, and industrialists in New York, were only too aware of the devastation wrought by the depression. They insisted nevertheless that poverty was caused not by failures of the economic system over which they presided but by deficiencies of the poor themselves, in essence reviving the analysis and strategy adopted nearly three decades earlier by the Society for the

Prevention of Poverty (a continuity underscored by the prominence in the AICP of Dr. John H. Griscom, son of SPP founder John Griscom).

To direct the new association's work the managers chose Robert Milham Hartley as executive secretary. The English-born Hartley, a devout Presbyterian, had served from 1833 to 1842 as secretary of the New-York City Temperance Society; like most of the directors, he believed poverty bespoke depravity. As "pauperism" was the problem, Hartley wrote, and "the chief cause of its increase among us is the injudicious dispensation of relief," the AICP's "primary" goal would be "to discountenance indiscriminate almsgiving."

What Hartley advocated instead was "scientific philanthropy," by which he meant not only rationalizing the distribution of relief citywide but also using it as an incentive to better behavior. The AICP would visit the poor in their homes to "inspire them with self-reliance and self-respect; to inculcate habits of economy, industry and temperance; and whenever it shall be absolutely necessary, to provide such relief as shall be suited to their wants." Under Hartley's leadership, the AICP divided Manhattan into several hundred sections with approximately sixty poor families apiece. Each section was assigned a visitor who would regularly canvass his charges and assess their condition and character. To discourage the poor from shopping around for handouts, Hartley had AICP visitors file their reports with a central registry; he also warned residents not to give money to panhandlers, advising them instead to disburse tickets bearing the address of the nearest AIGP visitor.

The point of establishing this moral credit-rating agency was to sort out the poor, deciding who was truly needy and who was idle or depraved; it would act, Hartley said, as "a vast sieve" to separate "the precious and the vile." If the visited were victims of temporary illness or adversity, the visitor would get them medical help and dispense relief, judiciously, until health and employment returned; if they suffered from drink or other vices, the visitor could hold out the promise of assistance as an incentive to reform. Persons deemed unable to support themselves because of age, chronic illness, or physical handicap would be dispatched to the appropriate municipal institutions. Ever wary of creating temptations to fraud, Hartley warned that people confined inside such places should never live better than the laboring poor outside; inmates who gained weight, he said, should have

their daily rations cut back. “Paupers” and “vagrants”—the idle and dissolute poor—should be put to hard labor in a workhouse until ready to become productive members of society. For the hopelessly “debased” and “depraved,” there was no choice except a sentence to the penitentiary, where they must suffer “exemplary punishments as a warning to the community.”

THE POLITICS OF LAISSEZ-FAIRE

The decline of civic volunteerism and the curtailment by evangelicals of “indiscriminate almsgiving” left the primary burden of aiding depression casualties to the city itself. New York would indeed succor many of the poor, but with ill grace and limited funds, its reluctance a function of penury, ideology, and a transformed political system.

Hard times reshaped the electoral landscape. Since the 1820s New York had been a Democratic town. The Whig Party, born during the Bank War, had lapsed into somnolence at its conclusion. After the crisis of 1837, Whiggery was born again, and over the next few years its candidates rode the depression first into City Hall, then into the governor’s mansion, and finally into the White House itself.

The parties had different core constituencies and policies. The Democrats, who cast their Whig opponents as aristocrats, drew upon new immigrants, antibank radicals, merchants trading with the South, workers tied to the port economy, and, thanks to Tammany’s long command of municipal patronage, a small army of grateful contractors, thankful work crews, and appreciative officeholders. Democrats opposed high tariffs, a smart strategy in a city with five times as much capital invested in trade as in manufactures; they also aimed to divorce government from banking, curb speculation, and reduce government expenses.

Whigs could usually count on evangelical and Episcopalian merchants, bankers, and businessmen, master craftsmen and the middling classes, and working-class voters hard hit by the depression. Whig planks backed governmental underwriting of internal improvements and stronger oversight of banking while defending the credit system. The party promoted itself as a bastion of “order, morals and religion” and portrayed Democrats as

agrarians, Fanny Wrighters, and people associated with “infidelity, anarchy, the riot, butchery, and blood of the French revolution.”

In 1837 Aaron Clark, the Whigs’ mayoral candidate, won office in part because Loco Foco radicals ran an independent candidate and siphoned off votes from Tammany’s man. When President Van Buren adopted the Locos’ approach to currency questions, the disaffected Democrats trooped back to Tammany Hall, only to see the Conservative Democrats, many of them bankers or bank stockholders, decamp en masse, make common cause with Whigs, and get Clark reelected in 1838. A brief economic upturn helped Democrat Isaac Varian squeak into City Hall in 1839 and 1840, and Democrat Robert H. Morris proved able to hold the mayoralty for three successive terms (1841—43), though again by slender majorities. Meanwhile the Common Council teetered back and forth, Whigs winning control in 1837—38, Democrats in 1839—41, Whigs in 1842, Democrats in 1843. At the state level, the governorship passed in 1838 from Democrat William Marcy to Whig William Seward, who was reelected in 1840 (though he lost in the city); then Democrats recaptured Albany in 1842 with William C. Bouck.

Whigs scored heavily among those who blamed the governing party for the depression, but they also did well because they finally turned to a new breed of professionals: Whig politicians who had mastered the art of Tammany-style electioneering. Thurlow Weed, an Albany newsman turned full-time politico, was a robust and florid fellow, a man who liked his oysters and wine. He was also shrewd, manipulative, and determined to whip the hitherto disparate elements of Whiggery into a cohesive party. Weed tapped New York City’s community of rich Whig and Conservative Democrat merchants for campaign contributions and amassed a sixty thousand dollar war chest his first year out. Spending cash as effectively as he raised it, he made use of promotional techniques invented by the penny press. In 1838 Weed rescued Horace Greeley, whose *New-Yorker* was foundering in choppy depression seas, and hired him to edit a party sheet, *the jeff-ersonian*, which contributed substantially to Seward’s victory.

Weed could play political hardball too. In the 1838 campaign Whig agents were dispatched to Philadelphia, where they hired two hundred lowlifes at thirty dollars a head. These “floaters,” conveyed to New York City, were trooped from poll to poll, casting fraudulent ballots. Once Whigs

gained power they happily deployed Tammany tactics to keep it, giving prison inmates one-day passes contingent on their voting the anti Tammany ticket, and marching almshouse paupers to the polls en masse, their gray uniforms temporarily exchanged for new clothing. Whigs also embraced the spoils system with delight and, when they captured the municipal government in 1837, handed out jobs and contracts to party members only. To block Tammany's penchant for mass naturalizations, Whigs passed a state law—applicable to New York City only—that required voter registration. They also cut the length of elections from three days to one.

In the 1840 presidential race, Weed again drew upon Greeley's skill as political publicist. New York Whig magnates opened their purses as never before, allowing Weed and Greeley to spend fabulous sums transforming patrician William Henry Harrison into a Man of the People. When Democrats incautiously charged that General Harrison had, since retirement, been guzzling hard cider in a log cabin in Ohio, Weed and Greeley transformed both wooden house and apple drink into badges of honor. New York imagemakers contrasted Harrison-as-backwoods-pioneer to a putatively aristocratic Van Buren. Greeley's new subsidized sheet, the *Log Cabin*, was also chock-a-block with woodcuts, cartoons, large-type slogans ("Tippecanoe and Tyler, too"), and the words and music for campaign songs. A smash success, its circulation soon topped eighty thousand.

Weed and Greeley took their presidential campaign to the New York streets as well, advancing an urban politics of spectacle. A totemic log cabin, capable of holding four to five hundred, was erected on MacDougal Street across from Washington Square; another went up near Prince Street. Tippecanoe Clubs paraded up and down the town with portable log cabins, ploughs, and barrels of hard cider, shouting, "Van, Van is a used-up man." Despite the hoopla—diverting fare for a depressed populace—Van Buren held the city, in part because Tammany could still deploy superior force at the polls.

Amid the clash and uproar of electoral combat, it was easy to miss the fact that while these realigned and oscillating parties in general presented New York voters with real alternatives on the issue of governmental responsibilities, when it came to depression-era relief they had worked their way, from opposite directions, toward a convergent position.

In 1838, when a group of citizens petitioned the Whig Common Council to restore the assize on bread—to put the city back in the business of regulating its price and quality—the supposed governmental activists refused. Indeed they continued to chip away at any regulations that hampered freedom of action in the marketplace.

Democrats, having long equated government intervention with special privilege, also adopted laissez-faire policies when they were in power. Democratic administrations cut expenses, sold off city-owned lands (at bargain prices) to reduce the debt, and in 1841 and 1843 repealed centuries-old privileges of cartmen and butchers, declaring that such market laws “no longer are observed and do not serve the people’s interests.” Some zealots proposed shuttering the city’s markets altogether and selling off the municipal docks, but neither side was prepared to go to such extremes.

A similar convergence marked their attitude toward aiding the unemployed. On the surface, the municipality’s response seemed munificent. The number receiving relief in New York City leapt from under thirty thousand in 1837 to over eighty thousand in 1838. Most of this aid took the form of outdoor relief: provision of food, fuel, and money to the impoverished in their own homes. In addition, the population of the almshouse jumped by a third, to over twenty-five hundred, with immigrants outnumbering native-born for the first time. The amount of money appropriated, however, as distinct from the numbers of people assisted, increased only marginally—though enough to hit a record level of \$281,000 by 1839. Conditions in public institutions worsened accordingly; almshouse commissioners found “neglect, and filth and putrefaction, and vermin.” The Bridewell, city hospital, and penitentiary were also crammed way beyond their physical capacities.

Mayor Clark nevertheless claimed in 1838 that Manhattan was being too generous. Clark worried that New York would get a reputation for liberality that would attract desperate out-of-towners. Even at present aid levels, he fretted, “New York is likely to become the general rendez-vous of beggars, paupers, vagrants and mischievous persons.” Tammany men pointedly busied themselves in private relief efforts, dispensing baskets of cakes, pies, and meat to the needy, but when they assumed power, their position was much the same.

Both parties, to be sure, confronted declining municipal revenues, a function of the falling assessed real estate values, and when the rate of taxation was compensatorily increased by 38 percent in 1842, bellows of protest arose from propertied Whigs and Democrats alike. Indeed large landowners demanded municipal retrenchment and threatened to move to Brooklyn, which publicized itself as a refuge from onerous impositions.

City fathers of both parties justified limits on relief by insisting, in tandem with the directors of the Association for Improving the Condition of the Poor, that healthy and able-bodied men and women seeking public assistance were not depression victims. The 1838 Whig Common Council committee harrumphed that charity would only “increase pauperism” and “promote a lamentable dependency.” In 1840 Democrat William Cullen Bryant’s *Evening Post* said the managers of public charity “were so grossly lavish and so careless of the consequences, that to them we must attribute a great deal of the demoralization, improvidence and misery that exists.”

In 1841 Mayor Morris called for isolating able-bodied paupers in a separate workhouse on Black well’s Island and assigning them to productive labor. The 1843 City Council agreed that this might well discourage “our dissolute and idle population” from seeking public aid in the first place.

Zealots urged more ruthless measures. One 1843 letter writer to the *Tribune* called for the complete elimination of *any* public aid that would keep paupers alive, fulminating in fine Malthusian fashion that “they who will marry and beget children in dirty cellars are a curse to the world.” Such sentiments remained beyond the pale of decent opinion, but so did Horace Greeley’s assertion that it was the depression that had made it impossible for many who wanted work to find jobs. During his relief stint in the Sixth Ward, Greeley had heard “stout, resolute, single young men and young women” pleading, “Help us to work, we want no other help; why is it we can have nothing to do?” What New York needed, Greeley declared, was not a workhouse but a “House of Industry” that could provide temporary employment in hard times. The elite consensus, however, followed Mayor Morris and his counterparts at the AICP, and before the decade was out, a workhouse would be up and running on Blackwell’s Island.

Dominant opinion was equally opposed to government’s providing public works jobs for the unemployed, as had been done in the embargo

crisis. When petitions were submitted in 1837 “in behalf of the unemployed operatives, for relief,” a Common Council committee conceded that the petitioners were “not paupers” and “merely ask for employment to enable them to procure food for their wives and little ones”; nevertheless, it declared its general opposition to work relief. The council did authorize a few street and sewer projects (in part to take advantage of low wages) but established such stringent conditions for contractors that no bids were submitted, and no work provided.

At the statewide level Whigs did support internal improvements. Whig Assemblyman (and Gramercy Park developer) Samuel B. Ruggles proposed an ambitious program of state-backed canals and railroads. Governor Seward, who had written an admiring biography of his hero De Witt Clinton, supported one such project after another, running up an unprecedented state deficit of eighteen million dollars.

Democrats denounced Whigs for increasing the state’s debt and endangering New York’s standing with its creditors. The principal bankers of New York City, including many Whig paladins, agreed that further borrowing would be “highly inexpedient and improper” (especially as their institutions held nearly \$750,000 of shaky state obligations). Democrats demanded that all public construction be halted. Seward, Greeley, and Ruggles argued this was short-sighted and inhumane and would flood the state with perhaps four thousand new unemployed. But Democrats took power in 1842, and New York’s grand program of public works came to a complete halt.¹

“WATER! WATER!”

With one magnificent exception. The Croton Aqueduct had been authorized before the panic struck, and powerful backers would sustain the gigantic state undertaking throughout the depression. Its construction would serve as New York’s de facto jobs program.

By early 1837 the Corporation had wrested control of the municipal water supply from Aaron Burr’s Manhattan Company, purchasing its works, pipes, and water rights. Lawsuits by Westchester County dwellers protesting land confiscations by big-city interests were overcome, as was opposition from northern Manhattan landowners. Albany authorized

issuance of \$2.5 million in stock, and despite the panic, so sterling was the state's Erie Canal track record that the Rothschilds and others were able to round up investors. Eventually an unprecedented twelve million dollars was raised.

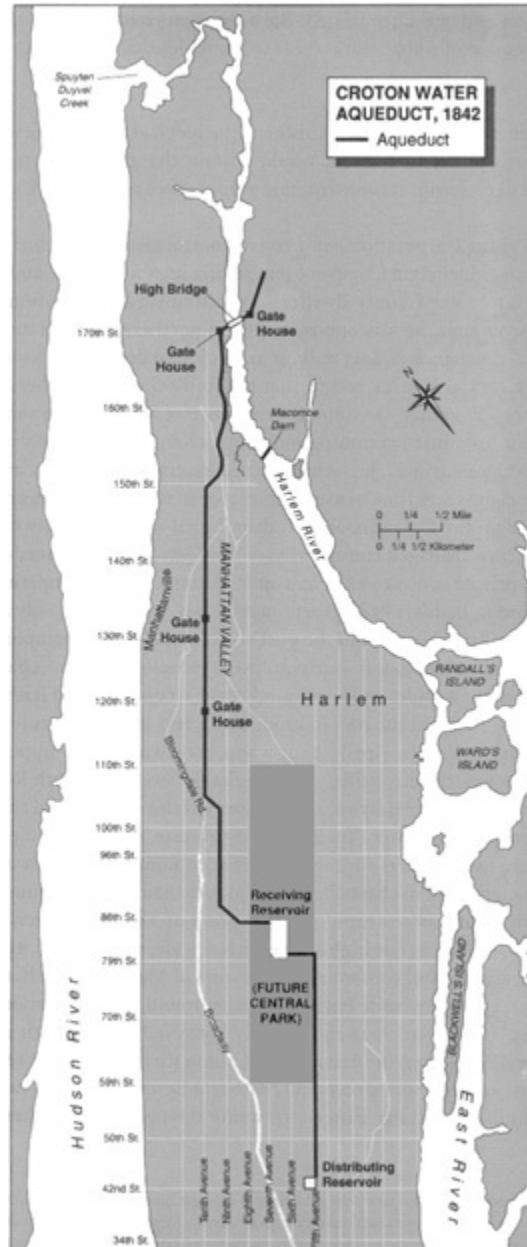

Government-appointed commissioners took charge of the project and selected John B. Jervis as chief engineer. Jervis had learned his craft on the Erie Canal—working his way up over eight years from axman to surveyor to Resident Engineer—and honed his skills further on the Delaware and Hudson Canal and the Mohawk and Hudson Railroad. Now Jervis managed construction of the forty-one-mile aqueduct, parceling out the work to private contractors in half-mile sections. Fierce competition kept bids low. To clear a profit, builders had to keep wages down, which they easily accomplished by recruiting their labor force from the port's vast reservoir of unemployed workers. Eventually three to four thousand were employed, including many mechanics from the devastated construction trades and large numbers of recently arrived Irish immigrants.

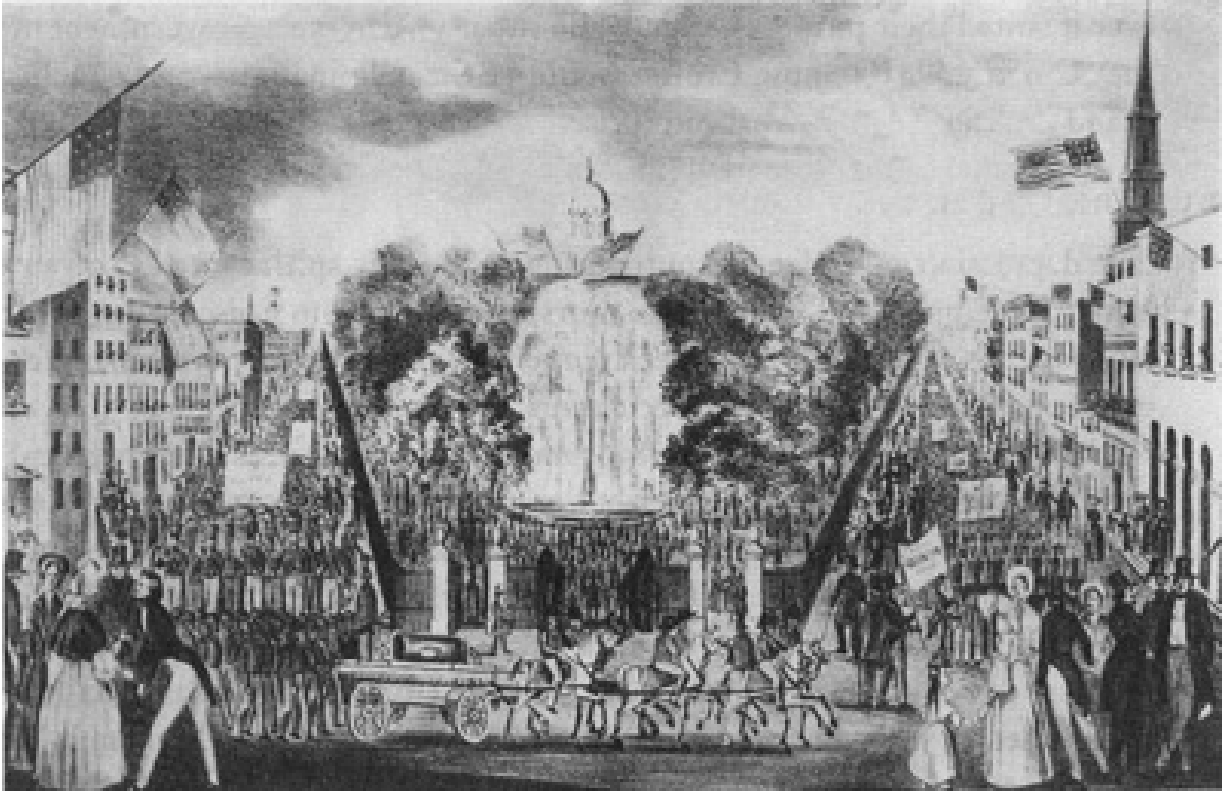

Laborers who resented the rock-bottom wages and strict work rules periodically launched violent strikes. In April 1840, when men working in upper Manhattan demanded higher pay, the city called out the reliable Twenty-seventh Regiment. The troops traveled to 42nd Street by railroad, dispersed the strikers, and returned to the city by late evening. There were further labor protests, which halted progress until slight raises were extended, as well as riots between immigrants from different Irish counties, each determined to channel precious jobs to their own community.

Despite this, progress was rapid. By the spring of 1840, work crews had run the masonry conduit, over eight feet high and seven feet wide, down to the city's edge, while others were laying pipes and constructing reservoirs in Manhattan itself and launching the spectacular 1,450-foot granite High Bridge that would span the Harlem River.

On June 23, 1842, water was successfully conveyed—along with a four-person boat, the *Croton Maid*—from the dammed-up Croton River to the giant receiving reservoir bounded by 79th and 86th streets and Sixth and Seventh avenues—a basin capable of holding 180 million gallons. Fifteen to twenty thousand New Yorkers traveled by foot, horse, carriages, or trains to Yorkville for a preliminary celebration, as the *Croton Maid* came sailing out of the great aqueduct to cheers, cannon salutes, and toasts of the “sweet,

soft, clear water.” On July 4 water flowed through three-foot-diameter pipes down Fifth Avenue to the distributing reservoir at Murray Hill. Located at Fifth Avenue and 42nd Street, this fortress-like container, whose embankments rose thirtyeight feet above street level, was topped by a railed promenade, reachable by a stone staircase. It held twenty-four million gallons and fed water down to the 13th Street tank, and thence into the network of underground piping that supplied the heart of the city.

Croton Water Celebration, October 14, 1842. As the huge procession came down Broadway and swung into Park Row, it passed the new fountain in City Hall Park. The prominence of fire engines in the line of march reflected the importance of the new water system for fire protection as well as health and sanitation. (© Museum of the City of New York)

On October 14 New York gave itself over to one of its most extravagant Festivals of Connection, on the order of those celebrating the Federal Union and the Erie Canal. In what the *Commercial Advertiser* called “the largest procession ever known in the city,” a parade five miles long marched through town with noisy jubilation, every bell pealed, and a hundred-gun salute honored the eruption of a fifty-foot plume of water from a fountain in City Hall Park. “Nothing is talked of or thought of in New York but Croton water,” Philip Hone recorded. “Fountains, aqueducts, hydrants, and hose attract our attention and impede our progress through the streets. . . . Water! water! is the universal note which is sounded through every part of the city, and infuses joy and exultation into the masses.”

Charles King, president of Columbia College, hailed the new system as “the crowning glory and surpassing achievement of the latter part of the half century,” and the Croton Aqueduct was indeed one of the era’s great engineering achievements. But it proved to be the last gasp of New York’s governmental activism. By 1842 the great enthusiasm for state-supported internal improvements had run dry. Governmental underwriting no longer seemed so necessary, nor state control so appropriate. City merchants and bankers would not hesitate to demand government aid for themselves whenever it suited their purposes, even while ritually denouncing government meddling in the economy. But for now, Croton would be the culmination—and conclusion—of a grand tradition of municipal enterprise.

RUM, REVIVALS, . . .

The depression galvanized an outpouring of the holy spirit as well as of water in New York City. Upper- and middle-class worshipers flocked to Episcopalian and Presbyterian churches to hear ministers declare the panic to be God’s punishment for the sin of greed and the evil of reckless speculation. Plebeian Protestants, too, filled churches as workshops emptied. In the mid-1830s most artisans had resisted evangelical blandishments and devoted themselves to labor organizing. Now, their unions in ruins, artisans packed into Methodist and Baptist tabernacles and feasted on fiery sermons.

Brand-new sects appeared. William Miller, a modern-day prophet, predicted the end of the world would arrive on April 23, 1843, and be followed promptly by the Second Advent of Christ. Miller’s New York disciples met in a large hall on Chrystie Street. Led by Joshua Himes, a brilliant publicist dispatched to the country’s communications capital to spread the good news, Manhattan’s Millerites helped blanket the nation with four million prophetic charts and pamphlets. In the city itself, believers put out a weekly, the *Midnight Cry*, and roamed the sidewalks auguring doom. As the final day neared, some gave away their possessions. Many garbed themselves appropriately for their impending transformation into angels by purchasing the “White Muslin for Ascension Robes” advertised in Bowery dry-goods stores. When the end failed to arrive, Miller announced an error in calculations; a revised forecast postponed Judgment

Day until October 23, 1844. After a second disappointment, the leadership recanted and the movement dispersed.²

Born-again workers seeking strength and solace also created a working-class temperance movement. In the flush years of the 1830s, most artisans and laborers had spurned the evangelicals' calls to give up drink, and hard times had driven many more to hard liquor. Yet within a year of the panic, journeymen and day laborers had formed the Temperance Beneficial Association, which set up street-corner pulpits from which reformed drunkards testified that alcohol made bad times worse, not better.

In 1841 journeymen and small masters launched the New York Washington Temperance Society, opening a mission on Chatham Street. Many in the panic-strengthened sects took the temperance pledge hoping Washingtonianism would bring order and self-respect to depression-buffed lives. With elites insisting that poverty was a sign of dissoluteness, sobriety was a way of attesting respectability. The Washingtonian movement spread swiftly. In six months, it claimed twenty thousand male members in fifty chapters. Thousands of working-class women joined the Martha Washingtonians: wives who watched their husbands squander precious wages or savings on drink had their own reasons for being drawn to the movement.

Washingtonian temperance became the largest popular movement in New York City's history. While merchants, professionals, and masters held some leading positions, the movement sustained an egalitarian tone, rejected pious coercion, and refused to insist on conversion in Christ. Aware of drinking's key role in male working-class sociability, Washingtonians sought alternatives to the saloon. They sponsored weekly experience meetings—confessional self-help groups—and offered alcohol-free amusements like steamboat excursions, picnics, dances, bazaars, and concerts. The evangelical American Temperance Union criticized these vulgar innovations; at *their* meetings, also burgeoning, people listened decorously to clergymen and doctors expound on the evils of liquor. But it was precisely the Washingtonians' ability to foster individual survival skills within a congenially communal context that made them popular.

Communalism had its downside, however. Temperance helped respectable Anglo Protestant artisans distinguish themselves from the (putatively dissolute) Catholic poor, a source of psychic comfort at a time

when the line dividing the two communities had become thinner than ever. But the depression had also galvanized New York's Irish Catholics. They too pursued consolation in consolidation and asserted an ever greater cultural and political presence in the city. In a context of frightening economic insecurity, heightened communal sensibilities could and did easily degenerate into urban tribalism. Soon the mid-thirties dream of working-class solidarity would be drowned in a sea of ethnic and religious bitterness.

... AND ROMANISM

The depression had badly battered the Catholic Church. Father Varela's Transfiguration was in particularly grim shape. Back in prosperous 1836 he and the lay trustees had borrowed tens of thousands of dollars, in small sums, from the poor people of the parish to buy a vacated Presbyterian church on Chambers Street. Now desperate parishioners, many of them out of work for months and "in the utmost distress," implored him to return their money lest landlords seize their few pieces of furniture as payment for rent. Transfiguration itself was on the verge of being auctioned off, however, and only managed to stave off creditors by mortgaging its organ.

Bishop John DuBois was not prepared to deal with a crisis of this magnitude. Now seventy-four, he had been a priest for nearly fifty years and head of the diocese since 1826. Even before the panic, the aging Frenchman, long resented by the Irish community and hierarchy, had signaled his readiness to pass power to the immigrant-strengthened Gaels. The American bishops, accordingly, now dispatched John Hughes, a priest in Philadelphia, to aid DuBois and his flock.

Hughes was himself an Irish immigrant. The son of poor farmers, he had arrived in the United States back in 1817, aged twenty, and supported himself as a gardener while studying for the priesthood. More than ethnicity distinguished him from DuBois. Where the bishop had shied away from controversy, fearing to raise the profile of an outnumbered community, Hughes thrived on conflict and had long urged Catholics to fight for political and civil rights. With his stern mouth, muscular body, and intimidating presence, Hughes looked like a fighter. His nickname of "Dagger John" rested on more than his penchant for inscribing a stiletto-like cross next to his signature.

Two weeks after Hughes arrived in 1838, DuBois suffered a paralytic stroke, and the newcomer took effective control of the diocese. In 1842, on DuBois's death, Hughes would become bishop, the first prelate to be consecrated in St. Patrick's, and his elevation would mark the ascendancy of the Irish in the New York church. The dethroned French, perhaps by way of consolation, were awarded their own parish of St. Vincent de Paul in 1841.

In the fall of 1839 Hughes sailed to Europe seeking aid from wealthy Catholics. He did receive funds from the Austrian Leopoldine Society, but these were earmarked for a college and seminary—the future Fordham—and for recruiting priests and teachers for Catholic schools. The troubled New York church would have to make it on its own.

With Catholics still a small minority—the diocese had only eight of the city's 150 churches—Hughes was convinced the community had to rally round its faith, as various Protestant sects had been doing. In 1840 Father Varela founded the New York Catholic Temperance Association; hundreds took the pledge at Transfiguration gatherings, and within a year the group had five thousand members. Hughes, however, decided to focus on the schools.

Missionary protestantism still permeated Public School Society classrooms. The King James Bible—which Catholics would not accept even when the American Bible Society gave them away free—remained required reading. Schoolbooks slurred Catholicism. Teachers derogated Irish culture. And the PSS refused to open branches for Five Points immigrants, as “it is not thought proper to associate them with the respectable and orderly children who attend the Public Schools.” The Church had expanded its own schools, but with public funding having ceased in 1825, they were overcrowded and understaffed. Thousands of Catholic children received no education at all.

Hughes wanted to restore public funding for church schools. This would relieve depression-aggravated poverty and end Catholics' second-class status in the city. The bishop soon discovered an ally in Governor Seward. An ardent advocate of Irish freedom and Irish immigration, Seward believed education was crucial for assimilating and elevating the arriving poor. Less high-mindedly, the governor knew that if Whigs were to sustain

their depression-era victories, they would have to break Tammany's grip on the city's Catholic Irish.

In January 1840 Seward recommended funding for schools in which children "may be instructed by teachers speaking the same language with themselves and professing the same faith." Catholic leaders promptly applied to the Common Council, which controlled distribution of school monies. They promised, if funded, to limit religious instruction to after-school hours and to require parental approval. A Hebrew congregation and a Scotch Presbyterian church joined the appeal.

Cautious aldermen arranged a debate. A battery of Protestant lawyers and divines supported the current arrangements as a satisfactory separation of church and state. Hughes, standing alone, gave a three-and-a-half-hour speech arguing that Catholics' religious liberties could be upheld only in Catholic institutions. Appealing to Loco Foco antimonopoly sentiments, Hughes also cast the PSS as unacceptably authoritarian, paternalistic, and undemocratic—a "complex monopoly, of mind, and money, and influence, in the city of New York." Nevertheless, a nervous Democratic council turned him down.

Hughes appealed to Albany, where the Whig legislature and governor backed a school decentralization plan giving each ward authority to decide what kind of schools it wanted. The PSS countered that—given the city's shifting population—New York needed more, not less, uniformity in its schools. Besides, the Catholic claim was unconstitutional. Also it was unrepublican, one Protestant paper said, to train up children "to worship a ghostly monarchy of vicars, bishops, archbishops, cardinals, and Popes!" Renascent nativists formed (in May 1841) the American Protestant Union (led by S. F. B. Morse) to back candidates in the upcoming November elections who were deemed safe on the school issue.

With Tammany waffling and city Whigs backing away from Seward, Hughes decided to enter politics directly. Days before the election, he called a meeting in Carroll Hall, which endorsed ten of the thirteen Democratic nominees for the Assembly but ran independent Catholic candidates for the three remaining slots. All ten joint selectees won, but the Carroll Hall ticket drew sufficient Democratic votes away from the contested trio to let three Whigs win. Hughes had demonstrated two things conclusively to the Democrats (who had regained both houses of the legislature): given the

roughly equal strength of Whigs and Democrats, Catholics held the balance of political power in New York City, and they would not hesitate to wield that power against Tammany.

Democrats, accordingly, passed the Maclay bill on April 9, 1842. It authorized each ward to elect commissioners who would supervise local schools and, acting together, constitute a citywide Board of Education. It also barred the teaching of any sectarian doctrine. Seward signed the bill. For the first time in its history, New York City had an education system financed entirely from the public treasury and directly controlled by the people.

Some of the people were less than pleased, however. On the night Seward signed, crowds stoned Hughes's home, forcing authorities to call out the militia. The editor of a new twopenny paper, the *Aurora*, applauded the attack. Already known for his diatribes against "villainous priests" and "Irish rabble," Walter Whitman now declared that if the missiles had been directed against "the reverend hypocrite's head, instead of his windows, we would hardly find it in our soul to be sorrowful."

Protestant die-hards quickly won control of the new Board of Education and ruled that classroom readings from the King James Bible were not precluded by the ban on sectarianism. Catholics also lost the battle for funding of their church schools. So Hughes returned to the task of building up a parochial school system, staffed primarily by nuns, that would parallel the city's network. At Hughes's request Mother Madeleine Sophie Bar at founded the Convent of the Sacred Heart in 1841 and opened an academy on Houston and Mulberry, near the cathedral.

THE RETURN OF THE NATIVES

Bishop Hughes's brief foray into politics, combined with the pressures of hard times, had reawakened New York's slumbering nativist movement, which now dramatically asserted its power.

At first, the panic had actually soothed anti-immigrant anxieties by diminishing the influx of Irish. "Times is hard and wages low," an Ulster-American warned his relatives back home, and the word got around. In 1837 forty-eight thousand crossed over; in 1838 only eleven thousand did. Still, the stream of new arrivals helped swell relief rolls, increase taxes, and

heighten competition for scarce jobs and housing. Hughes's Carroll Hall gambit of 1841 raised fears of Catholic political ambitions, and in spring 1842 newly reelected Mayor Morris rewarded Irishmen for their support by giving them jobs and licenses in the public markets.

Enraged Anglo-Protestant butchers, suddenly facing Irish competitors, spearheaded an anti-immigrant offensive. By August an American Republican Party was up and running, and in November its candidates received an astounding 22.9 percent of the vote for local offices. Spurred by this showing, a wide variety of New Yorkers clambered aboard the new party. Merchants, professionals, editors, and shopkeepers—furious at high taxes, financial profligacy, patronage abuses, outright corruption, and the yielding of Democrats and Whigs to Catholic pressure—hailed the American Republicans as a party of municipal reform. Small masters and journeymen in as yet unindustrialized trades like building, butchering, blacksmithing, and shipmaking signed on as well, in hopes that halting the immigrant flow might forestall the capitalist reorganization of work that had devastated the tailors, printers, and shoemakers. The new party also exalted the artisanal republican values of manly independence, Christian brotherhood, and craft solidarity and promised to restore the Trades to prominence.

What tied these disparate groups together was a shared Protestant culture, a nostalgic belief that New York City had been a far better place just after the Revolution, and a conviction that the evils now afflicting it—rising rates of crime, pauperism, and immorality—were foreign imports. The party's platform reflected these premises. The American Republicans wanted to extend the naturalization period to twenty-one years, effectively eliminating foreigners from politics and reserving government offices and market licenses to citizens. The nativists aimed to repeal the 1842 school law to guarantee preservation of Bible reading and “nonsectarian” religion in the schools. The party also promised budget cuts, tax reductions, law and order, sobriety, bipartisan appointments, and an end to corruption.

In 1844 the American Republicans ran publisher James Harper for mayor. An ideal candidate, Harper was native born and a devout Methodist, head trustee of the John Street Church. He was staunchly anti-Catholic: his firm had brought out Maria Monk's *Awful Disclosures*. He was a temperance man, a Washingtonian. Harper cast himself as “a mechanic”—

he was a member of the General Society of Mechanics and Tradesmen—and evoked the old artisanal town. He was also the city's largest employer, in command of its most technologically sophisticated plant, and thus appealed to propertied taxpayers and the men forging an industrial metropolis.

Many city Whigs deserted their party to support Harper's candidacy—some openly, most tacitly, given Governor Seward's opposition. With their support, American Republicans swept the spring 1844 elections, placed James Harper in City Hall, and won control of the Common Council.

Harper set out to forge a new civic order. On the Fourth of July, the Mayor banned the sale of alcohol, offering up instead a large basin of iced Croton water in City Hall Park. He enforced tavern laws prohibiting Sunday liquor sales (though he exempted the downtown hotels patronized by more elite clienteles). Foreigners disappeared from the city's payroll. Apple women and other vendors were driven from the streets. Some salaries were cut, though taxes and expenditures continued to increase. Plans were launched for reforming the almshouse. In the end, however, Harper's crusade went nowhere: partly because under the charter the mayor lacked real power; partly because his moral fervor was transparently class-partial; partly because he was inept at governance; but primarily because a sequence of shocking events discredited his nativist movement.

In May 1844 word arrived that Philadelphia, which had also been riven by debates about schools and Bibles, had exploded in violence, with frenzied nativists hunting down Irishmen by the light of burning homes and churches. Excitement spread through New York. Some local nativists were eager for combat; an hours-long battle with Irishmen had broken out in Brooklyn a few days before Philadelphia erupted. Now they called for a giant rally on May 9, to greet a delegation of Philadelphia nativists.

Bishop Hughes stationed a thousand armed Irishmen around each Catholic church and told his community to keep the peace but defend their property at all costs. Hughes met with the mayor, who asked if the bishop was afraid for his churches. "No, sir," he replied, "but I am afraid that some of yours will be burned." Hughes went on to make it utterly clear to the nativist administration that "if a single Catholic church were burned in New York, the city would become a Moscow." The authorities, fearing a bloodbath, pressed their Protestant allies to abandon their mass meeting, a

request to which they reluctantly acceded a scant few hours before it was to take place.

The riots in Philadelphia and New York's near brush with Armageddon deeply shocked many citizens. Nativists, now associated with riot and lawlessness, lost sympathy. In the 1845 mayoral election, the Seward wing recaptured control of city Whiggery and refused to back Harper's bid for reelection. Deserted by their allies, the American Republicans managed to win only a single ward constablenesship. The Democrats elected respected sugar merchant William Havemeyer Mayor on a reform ticket. Within two years the American Republican Party was dead, and with it, for the moment, nativism as a political force.

ROACH GUARDS AND DEAD RABBITS

Before receding, nativism contributed to an increase in street gangs, many of them ethnically based. "The city is infested by gangs of hardened wretches," Philip Hone told his diary in 1839. They "patrol the streets making the night hideous and insulting all who are not strong enough to defend themselves."

Gangs were no novelty in New York City. Citizens had complained of them since the early eighteenth century, and evanescent constellations of rowdy young men had been common enough after 1800. The Chichesters, perhaps the first gang with staying power, had commanded attention during the 1830s boom years, particularly for its assaults on brothels. But during the depression scores of gangs crystallized, each distinctively named and garbed.

The grocery-groggeries in the heart of the Five Points became headquarters for turf-based Irish gangs like the Forty Thieves, Kerryonians, Shirt Tails (from their shirts-out sartorial style), and Plug Uglies (from their enormous plug hats, which they stuffed with wool and leather and drew down about their ears like helmets when entering battle). The Roach Guards were conspicuous in their blue-striped pantaloons, and the Dead Rabbits, snappy in red stripes, adopted a name that meant "seriously *bad* dudes" in Points argot.

The Bowery was another gang locus. Here resided the Bowery Boys, O'Connell Guards, Atlantic Guards, American Guards (of nativist bent),

and True Blue Americans (Irishmen, whose costume consisted of long black frock coat and stovepipe hat—a send-up, perhaps, of the outfits favored by dandified young merchants and clerks). African Americans coalesced as well, a phenomenon one of Frances Grund’s local informants blamed on Arthur Tappan and his colleagues: “Our black servants are getting worse and worse every day ever since that bigoted scoundrel T*** has commenced preaching abolition,” he fulminated. “Those black devils have always been a nuisance; but now ‘a respectable white man’ can hardly walk up and down Broadway of a Sunday afternoon without being jostled off the sidewalk by one of their desperate gangs.”

Some gangs were pacific and merely took in the theater or circus together, but many were fiercely territorial. They guarded (as the names of many groups implied) particular pieces of city turf or invaded those of nearby bands. Neighborhood frontiers crackled with border wars. Combatants fought with bludgeons and brickbats, clubs and hobnail stomping boots, and occasionally, though still rarely, knives and pistols. At times, local rivals would league together into a giant horde and sally forth to challenge a gangcombine from some other part of town. Such combat was a customary entertainment in Ireland and England but increasingly frowned upon by the authorities over there. Over here, immigrants found, they could indulge in donnybrooks with virtual impunity; indeed spectators massed on rooftops or gathered at windows to cheer the scrappers on.

Gang members also latched onto volunteer fire companies and transmuted their traditional tussles into increasingly nasty confrontations. In 1839 over a thousand men and boys battled with sticks and brickbats. More and more often, such fire fights ended with stabbings or broken skulls. In January 1840 the mayor and Common Council found that “a great excitement prevails in this community, in consequence of frequent breaches of the peace, alleged to have been committed by a large number of dissolute and profligate young men.”

Tribalism provided camaraderie, protection, identity, and also a sense of being in charge, something increasingly hard to come by in the workplace. Many gang members were technically “apprentices” or “journeymen,” but few harbored any hope of becoming a “master.” Jobs seldom gave a worker status or a chance to display skill. And if being a waged employee diminished one’s sense of autonomy and control, being fired devastated it.

The panic had made painfully clear that the new economic order could pitch a worker into desperate poverty, virtually overnight.

Security and self-esteem were best pursued elsewhere. After work a butcher, tailor, or cartman could doff his smock, apron, or overalls, don colorful gang regalia, rendezvous with his comrades, and regain at least the illusion of being in control of his life, of being a man among men. Rude lads esteemed precisely those qualities the emerging bourgeoisie devalued: muscular prowess, masculine honor, swaggering bravado, and colorful display. Uptown precincts exalted domesticity and sanctified femininity, but the lower wards were dominated demographically by single young men, most of whom, given their limited prospects, married late or not at all, and there, rowdy masculinity ruled. Women might assist in battle by bringing stones to frontline fighters but were seldom full-scale participants. There were, however, some spectacular exceptions, like the Dead Rabbits' Hell-Cat Maggie, whose teeth, filed to points, and fingers, embellished with brass nails, made her a welcome companion on forays against the Bowery Boys.

Gang warfare reflected and exacerbated conflicts between old-timers and newcomers. Some groups took ethnic chauvinism or blustering nativism as a *raison d'être*. Others avoided straight-out trials of strength with evenly matched opponents, preferring to prowl the streets singling out victims to bash (as in an 1840 assault on German immigrants).

The emergence of a vigorous two-party system drew the gangs into politics as well. Democrats, especially, sought the services of well-organized and well-muscled groups. Many Tammany ward and district leaders were on familiar terms with gang members, being proprietors of the Bowery saloons where they congregated. It was easy enough, therefore, especially in straitened times, to hire men to strong-arm party opponents and to guard, steal, or stuff ballot boxes.

Some of these outfits had political ambitions of their own. Mike Walsh, brought over from Ireland as a child, was a lithographer and journalist by trade. A militant defender of the city's workers, Walsh was hugely popular for his vitriolic and hilarious speeches excoriating assorted elites as "curs," "grub-worms," and "vultures." An effective fighter as well as eloquent speaker, Walsh formed the Spartan Band, one of the city's most effective gangs, in 1840. In elections that year, he and his men, forty or fifty strong

and armed with clubs, invaded Whig headquarters, assaulting all present. In the November 1841 election, Walsh's Spartan Band, with three hundred members, became something of a loose cannon when he and his shoulder-hitters strong-armed their way into *Tammany's* precincts and forced the Democratic General-Committee to put Walsh's name on their ticket.

Captain Isaiah Rynders, for whom politics was strictly a business, was more typical of the new breed of gang leaders who tied up with Tammany. The Captain had earned his tide commanding a Hudson River sloop, then headed west, where he became a celebrated gambler and knife fighter, working the Mississippi River steamboats. Back in New York by the late 1830s, he opened half a dozen groceries and Bowery saloons. In 1843 Rynders organized the Empire Club, a group of bruisers who operated out of the Arena saloon at 28 Park Row—recruiting immigrants, breaking up Whig meetings, doing whatever Tammany called for.

At the same time some gang leaders were forging fateful partnerships with New York politicians, others were dedicating their energies to criminal enterprise. Complaints of robberies and muggings increased rapidly during the depression years. "The property of the citizen is pilfered, almost before his eyes," declared a special committee of the Common Council in 1842. "Dwellings and warehouses are entered with an ease and apparent coolness and carelessness of detection which shows that none are safe."

"A civic ARMY"

New York's patriciate had long tolerated crowds rather than maintain a "standing army" of professional police. As late as the rowdy Callithumpian processions of the 1820s, some gentlemen had still considered the occasional civil disorder to be compatible with civic order. No longer. Crowds had gotten too big, too unruly, too organized, too Irish, and (Hone feared) "will ere long be difficult to quell."

They were *already* difficult to quell. In the riots of the 1830s, mayors attempting to overawe crowds with the majesty of their office had been unceremoniously trampled on. Nor, given existing instrumentalities for maintaining law and order, did reliance on physical force work much better than relying on social deference.

The police force was not inconsequential, to be sure. Jacob Hays, appointed high constable back in 1802, was a seasoned enforcer of the law. During the 1830s disturbances he had plunged gamely into the thick of a crowd, armed only with his staff of office, and seized rioters with a viselike grip. Hays, moreover, was backed by an expanded cadre of peace officers. By day these consisted of two dozen elected constables (two per ward) and scores of mayorally appointed marshals. By night hundreds of watchmen roamed the streets; though primarily on the lookout for fires, they were empowered to arrest any criminals they caught in the act. By 1834, indeed, New York's constabulary was among the largest and most efficient in the United States.

But not efficient enough. Old Hays, as he was known, was in his sixties. The daytime men were unsalaried and often corrupt political appointees, more interested in earning fees than preventing crime. The "leatherheads" (as watchmen were jeeringly known, after their leather helmets) were poorly paid moonlighters, scantily trained and ill respected. In the big upheavals of the 1830s civil authorities had been repeatedly forced to resort to the militia—usually the elite Twenty-seventh—but frenzied lastminute responses to street turbulence no longer seemed acceptable.

After the shipworkers' strike of February 1836—an affair that underscored the vulnerability of the city's commercial core—an elite consensus had emerged in favor of strengthening the forces of law and order. The Twenty-seventh was issued standing orders to be ready to deal with street violence, and the state legislature (in March 1836) specifically authorized the mayor to order out the militia to "quell riots, suppress insurrection, to protect the property, or preserve the tranquillity of the city." Yet widespread sentiment still held reliance on the military to be inappropriate for a republican government. In 1836, accordingly, Mayor Lawrence had asked Police Justice Oliver M. Lownds to consider ways of reorganizing the police department.

Lownds proposed that New York establish a twenty-four-hour professional police force, modeled on the one created in London by Robert Peel back in 1829. Lownds's "System of Police" envisioned the creation of multiple stationhouses, each armed with alarm bells. It won the approval of Mayor Lawrence, but opponents killed it by rousing old fears of a standing army and playing on new antigovernment sentiments, distrust of

professionals, and fears that political parties might control the police. Besides, the Twenty-seventh Regiment had done such a sterling job suppressing riots. “Six hundred strong,” one paper noted, and “composed entirely of the respectable young men of the city,” they “may be considered the most efficient police we have, and we believe the Mayor and Common Council look upon them as such.” So, apparently, did the federal government, which in 1839 allowed the Twenty-seventh to drill at Fort Hamilton (making it the first National Guard training camp in the nation); in 1840 granted the fort twenty thousand dollars for additional armaments; and in 1841 dispatched Captain Robert E. Lee for a five-year stint as post engineer, charged with improving the fort’s defenses along with those of other military installations in the area.

The council did agree that New York needed a new jail. The old Bridewell was a nuisance, and the Bellevue Penitentiary was too distant from the downtown courts. In 1835, accordingly, construction commenced on a Hall of Detention and Justice. Situated on the grounds of the old Fresh Water Pond, along Centre Street between White and Leonard, the structure had a highly distinctive appearance. John L. Stevens of Hoboken had returned from the Holy Land with illustrations of an Egyptian tomb that caught the fancy of the Common Council. Completed in 1838, the new and imposing city prison became popularly (if mordantly) known as the Tombs.

In the depression, the propolice movement revived. The Twenty-seventh no longer seemed quite so potent a weapon since the panic had bankrupted many of its officers and men, and each passing year had underscored the inadequacy, inefficiency, and outright corruption of the existing force. The daytime marshals and constables, unsalaried, were compensated by fees, supplemented by privately offered rewards. The officers, not surprisingly, concentrated on crimes that seemed most likely to generate emoluments, such as thefts from a rich merchant’s warehouse. With New York in effect having evolved a system of privatized justice, some enterprising detectives went a step farther. They actively colluded with thieves by “recovering” stolen property, then splitting the reward with the perpetrator. Hearings in 1840—the first of many and many to come—produced shocking accounts of organized police corruption.

The night watchmen—“postmen” at fixed stands and “roundsmen” patrolling the streets—were equally problematic. As their numbers expanded

from 512 in 1830 to 1096 in 1845, their reputation declined. Many leatherheads were elderly retirees or working a second job: “While the city sleeps,” New Yorkers quipped, “the watchmen do too.”

In 1839 Mayor Clark pushed for a municipal “military arm,” on the grounds that having “the character of a riotous city fastened upon us would be truly calamitous.” Editors called for a force that would *prevent* crime, not just catch criminals after the fact. Yet reluctance to expand police powers stalled further action until the sensational death of Mary Cecilia Rogers generated a demand strong enough to overbear all objections.

Mary Rogers, known as “the Beautiful Cigar Girl,” had come to New York from Connecticut in the panic year of 1837. In 1838 she took a job selling cigars and tobacco at John Anderson’s popular Broadway haunt for journalists and politicians. (This too was a depression-era phenomenon: as an 1838 story in the *Sunday Morning Atlas* noted, “times are so hard” that out-of-work young women were taking jobs in cigar stores despite the potential threat to their virtue from rakish young customers.) Early one Sunday morning in the summer of 1841, Mary Rogers left the boardinghouse her mother ran at 126 Nassau Street and went missing. Three days later, her bruised and waterlogged body was found floating in the Hudson River near Hoboken.

The penny press turned Rogers’s death—like that of Helen Jewett—into a sensational event. Initial reports had it that Rogers had been gagged, tied, beaten, and raped by several men, then strangled and dumped in the water. Many assumed, with Philip Hone, that Rogers had “no doubt fallen victim to the brutal lust of some of the gang of banditti that walk unscathed and violate the laws with impunity in this moral and religious city.” James Gordon Bennett blamed a gang of “fire rowdies, butcher boys, soaplocks, and all sorts of riotous miscreants,” or perhaps a “gang of negroes.”

When police made no headway in solving the crime, the press, led by Bennett, escalated Mary’s death into a metaphor of New York’s social and moral disintegration. In a scathing editorial on August 12, 1841, Bennett denounced “the apathy of the great criminal judges, sitting on their own fat for a cushion bench—and the utter inefficiency of their police.” Such incompetence was “leading fast to reduce this large city to a savage state of society—without law—without order—and without security of any kind.”

Hysterical rhetoric about the proliferation of crime was seriously overdrawn, as an 1842 district attorney's report demonstrated, but sentiment proved more compelling than statistics. Governor Seward, citing the Rogers case, called for improving the police in his 1842 Annual Message. Local influentials now swung round and reached a consensus, as one advocate put it, about "the necessity (as in London) of a civic ARMY, a numerous Municipal Police."

In 1843 the state legislature passed a New York Municipal Police Act, which the governor signed on May 7, 1844. The new law abolished the Watch Department and the offices of marshals, street inspectors, health wardens, fire wardens, dock masters, lamp lighters, bell ringers, and inspectors of pawnbrokers and junk shops. All these responsibilities and more were turned over to a semimilitary "Day and Night Police," not to exceed eight hundred men.

New York's force was closely modeled on London's, with one crucial difference. London's Metropolitan Police was an arm of the national government, divorced from local control. New York's was totally decentralized. Each ward became a patrol district, with its own stationhouse. And each ward nominated its own candidates for police officers; if accepted by the mayor, they were required to live and serve in that ward. New York's police, beholden to politicians, would be inextricably enmeshed in local politics.

The new policemen were salaried—all fees were abolished—and each was expected to make policing his only and full-time job. Preventing crime became as important as apprehending criminals. Officers assigned to surveillance were required to report "all suspicious persons, all bawdy houses, receiving shops, pawn brokers' shops, junk shops, second-hand dealers, gaming houses, and all places where idlers, tiplers, gamblers and other disorderly suspicious persons may congregate."

The 1844 state law, however, was merely permissive legislation. It was up to the city to accept it. Mayor Harper's nativist administration, which took power after Albany acted, refused to ratify it. Instead, leaving the old system intact, the American Republicans added a body of two hundred men—native born and strictly temperance. Officially called the Municipal Police, they were known informally as "Harper's Police," as the mayor, not the wards, selected each man.

Harper also chose their wardrobe. The state law had explicitly rejected uniforms as a sign of despotic government, requiring only a star-shaped copper badge (hence “copper” or “cop”). Mayor Harper demanded a blue frock coat with covered buttons, a dark vest, blue pantaloons, and a standing coat-collar with the letters *M.P.* and a number in woolen embroidery. The men bitterly opposed the uniform, which they felt made them look like butlers. The public booed them in the streets, denouncing them as “liveried lackeys” of the nativists.

In 1845, when Democrats retook the city, they scrapped Harper’s Police and adopted the state law. Mayor Havemeyer, striving to establish a bipartisan department, appointed a political opponent, George W. Matsell, to be the first chief of police. Tammany men on the Common Council, having no such high-minded compunctions, promptly parceled out the eight hundred new positions to Democratic activists (some of them members of the new strong-arm gangs).

BOTTOMFEEDERS

Hard times had a golden lining for more than newly minted policemen. Indeed, the depression laid or strengthened the foundation for several of Manhattan’s foremost fortunes.

On May 14, 1837, August Belmont, aged twenty-three, arrived in New York City. His intention was to take the next boat to Havana, where he was to check on the Cuban interests of his employer, the House of Rothschild. Belmont immediately noticed the idle docks, the subdued streets, the general air of a city suffering from plague. He walked over to Wall Street to enquire of the Rothschilds’ American agents what was happening, only to discover that the House of Joseph and Company had folded its tent. An ambitious young man—he had worked his way up with the Rothschilds from errand boy to confidential clerk to private secretary—Belmont decided on the spot to set up as the Josephs’ replacement. Canceling his Havana trip, he rented a small room at 78 Wall Street and established August Belmont and Company, gambling on his employers’ approval. When the Rothschilds’ blessing arrived—along with a salary of ten thousand dollars a year, a fortune in shattered New York—he used Rothschild credit to buy up banknotes, securities, commodities, and property at severely depressed

prices. With building lots going for a tenth of their former value, he could hardly help but flourish.

Unto those who already had, even more was given. Jacob Little, the notorious short seller, positively thrived during the crisis, reaping vast returns as the market plunged. John Jacob Astor, profiteer of calamity, snapped up land and houses at fire sale prices, spending over \$224,000 in 1838 alone. At the same time, Astor ruthlessly foreclosed on hundreds of property owners who fell behind in their mortgage payments. Cornelius Van Shaack Roosevelt also accumulated land all over Manhattan during the panic years, betting it would rebound in value. Henry E. Pierrepont, whose proposed cemetery had been stymied by high land prices, now found old Dutch farmers willing to sell out for far less. Green-Wood was incorporated in 1838; the first lots went on sale in 1839. At the opposite end of the opportunity spectrum, James Weeks, an African-American stevedore, purchased land in 1838 from the Lefferts family estate, site of the future Bedford Stuyvesant's Weeksville.

Bottomfeeding was not the only route to success. Alexander Turney Stewart, born in 1803 near Belfast (where he was educated for the ministry), emigrated to New York in 1818 and found work as a schoolteacher. In September 1823 he opened a tiny drygoods store on lower Broadway just north of City Hall Park, offering Irish linens, French cambrics, damask, and similar items "on reasonable terms." The business flourished, and over the next twenty years Stewart moved from one location to another, each one a little bigger and fancier than the last. By 1837 his five-story, double-width emporium at 257 Broadway was one of the city's largest. In the panic, Stewart bought up great amounts of distressed merchandise from bankrupt wholesalers and resold it at lowprice high-volume, emerging as one of the city's first millionaires.

Lewis Tappan fashioned a new industry out of hard times. At first, he and his brother, Arthur, had concentrated on simply staying afloat. Prevailing on their creditors to let them to stay in business, they cut expenses to the bone—Arthur moved into a boardinghouse and slashed his aid to abolitionists—and in eighteen months repaid all outstanding obligations, an amazing accomplishment. Still, the silk business remained a day-to-day struggle, and in 1840 Lewis departed to launch the Mercantile Agency, the country's first credit rating firm (and ancestor of Dun and

Bradstreet). Even in good times, New York wholesalers had lacked information about the solvency and reliability of the far-flung country storekeepers to whom they annually entrusted goods worth millions of dollars. The depression had underscored the problem, as unscrupulous (or merely desperate) retailers used evasion or fraud to escape their liabilities. Tappan's solution was to establish a network of trustworthy informants—recruited from abolitionists, evangelical clerics, and solid young lawyers like Abraham Lincoln of Springfield, Illinois—who forwarded to New York confidential reports on the merits of local storekeepers. These communiques assessed net worth, liquidity, and “character.” They flagged storekeepers who had intemperate habits, led a sporting life, or were “mixed up with a bad woman” (marriage was deemed essential to good credit, though having too many children was thought to cut into capital). From these raw files Tappan fashioned reports he sent to subscribers twice each year, just in time for the fall and spring seasons, when inland storekeepers descended on the city. He thus secured his own fortune and strengthened New York's position as a commercial center and haven for creditors.

“LAUGH AND GROW FAT”

Clearly, New Yorkers' responses to the drawn-out depression varied widely. Some failed, others made fortunes; some gave charity, others accepted it; some plunged into politics, others into religion, others still into crime. But one reaction was well-nigh universal: a search for diversion, something to drive one's cares away. For all but the rich, this dictated a search for inexpensive pleasures. At first, the panic had sandbagged the city's entertainment trades, but it quickly became apparent to a new breed of entrepreneurs that substantial profits could be made in hard times by providing cheap amusements to mass markets.

In 1837 popular papers had suffered along with their working-class readers. The panic killed off most of the penny dailies, including the *Transcript*. Even pioneer Benjamin Day lost heart. Facing declining circulation and advertising revenues, Day sold the *Sun* to his brother-in-law, Moses Yale Beach, another Connecticut Yankee. Soon, however, it became clear that working people considered penny papers an excusable indulgence in difficult days. Beach infused the *Sun* with capital, jettisoned what remained of its insurrectionary character (though retaining its democratic

air), and filled its pages with romantic fiction, racy crime, theatrical and sporting news, and such “Help Wanted” notices as came along, making it popular with the unemployed. By 1843 the *Sun* was shining brightly, with a claimed daily circulation of thirty-eight thousand, and twelve thousand for the weekly edition.

Bennett’s *Herald*, aimed at a more middling market niche, flourished too. Readers enjoyed his misanthropic maunderings, scathing editorials, accounts of scandals, and attacks on deceitful politicians and venal financiers. On March 2, 1840, Bennett broke new ground yet again, when he devoted his front page to the “Grand Fancy Dress Ball, at Brevoort Hall.” The story, mixing fawning society reportage with expose, recounted a tale of outrageous extravagance amid widespread suffering. Nearly six hundred costumed gentry had partied from eight in the evening until five the next morning at the Brevoort mansion on Fifth Avenue and Qth Street. (The article included a layout plan of the first two floors.)

Philip Hone—who attended as Cardinal Wolsey, garbed in scarlet merino robe and ermine cape—was delighted with the event. “Never before,” he told his diary, “has New York witnessed a fancy ball so splendidly gotten up, in better taste, or more successfully carried through.” But the racy reportage—which aroused both fascination and fury among the city’s middle and working classes—led the old mercantile elite to declare total war on James Gordon Bennett.

“This kind of surveillance is getting to be intolerable,” Hone fumed, “and nothing but the force of public opinion will correct the insolence.” He, along with leading merchants, bankers, and civic notables, worked to have “respectable people withdraw their support from the vile sheet.” Genteel readers and advertisers boycotted the *Herald*, rooted it out of homes, clubs, hotels, and coffeehouses, and ostracized Bennett. To no avail. The so-called moral war cost Bennett a quarter of his readership and a chunk of his ad revenue, but he soon bounced back, and voyeuristic society columns, offering mass audiences a window into elite sanctums, became a permanent feature of New York journalism.

The “moral war” was, however, a great opportunity for any publisher willing to step in as a champion of respectable values, and Horace Greeley seized the moment. On April 10, 1841, backed by the Whig magnates who had underwritten his log cabin journalism, Greeley founded the *New York*

Tribune. His entrant in the penny press sweepstakes, Greeley declared, was intended for the “cultivated and influential families of the city,” those a notch above the *Herald’s* and two notches above the *Sun’s*. To penetrate “the parlors or sitting rooms of the uptown residents,” the *Tribune* would eschew the “immoral and degrading Police Reports, Advertisements and other matter which have been allowed to disgrace the columns of many of our leading Penny Papers.” Greeley’s efforts to win “the hearty approval of the virtuous and refined” soon garnered him a circulation of ten thousand a day.

Like the penny papers, city book publishers fared poorly at first. Prices and profits plummeted; so did the number of titles the houses issued. Even the largest were imperilled. Unable to transact business or secure credit in London, Harpers considered bankruptcy in 1837, before opting for retrenchment. The industry recovered, however, and even flourished, when eager newcomers, deploying penny press techniques, revolutionized the book trade.

Park Benjamin had been literary editor of Horace Greeley’s *New-Yorker* until, as Greeley wrote later, “the Commercial Revulsion of 1837 swept over the land, whelming it and me in the general ruin.” Benjamin then tried publishing the *American Monthly Magazine*, it collapsed in 1838. Finally, in 1839, he devised a publication suited to an era of cutthroat competition. *Brother Jonathan*, a weekly magazine, combined news with serialized novels pirated from England. It was printed cheaply, on a single giant sheet of paper, then folded but not bound; because of a postal regulation loophole, it could be mailed at cheap newspaper rates. Given the excess capacity of New York’s depressionidled presses, *Brother Jonathan* could be priced at six cents, an attractive bargain.

With *Brother Jonathan* launched, Benjamin departed to start up a rival, the *New World*. Each now vied to include the most material. The sheets grew larger and larger, winning the name “mammoths.” The *New World*, eventually six-feet-seven by fourfeet-four, comprised forty-eight columns of small type and was best read on the floor. The mammoths also issued “extras” or “supplements,” which crammed entire books into this format. They offered melodramas and high romances, English novels and French fiction in translation, as well as books by local authors, such as *Franklin Evans*, a temperance novel by the journalist Walter Whitman. Newsboys

hawked them on the streets and delivered them to subscribers' doors, offering premiums (Bibles) for quick renewals. Profit margins were slim, but volume was enormous. Circulation soared past that of all other magazines, even that of most penny papers, forcing book prices ever lower.

Suffering publishers loudly protested the ruinous competition. In 1842, Harpers decided to do battle. Slashing prices on its own English knockoffs, it overcame the attendant deficits with steady profits from schoolbook sales. Then, in 1843, postal authorities ruled that the mammoths' "supplements" had to be mailed at the more expensive book rate. The newcomers—undercapitalized and overextended—collapsed, succumbing at last to the depression they had up till then ridden so masterfully. What remained was a meaner, leaner New York book trade, geared more than ever before to low-cost, high-volume production.

A similar trajectory characterized the development of New York's theatrical life in these years. The panic devastated city playhouses. Ticket prices plunged, without attracting patrons. Some smaller theaters closed their doors; larger ones cut wages sharply. At the Bowery Theater, manager Hamblin hoped spectacular effects might improve attendance. In an 1840 drama, *The Pirates' Signal*, he replaced the stage with a tank of water, upon which a full-rigged ship sailed from rear to footlights, actors declaiming on deck. Equestrian spectacles followed, among them *The Battle of Waterloo*, which boasted fifty horses, two hundred supernumeraries, and cannons. Neither fared well; both were too expensive.

Elsewhere along the Bowery and Chatham Street new approaches were percolating. Taverns and small hotels provided free entertainment to draw in drinkers. These venues—known as "free and easies" or "varieties" or "vaudeilles"—offered an everchanging if incoherent assortment of music, dance, magic, ventriloquism, comedy, skits, and tall tales, frequently provided by the audience itself. Hamblin discovered that his Bowery Theater, too, did best when it ran circus shows, comic routines, and lowbudget acts appropriated from the streets and marketplaces. William Mitchell followed suit, halving his Olympic Theater's admission prices and focusing almost exclusively on what he called "tragico-comico-illegitimate" productions: travesties of local events, topical commentaries, and Shakespearean burlesque (*Julius Sneezer* and *Dars-de-Money*).

Shipbuilders and cartmen, butchers and firemen, tradesmen and laborers, domestics and launderers—the vast numbers of single men (and growing numbers of single women) who lived in nearby boardinghouses—began packing their way into such shows. New theaters (the Franklin, the Chatham) went up to house the overflow. The plebeian fare fit comfortably into the expanding spectrum of Bowery entertainments, which included scores of cheap dance halls, dime museums, brothels, billiard rooms, bowling alleys, saloons, oysterhouses, and amphitheaters offering bare-knuckle prizefights or cockfights. At the district's northern end, the shabby but genial Vauxhall Gardens, one-eighth its former size, still offered substantial food at reasonable prices, and its promenades, deserted by toffs, were thronged with toughs.

The Bowery came into its own during the depression as a plebeian recreation zone, one that rivaled, even outshone, the constellation of patrician venues around City Hall. Working people gravitated there after hours, attracted by the life and color, the array of services (including pawnshops, stage offices, butcher and grocery shops, and livery stables), and above all the vitality of crowds of people determined to have a good time.

The neighborhood was not all-inviting, however; the audiences at most festivities were white-only. The New York Zoological Institute, at 37 Bowery, had a sign reading: "The proprietors wish it to be understood, that PEOPLE OF COLOR are *not permitted to enter*, EXCEPT WHEN IN ATTENDANCE ON CHILDREN AND FAMILIES." When one African American challenged the edict by driving up with his own family in a hired carriage, he was barred, punched, and ejected. The *Emancipator*, an abolitionist paper, seethed at "these savage proprietors and managers," these "sordid knaves," and wondered if they would "allow *animals* of color in their institute!"

Blackness, barred from the audience, remained near the heart of the Bowery's art. "Negro delineations"—brief bits of burlesque, comic relief, and entr'acte songs and dances—grew ever more popular. At the Bowery Theatre, Hone noted, Jim Crow "is made to repeat nightly, almost *ad infinitum*, his balderdash song, which has now acquired the stamp of London approbation to increase its *eclat*." In February 1843 these solo performances evolved into the depression era's most remarkable innovation.

Four unemployed musicians, living in a Catherine Street boardinghouse, decided to pool their talents and work up a marketable routine. All had performed as blackface entertainers with circuses. Hoping to ride the coattails of a successful touring company, the Tyrolese Minstrel Family, the quartet called themselves the Virginia Minstrels. Their act featured presumed southern slave culture (“Virginia Jungle Dance”) and employed a heavy “nigger” dialect. Their eccentric movements, wild hollers, infectious music, captivating dancing, rollicking humor, and earthy jokes set Bowery audiences to whistling, shouting, and stomping their feet. From the second they strutted onstage at the Branch Hotel, the Virginia Minstrels were a sensation. They soon departed for an English tour, leaving behind a swarm of imitators. New York City had birthed the minstrel show—a baby that would soon reshape American popular culture.

Race was central as well to the career launch of the titan of the New York entertainment world, the era’s (and arguably the century’s) most important impresario, the master of humbug himself, the one, the only, Phineas Taylor Barnum. Barnum was yet another Connecticut Yankee who, loathing life on the family farm, had cast about for alternatives. He clerked for a time in a country store, learning the local arts of hard bargaining and sharp practices. He opened his own fruit and confectionery store. He became a lottery manager. In 1834 he moved to New York City, where he ran a boardinghouse, then a grocery on South Street. Finally, in 1835, Barnum discovered his true calling.

Barnum learned that in Philadelphia a Yankee showman was exhibiting a gnarled black woman who claimed she was 161 years old and had been George Washington’s slave nurse (with a 1727 bill of sale for herself to prove it). Joice Heth, toothless and totally blind, offered affecting stories about “dear little George,” but only meager audiences came. Barnum, convinced he could repackaging Heth into a paying proposition, sold his grocery store, borrowed more money, and bought the rights to her for a thousand dollars.

Barnum quickly displayed a genius for promotion. He got up a promotional pamphlet, festooned New York with posters, and persuaded the papers to discuss Heth. Most intriguing, he invited doubt about the truth of her story, even hinted she was a fraud, sure that audiences would be as interested in testing their ability to discover the truth as in the real facts of

the matter. He was right. After exhibiting Heth at a coffeehouse on the corner of the Bowery and Division Street, he moved her up to Niblo's Garden, eventually clearing fifteen hundred dollars a week.

Joice Heth died within a year, and Benjamin Day reported in the *Sun* that an autopsy showed her age to be half what Barnum claimed. By then the showman was on the road. For much of the next four years he traveled the country with a blackface dancer and a juggler, ran an entertainment steamboat on Mississippi, and sold Bibles. Then he abandoned itinerancy, returned to New York, and launched his career as impresario.

In May 1840 Barnum leased Vauxhall Gardens. Rather than assemble the usual (and costly) summer stock company, he brought in performers by the night. His "variety shows," like those up and down the Bowery, drew on popular plebeian entertainments ("grand Trials of Skill at Negro Dancing"). They featured familiar city types ("the Fireman," "the Fulton Market Roarer"). They redeployed street activities (like amateur slack-rope walking). In effect the self-styled Director of Amusement's variety show had appropriated the natural (and low-budget) theatricality of the street and market and made it pay.

The format proved popular. Its zestful novelty and continual change suited an audience quickly and easily jaded, and its miscellaneity mirrored metropolitan diversity. An ad in the *Herald* noted the performances "are exceedingly various, and full of life and merriment. This is what we want. The public have enough to groan and sigh about at home these times, they go out to such places as Vauxhall to 'laugh and grow fat,' and Barnum is determined they shall not go in vain."

"Blackness" remained central to Barnum's formula, though the tricky conventions of popular racism could present problems for a fledgling cultural entrepreneur. In 1841 his star performer, a white blackface dancer who specialized in "negro break-downs," struck out for greener pastures. Barnum (as editor Thomas Low Nichols of the *New York Aurora* later remembered) scouted the dance houses of the Five Points. He soon found a lad who could do the dance even better, "but he was a genuine negro; and there was not an audience in America that would not have resented, in a very energetic fashion, the insult of being asked to look at the dancing of a real negro." Barnum rose to the occasion. "He greased the little 'nigger's' face," Nichols recalled, "and rubbed it over with a new blacking of burnt

cork, painted his thick lips with vermillion, put on a wooly wig over his tight curled locks, and brought him out as the ‘champion nigger-dancer of the world.’ Had it been suspected that the seeming counterfeit was the genuine article,” Nichols chuckled, “the New York Vauxhall would have blazed with indignation.”

By 1841, when Barnum was ready for a grander venue, he learned that the old Scudder’s Museum was up for sale. Scudder’s had a great location, on Broadway at Ann Street, near to both plebeian quarters and patrician precincts (the Astor House Hotel and City Hall were just across the way). Barnum took over the building and its collections, renamed it the American Museum, and made it the nucleus of New York popular entertainment.

Barnum stocked his American Museum, as he had Vauxhall, with jugglers and ventriloquists, curiosities and freaks, automata and living statuary, gypsies and giants, dwarfs and dioramas, Punch and Judy shows, models of Niagara Falls, and real live American Indians. (Barnum advertised the latter as brutal savages, fresh from slaughtering whites out west, though privately he grouched that the “D——m Indians” were lazy and shiftless—“though they will *draw*.” Animal acts had their problems too: when his orangutan got sick in 1843, Barnum pinned his hopes on a goat but soon realized that “he *shits* so I can do nothing with him.”) After 1842 attendees could also see a two-foot, one-inch midget named Charles Stratton, better known as General Tom Thumb, whom crowds adored (especially after Barnum took him to Europe in 1844, where he performed for royalty). And, of course, he featured blackface dancers, Ethiopian melodists, and the new minstrel shows.

One key to Barnum’s success was his mastery of the art of imposture. Hoaxes had been a staple of the penny press since 1835, when Benjamin Day’s *Sun* had run its series reporting life on the moon. The failure of so many oversold speculations during the panic and the subsequent exposure of deceptions by swindling businessmen had lessened the public’s appreciation for plausible rogues, to be sure. But Barnum’s brand of humbug was neither malicious nor costly. In offering up such forgeries as the Fejee Mermaid he sold his audiences the sheer fun of debating truth or falsity, of outmaneuvering the hoaxer, of discovering how the deception was done. “The public,” as Barnum observed, “appears disposed to be amused even when they are conscious of being deceived.”

Barnum was also a brilliant promoter. “It was my monomania to make the Museum the town wonder and town talk,” he wrote in his autobiography, and he developed merchandising into a daring new art form. Barnum deployed all the familiar tactics—extensive ads in the papers, lithographs, pamphlet biographies, posters, flags, bright banners—and a slew of new ones. He installed the first “Drummond lights” in New York City, which illuminated Broadway with limelight “from the Battery to Niblo’s.” He stationed a band on his balcony. He covered the entire building with five-foot-high transparencies depicting over a hundred species of animals. He hired street performers and sent “bulletin wagons” with their sides plastered with ads rolling through the metropolis. Barnum imposed his institution on New York City with much the same flair and fanfare Thurlow Weed had used to hawk William Henry Harrison. And with even greater success, for by the mid-1840s, Harrison was in his grave, but P. T. Barnum’s Museum had become the boast of city guidebooks, a shrine for visiting tourists. More than anyone else, Barnum had realized and seized upon the essential compatibility of hard times and high times. His triumph would stand as an inspiration to countless successors in New York’s world of entrepreneurial entertainment.

PART FOUR EMPORIUM AND MANUFACTURING CITY (1844-1879)

Full Steam Ahead

Just before noon on April 23, 1838, the *Sirius*, a small paddlewheel steam packet nineteen days out of Cork, limped across the Upper Bay, its coal supply all but exhausted, and made landfall to the cheers of a great crowd gathered at the Battery. A scant four hours later, a second steamer, twice as big and half again as fast, hove into view, belching black smoke. This was the *Great Western*, fourteen days out of Bristol. She had been chasing *Sinus* across the Atlantic, and the sight of her churning toward the city touched off even more exuberant rejoicing, as it was now doubly clear that New York had established a maritime steam link to Europe.

Over the next twenty years, a growing fleet of transatlantic steamers would nourish the city's economic revival, but the newcomers would be *English* ships, which boded ill for the future of the port's merchant marine. More disturbing, when Samuel Cunard began twice-monthly steamer service out of Liverpool in 1840, he chose Boston as his line's terminus. Cunard was heavily subsidized by the British government, and New York editors and lobbyists bombarded Washington with appeals for equivalent support. In 1845 Congress grudgingly agreed to provide subsidies for steamships that carried the mail (and could be used by the navy in time of war). Still, no New York competitor materialized, and though Cunard did extend service to the Hudson, he built his piers in Jersey City.

Finally, in 1848, a city champion emerged. Edward Knight Collins, a well-connected New York packet operator, promised to build the biggest and fastest steamships afloat. Collins won a mail contract from the government, raised over a million dollars from New York merchant bankers, and organized the United States Mail Steamship Company. Commencing a prow-to-prow competition with Cunard, Collins's captains tore across the Atlantic. Where the *Great Western* had taken fourteen and a half days on her maiden run in 1838, Collins's *Pacific* made Liverpool in a record nine days, twenty hours in 1851. A grateful Congress raised the line's annual subsidy from \$385,000 to \$853,000.

The Arrival of the Great Western Steam Ship off New York on Monday 23rd April 1838, artist unknown. Once again, the opening of new connections between the city and the world beyond became an occasion for delirious celebrating. (I. N. Phelps Stokes Collection. Miriam and Ira D. Wallach Division of Art, Prints and Photographs. The New York Public Library. Astor, Lenox and Tilden Foundations)

But Collins never made money. His costs were higher than Cunard's, in part because English wages were lower, and he was hammered by disasters. In 1854 his *Arctic* collided with a French steamer off Cape Race and sank with a loss of 318 passengers and crew, including Collins's own wife and children. In 1858 Congress scuttled the mail subsidy program, largely at the behest of Jefferson Davis and other southerners at odds with New York. Once the federal government left the private enterprise to sink or swim on its own, it promptly sank. The last Collins sailing, in February 1858, marked the end of New York's bid to establish itself in transatlantic steam shipping. The field—and the future—were left to Cunard and newer British or German entrants. For the present, however, the decision of foreign steamers to make Manhattan their primary port of call, along with a spectacular efflorescence of New York's sailing fleet, sustained the city's commanding position as the nation's premier port.

New York's trim, square-rigged packets—products of the East River's thirty-odd yards—had been steadily growing in speed, agility, and size. By 1850 New York shipbuilders routinely constructed packets three times larger than the pioneer Black Bailleurs. Whenever one of these leviathans slid down the ways, thousands of spectators converged on the scene to watch and applaud. They were the city's pride and glory, bulwarks of its wealth, instruments of its power. But now they were superseded by still more awesome vessels: the breathtaking "clippers" for which the East River yards gained fame in these years.

The first true clippers were promoted by the city's traders in China tea, a fragile commodity that fetched exorbitant prices only if brought to market quickly after harvest. In 1844, hoping to shorten the voyage from Canton, which normally took more than a hundred days via the Cape of Good Hope, the firm of A. A. Low and Brothers invested forty-five thousand dollars in a packet-like vessel designed specifically for speed. Named the *Houqua* after a highly regarded Chinese merchant, she was slender and heavily sparred and canvassed, with a bow that cut rather than butted the waves. Inspired by her example, the South Street firm of Howland and Aspinwall ordered the *Rainbow* and the black-hulled *Sea Witch* from the yard of Smith and Dimon. In 1849 *Sea Witch* completed the run from Canton, a distance of fourteen thousand miles, in an astonishing seventy-four days, fourteen hours.

The production of clippers increased steadily over the next decade, and the enormous expense of constructing them led to further consolidation of the trade in a handful of wealthy firms. By the late fifties, with some fifty ships returning to port from China every year, half a dozen New York companies dominated the business completely. After the repeal of the British Navigation Acts, New York clippers managed as well to capture a large share of the carrying trade between China and London. In 1850 one of the Low clippers, *Oriental*, brought a cargo of tea from Hong Kong to the Thames in a record-breaking ninety-seven days; the proceeds nearly covered her original cost of construction.

The discovery of gold in California in 1848 gave the clippers their most lucrative mission. Inflamed by stories of egg-size nuggets lying about for the taking, men from all over the country headed west. "Nothing else is talked about but the quick fortunes to be made in California," one New

York paper reported that autumn. In 1849, with the Gold Rush in full swing, eighty thousand people converged on eastern ports to book passage on anything that would float for the long and dangerous passage around Cape Horn to San Francisco. Between 1849 and 1852 California's population ballooned from twenty thousand to 223,000.

The price of milk, coffee, work shirts, boots, and other necessities rose accordingly—a barrel of flour worth six dollars back in Manhattan would fetch two hundred in the goldfields—and merchants in the China trade soon saw that routing their outbound clippers west, around South America with a stop in California, rather than east, around Africa, was the way to maximize returns. Among the earliest China clippers out of New York to Frisco were the *Samuel Russell* and *Sea Witch*, each of which returned profits beyond the wildest expectations of its owners. Low and Brothers netted eighty-four thousand dollars on the initial voyage of the *Samuel Russell*, more than it cost the firm to build her. A load of flour, nails, and steam engine parts sent out on *the Sea Witch* made \$190,000 for Howland and Aspinwall.

Other firms jumped into the business. When news of the strikes reached the William Street store of Joseph Seligman and his brothers, they plunged all they had into small merchandise, sent it posthaste to San Francisco, and made a fast fortune. The Strauss brothers, a family of Bavarian emigres in the dry-goods trade, sent young Levi to San Francisco in 1853 to peddle wares that Jonas and Louis sent him round the Horn.

New York shipbuilders designed scores of clippers for merchants working the California market. Some of the best of the new crop were the work of William Henry Webb, whose yards stretched from 5th to 7th streets along the East River—notably the two-thousand-ton *Challenge*, which flew the checkered flag of N. L. and G. Griswold and was able to make San Francisco in 110 days or less. Webb's father had taught the art of shipbuilding to Donald McKay of Boston, who now built the *Flying Cloud*—loveliest of all clippers on the California run—for Grinnell, Minturn, and Company of New York. On her maiden voyage, in 1851, she dropped anchor in San Francisco Bay eightynine days and twenty-one hours after leaving the foot of Maiden Lane, a week under the previous record.

The demand for speedy service to the West Coast tempted some merchants into imperial adventures. Back in 1847 William Aspinwall and a tough river steamboat operator named George "Hell Fire" Law had won

federal subsidies to move mail and freight across the Isthmus of Panama. Law's firm ran steamers from New York, by way of Havana and New Orleans, down to the east coast of Panama. From there their cargoes were conveyed overland by canoe and mule train to Panama City, and thence up to San Francisco on the ships of Aspinwall's Pacific Mail Company. The entire trip took five weeks, and once the Gold Rush got underway it became fabulously profitable despite the unpleasant trek through the snake-infested, mosquito-plagued Panamanian jungle. Aspinwall's Panama Railroad, completed in 1855, improved transport considerably, and Panama City became an economic satellite of New York.

Law and Aspinwall's success whetted the cupidity of Commodore Vanderbilt, who calculated that a route across Nicaragua would be five to seven days faster than the one across Panama. Vanderbilt's initial plan called digging for a canal, at a cost of thirty-one million dollars, through the twelve miles of jungle and mountains that separated Lake Nicaragua from the Pacific Ocean. When that idea ran afoul of British interests in the region, Vanderbilt set up the Accessory Transit Company and wangled a franchise from the Nicaraguan government to run a macadamized road that, combined with bay and river steamers, connected San Juan del Sur on the Pacific and San Juan del Norte on the Atlantic. The new line's first passengers and a shipment of gold reached New York from San Francisco in August of 1851; within a few years it was earning Vanderbilt a million dollars a year, despite complaints about his penny-pinching disregard for public health and safety.

In 1855 an American filibuster named William Walker seized control of Nicaragua, installed himself as president, and revoked Vanderbilt's charter, transferring it to competitors who promised to pay more. This audacity made Walker a hero in New York—some Boweryites went down to join him—but it earned him the enmity of the ruthless and powerful Commodore. Without setting foot outside New York, Vanderbilt underwrote an invasion of Nicaragua by four other Central American republics, and Walker's hated American Phalanx was overthrown in 1857.

Most New York businessmen worried that such tactics could lead to war with Spain or Great Britain, but armed diplomacy became an acquired taste among some big merchants and railroad financiers, including August Belmont, Prosper M. Wetmore, Royal Phelps, and John A. Dix. Cheered on

by such prominent editors as James Gordon Bennett and John Louis O'Sullivan (of the *Democratic Review*), these "Young Americans" clamored for further expansion, especially in Central America and the Caribbean. It was the Manifest Destiny of the United States, they said, to spread republicanism, Christianity, and progress around the world—by trade if possible, by force if necessary.

In Asia, force seemed particularly appropriate, England having demonstrated its efficacy by ramming unwanted drugs into China during the Opium War. (The Lows and other China traders had also been smuggling in Turkish opium in exchange for tea, using fast little schooners turned out by the East River yards, and after Britain's success they too expanded their operations.) All New York celebrated when Commodore Matthew C. Perry took the navy's East India Squadron to Japan in 1853 and bullied the shogun into opening his country to American trade. Perry was almost a native son, having spent a decade at the Brooklyn Navy Yard pioneering the application of steam power to warships. Besides, he was Belmont's father-in-law. New Yorkers could be forgiven for thinking that Tokyo too was now an economic satellite of Manhattan.

From around the world, commerce poured into New York City. In 1849 over three thousand ships sailed or steamed into the harbor from more than 150 foreign ports—three times the number that had arrived in 1835—and they carried with them half the nation's imports and departed with nearly one-third its exports. In the Gold Rush decade (1849-59), ship tonnage through the port jumped another 60 percent.

As trade grew, so did the size and tempo of the waterfront. By 1850 a collar of piers, wharves, docks, and slips circled Manhattan below 14th Street—sixty on the East River, another fifty or more on the Hudson. Those along the East River were favored by sleek Liverpool packets and great square-rigged clippers, those on the west by deeper-draw coastal and transatlantic steamships (the Collins Line pier, for example, lay at the foot of Canal Street). East side or west, however, there was never enough room to accommodate the thousands of vessels now moving in and out of the port every year. At its busiest, the harbor looked (to landlubbers anyway) dangerously anarchic: pilots and crews jockeying for berths while schools of sloops and lighters darted in and out among canal boats, schooners,

yachts, barges, ferries, and two-thousand-ton steamers that plowed along at speeds approaching twenty miles per hour.

It wasn't any calmer on shore, either. In 1857, 598 licensed hacks, forty-five hundred carts, and 190 express wagons competed to tote cotton bales from southern packets to steamers heading to Liverpool; lug finished bolts just in from Manchester to storage warehouses, Pearl Street wholesalers, or Broadway retailers; carry ice, coal, or wood to consumers; haul brick, stone, and earth to construction projects; and fetch passengers from ferries and steamer berths. The number of omnibuses shot up from 255 in 1846 to 683 in 1853 (when they carried over a hundred thousand passengers a day). After 1840, cabs too began clattering about town. The din was terrific, what with hundreds of iron horseshoes striking cobblestone pavements, boxes rattling, drivers cursing and fighting. The racket was not much alleviated when, in 1853, the city began to substitute Belgian blocks—bread-loaf-size cut-granite chunks that were better able to withstand iron-rimmed wagon wheels than circular cobblestones and provided firmer footing for horses.

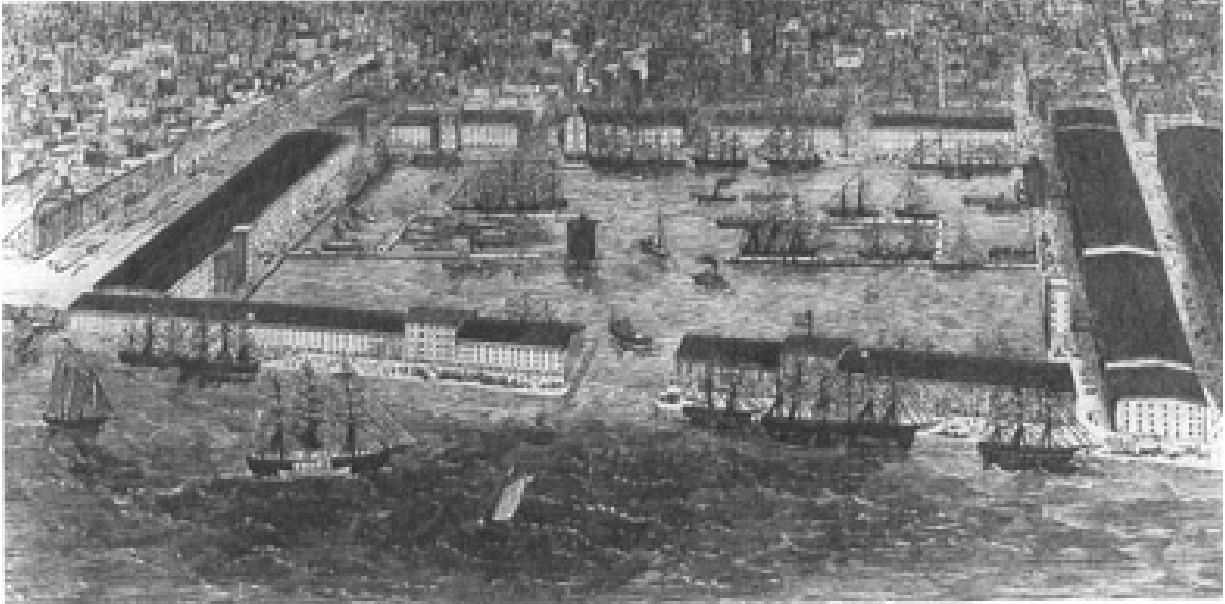

This profusion of conveyances soon swamped the downtown streets. On an average weekday in the mid-fifties, fifteen thousand vehicles rumbled by St. Paul's at the corner of Broadway and Fulton. "The throng and rush of traffic in the business part of New York is astonishing even for London," noted a visiting correspondent for the *London Times*. "There is a perpetual jam and lock of vehicles for nearly two miles along the chief thoroughfare." Along the riverfronts, West Street and South Street were lined by block after block (as *Gleason's Pictorial Magazine* put it in 1857) of bustling "sail-lofts, shipping offices, warehouses of every description, cheap eating-houses, markets, and those indescribable stores, where old cables, junk, anchors, and all sorts of cast-off worldly things, that none but a seaman has a name for, find a refuge." Like Broadway, these dockside streets were clogged with horsedrawn wagons, carts, and carriages, which by the 1850s often choked off movement altogether.

Decay and disrepair was as pervasive as congestion along both rivers. Pilings wobbled and shook. Wharves vanished under the waves at high tide, some never to reappear. Rotting piers suddenly gave way, tumbling people and cargoes alike into the water. Pools of effluvia from open sewers and drains, trapped by masses of floating debris, lapped at crumbling bulkheads; except in the dead of winter, the stench and flies could be

overpowering. By 1855, almost in defiance of the port's burgeoning traffic, New York's waterfront had deteriorated so badly that state investigators found no more than a dozen-odd piers in fair to good repair on either side of Manhattan. The one positive consequence was that wharfage rates remained low, maintaining New York's strong competitive advantage over ports having better but more expensive facilities. In 1852, for example, it cost one packet \$4.88 to unload seventeen hundred bales of cotton at a Hudson River pier over a two-day period; in Boston or Baltimore it would have cost sixty-eight dollars.

If there was short-term method in the madness, the city would pay a long-term price, as the deplorable condition of the Manhattan waterfront prompted new construction on the opposite side of the East River. From Green Point in the north to Red Hook in South Brooklyn, gangs of workmen filled in tidal marshes, built breakwaters, and threw up blocks of docks and warehouses. One of the largest projects was merchant and landowner Daniel Richards's plan to transform forty acres of Red Hook marshlands into the Atlantic Basin. Surveying began in 1839; the first dock blocks were sunk in 1841; the initial warehouse rose in 1844 under the direction of contractor James S. T. Stranahan; the port's first steam grain elevator was installed in 1846; and by the end of the decade, its forty acres of basin were capable of sheltering a hundred ships at a time. The docks in turn were covered with twenty acres of four-story brick and stone warehouses, erected by developers like Samuel Ruggles, and enough grain elevators to make it the main terminus for Erie canal boats. In the Brooklyn Navy Yard, meanwhile, the federal government spent two million dollars over a ten-year period on the construction of a massive masonry drydock.

Just as these sea-oriented projects were coming to fruition, new railroads began pumping even vaster quantities of cargo and passengers into the New York maelstrom.

Built in reponse to overcrowding and deterioration along the Manhattan waterfront, the huge Atlantic Basin in Brooklyn became an important destination for grain and other bulky cargoes entering the port from the Erie Canal. From Henry Stiles, *History of the City of Brooklyn*. (United States History, Local History and Genealogy Division. The New York Public Library. Astor, Lenox, and Tilden Foundations)

RAIL

In May 1851, with great fanfare, President Fillmore and a party of civic notables boarded a steamer at the foot of Duane Street and chugged twenty miles upriver to the westbank port of Piermont. There the party transferred to a New York and Erie Rail Road car and proceeded to travel 447 miles to Dunkirk, a hamlet on the shores of Lake Erie.

An ecstatic Common Council hailed completion of the long-delayed line as “emphatically the work of the age,” and for good reason. Incorporated in 1832, the New York and Erie had not only survived the bankruptcy of most of its original backers during the Panic of 1837, but its engineers and immigrant laborers had contrived to run a double track of six-foot gauge over a major mountain system. The economic significance of this linkage was manifest to all. As director and ironmonger William E. Dodge

jubilantly exclaimed: “The Empire City and the great West, the Atlantic Ocean and inland seas, are by this ligature of iron made one!”

Also in 1851, a second force of engineers and laborers was driving the Hudson River Rail Road within sight of Albany, having laid 144 miles of track along the bank of the Hudson. Like the Erie, the Hudson Line had overcome more than natural obstacles—including the opposition of powerful Hudson River steamboat operators who had been pouring money into the development of mammoth floating palaces to attract customers, with great success. Roused by the threat of a rival road out of Boston, however, the legislature assented to a charter for the Hudson Line. By the end of 1851 it was scooting passengers from New York to Albany in less than four hours as against seven and a half hours by steamboat. By 1853 its passengers could transfer to a set of interconnecting roads that stretched all the way to Buffalo. Unlike the Erie, moreover, the Hudson Line ran directly into Manhattan. Its cars rolled south down Eleventh Avenue to a massive depot covering the area between 30th and 32nd streets. There, since municipal regulations prohibited steam engines below that point (the danger of explosion still being very real), passengers and freight were transferred to horse cars, which clopped downtown along Tenth, West, and Hudson, stopping at 23rd, 14th, and Christopher, skirting the west side of Hudson Square, and finally terminating at a shed on Chambers Street.

The arrival of the railroad on the city’s West Side, coupled with the increasing preference of steamships for the Hudson River docks, pulled vast numbers of drygoods merchants across town from their Pearl Street quarters. By 1855, speeded by a city-engineered program of street widenings that cleared vast tracts for real estate speculators, some two hundred warehouses had been erected, many handsomely designed in the latest Italianate mode with white marble or brownstone facades. Rents and prices doubled in three months, quickly driving out groggeries and boardinghouses. “From the old worm of Decay,” exulted the *Tribune*, “flutters forth the gorgeous butterfly of Wealth and Beauty.”

Together, then, the Erie and Hudson lines sustained New York’s overwhelming advantage in the movement of western produce to the East Coast. By the late fifties, the city was handling half again as much rail tonnage as Philadelphia and Baltimore combined. In 1860, counting the still-heavy volume of traffic on the Erie Canal, it received \$161 million

worth of goods from the West, just about the value of that year's cotton crop.

A third line, the old New York and Harlem, was meanwhile acquiring a new look. It still ran cars every ten minutes from Union Square up to Harlem village, but in 1840 it bridged the Harlem River at 135th Street and began to push north. Two years later, construction crews had crossed the Bronx River and were driving into Westchester County. By the mid-fifties the Harlem Line had opened a feeder from its Melrose station in the Bronx (at 162nd Street) to Port Morris on the East River near Riker's Island, and at Woodlawn it had linked up with the New York and New Haven coming down from Connecticut. This vigorous expansion shortened the commute to Manhattan from the Bronx, Connecticut, and Westchester suburbs like White Plains. Harlem Line locomotives ran down the East Side, along Fourth Avenue and through the Murray Hill tunnel. At 32nd Street, passengers switched to horsecars for the short ride to Madison Square Depot, a grand, multitowered station in the newly popular Italianate manner the line had erected in 1845 in the block bounded by Madison and Fourth avenues and 26th and 27th streets. From that point passengers could catch a horsecar directly to Astor House while freight continued on south to a terminal occupying the blocks between Center, Franklin, Elm, and White streets. Built in 1853, it was thought to be the largest structure in the city at the time.

By 1852 the Hudson, Harlem, and New Haven lines were channeling 2.5 million passengers a year into the city. At the same time, carriers like the New Jersey Railroad funneled traffic from Philadelphia and elsewhere into Jersey City. There, at a new terminal built in 1858, people and vehicles transferred to the Sso-ton ferries that carried two thousand passengers plus horses, wagons, and carriages back and forth across the Hudson every ten minutes all day, every fifteen minutes all night. To the east, travelers could ferry across the East River and hook up with the Long Island Rail Road for a railsea voyage to Boston—until 1848, when the New York and New Haven established a direct and far more expeditious overland service.

DOLLARS AND DRY GOODS

Building railroads, clippers, and steamships took money—and money was something New York had plenty of. Between 1851 and 1854 alone, \$175

million in gold reached the city from California. A good part of it was brought in by the new American Express Company, organized in 1850, or by Henry Wells and William G. Fargo, who left American Express in 1852 and set up their own company “to forward Gold Dust, Bullion, Specie, Packages, Parcels & Freight of all kinds, to and from New York and San Francisco.”

This western bounty induced an upsurge in the banking business, which the state had opened to all comers back in 1838. New banks flowered even more profusely than railroads: twelve in 1851, another thirty by 1853, sixty in all before the middle of the decade. These institutions, in turn, served as depositories for six hundred of the nation’s seven hundred commercial banks, which maintained permanent balances in New York to expedite domestic and foreign transactions.

The efficiency of the banking system improved as well. For years now, it had been the practice of the city’s banks to close their accounts every day by settling up with one another directly—squadrons of clerks and porters rushing to and fro in an atmosphere of comic-opera frenzy, here with checks or notes for payment, there with hand trucks piled high with satchels of specie. But as the number of banks mounted, the financial system, like the streets, approached gridlock, and the need for a more rational approach became apparent. In 1853, accordingly, local bankers created the New York Clearing House, which enabled clerks to do in minutes what had previously taken hours.

More capital, more banks, and more efficient banking enabled New York to pull far ahead of its nearest competitor, Boston, in the moneylending business. By August 1857 local banks carried better than forty million dollars in outstanding loans on their books, a deep reservoir of credit that lubricated the expansion of trade, transportation, and manufacturing throughout the United States. Banking evolved from being an adjunct institution, created and controlled by merchants to facilitate their trading operations, into a distinct business enterprise, with a profit motive all its own.

Growing numbers of merchants—men like Moses Taylor—segued from commerce to finance. Taylor, like many of his contemporaries who amassed fortunes in business, had been born (in 1806) into relative affluence. His father, Jacob Taylor Moses, was a cabinetmaker who had invested

successfully in Manhattan land and become John Jacob Astor's "general agent." Young Moses apprenticed as a clerk with G. G. and S. S. Rowland, by 1830 the leading house in the Latin American trade. After he proved himself with diligent wharf and countinghouse service, the Howlands allowed him to trade on his own account. In 1832, with his accumulated profits, a loan from his father, and sterling references from Astor and the Howlands, Taylor set up on South Street as a commission merchant specializing in trade with Cuba.

In addition to arranging the transport of sugar from Havana to New York, Taylor advised Cuban planters on how to invest their excess funds and advanced them credit for land and slaves. In the 1840s Taylor turned much of his mercantile work over to Percy Rivington Pyne—successively Taylor's clerk, partner, and son-in-law—and concentrated on investing.

Taylor first favored cautious, capital-preserving vehicles like bonds, mortgages, real estate (especially wharves and stores near Manhattan's shore), and trust companies (like the well-established New York Life Insurance and Trust Company). Taylor branched out into gas and telegraph companies, and in the 1850s he became one of a small group of venturesome merchant-financiers who supplied capital to, and gradually assumed control over, many of the coal mines and blast furnaces in Pennsylvania. Taylor, Belmont, and other New Yorkers also became the nation's premier railroad financiers, with Taylor concentrating on lines in and out of the eastern coal fields. In 1851 one group established the Illinois Central Rail Road, with blueblood Robert Schuyler, Hamilton's nephew and the country's leading railroad tycoon, as its first president.

Taylor also moved directly into banking. In 1837 he had become a director of the City Bank of New York, acting as J. J. Astor's representative. He and the other directors invested in one another's ventures, and Taylor brought his own associates into the bank's management. In 1856 Taylor assumed the bank's presidency.

Entrepreneurs also turned to New York's capital markets to raise money, jolting the stock market out of the torpor that had gripped it during the recent depression. By the late fifties, hundreds of new brokerage houses had appeared in the city. These firms helped attract leery European capital—badly burned by American defaults during the panic years—back into U.S. businesses. The Barings had refused to participate the boom as late as 1850,

but the discovery of gold fired the imagination (and avarice) of investors, just as the Revolutions of 1848 frightened Euroelites into seeking safely distant havens for their money. By 1853 26 percent of all U.S. rail bonds were in the hands of overseas investors, notably English and German. During a typical week in the 1850s, hundreds of thousands of shares in railroads, banks, canals, and coal mines were traded, making New York one of the largest and most sophisticated capital markets in the world.

Speculators and stock manipulators also zoomed in on the glamorous new railroad issues. Jacob Little, the stockbroker who had already won the nickname “Ursa Major,” the “Great Bear,” now dazzled the city with ever more brazen feats of financial legerdemain. Little rigged prices with fake tips, false rumors, phony accounts, and fictitious sales. He outfoxed short sellers by organizing clandestine pools to corner the market, and he fleeced friends as well as enemies by working through other brokers to screen his movements. Not since the days of William Duer, if ever, had Wall Street witnessed such single-minded predation.

Little’s methods inspired a new generation of wheeler-dealers, most notably a country boy named Daniel Drew. Drew got his start in business as a drover, buying cattle from upstate farmers and herding them down to Manhattan to satisfy the growing city’s demand for beef. In 1830, at the age of thirty-three, he became manager of the new Bull’s Head Tavern on Third Avenue at 24th Street. Thrifty and clever with money, Drew became a trusted private banker for the drovers and butchers who met at the Bull’s Head, cashing their notes and extending them credit for a modest 1 percent interest. In 1838 he retired from the cattle business, moved down to Bleeker Street, and set up a banking and brokerage house in the basement of the City Bank building at 40 Wall, directly across from the Merchants’ Exchange.

Over the next twenty years, playing the market with the nerve of a riverboat gambler, Drew accumulated a personal fortune estimated in the millions. He took particular interest in the high-risk “fancies”—wildly fluctuating stocks of troubled companies, typically railroads that had underestimated costs and overestimated traffic. Drew learned to minimize his risks and maximize his profits by purchasing enough stock to get himself named an officer or director of the issuing company. Insider trading violated no laws in this feverish, cynical era, and Drew’s privileged position

helped him decide when to buy or sell the company's stock, as well as to manipulate its market value to his own advantage—something he did on numerous occasions as treasurer of the New York and Erie Railroad. Legend has it that while still a drover, Drew bamboozled Henry Astor by selling him cattle fattened on water just prior to sale; it didn't happen, but it served as a convenient origin myth for the term "stock watering," which came into currency to describe the practice of artificially inflating the value of securities.

While Drew himself never succumbed to the temptation, it wasn't uncommon to see a company straightforwardly looted by its own management. In 1854 directors of the New Haven line discovered that Robert Schuyler, their powerful and distinguished president, had privately printed up twenty thousand shares of bogus New Haven stock, sold them for two million dollars, and pocketed the proceeds. In the ensuing uproar, Schuyler slipped across the Canadian border; neither fugitive financier nor funds were ever recovered.

The results of all this commercial and financial activity, licit and illicit, were soon palpable on Wall Street. Many new banks set up shop in built-to-order Renaissance palazzos—monumental structures made of New Jersey brownstone and cast-iron columns and designed by stylish architects like Richard Upjohn and James Renwick. The new buildings, in addition to keeping up with the latest London fashion in commercial architecture, were more flexible than the now passé Grecian temples. Banks could rent the front rooms to other institutions (private bankers, insurance companies) and still have room in back for the small army of clerks, copyists, and accountants needed to handle their growing paperwork.

Still, the demand for office space kept burgeoning. The members of the Stock and Exchange Board burst out of their quarters in the Merchants' Exchange and sought new shelters. So did the legions of ever more specialized wholesalers—dealers in cotton, provisions, dry goods, hardware, drugs—and the formal organizations like the New York Produce Exchange (1851), which they established to standardize the grading, inspection, and marketing of their particular commodities. On top of this came the space requirements of brokers, agents, commission merchants, auctioneers, jobbers, and credit reporting firms. Tappan retired from his Mercantile Agency, but the company expanded under his successors

Benjamin Douglass and Robert Graham Dun, and indeed attracted rivals, like the Bradstreet Agency.

Insurance companies added to the crush. By 1860 ninety-five insurance outfits protected against losses from fire; seventy-one of them had been founded in the 1850s. A dozen firms covered maritime risks, with fully a third of the city's business being transacted by the Atlantic Mutual Insurance Company (dominated by the Jones family, which had invested its rentier inheritance in the firm).

The life insurance industry finally took root, as businessmen, scarred by the depression, responded to new hard-sell campaigns. Agents warned that "experience demonstrates that the possession of property is almost equally unstable with that of life," presented statistics demonstrating that "the merest fraction" of those in mercantile pursuits "leave any property to their surviving relations," and printed up chilling lists of men who had died shortly after taking out a policy. Using the new domesticity to counteract religious objections that insurance interfered with the workings of Divine Providence, agents pleaded with merchants and professionals not to let their "beloved wife or children" be left "often worse than penniless, to the cold charities of the world." Eleven life insurance companies soon were thriving in the city, paced by the Mutual Life Insurance Company (1843), which by 1860 had over twelve thousand contracts on its books.

IRON AGE

During the 1850s, fattened on trade and gold, New York became the nation's leading manufacturing center—indeed one of the fastest-growing industrial areas in the world. Testifying to this transformation were the ironworks that hunkered down along the East River and Hudson River waterfronts, attended like economic royalty by flotillas of barges full of New Jersey pig iron and Pennsylvania coal. (In 1854 alone over one million tons of the latter came down the Delaware and Hudson Canal.)

Some of the biggest—the Globe Iron Works, the Morgan Iron Works, and the Delameter Iron Works, each acres in extent and employing hundreds of workers—were creatures of the boom in railroads and steamships, producing entire trestles, thirty-ton marine engines, and the enormous bed-plates on which a ship's machinery rested. Largest of the lot,

an acknowledged wonder of the age, was the sprawling Novelty Iron Works on the East River shore at the foot of 12th Street. Founded in the 1830s by Thomas B. Stillman and Horatio Allen, Novelty was a five-acre maze of buildings that employed as many as twelve hundred workers by the early 1850s. Highly systematized, Novelty was sectioned into eighteen departments, each directed by a foreman who in turn answered to the “front office”—one of the city’s first—staffed by a superintendent and eleven clerks.

Another set of foundries turned out cast iron for warehouses and stores. In the mid-forties James Bogardus, a New York watchmaker and inventor, developed and patented a method for mass-producing prefabricated building elements. Columns, panels, and arches—in any architectural style—were cast from molds, laid on the foundry floor, primed, and assembled into small numbered units. Then, packed in straw, they were loaded on a horse-drawn dray, taken to construction sites, and raised and bolted into place, ready for painting (usually a light earthen color) and the installation of plateglass windows. At first Bogardus’s modular facades were simply fastened to the front of existing brick buildings, converting downtown structures from domestic to commercial use. In 1849, he designed a complete cast-iron facade, for a Broadway drugstore, and in 1850 he patented an all-cast-iron building.¹

Bogardus broke the logjam in commercial construction, and his structures—inexpensive to make, easy to erect and maintain, supposedly fireproof—were soon in great demand. Foundries were created or converted to supply them. Daniel D. Badger had moved to New York in 1846 to make iron shutters. Now he relocated his Architectural Iron Works to East 14th Street and Avenue C, where he churned out Corinthian columns, roof cornices, and (from 1852 on) complete cast-iron storefronts. Though Badger dominated the field, competitors flourished as well—notably the Jackson, Cornell, and Etna ironworks—most also located near the rivers for ease of access to coal and pig iron.

There were, however, serious drawbacks to erecting giant industrial plants in Manhattan. Apart from the overcrowded streets and jammed docks, the rapid rise in the price of land (and of taxes tied to assessed valuation) meant that, as of 1855, two-thirds of all fixed capital invested in iron foundries was tied up in real estate, and only onethird in machinery. It

still made economic sense for the big foundries to keep close to customers like the shipyards lining the East River from Grand to 12th streets, just as this great maritime complex, which launched one out of every seven steam-powered vessels built in the United States between 1850 and 1860, preferred proximity to its suppliers. But for many growing enterprises, cheaper land and more fluid transportation were the key desiderata. Some big operations like Steinway and Sons' piano-manufacturing plant (1853) found a satisfactory perch on the northern edge of the built-up city. But for many, it was Brooklyn that proved most enticing.

Sugar refineries were among the first to migrate. Back in the early nineteenth century, when the Havemeyer family operation required but five employees, a little building on Vandam Street had been perfectly adequate. But as Moses Taylor and other merchants funneled vast amounts of Caribbean sugar to the city, and as refinery technology underwent explosive development, the Havemeyers engineered a drastic change in scale and location. In 1858 Frederick C. Havemeyer bought a sizable waterfront tract in Williamsburgh and erected a million-dollar plant complete with its own docks and warehouses. By 1860, the Havemeyers and their thirteen competitors were producing half the nation's supply, and Brooklyn had become the greatest sugar-refining center in the world.

Other industries followed suit. By the 1850s Brooklyn's factory district stretched along the shoreline from Greenpoint and Williamsburgh in the north, down past the Navy Yard at Wallabout Bay, and on to South Brooklyn, where the building of the Atlantic Basin and the decision to construct a canal from Gowanus Bay to Douglass Street to drain the surrounding marshland spurred development.

Iron foundries flourished. So did drug companies: Pfizer started up its Williamsburgh plant in 1849, and Squibb opened on Furman Street in 1858. The Brooklyn Flint Glass Works and the Cartlidge porcelain factory paced two newly substantial industries. The city's distilleries produced over five million gallons of whiskey annually, its steampowered ropeworks thrived, and its white-lead manufacturers turned out more product than anyplace else in the United States.

Queens too proved attractive, especially as new transport increased its accessibility. In 1849 Peter Cooper transplanted his glue factory to a ten-acre site along the Maspeth Avenue Plank Road. And in 1854, Conrad

Poppenhusen set up a factory in College Point to produce household goods made of the hard rubber patented in 1839 by Charles Goodyear. Around his Enterprise Rubber Works, Poppenhusen constructed a company town—by draining marshes, bringing in water, streets, and gas, building a road to Flushing, and erecting houses he rented or sold to workmen and their families, whose ranks grew to two thousand by 1860.

To the north, the bucolic Bronx remained heavily forested, divided into sizable estates, with here and there some small farms, and a few minuscule villages and townships along the New York-Boston post road. The advent in 1841 of Jordan L. Mott, inventor of a coal-burning stove, and the arrival in 1842 of the Harlem Railroad opened up a small industrial beachhead. Mott purchased from Gouverneur Morris II a site on the Harlem River bounded by Third Ave and 134th Street. (After the sale he asked if he might name his new settlement Mott Haven. “I don’t care what he calls it,” Morris grumped. “While he is about it, he might as well change the name of the Harlem and call it the Jordan.”) Here Mott erected a sprawling ironworks, with a tall brick smokestack, where his workforce produced stoves, sinks, and ornamental ironwork. He also laid out the Mott Haven Canal to facilitate access to the foundry and purchased additional acres from the Morris family on which to found a community for craftsmen, near what is now Washington Avenue and 160th Street (this time he tactfully chose the name Morrisania). Other, grander operations soon followed, including the Janes and Kirtland Iron Works (on Westchester Avenue between Brook and St. Ann’s avenues); a mammoth plant, it turned out mammoth products, most spectacularly the 8,909,200-pound Capitol dome, which was transported to Washington section by section and set in place by 1863. Still farther north, large New York-owned firms operated out of Yonkers, Bridgeport, and Danbury—manufacturing bricks, stoves, and locomotives—while the output of the Catskills’ leather tanneries, when finished in Manhattan, allowed New York to dominate regional and national markets in yet another industry.

To the south, the agricultural and sea-based economy of Staten Island also began to draw large manufacturing operations to its wide open spaces. By 1860 the pioneer New-York Dyeing and Printing Establishment was employing 160 men, forty women, and eight steam engines to process nearly five million yards of cotton muslin annually, and rival firms had

emerged—like Crabtree and Wilkinson, whose 183 workers turned out 1,520,000 silk handkerchiefs annually. New manufactories made wallpaper, furniture, carriages, and Charles Goodyear's India rubber cloth. The village of Factoryville boomed. Nearby Tompkinsville benefited from the arrival of the Dejonge brothers' paper plant, which produced gift, art, commercial, and (a U.S. first) white-coated lithograph paper. Three Staten Island manufacturers devoted themselves to producing and bottling artificially carbonated or "soda" water for dispensation at "soda fountains."² On the southwest shore, along the Arthur Kill, discovery of clay and kaolin deposits led to the emergence of a major brick-manufacturing industry. The earliest, largest, and most influential company was founded near Rossville in 1854 by Balthazar Kreischer; by 1860 his sixty employees, housed in the company village of Kreischer ville, were producing a million firebricks annually.

Even Staten Island's most traditional occupation, oyster gathering, changed scale and structure. Most of the natural shellfish beds in Kill van Kull, Arthur Kill, and Prince's and Raritan bays had been exhausted as early as the 1810s. To preserve their livelihood and meet increasing demand, watermen imported and transplanted small "seed" or tiny, larval "set" oysters from fertile Virginia beds. By the 1840s oystering had become an extensive business. By the 1850s it was one of the region's foremost industries, dominated by large commercial firms that, collectively, employed perhaps a thousand men raking and longing the sea bottom with long wooden-handled iron tools, then culling, hauling, shucking, preparing, and cleaning the planting grounds.

Manufacturing also blossomed to the west, across the Hudson River, in a string of New Jersey towns easily accessible to the emerging national rail grid: Elizabeth, Jersey City, Newark, Orange, Passaic, and Paterson. Many manufactories had been transplanted from Manhattan and were still owned and operated by New Yorkers. The Colgate Soap Company moved to Jersey City in 1847. The Hendricks copper factory at Belleville had become one of the largest of its kind. Even so ardent a New York booster as Peter Cooper moved his ironworks to the banks of the Delaware at Trenton, where it would be closer to Pennsylvania anthracite, Jersey ore, and his biggest buyer, the Camden and Amboy Railroad. Cooper's son, Edward, and Abram Hewitt then expanded the business by combining the whole process

of iron manufacture from ore to finished product in one enormous complex, employing over two thousand workers, in the hills of northern New Jersey.

By the mid-fifties, then, considerable numbers of larger companies had situated or resituated themselves in an industrial belt girdling Manhattan, a regional economy that included such powerhouse cities as Brooklyn (fifth in manufacturing) and Newark (ranked sixth). Yet New York City remained number one—with one of every fifteen people employed in U.S. manufactures working on the island of Manhattan—because king-size iron works, factories, and refineries were not the be-all and end-all of industrialization.

METROPOLITAN MANUFACTURING

As of 1855 roughly two-thirds of the city's industrial workforce was employed in firms with fewer than a hundred hands, half of them in firms with under twenty-five—big by the standards of 1840, but nonetheless lilliputian alongside a behemoth like Novelty. Even in the iron industry, small- to medium-size firms were the rule. By 1860 New York had 539 iron works with 10,600 employees—an average of twenty per shop—producing gas meters, plumbing fixtures, printing presses, cutlery, iron beds, springs, nails, bolts, and the like. In woodworking, giant companies turning out pianos were far outnumbered by small furniture shops where handfuls of workers turned out cheap tables, cane chairs, sofas, beds, and chests. Shipmaking required huge yards but depended also on the sixty-odd firms that produced sails, blocks, and other marine equipment. All in all, in 1860 Manhattan housed 4,375 manufacturing establishments, which employed 90,204 workers. Most of these were small operations, crammed into the upper stories of buildings used otherwise for trade and commerce (44 percent were in the downtown warehouse district bounded by the Second Ward). Why did New York attract such a bevy of manufacturers?

Partly it was a matter of finance. Banks were still unwilling to lend to small manufacturers. Hence enterprising artisans either paid their own start-up and overhead costs, which limited them to the cheap rental spaces available in the warehouse district, or they relied on loans (and orders) from downtown merchants, who preferred their partners (and investments) close to hand.

Partly it was a matter of markets. For manufactures destined for export, it made sense to locate production facilities near the port, the place where it was easiest to get information about, and ship to, distant markets. When items were destined for Manhattan—and the city consumed most of what it made—it was proximity to local purchasers that dictated the choice.

Partly it was a matter of access to other manufacturers. New York was a warren of interlocking suppliers. Iron foundries produced steam boilers for shipyards, gas tanks for gas companies, architectural ornaments for contractors; and they relied in turn on a network of repairmen, machine shops, and importers of raw materials. Cabinetmakers prized nearness to sawmills, dealers, and auction houses. Papermakers, rag collectors, publishers, printers, and even pencil factories (the country's biggest was on the East River) developed synergistic relationships. P. J. Lorillard cut and cured tobacco at his plant in the Bronx and packed it downtown on Broome and West Broadway. While there were areas of topographical specialization, most manufacturing areas were a jumble of businesses. In the 1850s, when the blocks south of Houston and west of Broadway began to change from residential to industrial, they filled with foundries, copper and brass shops, locksmiths, China and glass manufactories, cabinetmakers and furniture makers, and the lumber yards that supplied them.

Partly—principally—Manhattan's was a labor-intensive economy. Most New York workshops relied on skill and muscle, not steam. Powered firms were roughly three times as expensive to establish as unpowered ones, so by 1860 only 18 percent of New York's shops were engine driven. This was up considerably from the 4 percent using steam a decade earlier, but it still left three-quarters of Manhattan's workers in firms where people-power was the only source of energy. Not surprisingly, most firms planted themselves close to the low-wage, walk-to-work proletarians who were stacked into the island's lower wards.

The most characteristic form of metropolitan manufacturing was the transformed textile trade. After 1840 the ailing artisanal system of production, unable to withstand the pressure of low-paid immigrant labor and a new national demand for ready-to-wear men's clothing, had succumbed to capitalist relations of production. Ready-mades had once been a synonym for slop clothes—cheap flannel shirts and dungarees fit only for sailors, slaves, and backwoodsmen. The tremendous expansion of

southern slavery increased demand for such inexpensive products, and the Gold Rush touched off a clothing rush in flannel drawers, overalls, and calico shirts. Falling labor costs also made it possible to manufacture high-quality reproductions of European fashions at half the cost of imports. As the national market for New York ready-mades ballooned, the wholesale value of clothing sold in the city between 1841 and 1853 leapt upward, rising from two and a half to twenty million dollars. By 1855 the garment industry was far and away the city's largest, embracing 35 percent of all manufacturing employees. In 1860 New York produced roughly 40 percent of the country's clothes.

Crucial to this rapid expansion was a reorganization of the trade into three distinct but interdependent levels: a small elite of wholesale firms at the top, a large corps of subcontractors who supervised final production in the middle, and, at the bottom, an army of outworkers. Wholesale firms like P. L. Rogers, D. and J. Devlin, and Lewis and Hanford (the nation's biggest) brought cloth straight from the mills to their own in-house tailors, who cut it to the desired pattern. These "cutters," aristocrats of the trade, were among the city's best-paid workers. The constituent parts of garments were then turned over to outworkers, men and women who worked in their own homes or shops sewing the pieces together into a final product. As one cutter could keep many outworkers busy, the ratio of employees was wildly skewed toward the latter. In 1854 Hanford's had seventy-five insiders and four thousand outsiders; Brooks Brothers (the former custom tailors turned wholesalers) had seventy-eight inside, fifteen hundred outside.

In time, as the volume of business grew, more and more wholesalers subcontracted their finishing work to smaller manufacturers. Many were immigrant artisans who had made the transition from wage-worker to proprietor. It didn't require much capital. A tailor might get a contract from a wholesaler or a larger shop, do his own cutting at home, and parcel out the sewing to outworkers, thus passing on the costs of space, light, fuel, and even needles and thread. Competition among subcontractors was fierce—vicious—and success depended on holding the wages of outworkers to an absolute minimum. ("If they were compelled to pay living wages for their work," Horace Greeley observed, "they must stop it altogether.") Even then, profit margins were slim, and the whole enterprise could easily collapse, tumbling a boss back down into the ranks of his workers.

Everything, in the end, came down to the workers, tens of thousands of them—male tailors and their families as well as unmarried seamstresses. Many of the men had fled Europe aiming to reestablish themselves as traditional artisans, only to discover that too many had come too late for that to be possible. Apprenticeship disappeared. Wages plummeted. The best and luckiest became contractors or cutters; most found themselves irredeemably proletarianized. By the 1850s piece rates in New York were so low that journeyman tailors couldn't earn enough to stay alive unless they had families and became, in effect, foremen of their own family shops. They negotiated with employers, did the heaviest or most skilled work, and supervised the labor of their wives and children. Working sixteen hours a day, seven days a week, they and their families together might take in ten dollars a week (compared to the twenty dollars an inside male cutter could earn).

Life was even more precarious for single women working as seamstresses, dressmakers, milliners, shirtmakers and collarmakers, embroiderers, tasselmakers, and artificial-flower makers. A woman's wages reflected the assumption that she didn't need to support herself but was merely supplementing the income of her husband. Single women and widows, frequently with children to support, made between fifty cents and two dollars a week (unskilled male laborers in other fields got seven dollars a week)—when they could find work at all in this highly seasonal and competitive business. This relegated them to the cheapest rooms in the upper floors of the worst housing, where they often worked without heat or light because firewood and candles were too expensive; they and their children routinely suffered from eyestrain, fatigue, malnutrition, pneumonia, and consumption. Sometimes groups of women banded together, sharing quarters in boardinghouses and turning them into all-female cooperative workshops. Some made ends meet by part-time prostitution. Even Bennett's *Herald*, no friend of labor, said in 1853, "We know of no class of workwomen who are more poorly paid for their work or who suffer more privation and hardship."

The plight of New York garment workers worsened after Isaac Merritt Singer came to the city in the early fifties to build and sell the first practical sewing machine. Raised in upstate New York, where his father was a village millwright, Singer apprenticed at a machinist's shop, worked briefly

in New York in the mid-1830s at Hoe's press works, then knocked about the country as an actor till discovering his true metier was inventing. In 1850, having produced rock-drilling and type-carving machines, he was solicited by a Boston machine shop owner to help improve the sewing machine, which Elias Howe had invented and patented in 1846. Singer came up with a working model incorporating a foot treadle.

In 1850 Singer moved to New York City, center of the garment industry, to market and manufacture his product. After settling a patent dispute with Howe by pooling their rights, he began production in a twenty-five-by-fifty-foot room over the New Haven Railroad Depot in Centre Street. At first, skilled craftsmen produced almost all the parts by hand, a process that was slow and costly and made each machine unique, thus hard to fix. Then the recently invented milling machine allowed Singer to make precision-measured interchangeable parts and introduce mass-production techniques heretofore employed only in armories. In 1857 I. M. Singer and Company opened a new factory, more advanced than any in Britain, in a six-story building on Mott Street, between Broome and Spring, complete with an up-to-date Badger and Company cast-iron front. Production soared from 2,564 machines in 1856 to thirteen thousand by 1860.

Demand for Singer's heavy industrial models grew brisk as wholesale clothing manufacturers insisted their subcontractors use them to standardize stitching and increase output: a gentleman's frock coat took sixteen and a half hours to make by hand, two and a half hours by machine. Contractors in turn demanded that outworkers buy machines. When few seamstresses proved able to afford them, Singer offered another innovation, installment buying, but the women soon discovered that if they fell behind on monthly payments, even if the machine was all but paid for, it was repossessed, and their money was not returned. Most women, and many men, were therefore forced to pay tailors who had managed to acquire machines to do the requisite stitching, shaving their incomes yet farther.³

Some garment manufacturers responded to Singer's invention by recentralizing production. Detail work (cuffs, buttonholes, sleeves) was put out to homeworkers to sew, and the garments were then assembled by machine operatives in inside shops under tight supervision. Fashion had a hand in this reconcentration, as the new "hoop skirts" required that cloth be sewn onto iron frames made in Connecticut and brought to New York

factories for assembly. By 1858 one hoopskirt factory alone employed 350, mainly women, to turn out three thousand skirts a day.

These factories or “sweatshops” tended to hire single girls between the ages of sixteen and twenty-five who lived either with their families or in boardinghouses. Their wages were higher than those of outworkers, and the work was steadier (owners being reluctant to leave costly machines idle); some even had a little money left over to spend on clothes and recreation. The setting had its drawbacks, especially given the power wielded by male foremen, but the factory girls, partly by virtue of their massed numbers, were seldom pliant and docile. Indeed a high-spiritedness characterized the shops at first, with much socializing and bantering, to the point where some bosses complained that “men are considered more reliable and more easily managed.” Employers soon began to impose stricter discipline—Brooks Brothers, for example, forbade all conversation—and as conditions worsened, turnover soared.

Factory production, in turn, increased pressure on small employers, who responded by lowering piece rates, forcing seamstresses to work ever faster and ever longer; fifteen-to-eighteen-hour workdays for seamstresses became common in the 1850s. And machine work proved just as taxing as hand sewing; it simply shifted the strain from arms to hips, while the jarring mechanisms generated altogether new nervous disorders. The Shirt Sewers and Seamstresses Union spoke out against the Singers, but they had come to stay.

PALACES OF CONSUMPTION

As production of commodities soared, local retailers began to adopt radically new marketing techniques to increase the volume and velocity of sales. The vanguard of this revolution was the department store, and the man who introduced it to New York was dry-goods merchant Alexander T. Stewart.

This slight, taciturn man with sandy-gray hair and whiskers, who had done so well during the Panic of 1837, came to realize that retail merchandizing was not keeping pace with the boom-era surge in industrial productivity. Even in larger shops like Brooks Brothers or Lord and Taylor, stock turnover could be glacially slow. According to time-honored custom,

each prospective customer who came through the door was engaged by a clerk, and prices, rather than being fixed, depended on the outcome of leisurely dickering. It was Stewart's genius to see that if he wanted to sell more goods, and to sell them more rapidly, he would have to sell them differently.

As early as 1832 Stewart, like Arthur Tappan, had advertised "regular and uniform prices"—an inspired tactic, as E. L. Godkin remembered half a century later, which made Stewart popular among female shoppers by "delivering them from distrust of their own power as hagglers or bargain-makers." Over the next dozen-odd years he perfected his appeal to women with periodic price reductions, special sales, auctions, and canny advertising that depicted his establishment as "the most desirable place to which ladies can resort." It was reported in the newspapers that he even sent salesmen outside to deliver "eulogies on silks, laces, and french muslin" to preferred customers while they sat outside in their carriages, "which must have won their hearts."

Stewart's most famous innovation, however, dates from 1846, when he opened a cavernous new store on the east side of Broadway between Chambers and Reade streets. The former site of Washington Hall, headquarters of the Federalist Party, this was now a prime retail location—close to wholesale clothing manufacturers, rail and ferry terminals, fashionable hotels, sumptuous private residences—and Stewart built accordingly. Instead of adhering to the Greek Revival style, he erected a magnificent Italian Renaissance palazzo, five stories tall and sheathed in dazzling white Tuckahoe marble. Its street-level facade, supported by great cast-iron Corinthian pilasters, boasted fifteen huge plate-glass windows. The interior, airy as well as opulent, was organized around a large circular court covered by a domed skylight. Nothing remotely like it had ever been seen in New York before; well-traveled residents knew it had no equal in London or Paris, either. People began to call it the "Marble Palace."

Stewart's Marble Palace on Broadway and Chambers Street, 1851, the pioneer department store in the United States. Fifteen years after it opened, Stewart moved to larger quarters uptown and turned the building into a wholesale outlet and warehouse. It still stands, having served (among other things)

as the headquarters of the *Sun* in the early twentieth century.

Historical Society)

Consistent with his previous experiments in retailing, Stewart encouraged customers to stroll at leisure around the selling floors, inspecting wares laid out on polished mahogany counters and marble shelves, everything clearly tagged with a set price and organized into separate “departments.” He instructed his sales staff, as always, to be helpful but unobtrusive and never to bargain. Above all, he continued to look for ways to make shopping agreeable to women of the propertied classes: by hiring handsome young men as clerks, by advertising aggressively in ladies’ magazines, by staging the first American fashion shows, and by locating a “Ladies’ Parlor” on the second floor featuring full-length Parisian mirrors.

Stewart’s store was a sensational success. Outside, private carriages jammed Broadway; inside, two hundred clerks allegedly took in ten thousand dollars a day, an unheard-of sum (a decade later, in 1859, sales topped nine million, almost twenty thousand dollars per day). Admiring newspapers paid homage to the owner as “Stewart the Great” or “King Stewart.” So did his competitors. During the 1850s one after another of them moved to Broadway—albeit a little to the north, to the five-block-long strip intersected by Canal, Grand, Broome, Spring, Prince, and Houston. Arnold, Constable opened a new “Marble House” facing Canal Street; its brass-buttoned, blue-uniformed porters opened carriage doors and held umbrellas over crinolined customers. Lord and Taylor opted for a palace of cast iron, an elegant emporium that opened a block farther north in 1859. There were other broad-gauged arrivals, such as Brooks Brothers and the Hearn Brothers, but specialized stores flocked to the strip as well. Badger’s ironworks cast a Venetian-style palazzo for E. V. Haughwout, an importer of silver and glass, who also manufactured fine chandeliers and handpainted china. Tiffany and Company, too, chose a Badger iron-and-glass front to show off its “diamond jewelry, watches, clocks, silverware and bronzes,” and assured would-be customers “that they may examine our collections, without incurring the least obligation to make purchases.” Cheny silks, Gunther furs, and W. and J. Sloane carpets were soon displayed in their own retail outlets.

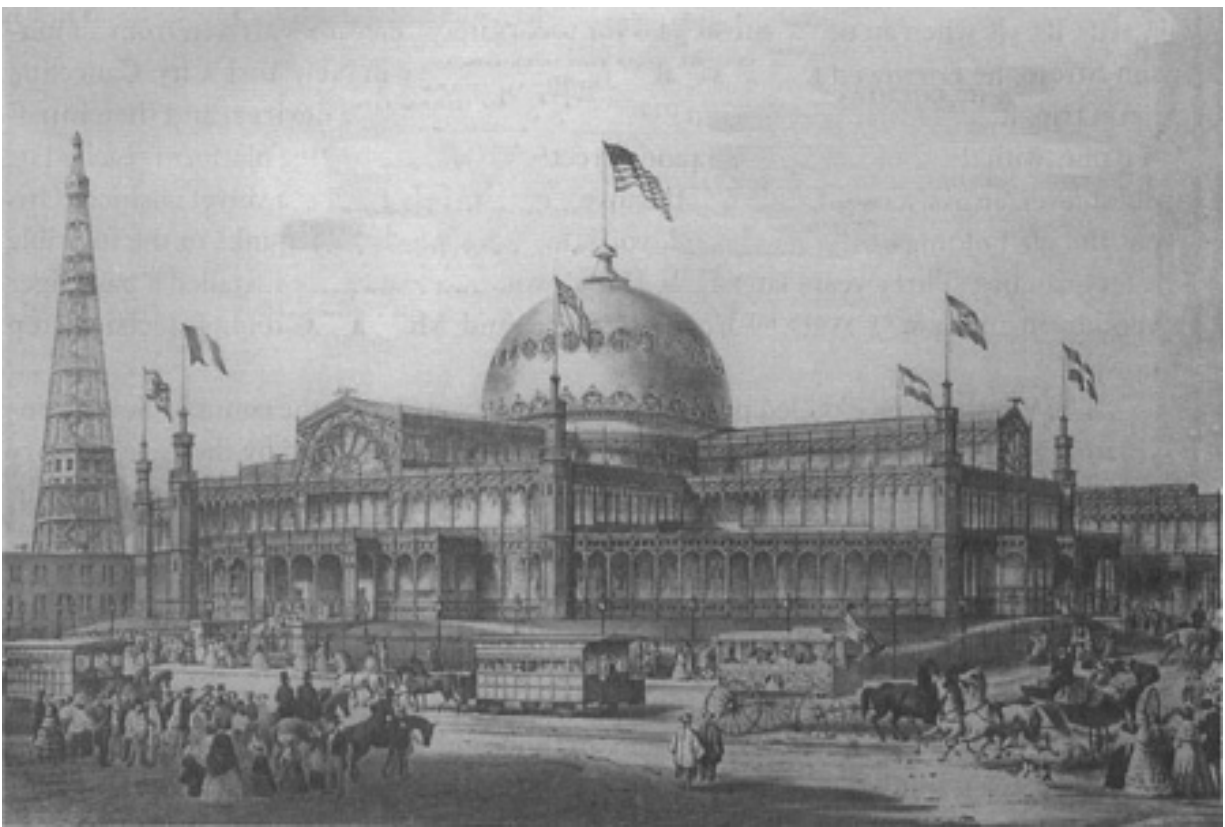

By the mid-fifties throngs of “window-shoppers” were promenading up and down Broadway delighting (as Henry James later remembered) in the goods “heaped up for our fond consumption.” The street became an extension of the stores, a stage for the fashion conscious. Hundreds of people “spend their lives in sauntering through Broadway during fashionable hours seeing and being seen,” the *Tribune* observed. Most were smartly dressed women, all ribbons and silks and Parisian fashions, who formed “one sheet of bright, quivering colors,” though men were also in evidence, conservatively dressed businessmen as well as dandies with hornlike mustaches, kid gloves, thin trouser legs, and patent leather shoes. At night the effect was almost magical as gas lamps and illuminated store windows captured the streams of pedestrians in their glow and the colored lamps on carriages and omnibuses transformed Broadway into a river of light.

A PALACE OF CRYSTAL

After 1853 omnibus riders could continue north past Houston, past Madison Square, and out beyond the settled fringes of the city, toward the only structure in town that put Stewart’s emporium to shame. Journalist George Foster described the journey: “For some blocks we have been aware, by the accumulation of coffee houses, grog shops, ‘saloons’, peep-shows of living alligators, model-artists and three-headed calves, that we were approaching the newly discovered, Sedgwickian centre of the metropolis. ‘Fortieth street, Crystal Palace’—says the conductor, stopping the cars handily on the crossing.”

Two years earlier, in 1851, the Great Exhibition of the Works of Industry of All Nations had opened in London’s fabled Crystal Palace, a soaring, glittering wonder of cast iron and glass. Later that same year, a group of influential New Yorkers—Theodore Sedgwick, August Belmont, Edward Collins, and William Cullen Bryant, plus assorted Schuylers and Livingstons and Hamiltons—resolved to build a rival Crystal Palace on Manhattan, as big as or bigger than the original. The site they chose lay far uptown, in a four-acre site along Sixth Avenue between 40th and 42nd streets (now Bryant Park)—the same field across which, seventy-five years earlier, Washington’s troops had been chased by jeering redcoats.

Construction advanced quickly, and New Yorkers soon had a Crystal Palace to boast about: eighteen hundred tons of iron supporting fifteen thousand panes of translucent enameled glass that peaked in a 123-foot dome, the highest ever built in America. When the Exhibition of the Industry of All Nations officially opened on July 14, 1853, tens of thousands of residents and visitors turned out for the occasion. President Franklin Pierce and Charles Lyell, the great English geologist, made speeches hailing the event as the birth of a new era, in which war would be replaced by the heroic advances of science and technology. There was art, too, “to educate and refine the masses” (said the catalog), including a colossal equestrian statue of Washington and thirteen gigantic sculptures of Christ and His Apostles.

The Crystal Palace, 1853, by Nathaniel Currier. The Latting Observatory rises to the left, on the north side of 42nd Street. “In remote districts of this great and growing country,” declared *Scientific American*, “young men, and old, too, have begun to lay by a few shillings weekly or monthly that they make be enabled to come from the far prairie and backwoods

to see the Crystal Palace in New York.” (© Museum of the City of New York)

For the next five years, crowds roamed the building’s halls past shimmering fountains and glaring clusters of gas lights, marveling at the miracles of the age, great and small: scales, meters, guns, lamps, safes, clocks, carriages, scientific instruments, agricultural implements, a Fresnel lighthouse lens, telegraphy and photography equipment, fire engines, ships, and plans for an elevated railroad above Broadway. And machinery, everywhere machinery—machinery to pump water, sew, print, finish wood, refine sugar, set type, make ice cream, and wash gold.

The machine that would have the most dramatic impact on New York’s cityscape—the elevator—was on display in a sideshow area across 42nd Street, in two different versions. One lifted passengers to the first- and second-floor landings of the Latting Observatory, a 350-foot-high viewing structure of iron-braced timber. The second elevator, less spectacular but more momentous, hoisted a mountable platform just high enough to clear the heads of onlookers. The man who mounted it was Elisha Graves Otis, a master mechanic turned inventor. Some years earlier, Otis had produced a machine that made bedsteads, and when the Yonkers bedstead plant where he worked needed an elevator, Otis was asked to install one. He did, and he also added an automatic device to prevent it from falling. Otis was just about to seek his fortune in the California goldfields when an unsolicited order for two “safety” elevators arrived from a Hudson Street manufacturer and Otis realized his fortune lay in New York City. Canceling his trip, he borrowed funds, set up a small shop to make the devices, and then introduced one, with theatrical flair, on 42nd Street. When the elevating platform reached its highest level, an assistant presented the inventor with a dagger on a velvet cushion. Otis cut the cable holding them aloft and, voila, nothing happened, thanks to the invisible safety catches. Three years later E. V. Haughwout and Company installed a passenger version in its new five-story Broadway store, and Manhattan took a decisive step upward.

The Crystal Palace pulled people to New York from across the country. Seventeen-year-old Sam Clemens came all the way from Missouri. Entranced by the “perfect fairy palace—beautiful beyond description,” he reported that it drew an average of six thousand visitors each day, “double the population of Hannibal.” On October 5, 1858, however, a fire broke out

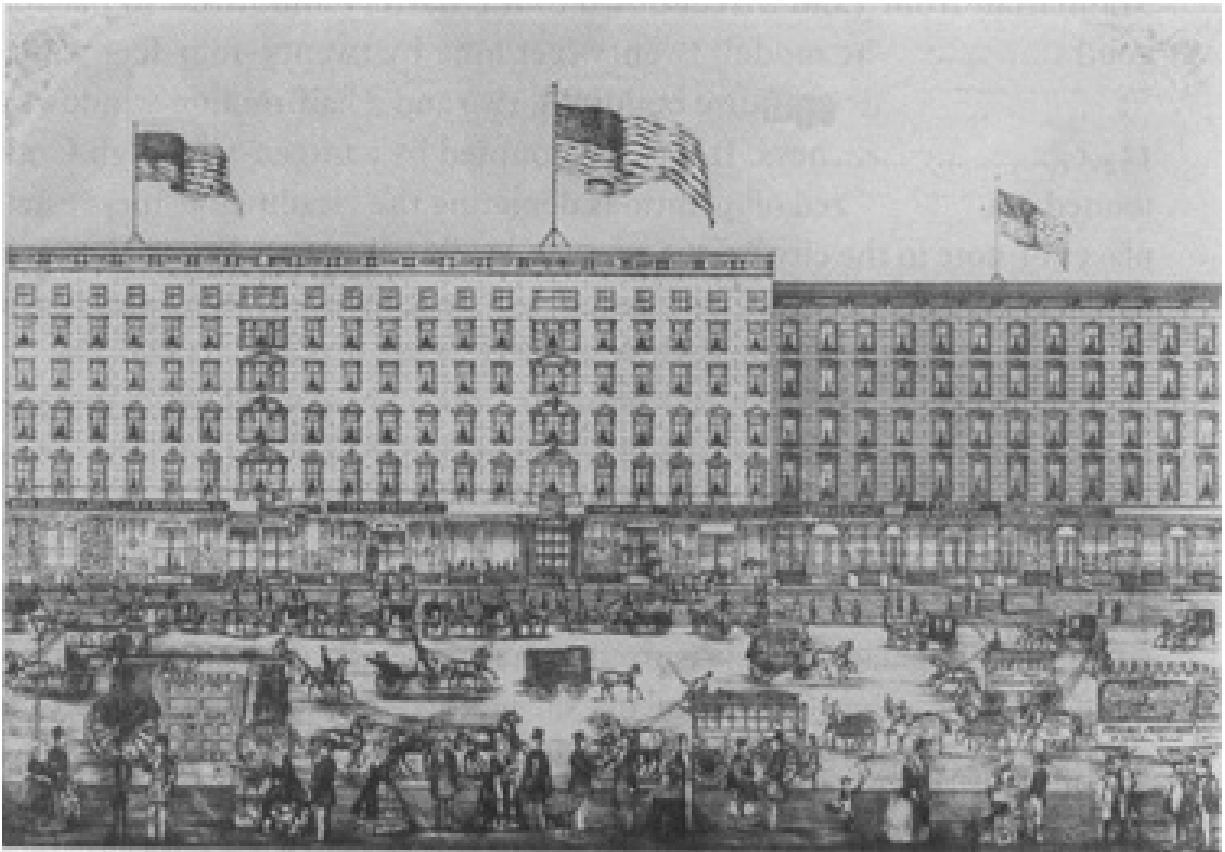

in one of the Palace's storage rooms. Although its cast-iron beams were believed to render the building fireproof, the flames spread quickly through some 750,000 board feet of wood flooring. In the intense heat, the roof and walls literally melted away, and within minutes the entire structure had collapsed in a spectacular shower of sparks and smoke. All of the two thousand visitors inside that day escaped with their lives, but the contents were lost. Scavengers later picked through the rubble looking for souvenirs, and a certain Mrs. Richardson went into business selling "vitrified masses of glass, metals, &c." They were, she said, relics "of the finest building ever erected in America."

PALACES FOR TRAVELERS

Before its blazing demise, the Crystal Palace, by boosting New York's tourist trade, had nourished an ongoing spate of hotel construction. Until mid-century, the premier hostelry had continued to be the elegant Astor House, on Broadway opposite City Hall, just down the street from Stewart's Marble Palace. But as Manhattan's commercial center of gravity shifted northwards in the fifties, Astor House came to seem too "downtown." Spurred by vast ranks of Crystal Palace gazers and burgeoning numbers of commercial travelers, dozens of hotels sprang up. Nineteen deluxe establishments appeared on Broadway alone between 1850 and 1854.

Grandest of these newcomers was the six-story, six-hundred-room St. Nicholas Hotel (1853), whose white marble facade dominated the west side of Broadway between Broome and Spring streets, fourteen blocks above the Astor House. Its guests, upward of eight hundred at a time, were pampered by a million dollars' worth of walnut wainscoting, frescoed ceilings, and such technological wonders as gas-light chandeliers (supplied by Haughwout's across the street), hot running water, central heating, annunciators, a telegraph in the lobby, and steam-powered washing machines in the basement. There were opulent parlors for gentlemen and ladies, a richly ornamented reading room, and a stately main dining room where a regiment of liveried servants (mostly Irish) escorted guests to their seats. Downstairs, right next to the hotel's main entrance, was Phalon's Hair-Dressing Establishment, the most fashionable place in town for gentlemen to be shaved, barbered, and groomed with grease, scent, and pale

rum. It was, said one English visitor in 1853, “like an introduction to the palace of some Eastern prince.”

Other hotels nestled within a few blocks of the St. Nicholas, interspersed among Broadway’s emporiums and theaters—like the Metropolitan (on the corner of Prince, next to Niblo’s Garden), famous for its “sky parlors” that allowed lady guests to observe the well-dressed throngs below. Additional grand establishments situated themselves along Broadway, marking fashion’s uptown progress. James Renwick’s St. Denis held down the corner of 11th Street across from the new and very stylish Grace Church; the Clarendon Hotel, famous for its huge bathtubs, overlooked Union Square; and the wave crested at the corner of Fifth Avenue and 23rd Street, three blocks below the New York and Harlem’s Madison Square Depot, where in 1859 Amos Eno opened his Fifth Avenue Hotel. Costing two

million dollars and employing four hundred servants, the Fifth Avenue was hailed as the most spectacular building of its kind yet erected in the city: “a larger and handsomer building than Buckingham Palace,” raved a correspondent for the *London Times* who came to New York the following year with the prince of Wales (later King Edward VII). Among other wonders, the Fifth Avenue offered private bathrooms, an unprecedented extravagance, as well as the city’s second passenger elevator (equipped with Otis’s safety device), described variously as a “perpendicular railway intersecting each story” or “a little parlour going up by machinery.”

Visitors of means clearly had no problem finding accommodations in New York City. What they needed—as did less affluent arrivals and even long time residents—was orientation. The cozy republican town had metamorphosed into a bewildering metropolis, and citizens and strangers alike sought ways to grasp its scale and meaning.

THE PIGEON PERSPECTIVE

In 1845-46, under the direction of E. Porter Belden, 150 artists, craftsmen, sculptors and mechanics collaborated on building a scale model of New York City. It represented Manhattan from 32nd Street down to the Battery and threw in part of Brooklyn for good measure. The model, twenty feet long by twenty-four feet wide, included two hundred thousand miniature buildings, two and a half million windows and doors, and 150,000 teeny chimneys. It was surmounted by a fifteen-foot-high Gothic canopy festooned with a hundred oil paintings depicting the “leading business establishments and places of note in the city.” This wonder, exhibited at the Minerva Room (406 Broadway, between Walker and Canal), became a principal sight for visitors and residents.

Belden went on to publish *New York: Past, Present, and Future* (1849), one of a large number of prideful, self-congratulatory guidebooks that appeared during the boom years. New York was delighted by its emerging metropolitan status and not shy about trumpeting its virtues. Addressing a national, indeed an international, audience, the volumes—many of which were underwritten by the new monster hotels or prepared for visitors to the Crystal Palace—proclaimed the city’s civic grandeur, its commercial entrepôts, its palaces of pleasure, its charitable and educational institutions. In Bunyunesque prose they boasted of the sheer scale of it all: their city had

the greatest concentration of wealth and energy and people in America, it was the largest market in America, it had “become so enriched that she may call Ohio her kitchen-garden, Michigan her pastures, and Indiana, Illinois and Iowa her harvest fields.”

In addition to encomiums, the guidebooks offered solid information: where to stay and eat; how to get around the city (with rail and omnibus timetables appended). Beyond providing pathways through the city’s labyrinthine corridors, the books helped readers grasp the city in its entirety by including “panoramic” representations of it as seen (or imagined) from elevated vantage points. C. S. Francis, the publisher who brought out Audubon’s *Birds*, offered in his *New Guide to the Cities of New-York and Brooklyn* (1853) a view from atop the recently completed Trinity Church.

Such representations broke with traditional ways of seeing the city. Manhattan had customarily been presented as it appeared from the opposite bank of an adjacent river. In colonial days, the waterways—New York’s commercial lifelines—featured as prominently as the land; in the early nineteenth century, the ensemble was often framed with a pastoral foreground scene in the manner of Thomas Cole. The new panoramic views, however, planted themselves squarely inside the city, generally atop one of its many steeples, presenting a pigeon’s-eye view of the bustling streets below.

In the 1850s the pigeons took wing. Inspired, perhaps, by experiences at the Latting Observatory, where visitors could use telescopes to inspect the island and its surrounds, artists began imagining the city from ever higher perspectives. An 1853 electrotyped woodcut, *Bird’s Eye View of the City of New York* from *Frank Leslie’s Illustrated News*, encompassed the town as a whole. And in John Bachmann’s spectacular fish-eye view, *New York & Environs* (1859), the Empire City seemed to stretch to the ends of the earth.

Manhattan, Ink

From a pigeon's point of view, the most obvious sign of New York's metropolitan transformation was the bulky physicality of its railroads, steamboats, factories, warehouses, and department stores. However, the city's metamorphosis could be measured as well by its production and distribution of something less tangible than clipper ships or steam boilers. In the 1840s and 1850s Manhattan became the nation's information center, a fountain from which news and novels, stock quotes and lithographs flowed in ceaseless profusion. A mountain of printed matter, generated by a growing army of publishers and printshops, was delivered by rail. But data was also dispatched, almost magically, through an expanding latticework of wires, itself the progeny of New York's scientific and commercial cultures.

WIRING UP

After painter Samuel F. B. Morse returned from Europe in 1832, the renaissance New Yorker devoted himself, more or less simultaneously, to art, politics, and science. He served as professor of the literature of the arts of design at the University of the City of New York. He joined the crusade against popery and ran for mayor on the Native American ticket. And he set out to design a device that would "transmit intelligence by electricity."

Morse was no theorist, though he had picked up the rudiments of electromagnetism at New York Athenaeum lectures. But in 1837, after years of dogged experimentation, he and his colleagues succeeded in transmitting signals through the hundreds of feet of wire Morse had looped around his university rooms overlooking Washington Square. Patenting their "telegraph," the inventors developed a dot-dash code system and set out to convince a skeptical public the machine was practicable.

In October 1842 Morse insulated two miles of copper wire with tar, pitch, hemp, and India rubber, put it on board a rowboat, and paid it out, one moonlit night, while a boatman paddled him over to Governors Island. In the morning the *New York Herald* announced that at noon Morse would transmit a message back to Castle Garden. The receiver worked for a bit,

then died when the wire snagged on a departing ship's anchor and was hauled up and sliced apart by puzzled sailors. The crowd, believing itself hoaxed, dispersed with jeers.

Morse had better luck in 1844 when, having convinced Congress to underwrite a telegraph line between Baltimore and Washington, he inaugurated the hookup with an exultant "What hath God wrought!" Morse, a good republican, offered to sell his invention to the government for development as a public network, but Congress in its laissezfaire wisdom declined to accept. Some businessmen shied away too, thinking Morse's device too risky an investment. Jacob Little, worried that vandals would make short work of poles and wires, preferred carrier pigeons. But scores of other entrepreneurs plunged with gusto into developing a new industry.

Morse himself rounded up enough backers, including the owner of a Nassau Street beanery, to establish the Magnetic Telegraph Company and begin service between New York and Philadelphia (actually, the line ended at Jersey City and messengers rowed telegrams across to Manhattan). In 1846, when speculators used stock and commodity news relayed from New York to manipulate prices on the Philadelphia exchange, even Jacob Little became a believer.

By 1846, also, independently owned telegraph lines were converging on New York from Washington, Boston, and Albany. Less than a decade later, better than fifty companies had sprung up around the country, and thousands of miles of wire coupled New York to such far-away places as Pittsburgh and Cincinnati.

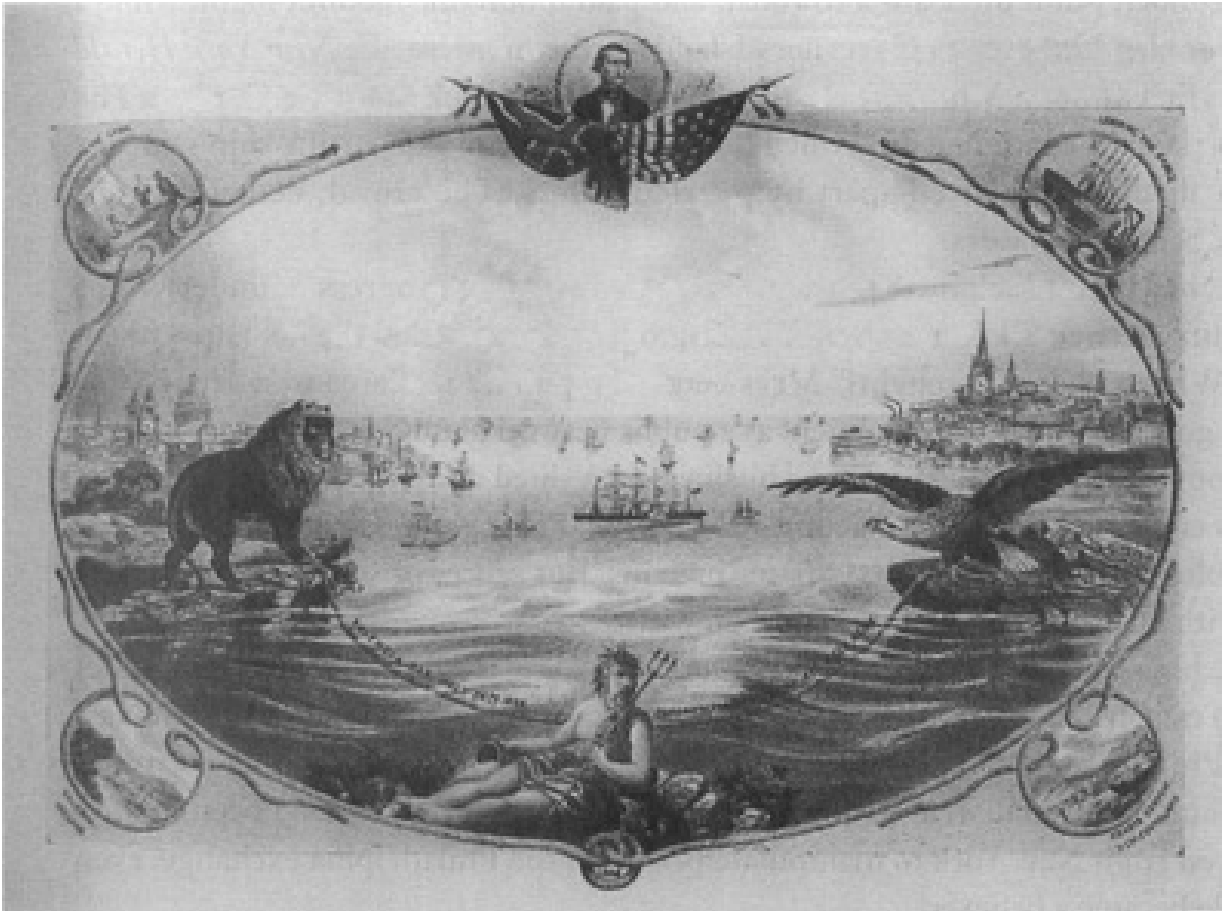

The city's commanding position in the new communications web was bolstered by establishment of a telegraphic link with Europe—the project of Cyrus West Field. A Massachusetts migrant, Field had worked as an errand boy at A. T. Stewart's store, then gone into paper manufacturing. Given the explosion of the penny press, the market for bank notes and bonds, and a surge in long-distance letter writing, Field's firm flourished, making him one of the city's richest men. At thirty-four he retired, bought a house in Gramercy Park, and turned to telegraphy.

In 1854, encouraged by the recent discovery of a shallow submarine plateau between Ireland and Newfoundland, Field teamed up with industrialist Peter Cooper (his Gramercy Park neighbor), ironmaster Abram

Hewitt, banker Moses Taylor, and Morse. After securing a charter and a fifty-year monopoly, the New Yorkers subscribed \$1.5 million, hired battalions of laborers to hack an eight-foot-wide path through four hundred miles of rugged Canadian wilderness, and succeeded in linking St. John's, Newfoundland, with Nova Scotia, then the terminus of lines from the United States.

In 1855, anticipating the European connection, Field, Taylor, Cooper, and Hewitt formed the American Telegraph Company to expand their control over the U.S. network. The New York-based firm quickly swallowed up smaller lines, Morse's among them. By the end of the decade its consolidated system stretched from Maine to the Gulf of Mexico, making it the largest telegraph company in the eastern states; its only rival was Western Union, a Rochester-based firm that had acquired lines in the Midwest.

In 1857, having raised additional capital in England, two sidewheel steamships provided by the U.S. and British governments began spooling out 1,950 miles of cable. After several setbacks, the mighty work was completed in 1858. On August 16 Queen Victoria sent President Buchanan a congratulatory message in "Morse" code officially opening the line; it was shortly followed by the first transatlantic news dispatch: "Settlement of Chinese Question; Chinese Empire open to trade; Christian religion allowed; Mutiny being quelled, all India becoming tranquil."

The Eighth Wonder of the World: The Atlantic Cable. When the cable was finally hooked up again in 1866, this print hailed the event—an iconographic echo of earlier Festivals of Connection in the city’s streets. (Library of Congress)

In a keystroke, what the *Times* hailed as the most “wondrous event of a wondrous age” had solidified New York’s position as principal link between New World and Old. In a jubilant Festival of Connection, cannons boomed, church bells pealed, and public buildings were illuminated. The fireworks at City Hall were so tumultuous they touched off a conflagration that destroyed the cupola before it was brought under control. On September 1 a parade with Field and the mayor in the lead carriage marched from the Battery to the Crystal Palace, past stores, hotels, and businesses festooned with banners, placards, and transparencies; the celebration was capped that evening by a torch-lit procession. The ecstasy proved a mite premature, however, as the cable fell silent at the beginning of September, spurring accusations of humbuggery, and would not be reconnected until 1866.

“EXTRA, EXTRA, READ ALL ABOUT IT!”

The telegraph, nurtured to fruitful life in New York City, in turn helped reshape the metropolis. By the 1850s the city’s railroads had adopted the device to route and dispatch trains, all police stations were telegraphically interconnected, and the New York Stock Exchange was setting securities prices for the entire nation. Nowhere, however, did the new technology have greater repercussions than in journalism. New York’s newspapers, driven by their mania for speed, became the telegraph’s most crucial supporters. In doing so, they won for themselves and their metropolis an insurmountable advantage in the collection and dissemination of information.

The rise of the penny press in the 1830s had put a premium on ever swifter access to news. Newsboy-hawked “extras” that scooped rivals by even an hour could harvest a bonanza in street sales. By the mid-1840s, New Yorkers were being bombarded by fastbreaking stories—garnered by pony express, chartered locomotives, express steamships, or carrier pigeons—and the race for news had itself become good copy.

Telegraphy accelerated the frenzy. Morse himself, after marveling at what God had wrought, had promptly tapped out a second message: “Have you any news?” Soon James Gordon Bennett of the *Herald* was paying a five-hundred-dollar bonus to news entrepreneur Daniel Craig for every hour his dispatches preceded those received by other papers, and when the Mexican War broke out in 1846, Bennett bankrolled an extension of telegraph lines to get up-to-the minute intelligence from the front.

No one was more adept at speeding news to press than Moses Yale Beach, proprietor of the *Sun*. But it was obvious to Beach that telegraphy required rewriting the rules of the news-gathering game. Wire companies swamped with usage demands had restricted each paper to a scant fifteen minutes of transmission time before passing the wire to competitors, effectively eliminating electric scoops. As the construction of private lines was beyond the capacity of even the biggest metropolitan dailies, cooperation, not costly competition, was now in the interest of the New York papers—especially as they faced a collective threat from Boston, where Cunard’s vessels still made first landfall in the States, bearing the latest news from Europe.

In June 1846, accordingly, Beach brokered an arrangement among six leading papers (the *Sun*, *Tribune*, *Herald*, *Journal of Commerce*, *Courier and Enquirer*, and *Express*). They agreed to collaborate in procuring Mexican War updates and, as well, to share the cost of transmitting political and congressional news from Washington. The associated papers also deftly bypassed Boston in 1849 by spurring Britain's Maritime Provinces to link New York to Halifax, the Cunarders' first hemispheric port of call. The group also formally established a Harbor News Association and jointly chartered a steamer—the *Newsboy*—to intercept incoming vessels off Sandy Hook. New Yorkers had locked in their control over the collection of information from Europe.

In the 1850s, the combination—soon to be known as the Associated Press (AP)—moved to dominate news distribution as well. AP agents, placed in major cities, gathered stories produced by local papers, then flashed them to headquarters in New York. There they were consolidated and wired back out to a client base that soon included the great majority of America's newspapers. Opponents cried monopoly, and they were right. The AP, in conjunction with New York City's cable and telegraph companies, had cornered the information market. Subscribing newspapers were forbidden from any independent use of telegraphy, barred even from receiving dispatches written by their own reporters.

Manhattan's papers thrived. By 1853 the circulation of Bennett's *Herald* had jumped to fifty-two thousand, making it the country's most profitable daily. Horace Greeley's *Tribune* was running a close second, and its weekly edition was probably the most widely circulated journal in America. Within the city itself, combined daily circulation shot from one paper per every 16 residents in 1830 to one for every 4.5 in 1850 (and 1 per 2.2 on Sundays).

The rise was due in no small part to the penny papers' explicitly addressing themselves to both sexes as readers, unlike the older, strictly male-oriented commercial press. The newspapers proved hospitable to women writers as well. In 1841 the Boston abolitionist Lydia Maria Child was a rarity when she moved to New York to edit the *National Anti-Slavery Standard*, and as the first woman to edit a journal of public policy, she was kept at arm's length by the male New York press. But after Child dramatically increased the *Standard's* circulation and published her urban

reportage as *Letters from New York* (1843, 1845), professionals like Bryant accepted her claim to a literary vocation.

Margaret Fuller, another pioneer, had been a highly respected editor of the *Dial*, the literary magazine founded by Emerson up in Concord. In 1844, at Horace Greeley's urging, she moved to New York and joined the *Tribune's* staff. Mostly she wrote on acceptably female subjects like literature and music, but Fuller also did pieces on slums, prisons, and almshouses—becoming the *Tribune's* woman-about-town. In 1846 Greeley even dispatched Fuller, an avid supporter of Garibaldi and Mazzini, to cover the fight for an Italian republic. (In 1850 the ship bringing her back to New York sank off Fire Island in a storm; a search party including Walter Whitman combed the beach, but her body was never found.)

Along with new readers and new writers, new technology made the expansion possible. What the telegraph was to getting a story, the rotary press was to getting it out. Patented in 1846 by New York City's Richard Hoe, it could produce over twenty thousand copies per hour, permitting a paper to be printed far more quickly, with far fresher news. In the 1850s, moreover, papermaking machines emerged to provide Hoe's "Lightning" presses with newsprint made from wood pulp rather than scarce cotton and linen rags, breaking another bottleneck.

The housing of mammoth presses, the steam engines to power them, and growing numbers of correspondents, bookkeepers, typesetters, and press operators required ever larger accommodations. By the 1850s the *Tribune* employed fifty people (not counting the hundred employees it shared with the Associated Press) and filled a five-story Park Row building. Bennett had moved the *Herald* to larger quarters on Fulton and Nassau in 1842, but after 1848, when he switched to Lightning presses and his workforce topped two hundred, he was forced to expand into three adjoining buildings.

Large premises, costly presses, sizable staffs, and telegraphic services—all drove expenses skyward. To offset rising costs, owners boosted advertising rates, justifying hikes by pointing to increased circulation. As Greeley noted in 1841, "We lose money on our circulation by itself considered, but with 20,000 subscribers we can command such Advertising and such prices for it as will render our enterprise a remunerating one." In the late 1840s, while a firm might still pay sixty dollars a year for ads in the

oldfashioned *Journal of Commerce*, a similar amount of copy in the *Herald* could cost over a thousand.

The increase in business precipitated the first advertising agencies. Enterprising young brokers tramped lower Manhattan's publishing district, buying space from newspapers, then hawking it to patent medicine manufactures and dry-goods emporiums. No one touted the new profession's benefits more ardently than Volney B. Palmer, selfstyled "Morse of commercial intercourse." By the end of the 1840s Palmer had established offices in Philadelphia, New York, Boston, and Baltimore and was proclaiming that "the day will come when a man will as readily think of walking without feet. . . as of success without advertising."

Even with enhanced ad revenues, it now required substantial capital to establish a newspaper. It was still possible—at least in Brooklyn—for artisan printers to enter the business, especially when backed by politicians. The *Brooklyn Eagle and Kings County Democrat*, established in 1841 to promote the party's fortunes, would remain more or less a one-man operation for years. But in Manhattan, only one entrant in the mass circulation sweepstakes succeeded during the mid-century boom: Henry Jarvis Raymond's *New-York Daily Times*.

Unlike the founding generation of penny press entrepreneurs, Henry Raymond had no links to the Trades. He came to work for Horace Greeley straight from college, then moved to James Watson Webb's *Courier and Enquirer*, where he rose to become managing editor. Here Raymond established solid conservative credentials by attacking socialism (a "stupendous humbug") in a six-month print duel with his former employer. In 1849 he was elected as a Whig to the Assembly. In 1851, as a leader of what Bennett called the "Wall Street clique," the thirty-year-old Raymond was chosen as speaker.

That summer a group of Whig bankers surveyed the penny press field with disaffected eyes. Bennett's *Herald* seemed too flamboyant, the *Sun* too plebeian, and Horace Greeley, though a stalwart Whig, had dedicated the *Tribune* to promoting social justice "causes." The dailies' collective prosperity, however, suggested there might be room for another penny press—more agreeably conservative in style and politics. The Whig magnates, accordingly, chose the reliably orthodox Raymond to found the *Times* (the

eighth to bear that name). They raised \$10,000, making the *Times* the most amply funded newcomer in American journalism.

Raymond acquired a Lightning press, hired a large staff, and joined the Associated Press. He also set out to establish a clear identity for the *Times*, one professing objectivity, detachment, and bourgeois respectability. The paper's first issue, in September 1851, declared, with unmistakable reference to Greeley's tubthumping, that "we shall *make it a point to get into a passion as rarely as possible*." Raymond's mix of prudent politics, good manners, and sober design found a readership at once—ten thousand in ten days—drawn, he claimed, from "business men at their stores" and "the most respectable families in town." Advertisers flocked in, circulation doubled, and the *Times* replaced the *Tribune* as the favored organ of New York Whiggery.

Raymond and his backers had entered an extremely influential circle. By 1860 the five leading New York dailies, with a combined per diem circulation of 250,000, wielded immense power. Printing House Square had become the hub of American journalism, and city editors and publishers would become national celebrities—better known than manufacturers, department store moguls, or clipper ship captains.

A PAGEANT OF TEXT

Newspaper publishing, the city's fourth largest manufacturing sector by the late 1850s, proved crucial to making the printing trade New York's fastest growing industry. But a vast array of quite different kinds of material also rolled from the city's presses, helping make Manhattan an ink-drenched town.

Ads were everywhere. Aleksandr Lakier, a Russian visitor in the 1850s, was struck by the steady flow of "notices and announcements [that] are thrust in your hands" along Broadway. Trade cards—four-by-six-inch handbills promoting everything from patent medicines to prostitutes—blossomed with the spread of lithography. "Bill-stickers" with paste buckets made their rounds late at night, plastering their posters over those of their rivals, creating a patchwork of odd and quintessentially urban juxtapositions.

“New York is distinguished for its display in the way of signs,” noted chronicler John F. Watson in 1846; “every device and expense is resorted to, to make them attractive.” Not only were stores festooned with ever more and ever bigger placards and announcements, but so were warehouses, carriages, buses, fences, lampposts, trees—and people: men walked the streets with sandwich boards on their shoulders. One commentator noted with mock surprise that umbrellas had as yet been left blank, “their ample and conspicuous surface bearing no announcement of any new pill, new adhesive gum, bankrupt’s sale, or What is it?”

Civic text added to the visual pageant—banners draped over buildings for celebration, broadsides for political campaigns, and “Direction Boards” erected at the Board of Aldermen’s insistence “for the accommodation of the whole public, and especially strangers.” Often these street signs appeared only on gas-light stanchions, making it difficult, complained visiting novelist Anthony Trollope, to know when to get off the horsecar. There were, however, remarkably few injunctions in the cityscape—little by way of traffic regulations or health warnings telling people what they should or should not do—though omnibuses did post warnings to BEWARE OF PICKPOCKETS.

Some of the cleverest trade bills on the street were designed to resemble paper money—no surprise, given the city’s role in producing the real thing. Manhattan was headquarters for the nation’s three largest banknote manufacturers, whose clients included many of the over ten thousand institutions empowered to issue currency. It was also home to those who produced bogus bills. “We have never known counterfeiting carried on to a more alarming extent than at present,” wrote the *Sun* in 1840. “We were shown yesterday a one dollar bill on the Atlantic Bank of Brooklyn, altered to a ten in so ingenious a manner as to have deceived all but the most wary.” This in turn gave rise to an impressive array of daily, weekly, and monthly journals—like *Day’s New-York Bank Note List and Counterfeit Detector*—produced by more than a dozen different publishers to help store clerks and bank tellers identify failed banks and fraudulent currency. By the late 1850s, as well, ninety-four engraving establishments and twenty-three lithographic works were churning out such other print-tools of the commercial and financial trades as checks, bills of lading, and bills of exchange.

commitment to teaching sacred texts, and the emergence of a cheap popular press—the literacy rate among white adults climbed past 90 percent in the city and throughout the nation.

With the national market for reading matter growing briskly, and with the economy rising, postal rates dropping, and railroads affording inexpensive access to the interior, New York publishers flourished as never before. By 1860 seventeen book-printing firms were manufacturing over three million dollars' worth of volumes for the national marketplace. New York City, with 2 percent of the country's population, produced over 37 percent of its total publishing revenue.

Harper and Brothers retained its preeminence. By 1853, when its workforce of five hundred issued more than four and a half million volumes, it had become the largest employer in New York Qty. After its Cliff Street plant burned down that year, the firm immediately set James Bogardus to building two splendid five-story cast-iron structures, which between them covered half an acre on Franklin Square. One combined all of Harpers' editorial, management, inventory, and wholesaling operations. The other, the factory, devoted a separate floor to each stage of the production process. This powerhouse secured Harpers' position as the largest publisher in the world.

The company distributed its tremendous output with smooth efficiency. Advertising extensively—it placed notices in 844 local papers during 1856 alone—Harpers circulated its wares through a network of over a thousand booksellers and a phalanx of colporteurs (peddlers of religious material). Harpers, indeed, had great success with religious works, especially *Harper's Illuminated and New Pictorial Bible* (1846) a giltedged, gold-embossed, morocco-bound edition that set new (and rococo) standards for taste and elegance. The firm did well, too, with inexpensive book sets: the 150 volumes of the *Harper's Family Library* could be had for sixty-five dollars. And state legislative appropriations underwrote widespread and profitable purchase of the two-hundredplus titles in its *Harper's School District Library* series.

The firm continued to pirate European authors: Dickens, Thackeray, the Brontë sisters, and above all Thomas Babington Macaulay, whose confident assertions in the *History of England from the Accession of James II* (1848) about the benefits of industrial progress helped it to sales of four

hundred thousand copies. It also extended growing attention to a wide array of American texts embracing Prescott's *Conquest of Mexico* (1843), a miscellaneity of geographies and travel accounts, including *Harper's New York and Erie Rail-road Guide Book* (1851), and the domestic advice books of Catharine Beecher.

Harpers' success spurred competitors. The House of Appleton retained its number two status by producing Spanish-language books for the Latin American trade, commencing the *New American Cyclopedia* (the greatest literary enterprise yet attempted in the United States), and securing rights to *Webster's Elementary Spelling Book* (which became the number two seller in the world, right behind the Bible). Behind the Appletons lay a pack of up-and-coming rivals including A. S. Barnes, Charles Scribner, David Van Nostrand, E. P. Dutton, and, scrappiest of all, the youthful George Palmer Putnam.

Putnam teamed with John Wiley in 1840 and quickly established an agency in England to forage for European books with which to rival Harpers. He also propelled Wiley and Putnam into building a strong domestic list, a focus he continued after setting up on his own in 1848.

Again, women writers and readers proved crucial to the expansion of the publishing world, particularly after 1850, when Putnam published Susan Warner's *The Wide, Wide World*. Warner had grown up in the fashionable town house of an affluent and genteel New York family, received an excellent education, and thrived on the city's cultural offerings. In the Panic of 1837, however, her father lost his fortune and took the family into impoverished upstate exile. Warner took to writing in hopes of making money and submitted a pious and sentimental novel to Harpers, which rebuffed it with the single word "Fudge." Brought out by Putnam, however, *Wide, Wide World* became a publishing phenomenon. It went through fourteen editions in two years, becoming the most successful novel yet written in the United States, and touched off a flood of domestic parlor books by and for women. Despite the strictures against women speaking in public, which if anything had sharpened since Fanny Wright had been howled from her platform, writing for the public became an acceptable extension of woman's sphere. Male publishers were simply not prepared to turn down the kind of revenue ladies generated, and "scribbling women,"

with the help of their consuming sisters, carved out a niche in the flourishing industry.

By 1857 there were at least 112 publishers in New York City. While most were “respectable” houses, emphasizing genteel, religious, and domestic literature, others catered to a rougher readership. These outfits churned out blood-and-thunder adventures, sadomasochistic romances laced with sex and horror, and lurid accounts of patrician villainy or plebeian roguery. Nearly 60 percent of all fiction published in the United States between 1830 and 1860 was of this ilk.

In 1846, four years after the federal government banned importation of erotic material, an indigenous pornographic publishing industry arose when William Haynes, an Irish surgeon who immigrated to New York, reinvested the money he’d made publishing *Fanny Hill* in the United States in the production of cheap erotic novels like *Confessions of a Lady’s Waiting Maid* (1848). Most such paperbacks—usually octavosized pamphlets with yellow or pink wrappers, priced at twenty-five cents—were aimed at a youthful male audience and written by men, some of whom achieved heroic levels of productivity. In the 1850s New York sensationalist George Thompson whipped off nearly one hundred steamy potboilers—with titles like *City Crimes* (1849), *New-York Life* (1849), and *The Gay Girls of New-York* (1853)—portraying group sex, nymphomania, miscegenation, and incest in the Five Points. This plethora of pornographic confections, often replete with lustful woodcuts, led one New York reformer to wonder: “Will not the steam-presses create licentiousness faster than police regulations can drain it off?”

In the 1850s New York’s competing book publishers discovered, as had their counterparts in journalism, that cooperation could be in the interest of all. The market’s growth in size and scale had made it ever more difficult for companies to inform backcountry stores about new titles. Nor was it easy for distant booksellers to get to New York for the fall and spring trade sales. Some of these problems were alleviated by the establishment of a trade paper in 1851, *Norton’s Literary Advertiser*, which included book news, ads, and reviews, and in 1855 the city’s bookmen decided to establish the New York Publishers Association. It was inaugurated with a banquet for six hundred at the Crystal Palace, the biggest-ever gathering of literary personalities in American history. This self-congratulatory conclave of

authors and editors marked publishing's arrival as a full-fledged metropolitan industry.

Book selling flourished too. Stores along Broadway between Pine and Houston concentrated on new titles. Secondhand volumes were found at shops on Nassau Street and Pearl or farther uptown along Canal, Mulberry, and the Bowery. When the Astor Library opened, Fourth Avenue between Astor Place and 14th Street became the city's used-book center; and it remained so for a century. In addition streetcorner bookstalls served as outlets, especially for the fledgling pornography trade: in 1843 one paper claimed that nearly every stand sold "libidinous books with the most revolting and disgusting contents."

"THE CENTRE OF LITERARY POWER"

The efflorescence of book publishing boosted magazine production as well. Political, literary, domestic, and religious journals had long flourished in New York. Now commercial periodicals began to circulate at a hitherto unmatched pace. As Henry Wadsworth Longfellow noted as early as 1839, in "the Great Metropolis. . . new literary projects in the shape of Magazines and Weekly papers are constantly started, showing great activity, and zeal, and enterprise."

Two of the grandest were offshoots of great publishing houses. In June 1850 Fletcher Harper set up *Harper's New Monthly Magazine*, in handsome format, with sumptuous engravings. The raw material was filched from the best English authors, supplemented occasionally by local talent. The magazine also featured columns of light commentary—including "The Editor's Easy Chair," a seat filled in the late 1850s by George William Curtis—and offered travel sketches by genteel tourists just back from perambulating Italian art galleries and classical ruins. The formula worked to perfection in a culture that still set its course by European stars. Harpers printed seventy-five hundred of the first number; in six months circulation hit fifty thousand; by 1860 it reached two hundred thousand.

With figures like these it wasn't hard for Charles F. Briggs, the New York editor (and author of *Harry Franco*), to convince Harpers' rival George Palmer Putnam to found another monthly. *Putnam's Magazine*, with

Briggs at the helm, sought out American authors, compensated them well, and attracted sophisticated contributions on art, literature, and society.

Robert Bonner's unaffiliated *New York Ledger* outpaced both *Harper's* and *Put-nam's*. An Irish immigrant printer turned entrepreneur, Bonner purchased the *Ledger* in 1851 when it hung on the brink of collapse. Over the next several years he aggressively improved its circulation by lowering the price to three cents a copy and offering a class and gender-straddling mix of adventure stories, domestic romances, and first-rank writing.

Bonner, an advertising genius, spent twenty-five thousand dollars a week on promotions. A pioneer in the use of "white space," he took out full pages in the *Herald*, *Tri-bune*, and *Times*, only to leave the entire space blank but for a single line in the center or a corner: "Read Mrs. South worth's new story in *The Ledger*." In this manner, Bonner promoted a star system that featured the writer as much as the written word. He paid unprecedented sums—thirty thousand dollars for a novel by Henry Ward Beecher, three thousand for a poem by Longfellow—then advertised his expenses. In 1855 Bonner signed Fanny Fern to write for the *Ledger*. Born Sara Payson Willis, Fern had won national acclaim in Boston for a volume of essays, *Fern Leaves from Fanny's Portfolio* (1853), that sold over a hundred thousand copies. Now she moved to New York, where Bonner paid her one hundred dollars a column, making her the most highly paid newspaper writer in the country. By 1860, with circulation topping three hundred thousand, the *Ledger* was the most widely read magazine in the nation.

Below these Everests lay ranges of more specialized weeklies and monthlies. New York published fifty-two religious periodicals at mid-century. There were magazines devoted to ethnic affairs, banking, sports, ladies' fashions, politics, culture, science, humor, trade and industrial technology. Even the *American Agriculturalist* made its home in Manhattan, noting that "more Farmers and Planters resort here than to any other city in the Union."

The magazine spectrum too had its spicier bandwidth, represented most notoriously by the *National Police Gazette*. In 1845 journalist George Wilkes, the New York-born son of an artisan cabinetmaker, was convicted of criminal libel while coediting the *Sub-terranean* with the pugnacious Mike Walsh. After serving four weeks in jail, Wilkes penned a pamphlet (*Mysteries of the Tombs*) exposing corruption in the city's criminal justice

system, then founded the *Gazette* to continue and extend his investigations. Imitating London's *Police Gazette*, Wilkes gave his readers lurid capsule reports of crimes in the city and around the nation (in columns titled "Seductions," "Rapes," and "Murders"), interspersed with criminal biographies ("The Lives of the Felons"), trial coverage of crimes involving sex and violence, and a glossary of criminal slang (the "Rogue's Lexicon"). Lively, at times quasi-pornographic graphics helped boost *Police Gazette* sales to over forty thousand by 1850.

The *Gazette* and its hundreds of periodical rivals made New York's literary marketplace intensely competitive. With journals being founded and folded almost daily, Manhattan was perilous for entrepreneurs but a magnet for would-be professional authors, whose arrival further altered the process of literary production. Writing had long been an amateur affair. Gentlemen authors wrote for their friends and peers; they lived *for* literature, not *offit*. Now, as one disgruntled Boston literatus put it in 1843, "literature begins to assume the aspect and undergo the mutations of trade," with authors hoping to sell their literary goods to impersonal and far-flung audiences, addressed by advertisement.

Writers found *themselves* advertised as well; they were packaged as commodities, their portraits and biographies promoted. Horace Greeley, acting as Henry David Thoreau's informal literary agent (an emerging profession), told him: "You may write with an angel's pen, yet your writings have no mercantile, money value till you are known and talked of as an author." Marketing, in turn, increased the importance of reviewing—another budding profession. When Margaret Fuller moved to the city to work on Greeley's *Tribune*, she became the first full time book reviewer on an American paper. Laudatory excerpts were cited in ads or the book itself, and while most were honestly come by, others were bought and paid for.

Writers were ambivalent about publishing's transformation into a capitalist enterprise. Formerly authors had financed their own books, kept the profits, and paid publishers a percentage for printing and distributing the work. Now the flow of funds had reversed itself, with publishers fronting costs and paying only "royalties" to authors. Yet the new system, along with the creation of a national market, clearly increased potential sales. Authors might therefore be simultaneously dismayed at being encouraged to tailor

their output to the marketplace and exhilarated at the chance to become self-supporting.

As writers poured into the city, supply outstripped even the surging demand and further tilted the balance of power from authors to publishers. By 1851 editor Nathaniel Parker Willis warned that New York City was the “most overstocked market in the country,” noting, “I have tried to find employment for dozens of starving writers, in vain.” Horace Greeley cautioned one upstate hopeful: “You do not realize how little the mere talent of writing well has to do with success or usefulness. There are a thousand at least in this city who can write very good prose or verse,” he added, “while there are not fifty who can earn their bread by it.” Few heeded such advice, for it was clear, as a writer in the *Literary World* noted in 1847, that “the seat of commerce” was fast becoming “the centre of literary power.”

YOUNG AMERICA

One thing this “centre” lacked was a center. New York’s literary world was fissured into warring factions, each with its own complement of writers, critics, and magazines. The two leading circles—Knickerbockers and Young Americans—disagreed on almost everything. The former were Whigs, Episcopalians, anglophiles, and hostile to all political and literary radicalisms. The latter were Jacksonians seeking a democratic literature and politics and an end to America’s cultural subservience to Europe.

Knickerbockers and Young Americans also related differently to the marketplace. Knickerbockers were prosperous gentleman amateurs—businessmen and professionals who dined well, told good stories at table, and wrote lightly ironical essays in the style of Charles Lamb. At the center of their circle was man-about-town Lewis Gaylord Clark, who since 1834 had piloted the *Knickerbocker* magazine, a literary monthly. Clark’s chatty “Editor’s Table” kept the nation apprised of the Rabelaisian wit of his glamorous circle, which included Henry Brevoort and Charles Astor Bristed (J. J. Astor’s grandson).

Clark didn’t pay his well-heeled writers; he considered publication its own reward. But the *Knickerbocker* wasn’t utterly divorced from the marketplace. Clark often “puffed” books for favored authors or publishers, tossing off glowing reviews of volumes he hadn’t necessarily bothered to

read. Whig newspapers then circulated his opinions to the nation, which meant a *Knickerbocker* puff could sell out a book in several weeks or, conversely, kill it. By 1840, much to the annoyance of Young Americans, the conservative *Knickerbocker* was the most influential literary organ in America.

Clark's nemesis, Evert Augustus Duyckinck, represented the young professionals. He himself had been bred to the business—his father was a Water Street bookseller and publisher—and unlike Clark, an upstate New Yorker, Duyckinck was an authentic Knickerbocker (his name in Dutch meant “diving duck”). An ample inheritance allowed him to attend Columbia, study law, and do the Grand Tour of Europe, after which, in 1840, he settled down in a Clinton Place town house, surrounded by a ducal library of seventeen thousand books.

Around Duyckinck gathered the first generation of New York intellectuals for whom literature was a vocation. These youthful writers shared a generational distaste for the clique of conservative critics, publishers, and magazine editors whose mutual backscratching made it difficult for newcomers to penetrate the market. But Duyckinck's circle focused on more than moneymaking. At rollicking Saturday night suppers they debated the future of U.S. culture. They adopted the name Young America, emulating and expressing solidarity with Mazzini's Young Italy and Daniel O'Connell's Young Ireland. Most mere young, in their late twenties or early thirties. Like Duyckinck's fellow Columbia alumnus Cornelius Mathews, an ardent (verging on shrill) literary nationalist, they considered New York “the seat and stronghold of this young power.” From their metropolitan base they set out to foster an American literature.

In 1840 Duyckinck and Mathews established *Arcturus*, a monthly literary magazine that quickly rivaled Clark's *Knickerbocker*. Two years later they organized an American Copyright Club, hoping that if Harpers and other pirates were forced to pay their European sources, they might turn more often to American authors. In 1845 Duyckinck urged city writers to develop the kind of labor solidarity common in other New York trades, for only a “union among authors, bringing together the force of their aggregate works, would create a sentiment, a feeling in their behalf, a voice to which booksellers would be compelled to listen.”

In 1845 Duyckinck became literary editor of the *Democratic Review*, a broad-circulation political magazine edited by John Louis O'Sullivan, a fiery and charming Irishman. O'Sullivan was a vigorous supporter of western expansion and European revolution. In both cases, he said, it was America's "manifest destiny" to extend the domain of democracy (though as a staunch Democrat, O'Sullivan exempted black slaves from this destiny). The swashbuckling O'Sullivan reached out to the scholarly Duyckinck because the latter's literary vision dovetailed perfectly with the former's political project. Both believed New York to be the ideal seedbed for a new American culture because it was home to writers from the West, South, and North, thus a more representative American city than provincial Boston. And New York, Duyckinck pointed out, was the country's "true publishing center," the only place technologically and financially capable of underwriting a people's art.

George Palmer Putnam, the aggressively entrepreneurial publisher, was Young America's perfect ally. Putnam was eager to promote America's cultural independence, especially if it could help him contest Harpers' domination of the literary marketplace, and he was prepared to pay authors fair dividends while distributing inexpensive editions of their books to ordinary American audiences. Duyckinck became general editor of Wiley and Putnam's watershed project, the Library of American Books, and enlisted some of the city's (and country's) outstanding younger writers in forming a new literary canon. In 1847, moreover, Wiley and Putnam joined Appleton and Company in launching the *Literary World*, with Duyckinck at the editorial helm. The new magazine would survey and publicize the nation's burgeoning literary output. It would assess, as well, the accomplishments of America's visual artists, who, like the writers, had been profoundly affected by technological and social developments in New York City.

ART IN THE AGE OF MECHANICAL REPRODUCTION

The Panic of 1837 had disrupted Manhattan's patronage system. Cole, Sully, and Asher Durand found that merchants laughed wanly at the notion of buying paintings with their businesses facing bankruptcy. Spurred by hard times, artists fashioned new and more collective ways of supporting their work.

In 1838 portraitist and engraver James Herring established the Apollo Gallery, where painters could exhibit and share in the proceeds of a twenty-five-cent admission fee. When this foundered, Herring decided to reach out to a far broader audience. In 1839, drawing on a model developed in several European cities, he created the Apollo Association, a noncommercial joint stock company. Subscribers contributed five dollars each to a fund, which then purchased works from artists. These were exhibited to the public free of charge and, at year's end, distributed by lottery to subscribers. Association members also received engraved reproductions of some of the artworks, as well as the group's *Bulletin*, the first magazine devoted exclusively to American art. In 1844 the enterprise, now going strong, was renamed the American Art-Union (AAU).

The AAU was run by managers whom Herring drew at first from the pool of gentleman art enthusiasts—among them Philip Hone, rentier James W. Beekman, and editors Henry Raymond and William Cullen Bryant. Some were attracted by old republican ideals of stewardship and civic patronage; others hoped art might exert what the Rev. Henry Bellows called “exalting, purifying, calming influences” on the increasingly agitated masses. Young America rallied to the AAU, seeing in it a democratizing project akin to their own. Duyckinck, Mathews, Putnam, and O’Sullivan, delighted to make art available to the many, also hoped that artists freed from dependence on Eurofixated patrons might create an American art.

By the late 1840s the American Art-Union was the nation’s primary market for U.S. paintings other than portraits. Each year roughly nineteen thousand subscribers purchased an average of four hundred artworks, benefiting painters, sculptors, and the engravers and die casters who prepared prints for reproduction. The AAU’s gallery, one paper reported, had “grown to be a kind of municipal Institution, visited by the whole people.” The managers had established a luxurious setting on bustling Broadway, replete with ottomans and gas lights, that stayed open at night when working people could come. The gallery drew from “every section of the social system,” the press noted, “from the millionaire of 5th Avenue, to the B’hoys of 3d.” Half a million people visited in 1848, the organization claimed, a number roughly equal to the city’s entire population.

The AAU collected enemies too: envious and profit-seeking private art galleries; disgruntled rejected artists; connoisseurs who sniffed at the

sometimes mediocre work submitted by sign painters, itinerant portraitists, lithographers, and banner painters; and the National Academy of Design, which, though many of its members participated in AAU affairs, worried about dwindling attendance at its own exhibitions. What finally brought the AAU down, however, was an assault by powerful antigambling forces (backed by Bennett's *Herald*) who managed in 1852 to have its lottery ruled illegal.

The private art market now flourished. The National Academy's annual spring exhibit blossomed into a major event. Galleries catered to wealthy collectors like department store owner A. T. Stewart, and Broadway showrooms attracted a steady patronage—occasionally a spectacular one: when Edwin Church's *Niagara* was first exhibited in May of 1857 thousands crowded into the gallery each day. The Art-Union had left its mark, however, in a heightened public interest in art, in the precedent it had set for a municipal museum, and in boosting the growing popularity of reproductions and strengthening the city's role in their supply.

Engraver and printer Nathaniel Currier, who had long been producing and marketing images from his Nassau Street shop in the heart of the newspaper district, was joined after 1852 by James Merritt Ives, a self-trained artist, who became his partner in 1857. Currier and Ives used the latest in steam-driven press technology to churn out lithographs from sketches drawn by staff artists. They also hired hundreds of women to hand-color the prints. Their inexpensive "Colored Engravings for the People" provided uplifting images of family life for moderate-income households.

They also portrayed New York City. Currier and Ives views of Broadway, the burning of the Crystal Palace, P. T. Barnum's galleries, and the clipper ships all sold briskly. The firm's success spurred competitors into providing urban imagery. Specialized producers turned out lithographed advertisements for ironworks, inexpensive wall prints of tourist spots, engravings of local scenes for guidebooks, and—for banks, shops, hotels, real estate promoters, and tourist operators—the bird's-eye views that presented a coherent and comprehensible metropolis, laid out for delectation and consumption.

The great national monthlies like *Harper's* and *Putnam's* joined in the preening. In 1853 *Putnam's* offered an illustrated series called "New-York Daguerreotyped" that depicted the emblematic edifices—the Crystal Palace,

the department stores, the newspaper headquarters, the monster hotels—deemed “worthy of her pretensions as the metropolis of the Union.” In 1854 another running commentary appeared in *Putnam’s*—“The World of New York”—which hailed the city’s energy, wealth, and culture. City sights and scenes also saturated the popular press, with *Harper’s*, *Putnam’s*, and journals like *Frank Leslie’s Illustrated Newspaper* (1855) and the *New York Illustrated News* (1859) helping make New York the most represented city in the country.

The process of urban imaging was further accelerated by the debut of photography. When news of Louis Daguerre’s success in fixing images on silver-coated copper plates arrived in New York City in 1839, the omniscapable Samuel F. B. Morse, together with scientific instrument maker George W. Prosch, devised a rudimentary camera. From the doorway of Prosch’s workshop, Morse captured an image showing City Hall, the Park, and a “coachman sleeping on his box.” Then he established a glass-walled rooftop studio on a Nassau Street building. From here he produced some of the first urban cityscapes, including one, a visitor reported, with “very clear, distinct views of Brooklyn in the distance.”

The novelty of daguerreotypy, along with its low start-up costs, attracted many to commercial photography during the depression. In 1843 the New York correspondent of a Washington newspaper wrote whimsically that “in these Jeremiad times” only two classes were making money in Manhattan: “the *beggars* and the *takers of likenesses by daguerreotype*.” Indeed, he added, ever since a Frenchman had set up shop selling apparatuses, “any pedlar can take up the trade.”

Mathew Brady was no peddler, though he did clerk for A. T. Stewart after moving to Manhattan from upstate New York in 1839. Then the young Irishman met Morse and discovered his life’s profession. In 1844, aged twenty-two, Brady opened the Daguerrean Miniature Gallery at Broadway and Fulton, on the top floor of a building directly across from Barnum’s.

Brady was an instant success, thanks to his talent and a Barnumesque flair for selfpromotion. Taking up residence at Astor House, he pursued and captured visiting celebrities so successfully that it was soon considered a mark of social standing and public distinction to be daguerreotyped by “Brady of Broadway.” He and his peers also made photography a public art form by opening their galleries to passersby. Strollers headed for Brady’s

(or Gurney's, Edward's, or Anthony's—all on Broadway near City Hall Park) to socialize and gaze at likenesses of the famous and notorious.

Brady had little interest in depicting ordinary working people (though in 1846 he did photograph inmates of the Blackwell's Island penitentiary for a book on "reading" criminal heads). But others soon jumped into the business of providing "occupationals"—pictures of artisans in daily dress holding the tools of their trade. By 1850 there were seventy-one daguerreotype studios (employing 127 "operators") ready to take one's picture, and at least one that advertised a willingness to make house calls in order "to take Likenesses of sick or deceased persons." By 1853 there were more such studios in Manhattan than in England, more on Broadway than in all London. By then, one magazine writer remarked, it was hard "to find the man who has not gone through the 'operator's' hands from once to half-a-dozen times, or who has not the shadowy faces of his wife and children done up in purple morocco and velvet, together or singly, among his household treasures."

As mechanized "daguerreotype factories" sprang up, driving down prices and speeding up delivery, photographers who sought an upscale clientele proclaimed themselves artists, not mechanics. Brady, to underscore his superior status and keep up with his migrating market, repeatedly moved uptown into ever finer surroundings. By 1853 his gallery on upper Broadway boasted satin walls, gilded chandeliers, and a mirrored parlor for the ladies.

The streets themselves continued to draw droves of daguerreotypists, especially in the latter 1850s, when new technologies made collection and dissemination of outdoor images easier. Such photographs could now be turned into lithographs, for reprinting in newspapers, and in the 1850s photographs became the basis of urban scenes published in *Harper's* and *Leslie's*.

Seizing on the latest technical improvements, Edward Anthony snapped freeze-frame images of Broadway street life (including pedestrians caught in midstride) and mounted two such shots, taken from slightly different angles, on a double print card called a stereograph. Viewers could insert these into an inexpensive and widely available stereoscope, a double magnifier that produced the illusion of three-dimensionality. Oliver Wendell Holmes raved at Anthony's ability to "snatch at the central life of a mighty city, as it

rushed by in all its multitudinous complexity of movement!” By 1859 Anthony had over two hundred stereographs on the mass market and was hard at work on factories capable of producing thousands of such cards a day. Within five years there would be stereoscopes in parlors across the country, further enhancing New York’s position as the most visually represented city in the country.

Photographs of street life and urban residents were also touted as enabling a new, more veracious knowledge of reality. Soon, inspired by the new way of seeing, journalists and novelists were busy turning out what they claimed were “daguerreotypes” of city life.

Seeing New York

In the 1820s city watching became a highly developed art form in Europe. Gentleman spectators sauntered the streets observing and recording impressions, then published amiable commentaries for coffeehouse and parlor readers that made bewildering, stressful cityscapes seem knowable and negotiable. One of the most popular of the genre was *Life in London, or The Day and Night Scenes of Jerry Hawthorn Esq and his elegant friend Corinthian Tom, in their Rambles and Sprees through the Metropolis* (1821). Written by Pierce Egan, an Irish-born London printer and journalist, and illustrated by the brothers Cruikshank, *Life in London* recounted the fictional peregrinations of two men-about-town. Tom and Jerry, though well-born, were equally at home in the West End or at gin parlors and cockfights—places respectable people didn’t go in person.

Over the next fifteen years, London’s slums attracted ever-increasing interest, penny papers commenced their Bow Street Police Court reporting, and Charles Dickens started evoking London’s lowlife. *Sketches by Boz* began appearing in December 1833, and soon, in *Pickwick Papers* (1836-37) and *Oliver Twist* (1839), Dickens had provided thousands of armchair Londoners with a guide to their city’s hidden terrains.

New Yorkers loved these European flaneurs. They bought American reprints of Egan’s *Life in London*, perused city sketches in the *London Quarterly* and *Edinburgh Review*, and devoured Dickens. Their own city, alas, was not deemed flaneurable. Lacking the spectacular variety of European metropolises, it didn’t seem worth perambulating for publication. Would-be urban spectators went abroad instead. They sent back dispatches on London’s immensity, on Paris’s complexity, on the power of great cities to induce disorientation—even insanity!—in unwary tourists. Washington Irving was an early American master of the form, and Nathaniel Parker Willis carried on the tradition. In 1835, after he joined George Pope Morris as coeditor of the *New-York Mirror*, the dandyish Willis went abroad and sent back somewhat precious urban sketches done in a pun-filled style. But flaneurism made Willis New York’s first successful professional “magazinish.” (“My rubbish, such as it is, brings me a very high price.”)

In the 1830s the *Sun* and its penny press competitors began defining everyday life in New York as something worthy of coverage. Benjamin Day published a vivid account of a visit to the Five Points in 1834 (“they endure literally, a hell of horrors”), launched police court reporting, and paid episodic attention to everyday life. But it was in the 1840s that New York became fully flaneurable. As Manhattanites turned their attention homeward—newly enchanted (or appalled) by their city’s growing size and diversity, the kinetic flow of its crowds, and its flowering as a cultural center—street narratives by middle-class walkers became omnipresent.

Willis turned his practiced eye on Manhattan in “Daguerrotypes of the Present,” a series of urban essays for the *New York Mirror*, and bundled up another batch of sketches as *Hurry-Graphs*. Lewis Gaylord Clark and the *Knickerbocker* crowd filled their magazine with sketches like “‘Loaferina’ in New York,” which celebrated the immensity and diversity of the “London of America,” and their Young American rivals at *Arc-turus* provided equally urbane commentary on New York’s passing show. For Duyckinck’s circle, moreover, the shift of sensibility suggested a new frontier for American literature. Cornelius Mathews argued this thesis vigorously in an 1840 manifesto, declaring that writers should embrace “the crowded life of cities, the customs, habitudes, and actions of men dwelling in contact.” In 1842 Mathews took his own advice. His *Career of Puffer Hopkins* was the first fictional attempt to capture the color of New York, as its flaneurial hero wandered about from fancy shops to dingy alleys, exploring the city’s various worlds.

CROWDS AND CIVILIZATION

Much of this city scrutinizing zeroed in on particular features of urban life, and among the closely watched phenomena none seemed more fascinating than the “crowd.” “Crowd” had long been disturbingly interchangeable with “mob,” but now it evoked something benign: a vibrant street life, an exciting tempo, a flood of sensation. Charles Loring Brace, a young seminarian arriving to study at Union Theological Seminary after graduating Yale in 1846, was astonished by Broadway. “Faces and coats of all patterns, bright eyes, whiskers, spectacles, hats, bonnets, caps, all hurrying along in the most apparently inextricable confusion. One would think it a grand gala-day. And it’s rather overpowering to think of that rush

and whirl being their regular every-day life.” Guidebooks trumpeted the sensuous excitement as a prime reason for visiting, with William Bobo’s *Glimpses of New York* (1852) typical in hailing “the throng upon the sidewalks” as “one grand kaleidoscope in perpetual motion.”

Natives might grumble at the rush and whirl’s impracticality—trying to cross Broadway was considered a risky business—but they too were taken with its poetry. One set of local enthusiasts—admittedly a committee of Broadway merchants—celebrated their chief thoroughfare’s bustle and color, its collisions and complexity. “The din, this driving, this omnibus-thunder, this squeezing, this jamming, crowding, and at times smashing, is the exhilarating [*sic*] music which charms the multitude and draws its thousands within the whirl. This is Broadway—this *makes* Broadway. Take from it those elements, the charm is gone.”

“Living in crowds,” the *Times* suggested in 1852, “gives to the business, the daily life, the whole character of great cities, such wonderful energy and vigor. Men in cities live and work constantly *under high pressure*. It is almost impossible to go on a walk on Broadway or Wall Street in business or pleasure; one naturally and unthinkingly quickens his pace to a run.” Living in crowds (the *Times* continued) gave a distinctively modern shape to the way people experienced life, in “gusts of passion and excitement.” Any “startling incident—the arrival of a steamer, the perpetration of a crime, the advent of a celebrity—anything at all calculated to stimulate curiosity or startle attention—comes upon half a million of people at once,” courtesy of the morning papers, and then “every man sees it in his neighbor’s face and hears it from his lips the moment he meets him.”¹

Crowds offered more than mere sensation, it was believed; they fostered interactivity, hence progress. *Tribune* reporter George Foster argued in 1849 that “a great city is the highest result of human civilization,” the place where people’s energies could be developed “to their utmost power and excited to their highest state of activity by constant contact with countless other souls.”

Going hand in hand with this new metropolitan self-confidence was a brash disdain for rural life and people. The author of an 1859 treatise called *Civilization in New York* suggested that living in the country “stupefies rather than deepens character.” A “human being dwelling alone, or in sparsely settled districts, without any communication with cities, remains

unacquainted with his own capabilities,” he explained, and thus “deteriorates in prejudice and ignorance.” New York banking authority J. S. Gibbons reported that “any one who has travelled among our country villages, out of the immediate influence of cities,” was struck by “the lack of energy, the rudeness of life and character, and the almost savage features of the common people”—but once urban institutions arrived “a less brutal and more intelligent spirit beams from their eyes.”

Ruralites responded with defensive counterassaults. An upstate doctor, Joel H. Ross, addressing his *What I Saw in New York* (1851) to the young men and women fleeing farms and villages, warned that city life consisted of “trials, losses, frowns, failures, pestilence, poverty, and hypocrisy.” Places like New York, he said, were “to dwellers in the country, very like what white lights at night are to flies—brilliant and attractive, but certain ruin.” But the destiny of America, metrophiles rebutted, lay less in taming the continental wilderness and creating independent homesteads and small towns than in establishing large cosmopolitan cities that harbored the greatest diversity of human types. By these lights, New York was in the vanguard of American development. As George Francis Train boasted in 1857, it was “the locomotive of these United States,” pulling the rest of the nation faster and faster into the future: “twenty miles an hour—thirty—forty”!²

LONELY CROWDS, CONFIDENCE MEN

Amid the din of celebratory oratory, some city-based critics could be heard suggesting that the crowded life had some distinct minuses, among them anonymity. Boosters, to be sure, relished it for facilitating the pursuit of private pleasures. New York City “is the most free and easy place conceivable,” wrote Thomas R. Gunn, author of a treatise on the city’s boardinghouses. “The right to do as you d——n please,” Gunn exulted, “is nowhere so universally recognized or less curbed by authority.” Others, however, observed that one woman’s liberation was another’s loneliness.

Lydia Maria Child had her rhapsodic moments as she rambled Manhattan compiling the “Letters from New York” she dispatched to the *Boston Courier*, and she regularly praised the city’s “many agreeable sights and sounds.” Overall, however, she had a most un-flaneur-like perspective on street life. “It is sad walking in the city,” Child reported. “For eight

weary months, I have met in the crowded streets but two faces I have ever seen before.” She discovered that in the city, “the loneliness of the soul is deeper, and far more restless, than in the solitude of the mighty forest.” Confluence didn’t guarantee connection, and indeed could underscore its absence. Child encountered much human suffering on her walks, “hungry eyes, that look as if they had pleaded long for sympathy, and at last gone mute in still despair,” but “the busy throng, passing and repassing. . . offer no sympathy.”

Crowding brought vulnerability too, especially in an era of humbug and flimflam. City people had to size up a stranger’s character from externals, which, like paper money, were all too easy to counterfeit. In 1849 William Thompson, a man of “genteel appearance,” struck up conversation on Broadway with a well-dressed stranger, greeting him as an old acquaintance. After a short time Thompson asked affably: “Have you confidence in me to trust me with your watch until to-morrow?” The victim, embarrassed at having forgotten such an agreeable fellow, and reluctant to deny such a forthright request, handed over his timepiece, and Thompson faded away into the crowd. The city wasn’t yet vast enough to swallow him up forever, though, and when the mark happened upon Thompson a second time, he got him arrested, convicted, and sent to the Tombs.

A local journalist called Thompson a “confidence-man,” and the coinage achieved instant currency. New Yorkers’ reactions to Thompson were mixed. Some admired, even hailed his enterprise. But the phenomenon of the Confidence Man proved deeply worrying to many—it earned the longest entry in the *National Police Gazette’s Rogue’s Lexicon*—as it underscored the increasing difficulty city folk had in distinguishing benign stranger from malign trickster. Fortunately these were skills that could be improved with time. Those most vulnerable to being conned were newcomers, hayseeds, “greenhorns”—and innumerable guidebooks, pamphlets, and newspaper articles were published to alert such novices to the scams and scammers awaiting them in the big city. The really polished New Yorker, as editor Walter Whitman noted in an 1856 “Advice to Strangers” piece, was one who could coolly respond to a con man’s pitch by looking him in the eye and saying: “You’ve waked up the wrong passenger.”

Another worrisome feature of New York life was the very “fluctuation, and neverceasing change” so beloved by boosters. “Overturn, overturn, overturn! is the maxim of New York,” declared former mayor Hone in 1845. “The very bones of our ancestors are not permitted to lie quiet a quarter of a century, and one generation of men seem studious to remove all relics of those who precede them.” *Putnam’s* 1853 series “New York Daguerreotyped” fretted that the businesses spreading “with such astounding rapidity over the whole lower part of the city” were “prostrating and utterly obliterating every thing that is old and venerable, and leaving not a single land-mark, in token of the former position of the dwelling-places of our ancestors.” Manhattan was a “modern city of ruins,” agreed the *New-York Mirror*, where “no sooner is a fine building put up than it is torn down.”

The result, said *Harper’s Monthly* in 1856, was that “New York is notoriously the largest and least loved of any of our great cities. Why should it be loved as a city? It is never the same city for a dozen years together. A man born in New York forty years ago finds nothing, absolutely nothing, of the New York he knew.” The city’s relentless focus on the future was ravaging its past, undermining the sense that New York was a home, not just a grid of opportunities.³

The razing and rebuilding generated nostalgia for an older, quieter, more comprehensible city and fostered efforts at commemoration. James Miller’s guidebook, *New York as It Is*, lamented that the city had sacrificed “to the shrine of Mammon almost every relic of the oldentime” and offered as counterweight a walking tour of such historic sites as remained. A more thoroughgoing intervention got underway when David Thomas Valentine, clerk of the Common Council, began issuing *Manuals of the Corporation of the City of New York*, an annual compilation published and widely distributed by the city between 1841 and 1866. Though mainly an assemblage of official data, the *Manuals* included woodcut and lithographic reproductions of old paintings, prints, drawings, maps, and documents that Valentine had rescued “from oblivion, to which they were hastening down the stream of time.” Nevertheless, Valentine worried in 1856, “the present rapid progress of the City” threatened “soon to obliterate all the natural landmarks of the island,” and he urged still greater efforts to preserve “for future generations” images of what remained.

Painters began tackling historical subjects: William Walcutt recalled *Pulling Down the Statue of George III at Bowling Green* (1857). Plays like *Charlotte Temple* and *Jacob Leisler, or New York in 1690* became popular fare at the Bowery Theater. Autobiographies appeared lamenting the passing of the Knickerbocker era, such as Grant Thorborn's *Fifty Years Reminiscences of New York* (1845). Evacuation Day was celebrated with fife-and-drum parades by ancient veterans in cocked hats and buff breeches and with full-scale reenactments of the British departure. And the New-York Historical Society took on nearly a thousand new members in the 1840s and 1850s, growing prosperous enough to erect a neo-classical headquarters at Second Avenue and nth Street, in genteel proximity to St. Mark's Church.

This wave of looking backward also spurred historical scholarship. When E. Porter Belden researched his model of New York in the late 1840s, he reported in astonishment that "no history of the city had ever been published, and that no accurate descriptive work had been issued in the last twenty years." He wasn't far wrong, as remarkably little had been published since William Smith's *History of the Province of New-York* back in 1757.

There was, however, much newly available raw material for would-be scholars, thanks to the state legislature. In 1839, following up a suggestion by the New-York Historical Society, Albany had authorized and paid for a "historical agent"—John Romeyn Brodhead—to spend several years in Dutch, French, and English archives, laboriously copying documents relating to New York's colonial history. Brodhead's eighty manuscript volumes were eventually brought out in eleven printed tomes edited by Edmund Bailey O'Callaghan, beginning in 1855, again with state support.

O'Callaghan, an expatriate Irish physician and activist in the Catholic emancipation movement, was chosen to compile Brodhead's documents in part because he himself had published a pioneering *History of New Netherland; or New York under the Dutch* (D. Appleton, 1846-48). His two-volume study, which ended with the English conquest of 1664, drew on original documents and interviews with old Dutch families in Flatbush and Gravesend, and it came as a revelation to those who had incautiously assumed Irving's satirical "history" was the real thing.

James Fenimore Cooper set out to follow O'Callaghan's treatment with a more comprehensive study—oddly enough, given that Cooper's 1820s

enthusiasm for New York City had given way in the 1830s to caustic derogation. Perhaps it was because he believed that Manhattanites, in their infatuation with wealth, displayed an “intensity of selfishness which smothers all recollection of the past” that he began researching *Towns of Manhattan*, for publication by Putnam. In July 1851, however, with only eight chapters completed, doctors ordered the ailing Cooper to stop writing. He died that September, and the manuscript was later lost in a fire at Putnam’s.

John Romeyn Brodhead stepped into the breach, and Harpers brought out the first of his planned series of volumes in 1853. Brodhead too got only as far as 1664. He’d hoped to get down to 1702, he recalled, but had been tempted by the mass of original documents he’d unearthed, and the volume “in spite of laborious condensation” had “grown unfashionably large.” Daniel Curry’s *New-York: A Historical Sketch of the Rise and Progress of the Metropolitan City of America* (1853) told more of the tale, but only because his book (he admitted) made “no pretensions to originality, nor yet to deep and thorough research,” as doing so would “have swelled the work to ten times its present volume.” Curry’s study was nevertheless notable for being among the first to advance the Manhattan-as-melting-pot theme. “From whatever point the denizen of that city may have come, a residence in New-York surely and speedily makes him a NEW-YORKER,” Curry asserted, as “New-York energy acts as a solvent to fuse the motley masses that Europe is pouring upon our shores into a consistent body of valuable and happy freemen.”

It was left to Mary Louise Booth to produce the first comprehensive study written in the nineteenth century, *A History of the City of New York* (1859). Formerly a Williamsburg schoolteacher like her father, Booth had been drawn, at age eighteen, to a literary career, and she moved to Manhattan to be nearer its newspapers and libraries. For several years Booth worked by day as a vestmaker while studying at night and writing without pay for educational and literary journals. Finally she was engaged by the *New York Times* as a piece-rate reporter on educational and women’s topics.

Booth was commissioned by a group of merchants to write a city history that would combat New Englanders’ denigration of New Yorkers as crassly commercial, while contesting their arrogation of the nation’s historical

narrative. She produced an eighthundred-plus-page study; even so, it left out many “curious and interesting events of the past” (she apologized), as their inclusion would have swollen the volumes “to so formidable a size that they would terrify the public.”

Booth argued that pluralistic New York, not provincial New England, best embodied the nation’s history. She hailed Manhattan’s “cosmopolitan character,” so evident “in its freedom from exclusiveness, in its religious tolerance, and in its extended views of men and things,” and she traced these admirable traits to the “genial hospitable nature ingrafted on the city by its early settlers” and the subsequent arrival of “all the races of the earth.” In New England, one stock of settlers predominated, but Manhattan’s populace “is blended with all the races of the earth; and if it be true, as one of our most eminent philosophers asserts, that a mixture of many materials makes the best mortar, there is no reason to regret it.”

MYSTERIES OF THE CITY

None of the misgivings about the isolation or the chicanery or the rootlessness or the ahistoricism of New York life did much to cloud the prevailing sunny optimism. But a much harsher take on the city was emerging in these years, promoted by a host of popular journalists and urban fiction writers. This genre dismissed the showier aspects of New York’s street life as inconsequential froth and proposed a troubling thesis. The *real* essence of metropolitan life was a stark, indeed shocking, contrast between two new social classes: a monied aristocracy of debauched nouveaux riches and a threatening mass of degenerate immigrants. These critics offered a darker way for New Yorkers to see, and evaluate, the new urban scene, a perspective summarized with brutal succinctness by *Harper’s* in 1857: “What was then [1827] a decent and orderly town of moderate size, has been converted into a huge semi-barbarous metropolis—one half as luxurious and artistic as Paris, the other half as savage as Cairo or Constantinople—not wellgoverned nor ill-governed, but simply not governed at all.”

This perceptual framework, like flaneurism an import, was first formulated by writers in Paris and London. In 1842-43, Eugene Sue serialized his *Mysteries of Paris* in the popular French press, a work that exposed two shadowy and corrupt worlds, one of the criminal underground,

the other of a decadent elite. Sue's *Mysteries* was widely pirated and reprinted in England and on the Continent—it appealed greatly to artisans and became the sensational reading of Chartists and the revolutionaries of 1848—and in New York Mike Walsh brought out excerpts in his *Subterranean*.

A still more influential lesson in how to read the contemporary city was delivered to Manhattan, in person, by Charles Dickens. His books had depicted a London where the center no longer held, where a well-ordered and harmonious world had split into realms of squalor and splendor, of civilization and barbarism. The depraved paupers and grasping nouveaux riches responsible for these appalling changes merited and received condemnation in his pages, but they were also fascinating in their very repulsiveness. Part of Dickens's phenomenal popularity was the opportunity he afforded readers of feeling simultaneously superior to, and enthralled by, villains of the upper and lower registers.

New Yorkers were thrilled when Dickens arrived in the city in January 1842, partly for sightseeing, partly in a fruitless attempt to promote an international copyright law that would require Americans to pay for the pleasure of reading him. New York's elite threw a Boz Ball in the Park Theater for twenty-five hundred people—"the greatest affair of modern times," said Philip Hone—and in an encore, Washington Irving presided over a feast for 230 diners at the City Hotel.

Later that year New Yorkers had the additional pleasure of being able to pick up *American Notes* (in a pirated twelve-and-a-half-cent edition Harpers brought out in November 1842) and find out how Dickens applied his way of seeing to their very own city. On the whole, his account of "the beautiful metropolis of America"—in a book whose revenues Dickens counted on to cover his travel costs—was quite flattering. Dickens had nice words for Broadway, the city's pride, apart from some catty remarks about its pigs—"two portly sows are trotting up behind this carriage, and a select party of half a dozen gentlemen hogs have just now turned the corner"—which called embarrassing attention to Broadway denizens routinely excised from boosterish lithographs. More delightfully, New Yorkers discovered, through Dickens's account of an expedition to the Bowery, that *Oliver Twist* was alive and well in their very own city.

On leaving Broadway, “the lively whirl of carriages is exchanged for the deep rumble of carts and wagons,” Dickens noted. “The stores are poorer here, the passengers less gay. Clothes ready made, and meat ready cooked.” Then, with two police escorts, he plunged into the dark heart of the Five Points, along “narrow ways, diverting to the right and left, and reeking everywhere with dirt and filth,” passing “coarse and bloated faces.” Now, deeper still, through “lanes and alleys, paved with mud knee-deep,” past “hideous tenements which take their name from robbery and murder”; groping down pitch-dark rickety stairs, past rooms where “some figure crawls half awakened, as if the judgment hour were near at hand, and every obscene grave were giving up its dead,” past rooms from which “vapors issue forth that blind and suffocate,” culminating at “underground chambers” at the bottom of “the world of vice and misery” where blacks and whites “dance and game” together. A final judgment: “All that is loathsome, drooping, and decayed is here.”⁴

From this rich storehouse of ready-to-wear metaphors, some popular New York authors drew heavily—and heavy-handedly, being far less talented than Dickens or Sue. In 1848 E. Z. C. Judson, better known by his nom de plume of Ned Buntline, penned the mammoth *Mysteries and Miseries of New York*. In it, he promised, he would provide “a perfect daguerreotype of this great city” from “above Bleecker” to the “horrors of the Five Points.” Advertising himself as a “Friend of the Working Man,” Buntline dwelt in lascivious detail on the plutocratic lifestyle of the city’s rich, and his hero also visited an underground nightclub—remarkably similar to the one described by Dickens—where, again, all is dirt and chaos and where blacks frolic with whites. In the manner of the *Police Gazette*, Buntline offered statistics on urban crime and provided a fourpage glossary of underworld argot. *Mysteries and Miseries* proved enormously successful. First serialized in popular journals, it was reprinted in the Harpers Family Library series, and the firm promoted it heavily in small-town and rural America as a testament to urban wickedness. It sold perhaps a hundred thousand volumes in all and helped mold perceptions of the metropolis.

With the public devouring Buntline’s *Mystery*, George Foster, who covered the city beat for Greeley’s *Tribune*, decided to collect his columns in book form. Foster, one of the first professional flaneurs, had long walked about the city, “eating with his eyes” and boasting of the “varieties of

human nature” he encountered in New York: “Every face you meet is a character, every scene affords a piquant contrast. Talk of your Eastern bazaars and Parisian arcades!” Yet his articles also drew heavily on the conventions of urban sensationalism. Foster promised to get beneath the tall spires, commercial palaces, and princely mansions “where life flows so brightly and so gaily” to explore the profoundest recesses of the “deep, dark, sullen ocean of poverty, crime and despair” and “bring to light of day the horrid monsters that live and gender in its oozy depths.”

Foster’s city was as polarized as Buntline’s. Above, the deceitful parvenus—“pompous without dignity, gaudy without magnificence, lavish without taste, and aristocratic without good manners.” Below, a degraded underclass of drunken Irishmen, grasping Jews, and black men who danced (in the same old underground dance halls reached via the same old labyrinthine passageways) with “sluttishly-dressed women, in whose faces drunkenness and debauchery have destroyed every vestige of all we expect in the countenance of women, and even almost every trace of human expression.”

Foster’s *New York in Slices* (1849) did well. A second series, published in 1850 as *New York by Gas Light*, surpassed his own record (and Buntline’s too), eventually selling about two hundred thousand copies. He followed this up with *Fifteen Minutes Around New York* (a guide book for Crystal Palace visitors) and a last effort, *New York Naked* in 1854.

Foster and Buntline believed that the metropolitan transformation of the 1840s and 1850s had destroyed the old republican town. New York was now a segmented city of poor and rich, each with their own territorial strongholds from which they issued forth to prey upon the other. Those in the middle ground—the assumed audience for this literature—were addressed but not described, and the result was a chiaroscuro portrait of pools of light and darkness, resembling the way radiance from gas-lit street lamps was swallowed up by surrounding blackness.

This noir-ish city was a far cry from the clearly legible one sketched by the flaneur, praised by the guidebooks, and portrayed in the bird’s-eye views. Those official New Yorks were civic spirited, filled with noble vistas. This New York was jumbled and anarchic, an incoherent labyrinth, a polarized city ruled by rapacity. It was not a site of civilizing encounters: it was a battleground, fractured along lines of class and sex.

The mysteries' New York was peopled with dangerous and endangered women. Harlots lured victims to their dens, notably in the Five Points, where "squalid females," or so William Bobo claimed in *Glimpses of New York* (1852), perched "about the windows, stoops and cellar doors, like buzzards on dead trees." Conversely, beautiful innocent females routinely fell into the clutches of sinister monied men against whom their virtue was no defense. Tales of sex and murder based on real-life incidents were particularly popular. George Wilkes of the *Police Gazette* vividly recounted *The Lives of Helen Jewett and Richard P. Robinson*, and the prolific Joseph Holt Ingraham was but one of many who recycled the Mary Rogers murder in his *La Bonita Cigarera, or The Beautiful Cigar Vender*.

Thus was born the sunshine-and-shadow tradition, a way of seeing New York that became the era's central cliché about the city. Countless writers were forced to grope for new and fresh ways to describe stark juxtapositions, usually without success. "It is but a step from the mansion where wealth gathers its luxuries," declared an anonymous clergyman in *Life in New York* (1847), "to the cellar or garret where hunger gnaws and cold pinches." Joel Ross spoke of "success and defeat, health and disease, wealth and poverty, comforts and misery, plenty and beggary." George Lippard, in *New York: Its Upper Ten and Lower Million* (1853), went with "empire of palaces and hovels, garlands and chains, churches and jails." Lydia Maria Child commented drily on the rage for "vituperative alliterations such as magnificence and mud, finery and filth, diamonds and dirt, bullion and brass-tape, &c. &c."

Much of this language was clearly formulaic, rhetorical, overblown. The writers, journalists, clergymen, and public officials who wielded it exaggerated the declension from the old order. But the melodramatic prose was a response to new realities: the transformation of public space and the transmutation of class and gender cultures and relationships. Sunshine-and-shadow hyperbole was reductive, but not ridiculous. When a trio of great writers turned their attention to metropolitan life, they incorporated these metaphors of popular culture in their poetry and prose, even while transcending them.

MAN OF THE CROWD

In April 1844 Edgar Allan Poe arrived in New York—dead broke but still optimistic that even at age thirty-five he could reestablish his career as a “magazinish.” Poe had done well in Philadelphia editing *Graham’s Magazine* but, sick of “fashion-plates” and “love-tales,” he’d resigned, hoping to launch a serious literary journal. Having failed to raise the capital—due, he was sure, to the machinations of a Philadelphia clique—Poe headed for Manhattan, accompanied by his tubercular wife, Virginia, and a reputation for drunken irresponsible conduct.

Poe found New York hard to afford and hard to take. He perched briefly in a Greenwich Street boardinghouse but was soon complaining about “insufferably dirty” streets and the din of clam-and-catfish vendors—“intolerably a nuisance.” Seeking more salubrious surroundings, the Poes moved to Patrick and Mary Brennan’s two-hundred-acre working farm, five miles outside town, just off the Bloomingdale Road near 84th Street. Here they would board until early 1845.

Poe was no fan of cities. They connoted heartless commercialism, poverty, pollution, and crime. He loved upper Manhattan and often rambled its woods and streams but believed the area “doomed.” Soon it would be withered by the “acrid breath” of “the spirit of Improvement,” its waterfronts lined with “nothing more romantic than shipping, warehouses, and wharves.”

Disdainful but needy, Poe plunged into New York’s expanding publishing world. Soon after arriving, he sold Moses Beach’s *Sun* a hoax he’d concocted about an Atlantic balloon crossing. Then he landed a spot at the *Evening Mirror* run by Willis and Morris. Hiking each day from the farm to Nassau Street, he scribbled anonymous filler for fifteen dollars a week, helping turn out a magazine he thought “frivolous and fashionable.” He did hackwork for other presses too, including a “Doings of Gotham” series for a small-town Pennsylvania paper.

In his tales, however, Poe was forging new ways to read the city. “The Man of the Crowd,” published in *Graham’s Magazine* in 1840, recounted the story of a balked flaneur. The narrator lounges in a London coffeehouse, observing the street scene, sorting passersby into familiar categories. Suddenly he sees an old man whom he can’t place, whose behavior challenges his ability to read and interpret the crowd. Leaping up, he follows his quarry through the metropolis, without stopping, for over

twenty-four hours. He discovers that the old man drives himself ceaselessly through the streets out of terror that if he stopped he would have to confront his own emptiness. The flaneur's confidence in civic legibility, Poe suggests, is shallow and misplaced. Crowds and cities are indecipherable.

A subsequent trio of tales, published in Philadelphia magazines between 1841 and 1843, extended and deepened this approach. "The Murders in the Rue Morgue," "The Mystery of Marie Roget," and "The Purloined Letter" all presented cities teeming with activity and possibility (as did the flaneurs) yet shot through with crime and random violence (as did the mysteries). "Marie Rogêt," putatively set in a Paris described as "odious" and a "sink of pollution," was in fact based on the death of Mary Rogers in New York City. Rogers's fate symbolized for Poe the vulnerability of city folk, how easily one could go missing and turn up a brutalized corpse. Yet Poe *solved* Marie's "mystery" by introducing an analytical investigator, C. Auguste Dupin, who acknowledged what flaneurs denied: that the city was hard to read, dangerous, even terrifying. Dupin is no amateur idler but a credentialed specialist, a master of the skills of decoding a cityscape. Poe had invented a genre—the detective story—that played upon but in the end relieved his readers' urban anxieties. Social order was possible after all, Poe implied, if authorities adopted scientific methods of investigation and control. The detective, embodiment of this reassuring message, became a fixture on the urban literary scene.

So did Poe. Hoping to improve his chances of starting a magazine, he tried to get Harpers to publish his tales, but it turned him down. Then, in "the bleak December" of 1844, he wrote "The Raven," a shivery poem ideal for reading aloud, which Willis published in January 1845 to uproarious acclaim. Buoyed by overnight fame, Poe renewed his efforts to launch a journal. He moved back to the city in early 1845 and perched, variously, on Greenwich Street, East Broadway, and Amity Street near Washington Square during the coming year.

Poe wrote a piece, which Willis published, called "WHY HAVE THE NEW YORKERS NO REVIEW?" In it, he proposed establishing a "proper indigenous vehicle" for rallying Manhattan's literati against derisive Boston intellectuals. Charles Briggs did just that by launching the *Broadway Journal*, a literary review with a strong focus on the cultural life of New

York City. Citing Poe's celebrity—everybody was “raven-mad about his last poem”—Briggs took him on as junior partner.

In 1845, at the behest of Duyckinck (whose *Arcturus* Poe had praised lavishly), Wiley and Putnam published editions of Poe's tales and poems in the Library of American Books. Social success followed commercial success. Poe was welcomed to literary salons sponsored by wealthy New York women determined to repudiate the city's money-grubbing reputation. He was often found at Anne Charlotte Lynch's Saturday evening “conversaziones,” which attracted the likes of Irving, Bryant, Emerson, and Fuller to Lynch's Waverly Place drawing room.

Poe worked fourteen-hour days at the *Broadway Journal*, but in the brutally competitive magazine world it failed to make money. A disenchanted Briggs turned it over to Poe's exclusive management. Poe finally had his own magazine, but not the resources to promote it. He borrowed. He ran every aspect of the journal himself and wrote for it as well. Circulation kept falling, and in January 1846 it collapsed, leaving Poe destitute.

To bring in funds and to revenge himself on real and fancied enemies, he began writing “The Literati of New York City,” a series of thirty-eight sketches published between May and October of 1846 in a Philadelphia magazine, *Godey's Lady's Book*. The pieces mixed brilliant if vitriolic criticism with venomous vignettes about local authors, gossip he'd picked up at salons. For all its pettiness, the series had an underlying ambition: to rid New York—which he considered “the focus of American letters”—of the curse of amateur writers. Poe, like Duyckinck and the Young Americans, had long railed against Lewis Gaylord Clark and his *Knickerbocker* puffery. He denounced the ability of “coteries in New York” to “manufacture, as required from time to time, a pseudo-public opinion by wholesale.” Puffery impeded America's literary development by subordinating independent professionals to established cliques of privileged gentlemen.

These sallies precipitated full-scale war. Clark accused Poe of duplicity and drunkenness, impotence and cowardice. Poe sued for libel and won but was nevertheless banished from literary circles. Increasingly depressed and erratic, he raged at his foes from a cottage in Fordham, thirteen miles out of town amid hills and heavy foliage, where he had moved in hopes that

country air would aid his failing wife. It did not: she died in January 1847, their first winter there.

Poe hung on a while longer. He took long walks atop the Croton Aqueduct, visited Jesuit faculty friends at St. John's College, and did some writing (with mixed success), including "Mellonta Tauta," a tale that imagined the future destruction of New York City by earthquake. By 1849, having concluded that the entire northern literary establishment was conspiring to thwart him, Poe decided to move south. Two weeks after Mathew Brady took his photograph, he set off to explore Richmond. On his way back, he stopped off in Baltimore, where in 1849, drunk and delirious, he died, aged forty, in a public house.

"DOLLARS DAMN ME"

Herman Melville had a bleaker yet more complex view of New York City than did Poe. Melville appreciated his hometown's energy and diversity, but he could never forget that Manhattan's marketplace had destroyed his father and stripped his family of its social position. Herman's mother, Maria Gansevoort, traced her family to Hudson Valley Dutch aristocrats, and his father, Allan Melvill [*sic*], a descendant of Scottish nobility, had been educated as a gentleman. Allan, a successful Boston merchant, became convinced that New York was "destined to become the Commercial Emporium of our Country" and relocated there in 1818. Setting up as an importer of French luxury goods, he quartered his family in an elegant house on Pearl Street near the Battery.

Maria Melvill craved social distinction—she was thrilled when the mayor's wife paid a welcome call—and soon after Herman was born in 1819 the family began a rapid ascent. Within two years they were ensconced in finer accommodations on Courtlandt Street, along with a housekeeper, cook, nurse, and waiter. In 1824 they climbed farther up-island to 33 Bleecker, whose proximity to "our Stylish Neighbours in Bond Street" delighted Maria. In 1828 the Melvills reached the pinnacle, a spacious house on Broadway, between Great Jones and Bond Street itself. Along the way, Maria gave her children the skills and graces appropriate to their would-be station. She taught them etiquette herself and sent Herman and his elder brother, Gansevoort, to the New-York Male High School, Mrs.

Whieldon's dancing school, and the prestigious Columbia Grammar School, attended by pupils from the finest families.

Then catastrophe struck. Hard-pressed to compete with New York's auctioneers, and dangerously overextended, Allan entered secretly into a speculative scheme that went sour. Maria's wealthy brother reluctantly bailed him out, but Melvill was soon on the skids again, sliding toward an 1830 bankruptcy. The family fled to Albany, where they lived, humiliatingly, on the charity of relatives and where Allan, broken, died in 1832. Maria, hoping to give her children a fresh start, added an aristocratic *e* to their name, and for a time it seemed Gansevoort would make a go of his fur-and-cap business. But the Panic of 1837 wiped him out, plunging the Melvilles into indigence.

With the depression dragging on, Herman shipped out in 1839 as cabin boy on a square-rigger to Liverpool. In 1841 he signed up for a four-year cruise on a "blubberhunter" but jumped ship in the Marquesas, drifted about the South Pacific for a year, then returned and wrote up his recent adventures in a narrative that he submitted to Harpers. The firm turned him down, believing the tale untrue, but after his brother Gansevoort sold the work to an English company, Wiley and Putnam brought it out in New York, published, under the direction of Evert Duyckinck, as *Typee: A Peep at Polynesian Life* (1846).

Melville's "peep" proved popular. His account of swimming nude with savage damsels was titillating yet not vulgar. His favorable comparison of Polynesian women's free and uncomplicated sexuality to the "stiffness, formality and affectation" of Victorian ladies back home struck a chord. So did his sympathy for the South Sea natives, whom arrogant American missionaries had "evangelised into beasts of burden." Irate religious papers assailed the sailor-author, but Margaret Fuller reviewed *Typee* favorably for the *Tribune*, and Harpers grabbed his next book—*Omoo: A Narrative of Adventures in the South Seas*—which came out in 1847 to good reviews and further fierce attacks.

Now a celebrated author, Melville moved to New York City with his new bride, Elizabeth Shaw. Pooling resources with his lawyer-brother, Allan, they bought a brownstone on Fourth Avenue, just behind Grace Church, a short walk to Barnum's Museum and Astor House and a few blocks away from Duyckinck. The critic championed Melville against the religious press

(an Episcopalian, Duyckinck had little sympathy for Methodist evangelists) and became his patron and mentor, inducting him into the ranks of Young America and guiding him into literary society.

Melville thrived in New York. Salon hostesses sought him out much as they had Poe. He read voraciously, borrowing from the New York Society Library and burrowing happily in Duyckinck's massive book collection. He loved Duyckinck's Saturday night suppers, where the Young America set debated literature, democracy, philosophy, and art over brandy and cigars. Embracing their cultural program, he rejected the *Knicker-bocker* gentry (as had Poe) and luxuriated in metropolitan sensations (as he was sure the Bard would have: "I would to God Shakspeare [*sic*] had lived later," he wrote Duyckinck in 1849, "& promenaded in Broadway").

He wasn't making much money, however, a situation that worsened after his next book, *Mardi*, departed from his established format and turned off reviewers and readers alike. Melville now reluctantly tailored his output to the marketplace, turning out two adventure stories, *Redburn* (1849) and *White-Jacket* (1850). "They are *two jobs*," he complained, "which I have done for money—being forced to it, as other men are to sawing wood."

Melville broke free again with *Moby-Dick*, not only from literary conventions but from New York City, the "insular city of the Manhattoes" whose citizens he characterized as "tied to counters, nailed to benches, clinched to desks." In 1850 Melville moved to a 160-acre farm near Pittsfield, Massachusetts. He continued to make trips to Manhattan to visit friends and publishers, but his disenchantment with the city and its literary marketplace grew stronger. "Dollars damn me," he wrote Hawthorne in 1851. "What I feel most moved to write, that is banned,—it will not pay."

After *Moby-Dick* came out to cursory reviews and limited sales, Melville began to see readers as adversaries. Most enraging of all, his Young America allies at the *Demo-cratic Review* published a devastating critique, and his mentor Duyckinck, discomfited by the book (and perhaps by the fact that Harpers had published it), gave it a tepid review in the *Literary World*.

In *Pierre* (1852) Melville purged his anger with lacerating indictments of, among other things, New York City and its literati. The book's doomed hero, Pierre Glendinning, cast out of his pastoral upstate world, comes to

Manhattan, intending to support his Isabel by writing. In the end, however, both sink into urban depths as black as any in the city mystery genre. From their first arrival by coach at night, jounced along on cobblestones as hard as “the buried hearts of some dead citizens,” Melville depicts a menacing city, where money rules and the poor can expect no pity. He now disdains Broadway’s “proud-rustling promenaders” as “drooping trains of rival peacocks”—peacocks, moreover, who little realized how close pavement was to gutter in a city where (and here Melville spoke from experience) families “rise and burst like bubbles in a vat.” As for denizens of the gutter itself—“diseased-looking men and women of all colors”—they seemed to have been “poured out upon earth through the vile vomitory of some unmentionable cellar.” In the end Pierre falls into the city’s very bowels, the Tombs, where he commits suicide.

Pierre was a monumental failure—condemned (as *the American Whig Review* put it) for morals “repulsive to a well constituted mind”—with the critical establishment’s fury no doubt exacerbated by Melville’s having singled them out in the book as monsters. Now a literary outlaw, Melville was in desperate financial straits when Charles Briggs, Poe’s former partner at the *Broadway Journal* and now editor of *Putnam’s Mag-azine*, courageously solicited his work. *Harper’s New Monthly Magazine* followed suit, and the author soon gained greater success as a magazine writer than he ever had as a novelist.

Melville continued to blast away at the city as the apotheosis of America’s moneymad society, a place of deceit and despair. In 1853 *Putnam’s* brought out “Bartleby, the Scrivener: A Story of Wall-Street,” about a clerk in the office of an elderly Episcopalian lawyer who does a “snug business among rich men’s bonds, and mortgages, and titled deeds.” Bartleby—“pallidly neat, pitiably respectable, incurably forlorn”—copies legal documents “by sun-light and by candle-light,” working “silently, palely, mechanically” in his cubbyhole, until the day he politely but firmly responds to the lawyer’s assignments with “I would prefer not to,” eventually declining all duties. Fired, he refuses to leave, and indeed moves in. His baffled employer, by turns concerned and furious, abandons the office to a new landlord, who has Bartleby thrown into the Tombs. There the inscrutable scrivener—more unknowable even than Poe’s Man of the Crowd—starves himself to death, declining life itself.

Melville also explored the sunshine-and-shadow mode. *Harper's* published his "Poor Man's Pudding and Rich Man's Crumbs," which excoriated the hypocritical wealthy, particularly "the criticisms made on the habits of the poor by the well-housed, well-warmed, and well-fed." "The Two Temples," which decried the snobbish atmosphere at a fictionalized Grace Church, proved too hot to print; even Briggs feared it "would sway against us the whole power of the pulpit."

The Confidence-Man: His Masquerade, Melville's ferocious judgment on marketplace civilization, was brought out in 1857 by a small New York house that folded shortly thereafter. The title borrowed the label affixed to swindler William Thompson, and many of its characters were modeled on New Yorkers. More to the point, *The Confidence-Man* was set on a symbolic Mississippi riverboat, which represented a commodity culture, peopled by highly mobile strangers, of which Manhattan was the epitome (in "Bartleby" Melville referred to "the Mississippi of Broadway"). One trickster after another peddles bogus products—stocks, patent medicines, plots in a real estate development called "the New Jerusalem"—in a sardonic satire on the prevailing chicanery and manipulation of urban encounters. More darkly still, Melville indicts a civilization where all human exchange, including language itself, has become deeply corrupted.

Moody, depressed, and increasingly dependent on drink, Melville took a trip abroad. On his return he tried lecturing to make money. He first proposed a sarcastic talk on the "daily progress of man towards a state of intellectual & moral perfection, as evidenced in the history of 5th Avenue & 5 Points," but in the end opted for safer subjects like the South Sea islands. Abandoning prose altogether, Melville tried poetry, only to have Charles Scribner decline to publish his poems on the grounds they wouldn't pay. As the 1850s wound down, the frustrated professional writer, largely dependent on Elizabeth's family, began casting about for a job in the New York Custom House. His long slow slide into obscurity had begun.

"MY CITY!"

Both Walt Whitman and Herman Melville spent many hours standing in the Battery, gazing at the bay, but apparently they never met. Nor did the two men, though exact contemporaries, see their city the same way. Melville, a

patrician on the way down, regarded it with an embittered eye, while Whitman, an artisan on the way up, became its exuberant celebrant.

Walter Whitman was born in 1819, two months before Herman Melville, in West Hills, Long Island. The Whitmans, English Quakers, had long been substantial farmers and landholders. So were the Dutch Van Velsors, and as a boy Walter often accompanied his maternal grandfather delivering produce to Brooklyn, a forty-mile wagon ride over tortuous roads. Walter's father, apprenticed as a carpenter, raised houses as well as crops, and in 1823 he took his pregnant wife, Louisa, and their three children to seek his fortune in booming Brooklyn. He fared poorly. An old-fashioned artisan, he was shunted aside by contractors who hired unskilled and poorly paid laborers to throw up prefabricated dwellings. Over the next decade, the hard-pressed family shuttled repeatedly around the Brooklyn waterfront in search of affordable housing.

Young Walter was occasionally sent to Saint Ann's Sunday school, but mainly for its free lunch, the elder Whitman having been a friend of Tom Paine and a follower of Fanny Wright. From 1825 to 1830 Walter attended Brooklyn's only public school, on Adams and Concord, until family finances forced him, at age eleven, to seek employment. He worked for a time as an office boy at a Fulton Street law firm, then was apprenticed as a printer to the editor of the *Long Island Patriot*. In 1833 his family, defeated by the city, moved back to farm country. Walter stayed on, learning his trade, exploring Brooklyn, ferrying across to New York's theaters.

In 1835, now a journeyman printer, Whitman moved to Manhattan. After a year spent in setting type, he too retreated to Long Island in the difficult aftermath of the Great Fire. Between 1836 and 1841 he started up and sold off a penny paper, set type for a Jamaica weekly, participated in politics as a Loco Foco Democrat, and taught school. In 1841 Walter plunged back into the world of Manhattan journalism, where, despite the ongoing depression, the mammoth weeklies and penny dailies offered opportunities for would-be writers and editors. Whitman worked awhile as a printer for Park Benjamin's *New World*. He also wrote poems and stories and published some in the *New World*, its rival *Brother Jonathan*, and John O'Sullivan's *Democratic Review*. In the spring of 1842, just shy of his twenty-third birthday, Whitman was hired to edit a recently established twopenny

paper, the *New York Aurora*, completing his transformation from artisan printer to Grub Street professional.

Assuming a flaneuresque persona, the *Aurora*'s editor promised his readers a regular reckoning with "this great, dirty, blustering, glorious, ill-lighted, aristocratic, squalid, rich, wicked, and magnificent metropolis." Duding himself up—his daguerreotypes depict a sophisticated dandy in frock coat and fashionable hat—he strolled around town, sporting a polished cane, absorbing scenes and characters. Whitman particularly explored the plebeian world of popular culture, visiting fire companies, gambling dens, whorehouses, and theaters, and he wrote up richly detailed sketches of newsboys, pawnbrokers, stage drivers, salesclerks, and butchers. He also captured the excitement of being on Broadway, reporting from atop a mobbed Yellow Bird omnibus or from a pavement crammed with enough people "to make one continued, ceaseless, devilish provoking, delicious, glorious jam!"

As a New York booster, Whitman was hard to top. Manhattan, he wrote, was "the great place of the Western Continent, the heart, the brain, the focus, the main spring, the pinnacle, the extremity, the no more beyond of the new world." Yet he was not blind to its negatives. Whitman worried particularly about the city's obliteration of its past, its "rabid, feverish, itching for change." At one point he recounted the efforts of a large crowd of women to block workmen from digging up a Baptist cemetery at Crystie and Delancey, noting that in the end the speculators—"a set of miserable wretches" who wanted the land for house lots—succeeded in "desecrating the *very grave* in order to add something to their ill won heaps of gold."

Dismissed from *the Aurora*, Whitman leapt nimbly from job to job. He worked as a penny-a-liner for the *Daily Plebeian*, run by Loco Foco Levi Slamm. He knocked out a popular temperance novel, *Franklin Evans the Inebriate*, admixing praise for the Washingtonian temperancites with sensational descriptions of miscegenation and murder ("damned rot," he'd later say). He covered the courts and prison for Beach's *Sun* (he would write a piece on jailhouse lawyers called "Tomb Shysters of Gotham"), contributed to Willis and Morris's *New-York Mirror*, edited the *Democrat* (a party paper), and wrote for the *Broadway Journal*, where he met Poe when picking up his pay and found him "very kindly and human" if "perhaps a

little jaded.” Clearly Whitman had mastered the art—better than had Poe—of staying afloat in a quicksilver literary marketplace.

Whitman’s housing arrangements were equally peripatetic. He moved repeatedly between boardinghouses on Spring, John, Vesey, and Duane streets until 1845. Then, after four years in Manhattan’s fast lane, dismayed to be still earning less than five dollars a week in an ever more viciously competitive industry, he returned to slower-paced Brooklyn, where his parents and five siblings had come to take another stab at housebuilding and where he would stay for the next seventeen years.

In March 1846 Whitman became editor of the *Brooklyn Daily Eagle*. In the morning he penned editorials in his Fulton Street office, which commanded a good view of the ferry landing, then set out in search of stories. He might take a stagecoach to Fort Greene or Green-Wood Cemetery, attend a Sunday school picnic in Jamaica, drop in on sermons by Brooklyn preachers, or head south to Coney Island for a swim in its “beautiful, pure, sparkling, sea-water!”

Whitman was now a Brooklyn booster—he began referring to New York as “the Gomorrah across the river”—but didn’t shy from pointing out its downsides. He ran stories about crime and violence. He complained about filthy, ill-paved, and unlit streets. He criticized real estate developers for their “pull-down-and-build-over-again spirit” and sought to strengthen Brooklynites’ historical sensibilities by campaigning to commemorate the Prison Ship Martyrs. He even chided the crowds heedlessly rushing on and off the Brooklyn ferry and sighed: “How it deadens one’s sympathies, this living in a city!”

The *Eagle* was a Democratic paper, and Whitman was a vigorous party supporter. He also considered himself a foot soldier in Young America’s ranks, though he didn’t move in their social circles, and applauded projects O’Sullivan advanced in the *Democ-ratic Review*, seconded Duyckinck’s efforts to foster a national literature, and hailed Melville’s *Typee*. But in 1848, with the Democrats split into radical and conservative wings, the radical Whitman found himself at odds with the *Eagle*’s conservative owners and, once again, out of a job.

In the 1850s Whitman drifted away from journalism. He joined his brothers in speculative building ventures—purchasing lots, then erecting

and selling frame houses. He abandoned his foppish dandy's outfit for a workingman's slouch hat, checked shirt, and baggy pants. But he never stopped his urban peregrinations. Whitman explored the two cities from end to end. Tuning his ear to the "superb music" of the streets and worksites, he jotted down slang expressions (among them "cave in," "dry up," "bully for you," "that's rough," and "the New York Bowery boy—'Sa-a-a-y! What-a-t?"). He loved the voices of "workmen and apprentices in the spar-yards, on piers, caulkers on the ship-scaffolds, workmen in iron, mechanics to or from their shops, drivers calling to their horses." He dropped in often at Brady's daguerreotype gallery (and called an essay series in the *New York Leader* "City Photographs"). Entranced by the Crystal Palace, he returned so often that officials assigned detectives to shadow the tall and roughly garbed man.

In 1854 a recession halted Brooklyn's building boom. Unemployed, Walter returned to professional writing. On completing a dozen poems, he took them to a friend's printshop (setting some himself) had himself daguerreotyped wearing an open-collared shirt, rumpled pants, and tilted round hat, adopted a new name ("Walt"), and by Independence Day of 1855 had eight hundred copies of *Leaves of Grass* ready for sale.

In 1854, Whitman posed as a New York rough for the Brooklyn daguerreotypist Gabriel Harrison, who specialized

in the images of workingmen that were known as “occupationals.” The daguerreotype was then copied onto a lithographic plate and used as the frontispiece for *Leaves of Grass* (1855). (© Collection of The New-York Historical Society)

An ode to New York, *Leaves* was perhaps the first great urban epic. English poets had flinched from London. Poe and Melville found only alienation in the New York milieu. But Walt Whitman was gloriously at home in the city. Indeed, Whitman *was* the city. No aloof, flaneural observer, he incorporated into himself the masses crossing Brooklyn’s ferry or thronging New York’s streets. “When million-footed Manhattan unpent descends to her pavements,” he wrote, “I too arising, answering, descend to the pavements, merge with the crowd, and gaze with them.”

Yet Whitman maintained his individuality. Immersed in “Manhattan crowds, with their turbulent musical chorus!” he experienced not dissolution or isolation but sensuous delight. “Give me interminable eyes—give me women—give me comrades and lovers by the thousand!” he cried. “The life of the theatre, bar-room, huge hotel, for me!” he exulted. “Give me the streets of Manhattan!”

The crowd’s “million hued and ever changing panorama” inspired him to new metaphors with which to capture its sounds—“the blab of the pave, tires of carts, sluff of boot-soles, talk of the promenaders”—and its range of movement. Grace Church became a “ghostly light-house looming up over the porpoise-backs of the omnibuses, as they lift and toss in that unquiet sea.”

Whitman’s omnivorous curiosity embraced far more than crowds and streets. “This is the city and I am one of the citizens,” he declared. “Whatever interests the rest interests me, politics, wars, markets, newspapers, schools, / The mayor and councils, banks, tariffs, steamships, factories, stocks, stores, real estate and personal estate.” He hailed its industry: “On the neighboring shore, the fires from the foundry chimneys burning high and glaringly into the night, / Casting their flicker of black, contrasted with wild red and yellow light, and down into the clefts of streets.” He cherished its multiplicity: “city of the world! For all races are here; all the lands of the earth make contributions here.” He revered its superb shoreline—“hemm’d thick all around with sailships and

steamships”—and its “high growth of iron, slender, strong, light, splendidly uprising toward clear skies.” “City of hurried and sparkling waters! city of spires and masts!” he exclaimed. “City nested in bays! my city!”

Yet in all this the poet was protesting a bit too much. The dazzling perfection of his “Manahatta” seems strangely distant from Manhattan, the city of grime and crime that journalist Whitman knew. “Manahatta” was Manhattan without a dark side, Manhattan with its contradictions resolved, dissolved. Broadway had become a metaphor—the highway of equal souls—and New York City the symbol of egalitarian and democratic community.

Whitman’s poetry finessed social and class tensions of which he was only too aware, which he himself embodied. It was, to be sure, saturated with a workingman’s sensibility. He was “Walt Whitman, an American, one of the roughs,” “one who does not associate with literary people—a man never called upon to make speeches at public dinners . . . rather down in the bay with pilots in their pilot-boat. . . or riding on a Broadway omnibus, side by side with the driver.” And he could be severe with the “upper ten,” referring in “Song of Myself” to the “many sweating” and the “few idly owning” (in his notebooks he denounced the “vast ganglions of bankers and merchant princes”). He disliked posh Grace Church even more than Melville did, and on one occasion, when an overzealous usher removed Whitman’s hat, he grabbed it back, beat the man over the head with it, and swept out in a fury.

Yet Whitman didn’t grapple with the transformations these classes were undergoing. He rhapsodized the city’s growth and progress as if it came without cost, as if skilled artisans like his father were not plummeting in status and income. Nowhere were such changes more pronounced and more obvious than in the world of printing and publishing, where Harpers and the penny press were crowding out small artisanal publishers and one-man newspapers. Whitman himself had abandoned the compositor’s trade and sustained his artisanal journalism and artisanal authorship by moving to Brooklyn, where older ways remained viable. But if Whitman the journalist expressed dismay over aspects of modern publishing, Whitman the poet elided such concerns with a rapid-fire cataloging of the undoubted marvels that world had wrought: the “story papers, various, full of strong-flavored romances, widely circulated . . . the onecent and two-cent journals—the political ones, no matter what side—the weeklies in the country—the

sporting and pictorial papers—the monthly magazines, with plentiful imported feed—the sentimental novels, numberless copies of them—the low-priced flaring tales, adventures, biographies—all are prophetic; all waft rapidly on . . . swell wide . . . What a progress popular reading and writing has made in fifty years! What a progress fifty years hence!”

There was little sense in *Leaves* that the artisanal and republican city was passing and ushering in the metropolis of slums and mansions to which the urban mysteries were calling relentless attention. Whitman didn’t see the imperiled city Melville did, perhaps because he had been relatively successful at negotiating his way in the new order. Or perhaps he hoped to suspend those changes, to freeze the present moment with the power of his poetry, thus holding in suspended animation the baleful metamorphosis against which Melville and Poe ineffectually railed.

Whatever its evasions, his masterpiece was an astonishing—and ironic—development. Here was the powerful urban voice Young America had long been calling for, yet the survivors of that movement never noticed its coming. They had not expected their literary messiah to be a half-educated carpenter’s son, a political journalist who consorted with b’hoys and coachmen. They’d been expecting the Great American Poem to issue from the parlor. Instead it bubbled up from the streets.

Whitman’s language threw them too. Young America sought a literary democracy but shied away from the country’s ruder idioms. Cornelius Mathews insisted it be American in the “purest, highest, broadest sense. Not such as is declaimed in taverns, ranted off in Congress.” In *Pierre*, a disillusioned Melville had warned Young Americans they would never produce a native literature because “vulgarity and vigor—two inseparable adjuncts” were denied them. What, then, were they to make of a poet whose work drew sustenance from minstrel shows, blood-and-thunder romances, and the penny press, who boasted that “copulation is no more rank to me than death is” and proclaimed “the scent of these arm-pits is aroma finer than prayer”?

Much of polite New York shuddered at *Leaves of Grass*, reviling Whitman as a disgusting barbarian, but not all the reviews were bad. Whitman the journalist had many friends in the press—Charles A. Dana said nice things in the *Tribune*, Fanny Fern applauded him in Bonner’s *Ledger*—and besides, Whitman had taken the precaution of publishing

three glowing reviews himself. New Englanders, curiously, were the most supportive, perhaps because, with Charles Eliot Norton, they saw Whitman as fusing “yankee transcendentalism and New York rowdyism.” Emerson sent a splendid salutation and came to pay respects (Whitman took him to a rowdy Mercer Street firehouse for a glass of beer). Bronson Alcott made a pilgrimage to Whitman’s home on Classon Avenue, then came again with Thoreau in tow. Not all Yankee intellectuals were taken with *Leaves of Grass*, however: James Russell Lowell threw his copy in the fire and warned off a foreign visitor by declaiming, “Whitman is a rowdy, a New York tough, a loafer, a frequenter of low places, a friend of cab drivers!” But cab drivers didn’t buy the book either. Despite the workingman-poet’s strenuous efforts to reach a wider audience, he sold only several hundred copies.

Like Melville, Whitman had failed to get the hearing he wanted. Unlike Melville, Whitman didn’t fade away. Instead he went underground, joining the bohemians, New York’s first self-declared counterculture.

“Bohemians” was the French term for gypsies, based on the erroneous assumption that Bohemia was their original homeland. In the 1840s the name was affixed to the poor artists of Paris’s Latin Quarter—first in derision, then in fascination. Henry Murger’s romantic tales about the left bank’s denizens, serialized between 1845 and 1846, then published as *Scenes de la vie de boheme* in 1851, presented them as principled people who repudiated middle-class morality, held money in contempt, and adopted alternative work habits and domestic arrangements. The French bourgeoisie, initially scornful, became intrigued by their lifestyle, and some of the affluent adopted or affected their ways.

The apostle who brought the boho gospel to New York City was a Nantucket-born journalist and theatrical critic named Henry Clapp Jr. After several years’ residence in Paris, Clapp moved to Manhattan in the mid-fifties and gathered a like-minded group around him. Its members included Fitz-Hugh Ludlow, who would write *The Hashish Eater* about his drug experiences, and Ada Clare, the Charleston-born and independently wealthy writer who scandalized respectable New York by publishing torrid love poems and flaunting her illegitimate son. Bohemia also attracted writers, actors, artists, and students from the now sizable class of professional

cultural workers, many of whom felt insufficiently remunerated or attended to.

Clapp's circle found a home in 1855 when Charles Pfaff, a rotund German Swiss, opened a basement beer hall on Broadway, just north of Bleecker Street. Modeled on the rathskellers and underground grottos becoming popular in Europe, Pfaff's offered the best coffee in town along with rich German beers, fine wines, and cheeses. At the cellar's far end, extending beneath the sidewalk upon which Broadway's endless crowds promenaded, was a vaulted "cave." Here Pfaff reserved a long table for Clapp's crew, who would filter in by late afternoon and again after an evening at the theater, to eat, drink, and inveigh against dull, respectable Manhattanites.

The bohemians adopted the departed Poe as their patron saint, attracted by his morbid writings, but they made Walt Whitman their reigning luminary. Even if he was not the most loquacious of the regulars ("my own greatest pleasure at Pfaff's," Whitman recalled, "was to look on—to see, talk little, absorb") he nevertheless spread the tavern's fame by writing of "The vault at Pfaff's where the drinkers and laughers / meet to eat and drink and carouse / While on the walk immediately overhead pass the myriad / feet of Broadway." By decades end, Pfaff's vied with Castle Garden, Tammany Hall, and Barnum's Museum as a New York City landmark.

The bohemians, in turn, promoted Walt's reputation. In 1858 Clapp founded the *New York Saturday Press*, an irreverent weekly with radical perspectives on art and politics that showcased new American writing, especially Whitman's. In distant Ohio, the youthful William Dean Howells was so impressed by the journal—it "really embodied the new literary life of the city"—that he made a pilgrimage to Pfaff's in 1860 to visit its resident poet.

None of this paid Whitman's bills. Having failed to support himself as a free-lance writer, he had returned to full-time journalism in 1857, becoming editor of the *Brooklyn Daily Times*. His poetry had dried up too (though shortly to reflower), perhaps because he had exhausted the material he'd been ingesting for years. *Leaves of Grass*, he would later say, "arose out of my life in Brooklyn and New York from 1838 to 1853, absorbing a million people, for fifteen years, with an intimacy, an eagerness, an abandon, probably never equalled."

Life Above Bleecker

In 1845, with the great mid-century boom just getting underway, only two men—John Jacob Astor and Peter G. Stuyvesant—possessed estates whose value topped the million-dollar mark. So many and so great were the fortunes accumulated over the next decade, however, that by the mid-fifties New York was home to dozens of so-called millionaires—a new word for a new social reality.

“Wealth,” mused George Templeton Strong, “is rushing in upon us like a freshet,” and it was clear who had navigated the current most successfully. In 1856 9,122 individuals were assessed for tax purposes as having a net worth of at least ten thousand dollars. Of this group, which collectively possessed the overwhelming bulk of the city’s wealth, close to half engaged in mercantile pursuits, with merchants, auctioneers, brokers, and agents being far and away the richest New Yorkers in this, their Golden Age. Rentiers and others who profited from soaring land values did well too, making up about a fifth of the top taxpayers. Roughly another fifth owned goods-producing firms, a category that embraced ironmasters like Peter Cooper and contractors like Alexander Masterson, the Scots stoneyard owner who erected the Customs House. A tenth of the rich were professionals, though many owed their ranking more to capital than credentials, having parlayed substantial fortunes and family connections into lucrative careers in law, doing probate and trust work, or in medicine, attending to fellow patricians.

New York’s economic elite had ballooned in size and complexity as well as wealth. The city teemed with bankers, brokers, importers, exporters, manufacturers, insurance tycoons, blueblood professionals, real estate moguls, department-store lords, railroad barons, and publishing magnates. So diverse a constellation was sometimes hard to recognize as a discrete social entity, riven as it was by divergent interests and styles.

Industrialists, for example, tended to be dependent upon but antagonistic to merchants. The latter demanded high prices for raw materials, paid low prices for the manufacturers’ products, offered credit on harsh terms, and

promoted free trade. Culturally, moreover, genteel wholesalers had little in common with manufacturers, many of whom came from artisanal backgrounds and worked on a daily basis with grubby proletarians.

Respectable old clans like the Beekmans, Livingstons, Stuyvesants, DePeysters, and Schermerhorns, for their part, claimed that recently acquired wealth didn't count for as much as riches that were properly patinaed, and that nouveaux like the Vanderbilts, Laws, and Stewarts did not belong in their category, much less their company. To help keep them out, hostesses like Mrs. James D. Roosevelt, Mrs. Hamilton Fish, Mrs. Henry Brevoort, and Mrs. William Schermerhorn—whose invitations still signified social acceptance—relied on Isaac Brown, the sexton of Grace Church who doubled as society's majordomo. Brown screened their guest lists, using his formidable grasp of Knickerbocker bloodlines to sort social aspirants into "old family, good stock" or "new men."

"Old stock" families wishing to wall themselves off from vulgar "new men" had other gatekeeping institutions besides Sexton Brown. The Society of St. Nicholas and the Union Club were joined by the New York Yacht Club (1844), whose cachet was assured in 1851 when John Cox Stevens took the yacht *America* to England and beat Britain's best while Queen Victoria and Prince Albert looked on. Another newcomer, the Century Association (1847), was in theory open to talent and accomplishment in every field—"Artists, Literary Men, Scientists, Physicians, Officers of the Army and Navy, members of the Bench and Bar, Engineers, Clergymen, Representatives of the Press, Merchants and men of leisure." In practice, by the mid-fifties, the bulk of the Century's members were merchants, bankers, railroad executives, insurance officials, and leading lawyers and physicians. Some Centurions fancied their club the American equivalent of the august French Academy, but while gentleman authors like Lewis Gaylord Clark of the *Knickerbocker* set were indeed on board, on the whole the Century's clubhouse tended more toward hearty masculinity than intellectual discourse.

Some of the rich even tried on the trappings of aristocracy, riffling through the pages of Gwilt Mapleson's *American Hand Book of Heraldry* in search of noble forebears. There was a certain appropriateness in making lineage a prerequisite for status, as kinfolk had supplied the capital for many of the elite's enterprises. Roughly seven of every ten New Yorkers

whose wealth was assessed at over a hundred thousand dollars—men like Moses H. Grinnell, Robert B. Minturn, Samuel Shaw Howland, and Abiel Abbot Low—had inherited substantial fortunes and thus stood on the shoulders of their forebears.

On the other hand, most of those forebears weren't New Yorkers. Forty-three percent of the top taxpayers in 1856 had been born in other parts of the United States (especially New England and upstate New York). And fully 25 percent had come from foreign countries (especially England, Ireland, and Germany), making the overseas contingent nearly as big as the fewer than one-third born in the metropolis. Manhattan had an old guard, but it had been swamped by outsiders. Requiring a civic ancestry might make sense for provincial Boston's upper class, but in cosmopolitan New York it would exclude two-thirds of the rich, and the miffed might decide to form alternative, competing power centers.

Most old residents, therefore, accepted the newcomers in time. The Union Club blackballed A. T. Stewart—an Irishman, it was pointed out, and a mere shopkeeper writ-large to boot—then invited him in, a few years later, when his wealth and prominence could no longer be denied. The Yacht Club snubbed Cornelius Vanderbilt, notorious for his swearing, womanizing, and general disdain for bourgeois domesticity. Vanderbilt's revenge was to build the first American-owned, oceangoing steam yacht, the *North Star*, furnished with a plush saloon in the style of Louis XV. After a decent interval, the club relented.

The old monied even accepted August Belmont. Favored by an unrivaled knowledge of high finance and access to Rothschild credit, the German-Jewish Belmont had amassed a major fortune since his arrival in 1837. One of the leading private bankers in the country, he had also become one of the most colorful figures on the New York social scene. He was multilingual, handsome, and suave, a connoisseur of food and wine and art and horses and dogs. He hosted fancy soirees and led a pack of young uptown bachelors in late-night adventures around town. He limped romantically, the result of a duel over the attentions of a certain Mrs. Coles. His position improved even further in 1849 when he married nineteen-year-old Caroline Perry, daughter of Commodore Matthew Perry. Jewishness was not yet a bar to genteel status—the Hendrickses were honored members of the Union and St. Nicholas—but polite society took comfort from the fact that the

wedding occurred in an Episcopal church (not to mention that he gave the bride an entire city block as a wedding present).

Other such alliances—such as the 1853 nuptials of William Backhouse Astor and Caroline Webster Schermerhorn—further blurred the distinction between arrivistes and aristocrats. Sniping at social climbers would continue, to be sure, as when Episcopal Bishop William Kip tartly observed that “wealth came in and created social distinctions which took the place of family, and thus society became vulgarized.” But New York’s pragmatic patricians accommodated newcomers and thereby made themselves a more durable and coherent elite.

But what to call themselves? Some were quite happy to be known as “aristocrats,” though this was still a fighting word in republican America. Others preferred more neutral, though still hierarchical, language: “best society,” “higher classes,” and (given the craze for things French) “*ban ton*.” “Bourgeoisie” had some appeal, though it had disparaging connotations: one local informant told Francis Grund, Viennese-born author of *Aristocracy in America*, that the “aristocracy here is itself nothing but a wealthy overgrown *bourgeoisie*, composed of a few families who have been more successful in trade than the rest.” The most New York City-specific solution was a numerological one. The phrase “upper ten thousand” (often awkwardly abbreviated as “uppertendom”) was originated by social arbiter Nathaniel Parker Willis and ratified by Charles Astor Bristed, Cambridge-educated grandson of John Jacob Astor, who used *The Upper Ten Thousand* as the title for his 1852 sketch of elite life in New York City.

Membership in uppertendom required but two things: having a lot of money and spending it in approved ways. Willis’s checklist of appropriate consumption patterns awarded upperten status to those “who keep carriages, live above Bleecker, are subscribers to the opera, go to Grace Church, have a town house and country house, give balls and parties.” There were rival definitions, but all focused on measurable behavior: one had only to observe how—and especially where—an aspirant for elitehood lived.

“FLED BY DIGNIFIED DEGREES UP BROADWAY”

“Startled and disgusted with the near approach of plebeian trade,” one observer noted in 1853, New York’s wealthiest “fled by dignified degrees up Broadway.” By the midfifties private residences had virtually disappeared from once fashionable blocks around lower Broadway, Greenwich Street, and Park Place. Amos Eno, the hotel builder, stuck it out on Greenwich (his daughter recalled) “until we were surrounded by immigrant boarding houses, and then went uptown to live.” Yachtsman John Cox Stevens had incautiously erected an extravagant Greek Revival mansion on a corner of the Columbia College campus in 1846, only to see the the area become a black and Irish slum. In 1856 Cox tore down his “palace” and built warehouses on the site; that same year Columbia College itself headed north to 49th Street.

Neighborhoods thought immune from urban squalor as recently as the 1820s and 1830s became undesirable in the 1840s and 1850s. St. John’s Park denizens fled in droves, especially after Vanderbilt’s Hudson River Railroad ran tracks down its west side in 1851. A few blocks to the east, so many beer halls and tobacco shops had spilled off Broadway onto Bleecker and Bond streets that those addresses, as one paper put it in 1853, could no longer be considered “the *ultima thule* of aristocracy.” Even in the Astor Place district, Charles Astor Bristed wrote sadly, “the dwellings are interspersed with shops; elegant mansions are beginning to be elbowed by dentists and boarding houses, and to assume an appearance of *having been* in the aristocratic precincts.”

Willis had warned wealthy New Yorkers that they must settle “above Bleecker” to be socially acceptable. But how far above Bleecker? One answer was the brand-new neighborhood around Union Square Park, the three-and-a-half-acre elliptical oasis laid out in the 1830s on the northern frontier of the city at the instigation of developer Sam Ruggles. Building, halted by the panic, began anew with recovery. The park itself was fitted up with a fountain, gas lights, birdhouses named for prominent municipal buildings, and a bronze equestrian statue of Washington on the exact spot where he’d been received by citizens on Evacuation Day in 1783. In 1848 the *Herald* announced that 14th Street, the square’s southern boundary, was “now nearly the center of the fashion-able faubourgs.”

Gramercy Park, another panic-stalled Ruggles project, took off as well. By the midfifties the discreet little square was snugly enveloped by

expensive residences. Among the wealthy new arrivals were Peter Cooper, Cyrus Field, James Harper (who relocated his mayor's lamps to the front of Number 4), and George Templeton Strong, who had married Ellen Ruggles, the developer's daughter.

But it was Fifth Avenue, a block west of Union Square, that drew the very wealthiest New Yorkers. When Henry Brevoort had built his mansion on 9th Street in 1834, the "avenue" was a near-deserted country lane running up from Washington Square to the municipal parade-ground on 23rd Street. In 1847 the city replaced the parade-ground with Madison Square, a seven-acre park that by the early fifties was being touted in the press as a sure bet to become "the most fashionable part of our rapidly increasing city." A parade of commodious row houses and ornate mansions advanced quickly up Fifth, lodging the likes of August Belmont, Moses Grinnell, and William Lenox. By the end of the fifties, when Caroline Schermerhorn Astor convinced her husband, William Backhouse Astor Jr., to erect a mansion (with a capacious ballroom) between 33rd and 34th streets, next door to that of his brother, John Jacob Astor III, it qualified as the richest thoroughfare in America.

Union Square, 1849, looking south across 4th Street.

between 15th and 16th streets, is the row of fancy bow-fronted
residences erected by Samuel B. Ruggles. (© Museum of the
City of New York)

Upperten housing was as distinctive for its architecture as its location. Economic depression had put paid to the reigning Greek Revival style, and returning prosperity brought to the fore designers captivated by the Italian Renaissance. A. T. Stewart's Marble Palace had been the first New York structure inspired by fifteenth-century palazzos, a style with which Londoners and Parisians had been experimenting for a decade. Now Herman Thome, who had lived stylishly in France, engaged Stewart's architects, Trench and Snook, to design him an Italianate residence. Completed in 1848, the freestanding mansion, sited on 16th Street just off fashionable Fifth, was an instant hit. Magazines and guidebooks raved about its courtyard, carriage drive, and Tuscan portico, and with startling speed other detached mansions boasting rusticated basements and winter gardens went up within a few blocks of Thome's.

Equally startling, most of the new structures were made of a triassic sandstone, which, thanks to the presence of hematite iron ore, turned from pink to chocolate as it weathered. Brownstone, as it was called, was a familiar building material in New York City—St. Paul's (1766) had used it along with Manhattan schist—but until now it had mainly been a substitute for marble or limestone, reserved for basements, stoops, and details. Suddenly it became a luxury item, deemed more dignified than brick or wood and more in tune with the current romantic aesthetic favoring “natural” darks over “artificial” whites.

The soft brown stone also allowed for richly carved facades and lavish ornamentation, to the delight of the wealthy, who were sick of simplicity and republican restraint. Federal houses now seemed dowdy, while brownstones (as one magazine observed) allowed their owners to “make a gratifying display of knowledge and taste.” This wondrous material, moreover, was relatively inexpensive, thanks to new steam-cutting technology, and readily available from nearby Paterson, New Jersey, and Portland, Connecticut. Soon nearly every architect and builder in the city was putting up Italianate brownstone mansions for rich clients, and four- or

five-story brownstone row houses for the merely affluent. Marching up Fifth and its adjacent avenues, these buildings created block after chocolate block of monumental streetscapes, and by the 1850s it was agreed that, as one magazine put it, “the prevailing tint of New York is fixed.”

As uppertens clambered uptown, they drew their institutions up with them. The Union Club relocated to a Florentine mansion on the corner of Fifth Avenue and 21st Street, while the Century settled into a clubhouse on East 15th Street, just off Union Square. But churches remained the anchors of choice.

In 1839 the wardens of Trinity Church, fearing their building was about to collapse, had pulled it down and begun work on what would be the third Episcopal house of worship to occupy that site since 1699. Designed by Richard Upjohn, an up-and-coming young architect, and completed in 1846, the new structure of reddish-brown sandstone was a paragon of the “pointed” or spiritualized Gothic style newly popular among “high church” adherents. Its “very ornaments,” one writer enthused, “remind one of the joys of a life beyond the grave.”

But the flight of the propertied classes out of lower Manhattan meant that Trinity could no longer claim to be the *ne plus ultra* of city churches. That distinction now belonged to Grace Episcopal, housed on Broadway at 10th Street in a Gothic masterpiece designed by James Renwick. Situated only a few blocks below the refined precincts of Union Square, Grace served a congregation notable for long pedigrees and deep pockets. Pews sold for as much as sixteen hundred dollars, and it became the preferred setting for baptisms, weddings, and funerals among well-to-do New Yorkers. (The cachet of the nearby Church of the Ascension got a huge boost when August Belmont married Commodore Perry’s daughter in its sanctuary.)

As in the past, the Presbyterian wing of respectable society came closest to matching Episcopalians in wealth and influence, and several Presbyterian congregations, almost as exclusive as Grace, also struck out for uptown. In 1845 a high-powered group that included James Brown and Henry Raymond called a meeting, subscribed the money, purchased a site, hired Richard Upjohn, and put up a church on University Place at 10th Street. Pew for pew, the congregation was probably the wealthiest in New York. The very next year, led by the redoubtably rich James Lenox, First

Presbyterian abandoned Wall Street for an imposing Gothic edifice and tree-shaded grounds on Fifth Avenue between 11th and 12th streets. A decade later, in 1857, the venerable Brick Presbyterian auctioned off its valuable lot across from City Hall Park, shifted all unclaimed bodies from its vaults to Cypress Hills Cemetery in Brooklyn, and resettled on the brow of Murray Hill, at Fifth Avenue and 37th Street. Brick's old building was razed and replaced by the headquarters of the *New York Times*.

Other wealthy New Yorkers attended the Unitarian Church of All Souls on the corner of Fourth Avenue and 20th Street, close to Gramercy Park. Erected in 1855 at a cost of over a hundred thousand dollars, All Souls was vaguely Romanesque in appearance, with alternating bands of black and white stone and a 106-foot dome that towered over the neighborhood—the irreverent called it the Church of the Holy Zebra—and prominent pewholders were attracted by its dynamic minister, Henry Bellows.

SUBURBS AND SUMMER SPOTS

The rich were prepared to abandon downtown Manhattan, but not the city itself. Though surrounded by vast open spaces, newly accessible by speedier transport, most of the wealthy preferred to cluster together, living literally side by side, cooped up in narrow row houses on relatively tiny lots. The urbane inclinations bequeathed by the Dutch remained vibrant as ever.

A minority, however, did defect to the countryside, seduced by the siren song of Andrew Jackson Downing. A Newburgh-based landscape gardener for the Hudson Valley gentry, Downing wrote a series of books in the forties advocating villa living as an antidote to “the too great bustle and excitement of our commercial cities.” Villas—asymmetrical, natural-hued country mansions—really belonged on properties of several hundred acres, Downing admitted. But he allowed that one might opt for a smaller villa (with as few as three servants) if grouped with others around a common park, in the manner of English “romantic suburbs.” When Downing died in 1852, his close friend Alexander Jackson Davis took up the campaign for rural residency. Hitherto a Greek Revival man, Davis nimbly embraced the Gothic and received several commissions for baronial homes in quasi-rustic settings.

In Brooklyn, Edwin Clark Litchfield, a lawyer who made a fortune in midwestern railroad development, had Davis erect Grace Hall, a grand Italianate villa, on the crest of Prospect Heights from where he could survey his square mile of virtually vacant land. Costly villas and sloping lawns also began to dot the Bronx (Richard March Hoe's Brightside in Hunt's Point), Riverdale (actor Edwin Forrest's Font Hill), Queens's East River shore (a cluster at Ravenswood), and far-off hillsides in Staten Island.

In New Jersey one venturesome contingent of affluent New Yorkers experimented with Downingesque suburban living. In the mid-1850s, aided by Davis, Llewellyn Haskell, a wealthy drug merchant, built Llewellyn Park, a collection of villas set along curving roads ranged around a fifty-acre park called the Ramble. Situated in the Jersey foothills of the Orange Mountains, the elaborately landscaped suburb succeeded, but there would be no more planned communities in this era. Those willing to leave Manhattan preferred to settle in nearby, already established villages made newly accessible by rail, and depot towns such as Mott Haven, Morrisania, Tremont, and Fordham experienced substantial growth during the 1850s. Deeper Westchester was deemed inconvenient; it took ninety minutes to do the nineteen miles to Bronxville.

Outlying villages in Queens were even less enticing to uppertens, though real estate speculators hoping to boom Maspeth, Newtown, and Flushing tried hard to woo them. Even when bumpy stagecoach rides over plank roads gave way to rail connections direct from the Hunter's Point ferry landing, these county towns remained too far out. As one commuter complained in 1854: "The inability to get to a meeting or a lecture—to a place of amusement, or to do a little shopping are tolerable; but to be half a day in getting to and from business is a bore."

The only suburb that really enticed elite New Yorkers lay a scant ten minutes away, in Brooklyn Heights, and Pierrepont's genteel bastion on the cliffs overlooking the East River was no romantic confection, but rather a Manhattan clone. Its gridded, tree-lined streets were reassuringly covered with brick and brownstone row houses, in up-to-date styles with modern conveniences, and punctuated by churches designed by Renwick, Upjohn, and Minard Lafever.

Brooklyn was also a tax haven: its promoters publicized it as an offshore financial refuge from Manhattan. This in turn generated some proposals for

annexation, the solution Philadelphia authorities embraced in 1854 to recapture runaway taxpayers. (One New York state senator proposed physically uniting the two islands by filling up the East River with gravel and covering the cost of the enterprise by selling the newmade land at high prices.) But it was Brooklyn, not New York, that resorted to annexation. Absorbing neighboring Williamsburgh and Bushwick in 1855, it became the nation's third most populous city. Brooklyn not only bolstered its status as an independent municipality but emerged as a credible competitor to Manhattan itself, complete with its own imposing City Hall; construction, halted by the panic, had recommenced in 1845 and been completed by 1849.

Though most of Brooklyn's newly rich merchants and financiers joined old established families on the Heights, more venturesome types pioneered other exclusive locations. Just to the south lay the Heights' fashionable offshoot of Cobble Hill, where in short order the assessed value of houses almost matched those of its progenitor. To the east lay "the Hill," where General Greene's Fort Putnam—renamed Fort Greene in the War of 1812—had been replaced by Washington Park, thanks largely to a campaign waged by *Eagle* editor Walter Whitman.

Those who found the Hill too close to the Navy Yard could opt for Bedford Corners. A sleepy Dutch village as late as 1850, it first became accessible via the Long Island Rail Road along Atlantic Avenue. Then, after 1854, the Brooklyn City Railroad Company began running forty-passenger horsecars along the recently opened Fulton Avenue (now Street) and Myrtle Avenue. Large rural landowners like the Lefferts and the Lotts began to sell off property to speculators, who subdivided it for individuals or small developers. Ads in the *New York Times* soon proclaimed the availability of "villa plots" and residences complete with stables, gardens, and "all modern improvements," just thirty minutes from downtown Brooklyn.

Farther than this uppertens seldom went. Developers in the 1850s tried promoting Fort Hamilton, Bushwick, and East New York as suburban retreats—promising trees, parks, nuisance clauses, minimum plot sizes, an escape from city taxes and dirt, and a good investment to boot. But these were too far away, scattered amid small farming communities like Flatbush, Flatlands, New Lots, New Utrecht, and Gravesend. Cannier developers, like

Park Slope's Edwin Litchfield, patiently accumulated property and bided their time.

Brooklyn did have one Downing-type suburb, which griddish New Yorkers liked. The spectacular if belated success of Green-Wood Cemetery proved that while they didn't want to spend their lives in such locations, they had no objection to spending eternity there. With its landscaped terrain, pastoral winding paths, weeping statues, and plots enclosed by iron railings, Green-Wood was a romantic suburb for the deceased. Indeed early suggestions that it be called the Necropolis had been rejected precisely because the word would have conveyed "an idea of *city* form and show." The quick as well as the dead flocked to Green-Wood. On pleasant days hundreds of carriages headed for the Hills of Gowanus, taking the Hamilton Avenue ferry that Henry E. Pierrepont had started up in 1846, then crossed Gowanus Creek over the Hamilton Avenue toll bridge. By the early 1850s Green-Wood had become, in effect, the preeminent park for both Brooklyn and Manhattan.

In the summertime, uppertens pursuing relief from city heat would press on farther still. Their carriages headed south—often on Sundays, to the dismay of Gravesend's religious element—toward the exclusive hotels and beaches of Coney Island. There they spent the Lord's day watching the waves from porch chairs, eating clam chowder, or hunting snipe and duck near the marshes. But Coney Island couldn't solve the more difficult dilemma confronting society's upper echelons: how to maintain class cohesion when once compact precincts had been scattered into far-flung enclaves.

Traditional customs like New Year's Day visits were becoming increasingly unwieldy. "The extent of the visiting circle in New York has become too great for the operations of one day," Philip Hone lamented as early as 1840. The grand promenade hour along Broadway served as a partial substitute. In the late afternoon, reporter George Foster observed in 1849, the street became "a perfect Mississippi, with a double current up and down" of bourgeois ladies and gentlemen acknowledging—or not acknowledging—one another in prescribed ways. This ritual did help define and police social boundaries. But it remained awkwardly open to disruption—performed as it was on a very public stage—by any rowdies who declined to accept their assigned roles as awed spectators.

Uppertens began to rely more heavily on the summer season and the summer resort, and as a result, Saratoga Springs blossomed in the boom. Far from the hoi polloi—and Coney Island, even the Catskills, were no longer far away enough—the city’s elite constructed a town-away-from-town, a place to mix and mingle among themselves. At first the notion of spending an entire summer lolling in leisure grated on still-sensitive republican nerves, so Saratoga’s properties as a restorative health spa were emphasized (the “Bath of America,” Willis called it). In the 1850s such scruples dropped away, and visitors to the elegant United States Hotel devoted themselves to matchmaking, horse racing, gambling, and gamboling in what was universally agreed to be the nation’s most brilliantly fashionable resort. So popular did it become that by decade’s end, New York’s *crème de la crème*—the Fish, Rhinelanders, Lenox, Schermerhorn, Taylor, and Belmont families—began moving on to Newport, Rhode Island, settling into a growing number of “country houses” there.

Uppertens routinely traveled to Europe, too. The entire family might go, or just the wives and children, or bourgeois scions would decamp by themselves on extensive grand tours. Foreign travel provided the extra bonus of allowing the New York rich to keep abreast of the forms of display currently fashionable among Europe’s titled aristocracy and haute bourgeoisie—forms they set about duplicating the minute they got home.

“I NEVER SAW SUCH LUXURY AND EXTRAVAGANCE”

The elite’s retreat from downtown Manhattan was also a farewell to older standards of reticence and restraint. By 1850 prosperous New Yorkers, particularly younger ones, were wallowing in luxury with a nonchalance unknown among prior generations. Much of this took place in private, behind Italianate walls, but some uppertens didn’t hesitate to flaunt their wealth. They adopted theatrical forms of conspicuous display, which provided yet another reason to live in town, not the suburbs.

“The first thing, as a general rule, that a young Gothamite does is to get a horse; the second, to get a wife,” wrote Charles Astor Bristed, only half jokingly, about elite New York males’ passion for fine horses. Young men loved harnessing their blood chestnut colts and beautiful bays, then heading over to Third Avenue, Manhattan’s *de facto* exercise and racing track. From where the town’s cobblestones ended, Third’s newly macadamized

surface, flanked by soft earthen trails for trotters, ran north for nearly five uninterrupted miles to Harlem Bridge. Every day from three o'clock until dark, fast horses and fast men climbed steadily up the gradual hills, then quick-timed to the bottom, where convivial taverns awaited, as well as blacksmiths and coachmakers who could repair a broken wheel or replace a lost shoe. Trotting—taken up by the likes of Cornelius Vanderbilt and magazinist Robert Bonner—remained a passion for Bowery B'hoys as well, and impromptu, interclass drag races were not unheard of.

Private equipages, modest in the early 1830s, grew increasingly ostentatious. (Carriage showrooms and harness shops took over the tiny hamlet of Great Kill, on a creek at what is now 42nd Street, and the area above it renamed the Longacre, after London's equestrian hub.) Four-in-hand carriages were everywhere, their horses driven "chequered"—steeds of matching color arrayed diagonally. In winter, fancy cutters and family sleighs were de rigueur, and wealthy families, wrapped in bearskin robes, rode up to Wintergreen's in Yorkville for sherry flips. "One would hardly believe he was in a republican country," said one guidebook author, "to see the escutcheoned panels of the carriages, the liveried coachmen, and the supercilious air of the occupants of the vehicles, as they go pompously and flaringly by."

Bourgeois brownstones were showy too, but their exteriors were sobriety itself compared to their extravagant interiors. Affluent New Yorkers might easily spend ten thousand dollars on furniture for a single room, reported Lydia Maria Child. "Foreign artistic upholsterers assert that there will soon be more houses in New York furnished according to the fortune and taste of noblemen, than there are either in Paris or London." Henry Parish's mansion off Union Square had half a dozen period reception rooms decorated with Italian statuary, Gobelin tapestries, and Sevres porcelain. The mistress of a hundred-thousand-dollar mansion on Fifth Avenue slept in a bed inlaid with pearls and draped with satin and lace.

Portraits of family members, living or dead, often lined these walls, signifying (or confecting) tradition, but more and more elites began collecting old masters to adorn their parlors or private galleries. To serve them, especially after the American Art-Union was scuttled, European dealers began setting up branch offices—the House of Goupil dispatched

Michael Knoedler from Paris to New York in 1846—which stimulated the growth of American dealerships as well.

Wealthy households were rich in mechanical marvels, too. An ad for a dwelling off Union Square in 1846 ticked off the new essentials: “Croton water, range, boiler, bath, water closets,. . . furnace, dumb waiter from basement to attic, gas, and every other improvement introduced into modern built houses of the first class.” Water taps, now on every floor, splashed into marble washbasins. Bathing and toilet facilities (virtually unknown outside the major hotels before 1842) supplanted chamber pots and privies. Central heating arrived: cellar furnaces fired with Pennsylvania coal forced hot air through pipes and tin ducts up to cast iron or brass registers (though the upstairs bedrooms still relied on fireplace coal grates).

Maintaining these mechanical marvels required lots of labor power. In the case of central heating, a servant had to rake out the furnace, throw away the ashes, stoke it with coal twice a day, and bank the cinders at night. Fuel and ash had to be carried to and from the new stoves, and the icebox water pan needed emptying. Furniture also demanded upkeep. The very wealthiest families might have six or eight servants, including a cook, butler, waiter, parlor maid, upstairs maid, laundress, houseman, and coachman, though most elites had less than half this number.

The upper class adorned their persons with as much care as they did their houses, though men and women now took different stances on the question of fashion. Most businessmen did not devote undue time or attention to clothing, and indeed considered those who paid attention to fashion as ne’er-do-wells or fools. They simply wrapped themselves in loosely cut waistcoats and frock coats of increasingly somber hue: nineteen out of twenty were of black broadcloth, with claret or mulberry acceptable for weddings. Dark stovepipe hats dignified most heads, while at the neck bourgeois gentlemen sported a “modern high & pointed shirt collar, that fearful sight to an approaching enemy” (or so said Walt Whitman, he of the open-necked shirt). The business suit had arrived—a class costume tailor-made for sedentary activities, in contrast to eighteenth-century gentrywear, which had befitted more active pursuits like hunting, riding, dueling, and dancing. Only when businessmen donned militia uniforms were they allowed to dazzle and display their physical attractions.

One subset of male New Yorkers did keep the older love of plumage alive. “Dandies”—usually sons of the wealthy—promenaded on Broadway and attended fashionable events dressed in up-to-the-minute Euromodes, with an attention to detail (monocles, canes, gold chains) that contemporaries considered effeminate. Dandies were also pioneers, however, as they began sporting mustaches in the 1840s, a full decade before luxuriant beards became generally acceptable.

Most of the pleasures and burdens of dressing up fell to the ladies. In public, genteel women still went about virtually veiled, muffled head to limb in bonnets, shawls, skirts, and gloves, all of muted colors. In two venues only did women discard such selfeffacement and display their silks and satins: when promenading on Broadway; and at Easter-time, when some fine ladies began showing off their new dresses in an unofficial after-church stroll along uptown’s Fifth Avenue.

At home or church, however, as at dinner parties, balls, the opera, and summer spas, wealthy New York women demonstrated clear mastery of the latest French fashions. Fabrics grew steadily more voluptuous (gauze, tulle, organdy, brocade, velvet) and their colors more intense (crimson, maroon, purple). Hemlines on stylish gowns and dresses fell steadily as skirts ballooned outward on layer after layer of petticoats—as many as fourteen. Changing tastes (and the arrival of the sewing machine) required and supplied more and more ruffles, fringes, flounces, lace, and artificial flowers, and sent dressmakers into a frenzy of braiding, pleating, puffing, and tucking. By the late fifties skirts ran to six feet in diameter (department stores widened their aisles accordingly), and a cotton dress required thirty to forty yards of material on the average; counting petticoats and other undergarments, the total could reach a hundred yards or more, eight times what it would have been half a century earlier.

Society women escaped utter immobilization only through the introduction of the cage crinoline, an undergarment into which were sewn narrow steel hoops capable of supporting the massed weight of the garments above. A godsend in helping one walk, the crinoline could all too easily get tangled up in carriage wheels, and wind gusts could blow a woman off her feet. Even more problematic were the tightly laced corsets that produced the stylish eighteen-inch waist, along with headaches, fainting spells, and assorted internal disorders.

The vast consumption of assorted fabrics was a great boon to the city's dry-goods trade but a breathtaking expense to the consumer. James Fenimore Cooper, writing to his wife in the winter of 1850, described a party where one woman wore "a dress that cost, including jewels, thirty thousand dollars"—a fantastic sum at a time when skilled mechanics and craftsmen took home between \$1.25 and \$2.00 a day in wages.

Jewelery embellished many a costume—Mrs. Belmont attended the opera wearing a gold crown decorated with "clusters and flowers of emeralds and rubies, spangled with dew-drops of diamonds"—and among those hastening to supply these new needs were two young New Englanders, Charles L. Tiffany and John P. Young. Back in 1837 they had opened a stationery and dry-goods shop on Broadway, then slowly switched to more spectacular offerings as the boom took off. At first Tiffany and Young offered only imported goods: English silver and Continental crystal, gold jewelry, and Swiss watches. In 1848, a year of European revolutions, the firm purchased the jewels of Maria Amelia, wife of the recently deposed French king, and put them on display, winning for Tiffany the title "King of Diamonds." That same year the firm's new goldsmithing shop began producing its own jewelry, and three years farther on the company acquired New York City's leading silver manufacturer (and adopted its "Tiffany blue" packaging). By 1854 it had moved to an Italianate white marble palazzo at 550 Broadway, just north of Prince, in the heart of the elite shopping district.

Once properly bejewelled, only a touch of perfume was needed—and by 1858 there were six perfume manufacturers in the city, advertising their wares via scent-soaked cards—and mademoiselle was ready for a ball at Delmonico's. There she could flaunt her shoulders, display alluring décolletage and voluptuous (if possibly padded) curves, and set her crinoline swinging, revealing a flash of ankle. This was all the more likely as the tempo of dances quickened in the 1840s, with tearing polkas now complementing the waltzes and quadrilles. As George Templeton Strong informed his diary in December 1845 after a gathering at Mrs. Mary Jones's: "Polka for the first time brought under my inspection. It's a kind of insane Tartar jig performed to a disagreeable music of an uncivilized character."

The marriages that flowed from these mating rituals were not prearranged; indeed romantic love had never been more highly touted. However, by excluding all but young men of appropriate status and wealth, upper-class families practically guaranteed their daughters' choices would be appropriate. In 1856 37 percent of New York's wealthiest were directly interrelated.

At-home festivities had increased in number and opulence since Mr. and Mrs. Henry Brevoort had set the pace with their famous 1840 costume ball. The grandest *affaire de luxe* of the new era was the costume ball that took place in 1854 in the Lafayette Place mansion of Mrs. William Colford Schermerhorn. Sparing no expense, that redoubtable lady redecorated her house to resemble the Versailles Palace in the age of Louis XV, then invited six hundred of the city's richest citizens to dress up like French courtiers for an evening of dining and dancing.

France set the trends in cuisine as well, with Delmonico's as transmission belt. The Beaver Street establishment remained the preferred setting for balls, assemblies, and family dinners until well into the 1850s. In 1856 the restaurant added an uptown venue on Broadway and Chambers Street. At lunch the new eatery soon drew local influentials like A. T. Stewart (whose store was across the street) and Henry Raymond (whose *Times* would settle across the park). In the evening, famines strolled down from upper Broadway for social dining. At either location, those eager to explore the creations of Robert Beauvilliers and Careme could be sure Delmonico's was offering the latest in Parisian dining.

Upper-class entertainments were rehoused in new settings. Wealthy audiences packed into the grand new Lyceum Theater, on Broome and Broadway, where James William Wallack had established a resident company in 1852 and begun staging English productions with his son, Lester Wallack, as leading man. Laura Keene, a local actress who had worked for Wallack, launched her own company in 1856 in a new playhouse on Broadway just below Bleecker. Her polished productions in the 1858-59 season included the drama *Our American Cousin*, which would be upstaged by tragedy half a decade later when taken on the road to Washington, D.C.

As a bulwark of refinement, however, nothing held out more promise than the establishment of a new opera house in Astor Place. Although they

had long shied away from it as an expression of aristocratic decadence, upper-class New Yorkers finally acquired a taste for opera. This was thanks partly to the lyricism of Verdi, Bellini, Donizetti, and other contemporary composers, and partly to the impact of visiting European singers who began flocking to New York via the speedy new steamships and dazzling audiences at the Park Theater and Niblo's Gardens. Equally weighty was uppterten's expectation that an opera house would provide, in Nathaniel Parker Willis's words, "a substitute for a general drawing room—a refined attraction which the illmannered would not be likely to frequent, and around which the higher classes might gather, for the easier interchange of courtesies, and for that closer view which aides the candidacy of acquaintance."

Designed by Isaiah Rogers (architect of the Astor House, among other buildings), the new Astor Opera House pioneered a frankly elitist organization of theatrical space. The pit was "aristocratized" (Willis's term) by replacing the usual benches with fixed, upholstered, and numbered chairs sold only by subscription. Above the pit rose two tiers of open boxes, also reserved exclusively for subscribers, where patrons could see and be seen by the entire assembly. A gallery at the very top of the house provided general-admission benches for five hundred people; accessible by a single narrow staircase, this plebeian "cockloft" was almost completely quarantined from the genteel zones below. On opening night in November 1847, amid blazing jewels and rustling silk, New York's haut monde signaled their approval by turning out en masse for a performance of *Ernani*. (Brooklynites quickly set to creating equivalent venues, among them the Athenaeum [1853], the Philharmonic Society [1857], and the Academy of Music [1859-61].)

New York's upper classes now lacked but one thing: a house organ to provide respectful coverage of their doings. Society reportage remained monopolized by James Gordon Bennett's sardonic reflections in the *Herald* until 1846, when Nathaniel Parker Willis and his old *Mirror* partner, George Pope Morris, launched the *Home Journal* (later *Town and Country*). The *Home Journal* announced its intention of keeping New York City's "more refined individuals" apprised of all that was "new, charming, or instructive in the brilliant circle of city life." *Home Journal* featured talk of the town columns like "Prittle Prattle," "The Season and Society," and "Uptown

Correspondence,” the latter done with the aid of wealthy society ladies (whose lives a grateful Willis then chronicled in serial features). The magazine also provided dramatic and musical reviews, literary notices, and, for gendemen, digests of the week’s news condensed “in small compass.” To report the doings of England’s haut monde, it excerpted London society journals, and French affairs were covered in “Parisian Chit-Chat,” much of it translated (possibly by Edgar Allan Poe) from New York City’s own Frenchlanguage paper, the *Courrier des Etats-Unis*.

On the whole, uppertendom was quite comfortable with success and indulged in fine wines, fast horses, and vogueish clothing with no discernible traces of guilt. Yet in certain quarters, republican suspicions of aristocratic luxury retained considerable sway. Cold-water Yankees had long differed with pleasure-loving Knickerbockers about the proper use of wealth, and still did. Nor had old-stock spokesmen quite resigned themselves to the new monied’s ascendancy, and lampooning the pretensions of Fifth Avenue vulgarians became itself a mark of respectability. James K. Paulding, Irving’s collaborator on *Salmagundi*, dryly observed that when invited to dinner “I ate out of a set of China, my lady assured me cost seven hundred dollars, and drank out of glasses that cost a guinea a piece. In short, there was nothing on the table of which I did not learn the value.”

Industrialists too tended to decry the growth of luxury, in part because they saw themselves as useful producers, in contrast to superfluous financiers. Peter Cooper, one of New York’s richest men, continued to live at Fourth Avenue and 28th Street even after the New York and Harlem Rail Road began parking cattle cars in front of his house. Even after he moved to Gramercy Park in 1850, Cooper disdained ostentation, dressed simply, and limited the family to two servants; when his wife bought an elaborate carriage, he exchanged it for a more frugal model.

Principled objections to high living required principled rejoinders, and some prestigious churchmen endeavored to supply them. The Rev. Henry W. Bellows, minister of All Souls, editor of the *Christian Enquirer*, and a founder of the Century Association, addressed such issues in *The Moral Significance of the Crystal Palace* (1853) and other widely touted tracts. Bellows had no brief for the mere pursuit of money, and he blasted aristocratic foppery. He insisted, on the other hand, that the enterprise of self-interested Christian businessmen had brought wealth and progress to

the republic, that the desire for material goods would promote hard work among the poor, and that possessing goods was as morally beneficial as pursuing them. Poverty, to his way of thinking, had nothing to recommend it.

Even Nathaniel Parker Willis agreed that a proper aristocracy had to rest on more than wealth and fashion. He reminded readers that refinement was the true hallmark of respectability, and he called for creation of “a class whose opinion is entitled to undeniable weight—a class whose judgement is made up from elevated standards.” Without the authority conferred by refinement, no local elite would be ever be able to provide a “breakwater” to the dangers posed by the “ignorant and vicious classes.”

Nevertheless, many of the city’s haute bourgeoisie found it uncomfortably hard to reconcile upperten lifestyles with their still-cherished beliefs in political equality (for white men), equality of opportunity, the fairness of market relationships, the possibility of social mobility, and the purported insignificance of class divisions in republican America.

Uppertendom seemed even more problematic to the petite bourgeoisie, newly enlarged and newly self-conscious, which the boom had summoned into being. New York’s middling strata would split on the luxury issue, some opting for fierce republican disapproval, others for fawning emulation. Most, however, sought to carve out a position that, while drawing the line at aristocratic frippery, nevertheless sought to find some common ground with the city’s most powerful people, ground they discerned in the theory and practice of “respectability.”

THE RESPECTABLE CLASSES

A state census completed in 1855 fixed the population of New York City at just under 630,000 people, about 215,000 of whom were gainfully employed. Perhaps 30 percent of these were members of a many-layered middle class, though the 30 percent figure varies markedly depending on which social clusters get classified as middle class, something on which observers did not (and still don’t) agree.

Nearly everyone placed professionals in the middle class—after setting aside those few whose wealth and connections placed them in uppertendom. This group included traditional practitioners like doctors, lawyers, clergy,

and teachers, and newcomers like the members of the American Society of Civil Engineers (1852) and the American Institute of Architects (1857). Lesser merchants, along with small independent businessmen, were usually considered another middle-class contingent: clothiers, grocers, barbers, druggists, shopkeepers, restaurateurs, undertakers, and dealers in commodities as varied as books, cattle, oysters, coal, or stone.

Clerical workers, though employees, were generally but not always accorded (lower) middle status. Some of these—bank tellers, accountants, bookkeepers, cashiers, and copyists like *Bartleby*—handled the surging paperwork in the city's (by 1856) seventy-five banks, ninety insurance companies, and brokerage houses (130 on Wall and William streets alone). Another set acted as management assistants, staffing the headquarters of railroad, shipping, publishing, mining, or manufacturing companies. Thus the Novelty Iron Works had eighteen departments, and each was headed by a foreman who reported to a "front office" presided over by a superintendent and eleven clerks. A third complement served in the great retail establishments and thus included the two hundred clerks and salespeople who worked the floors at Brooks' Brothers Broadway emporium. Taken together, the nearly fourteen thousand clerical workers constituted New York City's third largest workforce category after servants and laborers.

It proved hardest of all to situate those in the upper ranks of the artisanal economy: "mechanics of the better class" or small contractors and manufacturers. In 1855, when one Yorkville resident said his community was "mostly made up from the middle class," he referred not only to neighboring merchants, brokers, bookkeepers, and clerks but also to master masons, carpenters, printers, and bookbinders. Other contemporaries, however, set skilled workers apart from professionals, managers, and clerical workers, pointing to marked contrasts in their work and lives.

Middle-class workspaces differed sharply from artisanal workshops. In the financial district, men spent their days in quiet, clean, even elegant "offices" (a word that began to replace "countinghouse" in the 1850s, the same decade in which dealers in office supplies first appeared in city directories). One of New York's earliest offices erected as such was the Trinity Building (1853). A five-story, double-width structure, enormous for the time, it replaced an eighteenth-century sugar house just north of Trinity

Church. The commercial Trinity, like the ecclesiastical one, was an Upjohn-designed edifice whose very architecture proclaimed its occupants genteel.

Inside such buildings—and retail equivalents like Stewart's Marble Palace—clerks and professionals seldom encountered manual workers. The same was true outside, on the streets and in the lunch-hour restaurants of the financial or shopping districts. As they made their way home on omnibuses and commuter trains, middling people again traveled in different circles from the bulk of walk-to-work laborers. Even in the industrial world, firms began to carve out separate workspaces for nonmanual employees, accessible by separate entrances.

Middle-class employees dressed differently from manual laborers. Salesmen in fancy retail stores were expected to be indistinguishable from patrons, both in clothing and bearing. Cashiers and bookkeepers not only had to look the part but could afford to, as salaried workers were usually better compensated than artisans and laborers. True, some old-fashioned firms still paid clerks less, considering them merchants-in-training. But most office workers were Bartlebys now—permanent wage-workers—solaced with annual salaries that could run as high as two thousand dollars. Professionals, lesser merchants, and small proprietors could earn considerably more.

These higher incomes allowed many to attain a modest version of haut bourgeois status. In the colonial era, the middling sorts had stood far closer to poor plebeians than to aristocratic elites. The new middle class repositioned itself much closer to the upper echelons, starting with how and where its members lived.

Middle-class families couldn't afford mansions or grand row houses, but thousands managed to purchase or rent a red brick dwelling, or even a brownstone with showy facade, albeit a narrower model. Where the *bon ton* enjoyed twenty-five-foot fronts, upper-middle-class residents settled for twenty- or eighteen-foot widths, while lowermiddle-class buyers squeezed into structures but fourteen to twelve and a half feet wide. Still, most could afford amenities—indoor plumbing, Croton water, cast-iron stoves, gas lights, and plaster walls—that would have been considered the height of opulence only a decade or two earlier (and were still out of reach of the majority of their fellow citizens).

Middling families could live “above Bleecker” too—not in the upperten enclaves running up Manhattan’s spine but along the flanking avenues and streets that lay between the wealthy center and the working-class riverfronts. The most affordable opportunities lay far uptown, in areas still under construction. These once distant venues had become newly accessible with the rapid spread of street railways, hastened by the invention in 1852 of a grooved rail that lay flush with the pavement. By decade’s end horsecars were rolling smoothly up and down Third, Sixth, Eighth, and Ninth avenues and crosstown at 8th, 14th, and 23rd streets. They carried a hundred thousand passengers a day, and allowed middle-class commuters to get downtown in less than forty-five minutes, though traveling conditions were admittedly less than optimal. “The seats being more than filled,” one paper observed, “the passengers are placed in rows down the middle, where they hang on by the straps, like smoked hams in a corner grocery.” Nevertheless rapid transit promoted rapid infill of Manhattan’s open spaces. By 1860 the island was solidly blanketed with residences as far north as 42nd Street. In another four years, over half the city’s population would live above 14th Street—the northern frontier as recently as the mid-1840s.

Middling sorts were a major presence in the new territories. On the west side they settled from west Greenwich Village and Clement Moore’s Chelsea up to the moderately priced brownstone row houses William B. Astor erected in the mid-40s between Broadway and Ninth Avenue. On the east side, old-fashioned but respectable three- or four-story brickfronts were to be had in the 20s, east of Third Avenue, and “handsome dwellings” between 30th and 45th streets could be rented for three to four hundred dollars per annum—beyond the means of most clerks but within the budget of a frugal professional family of four.

Even uptown, however, many middle-class New Yorkers could not afford a home of their own and had to settle for sharing space with others. “Part of a house to let”—read one 1854 ad, describing an opportunity in the west 303 near Ninth Avenue—“the upper part of a first-class house with modern improvements to a small genteel family.” Such quarters might be rented for \$160 to \$300 in the 1850s, too high for a mechanic making a thousand a year, but accessible to a middle-class person making twice that.

Others turned to boardinghouses. Doctors, lawyers, professors, and lower merchants—especially when single or married without children—

might place an ad stating their preferences in the *Herald*, *Tribune*, or *Times*, or peruse there the communiques from proprietors seeking appropriate renters (“family must be small and of the highest respectability”).

Boardinghouses ran the gamut from former mansions of Knickerbocker patricians, replete with furnished parlors, pianofortes, and “all modern improvements,” to dingy and warren-like barracks offering lodging, meals, threadbare carpets, and cockroaches to dry-goods clerks.

All of them had their drawbacks, however, said Thomas Butler Gunn in his humorous but instructive *Physiology of New York Boarding Houses* (1857). These ranged from landladies trying to palm off unmarried daughters, to thunderous snorers in adjoining apartments, to pious gatekeepers who locked up at eleven and refused to give out latchkeys. Even in the best of circumstances, multifamily dwellings were ultimately inconsistent with the middle-class desire for a “genuine home.” As one little girl replied when asked where her parents lived: “They don’t *live*; they BOARD.”

For those priced out of domesticity in Manhattan, a proper independence could be purchased at the cost of trekking greater distances. Some made their way north to the growing railway communities of Mott Haven, Morrisania, and Fordham. But far greater numbers of clerks, shopowners, teachers, and youthful professionals migrated east to Brooklyn. After 1853 a steamboat ferry connected Wall and Montague streets, supplementing the older Fulton Ferry to downtown Brooklyn and the South Ferry to Atlantic Avenue (where it linked with the LIRR). By the mid-1850s the giant Union Ferry Company had consolidated most such nautical operations, and its vessels, carrying as many as six hundred passengers at a penny a ride, shuttled an estimated seventy thousand commuters to and from Manhattan each day.

A building frenzy struck Brooklyn in the 1850s (to which Whitman and his brothers made their small contribution). Twenty-six hundred new structures—balloonframe houses and inexpensive row houses—went up during 1851 alone. Middle-class people filtered into the interstices of affluent Brooklyn Heights. Others migrated to South Brooklyn (embracing parts of today’s Cobble Hill, Boerum Hill, and Carroll Gardens), where it was possible for a dry-goods clerk to rent a narrow row house with a large back yard for two hundred dollars a year. Bolder souls could travel farther

east to the brownstones of Fort Greene or to East New York, where in 1853 ads proclaimed: “Now every family can own a home.” Far to the south lay the respectable community of Fort Hamilton, with its own episcopal St. John’s Church; here, in the 1840s, Robert E. Lee was a vestryman and Thomas (later Stonewall) Jackson was baptized.

Middle-class communities, like wealthy enclaves, sought ecclesiastical anchors. In mixed-class districts they often made use of churches established by their more affluent neighbors. On Brooklyn Heights professionals and clerks might join an Episcopalian stronghold of the older-monied elite, whose fortunes flowed from land. Or they might associate themselves with the richest of the mercantile elite who worshiped along with the Low family at the Unitarian Church of the Saviour, Minard Lafever’s brownstone Gothic masterpiece. But the middle class had an anchor of its very own in Brooklyn Heights—the largest and most influential church in all Brooklyn, all New York, and some said all the nation.

Plymouth Church was a breakaway from Brooklyn’s first Congregational venue, the Church of the Pilgrims, a conservative bastion of New Englanders led by the Rev. Richard Salter Storrs. In search of a more potent pastor, Plymouth’s founders reached across the country to Indianapolis, where they found Henry Ward Beecher, himself of New England stock, and brought him east to serve.

When Beecher arrived in 1847, Plymouth consisted of fewer than two dozen members, but soon his bravura preaching was pulling in crowds (including an enraptured Walt Whitman). A large-framed man, Beecher had a powerful voice and was a master of the anecdotal and colloquial: some called him a combination of St. Paul and Phineas T. Barnum. When Plymouth burned down in January 1849, it was rebuilt according to Beecher’s specifications—along lines pioneered by Charles Grandison Finney—with a central platform instead of a pulpit and with seats arranged in a giant semicircle. This format would allow his “social and personal magnetism” to work better, Beecher said. “I want the audience to surround me,” he told the architect, “so that I shall be in the centre of the crowd, and have the people surge all about me.”

The barnlike sanctuary on Orange Street was completed in January 1850—barely adequate, it turned out, for within another few years Plymouth’s

membership stood at twelve hundred, there was a waiting list of over two thousand, and the deacons had figured out how to distribute the communion bread and wine to fifteen hundred worshipers in under ten minutes. So many people came over from Manhattan to hear Beecher that on Sundays the Fulton Street Ferry came to be known as “Beecher’s Ferry.” His ministerial range was magnified, moreover, by New York’s national-circulation newspapers, which covered Beecher consistently, and by the *Independent*, a Congregational journal for which he himself wrote regularly.

Beecher was successful because his message suited the membership. Although Plymouth’s trustees included a few of Brooklyn’s wealthiest merchants, its congregants and visitors were predominantly middle class. Many (perhaps three-fourths) were newly arrived in Brooklyn and New York. Like Rufus Griswold, clerk in a business house, they were doing well in the marketplace but feeling socially isolated, fearful of wandering into wicked ways. Griswold immediately felt “at home” in Beecher’s church, in part because the minister’s liberal, barely denominational Protestantism presented virtually no doctrinal barriers to admission.

Beecher’s lack of concern for old dogmas and rigid creeds appealed to young men and women who themselves had broken with their past. His amiable and urbane theology also offered a comforting contrast to the faith of their parents, with its emphasis on human depravity and damnation. Beecher did not try to frighten them with strident Calvinist warnings about the wrath of Jehovah. He spoke instead of human perfectibility, a benevolent Deity, and the beauty of the natural order.

Beecher insisted, moreover, on Christians’ responsibility for their fellows, a position with great appeal for those who wanted to be socially respectable *and* socially responsible. Plymouth thus provided a welcome contrast to elite churches like Grace Episcopal, which middle-class spokesmen like journalist James Parton lambasted as little more than ecclesiastical clubs, designed “for the accommodation of persons of ten thousand a year, and upward.”

Beecher, like Finney before him, believed that people could and should contribute both to their own salvation and to society’s. Indeed he went Finney one better. The older evangelist (whom Beecher invited to preach at Plymouth in 1849) sought social reform through conversion, not legislation; he declined to “get up a Christian party in politics.” Beecher, however,

engaged in direct political action. Each year, just before Plymouth's sale of pews, he restated his outspoken support for abolition and women's rights, so that congregants would have no cause for later complaint about their investment.

Beecher also helped parishioners negotiate the oft-conflicting claims of morality and business. He vigorously denounced speculative and corrupt practices and demanded that trade be conducted according to the highest standards. Yet he insisted that "religion and commerce stand together," with "one working from a divine nature, and the other from a selfish; but both together conferring benefaction." He also helped his flock deal with the prosperity attending their worldly success. Counseling against either extravagance or penuriousness, he defended frugality and discipline, while reassuring his audiences that affluence as such presented no obstacle to God's grace and might well be a sign of divine approbation. A love of true beauty—as opposed to superficial fashion—was evidence of inner refinement. And true refinement—not mere aristocratic display—was evidence of Christian grace.

GENTEEL PERFORMANCES

Middle-class New Yorkers who set out to demonstrate refinement by acquiring beautiful commodities found handcrafted luxury items unaffordable. Mass-produced versions, however, were well within their reach—and satisfyingly beyond the grasp of cruder classes below. Their parlors now bloomed with framed chromolithographs, machine-woven floral carpets, machine-pressed glassware, mahogany bureaus, wallpaper, ottomans, sofas, chairs, tables, and books. Perhaps even a modest upright piano.

Commodities were problematic, however. Those in the middling ranks who really *did* hanker to keep pace with the rich were doomed to be outspent and outclassed, their imitation luxuries branding them an imitation bourgeoisie. Those who made a point of denouncing "profligacy and waste in the upper classes" (as middle-class tribune Horace Greeley put it) worried that they themselves might be succumbing to what Greeley called "the shameless ostentation which reigns in our dwellings and furniture, the boundless luxury which presides at our entertainments, [and] the premature

exposure of our young men to the contact of a vicious and rotten civilization.”

In either case it was imperative to demonstrate that goods signified grace, not vulgarity. And the best way to do so was by *acting* in a refined manner—displaying graceful manners, polished conversation, a self-assured bearing, a genteel sensibility. Assuming such virtues, however, especially for those new to citified or bourgeois ways, required study and practice. Fortunately, a small army of experts was ready and eager to advise them. The publishing industry churned out etiquette books—over one hundred between 1830 and 1860—aimed at upwardly striving urbanites or those who were wealthy but socially challenged urbanites. The courtesy-book authors, along with popular fiction writers, codified and inculcated standards of polite behavior, counseling novices how to dress, how to dine, how to walk, how (and how often) to bathe. Magazine editor Nathaniel Parker Willis also set out to “instruct” and “refine” readers in what he called the “vital middle class” that lay between “wealth and poverty.” Willis offered articles on posture and dress, answers to questions about social do’s and don’t’s, and endless exhortations to embrace “TASTE and ELEGANCE.”

Parlors were crucial performance spaces. Here neophytes, by paying and receiving visits properly, could display their newfound delicacy of feeling, capacity for embarrassment, and rigorous self-control—acting “naturally” all the while, as if to the manners born. Hundreds of rules governed these events. You arrived at the stroke of the clock—“if you are a moment later, your character is gone”—and presented your calling card. On entering the house, you never thumped into the parlor, breathing hard, but prepared yourself first in an offstage dressing room, until “every part of your person and dress” was “in perfect order.” Next, your entrance: “A graceful bearing, a light step, an elegant bend to common acquaintance . . . are all requisite to a lady.” Gentlemen, for their part, were warned against offering their seat to the newly arrived lady—body warmth was offensive—and instructed to avoid “ill-bred” or “indecent” subjects of conversation. At table, as in conversation, all participated in making other players look good; should one spill wine on one’s dress, one was not to “exhibit peculiar or violent emotion,” and others were to tactfully ignore the faux pas.

Death was the final performance, and mourning manuals—advice books on bereavement—counseled that the capacity to experience deep grief was

a sign of true gentility. As never before, the bourgeoisie (haute and petite alike) wept over their dead and developed a sentimental reverence for keepsakes, relics, “locks of shining hair.” 1846 witnessed the invention of the Frederick and Trump corpse cooler, indispensable for the expanding profession of undertaker who prepared the deceased—affixing cosmetics, wiring limbs in a “natural” position, inserting false teeth—until a polite visitor could give the formerly vulgar corpse the ultimate accolade: “He looks asleep.” Widows (though not widowers) were expected to wear mourning for two years, just as, in general, the burdens of refinement fell most heavily on women. It was a virtual prerequisite for middle-class (as for upperten) status that the male breadwinner spare his wife from work outside the household. She was installed instead as priestess of the home, where her task was to provide a serenely pastoral sanctuary from the urban jungle. In theory this was achieved by effortless emanations of her character; in fact it took a tremendous amount of hard work.

Usually the middle-class housewife had help, though seldom as much as was available to wealthy women. In 1855 New York had thirty-one thousand domestics, the largest category of women workers. This vast pool allowed one family out of every four to employ at least one servant. The ability to command at least some labor power—perhaps a cook or maid—became another virtually defining characteristic of middle classness.

To help the housewife manage these servants, a host of advisers was standing by. Often the how-to books and ladies’ magazines counseled mistresses to take a tough line vis-a-vis their employees. Complaints about refractory or inexperienced help became common coin, a way respectable women could instantly establish a class camaraderie. Elizabeth Cady Stanton was heard to say that one day she’d surely be hanged for “breaking the pate of some stupid Hibernian for burning my meat or pudding on some company occasion.”

Advice books also aided women in managing other aspects of their increasingly complex households. Housewifery was becoming a “profession,” wrote Catharine Beecher, Henry Ward Beecher’s sister, and she along with other writers would help women master it. They discussed how to do (or oversee) the cleaning, cooking, health care, and childrearing and how to sort out the new technology of stoves, illuminants, furnaces, and sewing machines.

“The Miseries of Mistresses,” cartoon views of the “servant problem” from *the New Monthly Magazine* of 1867. Among middle- and upper-class New Yorkers, the alleged foibles of Irish maids like “Bridget” and “Peggy” were a running joke. (© Collection of The New-York Historical Society)

As women’s work expanded, it became less valued, in part because it was unpaid, in part because, as home was meant to be the antithesis of the workplace, labor there was not something to be acknowledged. Indeed the success of women’s work was often measured by its invisibility. The veiling of domestic labor’s contribution was accompanied by an insistence on women’s importance as civilizing agents. Home, one minister wrote, was the place where “fighters, with their passions galled, and their minds scarred with wrong—their hates, disappointments, grudges, and hard-worn ambitions—may come in, to be quieted and civilized.” Housewives, that is,

were expected to instruct their husbands in matters of sensibility, in part by crafting an environment that exerted a refining and spiritualizing influence.

As women guided their husbands, so they molded their children, lavishing increasing nurturance on fewer offspring. It was the father's duty to pay for formal schooling. It was the mother's to impart the character traits, table manners, conversation styles, dress codes, and spiritual wherewithal required to retain and transmit the family's position in the middle class. In shaping their children, it was argued, women shaped the country. Mothers, said one minister, would decide "whether we shall be a nation of refined and high minded Christians" or "a fierce race of semi-barbarians."

Middle-class men were not entirely irrelevant to the civilizing process. They enrolled in literary discussion societies, went to concerts, and attended lyceum lectures, which in the mid-fifties almost surpassed theaters in popularity. Clerks flocked to talks sponsored by the Mercantile Library Association, which, still going strong, had over four thousand members by 1853. Formal associations were equally decorous. The International Order of Odd Fellows, which had once featured convivial gatherings in taverns, now forbade drinking and promoted individual self-improvement.

In physical pursuits, too, middle-class men hewed to respectable activities. Some exercised at gyms (by 1860 there were seven in operation). Others attended regattas, trotting meets, and pedestrian races. But it was on the new frontier of participatory sports that a handful of New Yorkers, in search of an appropriate after-work pastime, invented a game that would sweep the country, and eventually the world.

Cricket, played informally in the city since the Revolution, got organized, in a small way, with the formation of the St. George Cricket Club in 1839-40. The members were all Englishmen, mostly merchants and agents of English import houses, along with some skilled craftsmen. But the sport grew very slowly in the 1840s and 1850s. Despite the *Times's* praise of it as a "manly, healthy and invigorating exercise," its complexity, professionalism, and English associations limited its appeal.

In 1842, however, white-collar workers who lived near Madison Square and Murray Hill came up with an alternative. In a vacant lot at 27th and Madison Avenue they began playing a version of the children's game

known variously as one-old-cat, stool ball, bat and ball, base ball, or rounders—the latter being the others’ English forerunner. Popular since its arrival early in the century, rounders and its cognates involved four bases in diamond formation and a “feeder” who tossed balls to a “striker.” After several years of informal play, Alexander Joy Cartwright, a shipping clerk who later opened a bookstore and stationery shop, proposed to his fellows that they constitute themselves the Knickerbocker Base Ball Club. The group—almost all of them businessmen, professionals, or clerks like Cartwright—drew up a constitution and wrote down a set of formal rules for the game. After being forced out of their playing field by resurgent uptown development, the Knickerbockers rented a site at the Elysian Fields across the Hudson in Hoboken. In June 1846, using the new rules, they took on their first challenger, a group called the New York Club.

Slowly the game caught on. The Gothams (originally the Washingtonians) began play in the early 1850s at the St. George Cricket Club’s ground in Harlem. By 1854 the Eagles and Empires had taken the field, as had, across the river in South Brooklyn, the Excelsiors. Like the Knickerbockers, most of these clubs were comprised of middleclass men and were more fraternal organizations than competitive teams. Club members met off as well as on the field, with postgame collations at their favorite hotel or restaurant, and in the winter at suppers, promenades, skating parties, soirees, and an annual ball. Most games were intramural, with only an occasional match game, initiated by written challenge, the winner of which got to keep the game ball in its trophy case. The clubs insisted on decorum and gentlemanly behavior, emphasizing their self-control in contrast to working-class raucousness.

In the late fifties the game took off. By 1858 there were seventy-one clubs in Brooklyn and twenty-five in Manhattan; others on Long Island and New Jersey brought the metropolitan area total to 125. 1858 saw the establishment of a National Association of Base Ball Players to refine rules, resolve disputes, and control the game’s development. The title may have seemed a bit grandiose, as the constituents were all local teams, but the wording was fair enough, for Brooklyn and New York City had between them become the acknowledged capital of the sport. For a time, the “New York” game was rivaled by “Philadelphia” and “Massachusetts” varieties. But all the leading sports journals—like Porter’s *Spirit of the Times* and the

New York Clipper—were located here, and they gave tremendous nationwide coverage to epic contests played by “New York” rules; among these was the first intercity all-star match, in 1858, in which New York beat Brooklyn in a best-two-out-of-three series at the Fashion Course (to which tens of thousands paid admission, another first). With over a million readers devouring such stories, and sports papers issuing series on the history of the game, and baseball editor Henry Chadwick of the *Brooklyn Daily Eagle* devising a scoring system, the metropolitan version of the game soon became standard throughout the nation. In yet another indication of the city’s imperial outreach and cultural clout, its native sport had become the national pastime.

Even as it careened toward a more competitive, commercial format, baseball remained predominantly a middle-class affair. In the late fifties roughly a quarter of the players were businessmen and professionals. Half were clerks and small proprietors (occupationally based teams of schoolteachers, physicians, even clergymen had become popular). But the percentage of artisanal ballplayers had also risen rapidly. Skilled workers now constituted a quarter of the players in Manhattan and an even larger component in Brooklyn, though virtually no laborers had time for baseball. But if by 1860 baseball had become a sport that straddled cultural boundaries, it is a sign of the degree to which the game had been indelibly molded by its middle-class progenitors that newcomers like butchers and volunteer firemen, who leaned toward more rowdy pursuits, accepted the rules, conventions, and even the adherence to decorum laid down by their predecessors. The spread of baseball, some thought, was a triumph of the civilizing process.

The respectable classes had carved out a social and psychological location for themselves vis-à-vis the uppertens, by stressing their shared gentility while disavowing undesirable aristocratic elements. But in moving closer to the city’s elite they distanced themselves culturally as well as physically from the less respectable orders. They could play ball with artisans who accepted their standards of propriety but had only scorn for mechanics who did not. With refinement open to all, they reasoned, the lower sorts had only themselves to blame for their vulgarity.

By mid-century organs of middle-class opinion like *Harper’s Monthly* were making ever more condescending references to manual laborers: their

sun-darkened skin, tattered clothes, rough hands, mental sluggishness, even their “bestial” character. The widening cultural divide was enormously exacerbated by the fact that, in an astonishingly short period of time, the class landscape had been drastically rearranged. Most merchants, professionals, shopkeepers, and clericals could consider themselves socially superior, not simply because the city’s laboring force still worked with its hands but because, augmented by a torrent of immigrants, it had become overwhelmingly alien in tongue and habit.

City of Immigrants

Ireland, the summer of 1845: the air reeked with a sickly odor of decay as the potatoes blackened and died. Nearly a third of the crop rotted that year, nearly all of it the next. Starving men and women ate grass, then died along the roads. Skeletal children grubbed the fields in search of food, their faces “bloated yet wrinkled and of a pale greenish hue.” Before the famine ended five years later, as many as a million and a half people would perish, most of them poor laborers and cotters.

England, whose imperial exactions had led to the crisis, now worsened it. The British government required relief committees to sell rather than give food to the starving, lest charity foster dependency. It permitted cattle and grain to flow out of Ireland rather than tamper with the free market. It supported Protestant landlords in evicting over half a million tenants. (Soon, crowed the *London Times*, “a Celtic Irishman will be as rare in Connemara as is the Red Indian on the shores of Manhattan.”) Of the two million sons and daughters of Eire who eventually escaped the devastation, perhaps three of every four headed for the United States. Crammed below decks in “coffin ships” by shipmasters bent on maximizing returns, more than one in every ten didn’t survive the journey.

Thousands of peasants in the southern and western German states also fell victim to the potato blight and made their way to Bremen, where they booked passage for the United States. Joining them were thousands of other Germans: small proprietors forced off the land by agricultural depression, spinners and handloom weavers unable to compete with English textiles flooding down the Rhine, skilled shoemakers and furniture makers facing proletarianization, and handfuls of merchants and manufacturers frustrated by economic stagnation and political repression.

Emigration from German states accelerated following the suppression of the short-lived revolutions of 1848. The recapture of Berlin by forces loyal to the Prussian monarchy precipitated a flight of craft workers, small shopkeepers, and intellectuals, all of whom had backed a program of radical social and economic change: universal suffrage, socialized workshops, a

minimum wage, a ten-hour day. They too set their sights on America. *Kein König da*, said the republicans among them—no king there. “Since Capital so commands Labor in the Fatherland,” explained a group of radicals departing Baden, they would go to a new country “where the reverse relationship prevails.”

In the gray industrial towns and villages of England rose still another stream of emigrants, including unemployed handicraft workers, disgruntled factory hands, and defeated Chartists. A largely working-class movement, Chartism had hoped to secure economic justice through political reforms: universal manhood suffrage, secret balloting, and annual Parliaments. In 1848, after a decade of having their petitions rejected by Parliament, Chartists talked about linking up with European revolutionaries, but a combination of internal division and government suppression squelched their attempt to march on Parliament. Many fled to America, scant steps ahead of the police, beaten yet unrepentant. (Similarly defiant were the defeated Italian veterans of the 1849 war for independence from Austria, among them Giuseppe Garibaldi, who settled on Staten Island in 1850.)

Irish peasants, German craftsmen, English Chartists—America was their common destination, and it was New York, now the principal western terminus of transatlantic traffic, where they converged. Between 1820 and 1839, better than 667,000 immigrants had arrived in the United States. Some 501,000 (75 percent) of them entered at the Port of New York, a yearly average of around 25,000. Between 1840 and 1859, however, the total number of immigrants soared to 4,242,000. Forty percent were Irish, 32 percent were German, and 16 percent were English. Three out of every four entered at New York, approximately 157,000 per year on the average. In 1854 alone, setting a record that stood for decades, the United States accepted 428,000 immigrants. Of that number, roughly 319,000 (75 percent) descended on Manhattan—more than the entire population of the city in 1840!

Only a minority of these immigrants became permanent residents. Every year, as a general rule, perhaps three of every five departed immediately for the interior. Others moved on after a short stay. Of the more than three million immigrants who passed through the city between 1840 and 1860, maybe one in five or six remained—but this was enough to help drive the population of New York City from 313,000 to 814,000 and that of Brooklyn

from 11,000 to 267,000, an aggregate increase of some 757,000 people. In 1845 Manhattan had been half the size of Paris; by 1860 it had over a million inhabitants and had pulled even with the French metropolis.

New York's surging population wasn't wholly the result of foreign immigration. The villages of New England, New Jersey, and Long Island continued to export men and women to the city, as they had since the 1790s. The pace of this migration quickened during the 1830s and 1840s as a ramifying network of canals and railroads brought New York's older agricultural hinterlands into direct competition with more productive farmsteads around the Great Lakes and west toward the Mississippi. Thousands of marginal growers and stockmen left the land altogether and went to Manhattan in hopes of making new lives for themselves; others joined a burgeoning corps of farm laborers, wandering between town and country in search of seasonal employment, here successful, there obliged to subsist "on the good-nature of relatives, landlords, or grocers, so long as they can, and then make their choice between roguery and beggary." Also on the move were numerous small-town craftsmen and retailers whose livelihoods had been destroyed by the expansion of urban manufacturing.

Although native migrants (sometimes called "buckwheats") had a good deal in common with their immigrant counterparts—above all, the confusion and resentment of lives thrown into disarray by the advent of new capitalist economies—it was the immigrants, more alien and far more visible, who had the most profound impact on New York. By 1855 over half the city's residents hailed from outside the United States: 176,000 from Ireland, another ninety-eight thousand from Germany, and thirty-seven thousand from England, Wales, or Scotland. Two of every three adult Manhattanites had been born abroad.

New York City was no novice at handling large-scale immigration, but never before had it confronted anything like this inundation. Where the English had overborne the Dutch in a century-long evolutionary process, this demographic revolution took but twenty years. It was as if a second city had sprung up, virtually overnight—not encamped across the river but superimposed atop the older metropolis. Newcomers in such numbers would not be stirred and dissolved in some metropolitan melting pot.

RECEPTION CENTER

By the early 1840s up to forty passenger ships might drop anchor off Manhattan every day, the biggest carrying as many as a thousand men, women, and children in steerage. As lighters and steamboats shuttled their cargoes to shore, bedlam engulfed the waterfront. Clattering wagons careened around heaps of boxes and crates. Newsboys, peddlers, apple sellers, and hot-corn girls elbowed noisily through the crowds. Throngs of bewildered newcomers milled about, searching for friendly faces and familiar voices. “Runners” wearing bright green neckties and speaking in thick accents competed to channel their “fellow countrymen” to boardinghouses along Greenwich Street—charging them exorbitantly or robbing them outright—or booked them passage to points further west at rates that were the envy of swindlers everywhere. Hundreds, penniless and half starved, wandered into town, where they begged for food and hunkered in doorways.

Besides the din and disorder and sheer misery of it all, large numbers of those coming ashore had been exposed to typhus, cholera, smallpox, and other infectious diseases that ran rampant on immigrant ships. Under state legislation dating back to the 1790s, the visibly sick should have been dropped off at the marine hospital in Tompkinsville, Staten Island, until doctors certified their fitness to enter the city. Many captains regarded the law as a time-consuming nuisance and either ignored it altogether or surreptitiously landed passengers in places like Perth Amboy, New Jersey, from where they easily made their way to Manhattan.

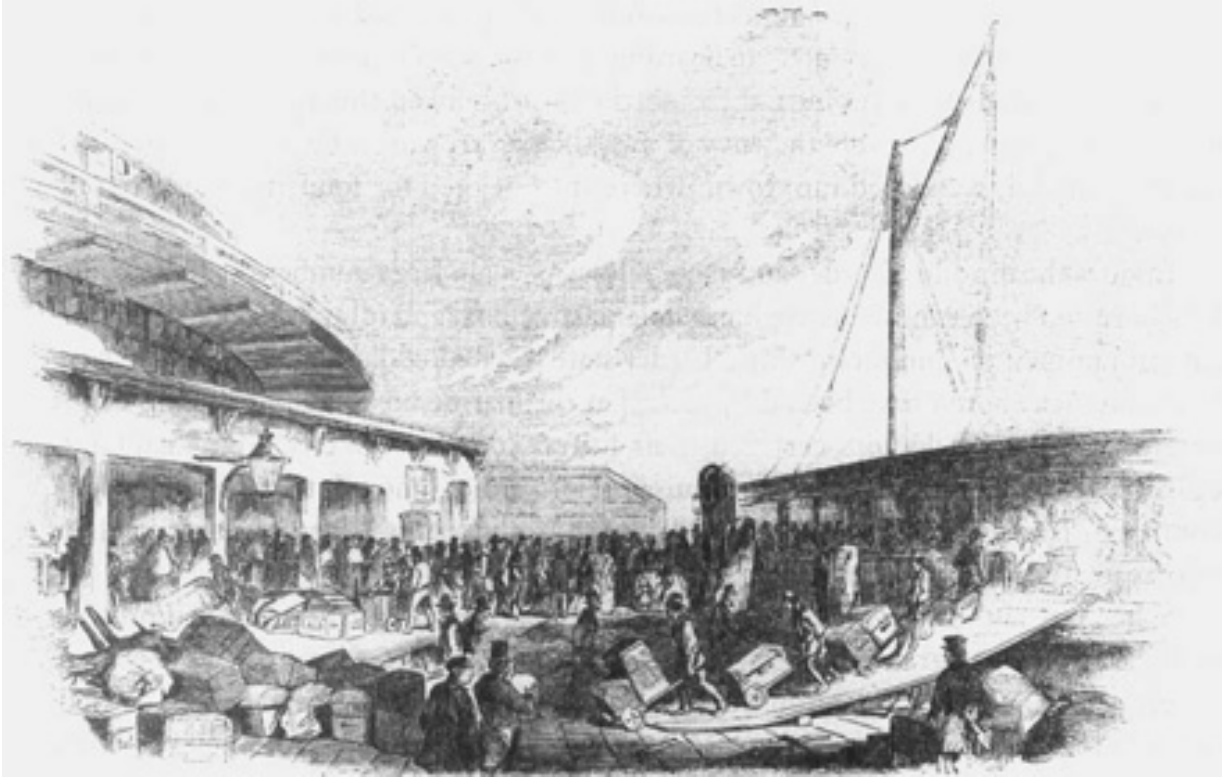

When city authorities proved unwilling or unable to provide even minimal protection to the new immigrants, associations of older ones stepped forward. The German Society set up an office on Fulton Street, and the Friendly Sons of St. Patrick busied itself with its compatriots’ problems. Most notably, the Irish Emigrant Society (1841) offered information about jobs and lodgings, filed complaints against charlatans, protested shipboard conditions, remitted money and prepaid tickets back to Ireland, and in 1850 established an Emigrant Industrial Savings Bank.

For all their energy, the private German and Irish organizations were quickly overwhelmed, and they demanded and got greater state support. In 1847, overcoming bitter opposition from politicians and would-be predators, they prevailed on Albany to create a Board of Commissioners of Emigration. The panel included the mayors of Brooklyn and New York, the

presidents of the German and Irish Emigrant Societies, and six gubernatorial appointees (six of the original ten were members of the Friendly Sons). The legislature empowered the new board to organize and reform the entire process: inspecting inbound vessels, helping immigrants find work, and arranging food, lodging, and medical care for those who had been in America for less than the five-year naturalization period. Funds to pay for it all were gathered by taxing the captain of each arriving vessel a dollar per passenger.

The commission would receive considerable criticism in the coming years. More than a few members had vested interests of one kind or another in the immigrant traffic, and periodic investigations turned up evidence of persons in their care being victimized by poor medical care, bad food, and dirty lodgings. But overall the commissioners accomplished a great deal, starting with a mammoth emergency medical relief program for the thousands of arriving sick and destitute. In 1847 they set up the Emigrant Refuge and Hospital on Ward's Island, rapidly expanding it from a handful of temporary buildings until by the mid-1850s it was the largest hospital complex in the world.

In 1855 the commissioners converted Castle Garden into the Emigrant Landing Depot. The nation's first immigrant reception center significantly reduced the abuses to which newly arrived aliens had been subjected for years. After ships had passed through the Quarantine Station, six miles below the city, they anchored off the Castle Garden pier, where they were inspected by medical officers and customs officials, and their passengers were barged to the great stone rotunda. Here, clerks of the Emigration Commission supervised the collection and weighing of baggage, enforced uniform porters' fees, steered travelers to approved agents of railroad and steamship companies, and maintained an official cashier to prevent price-gouging, extortion, and other frauds. In conjunction with labor contractors and manufacturers, the commissioners opened an Intelligence Bureau and Labor Exchange in Castle Garden and began sending tens of thousands of unskilled immigrants every year to the interior to take work on farms and construction crews, in mines and factories, as laborers and domestic servants.

Immigrants arriving at the new Emigrant Landing Depot, formerly Castle Garden. From Frank Leslie's Illustrated Newspaper, December 29, 1855. Here some seven million immigrants, mostly Irish and German, would enter the United States over the next thirty-five years. (© Collection of The New-York Historical Society)

Nowhere, however, would the torrent of immigrants have greater impact than in New York City itself. The new arrivals would transform every aspect of life in the metropolis—its patterns of work, housing, religion, politics, and gender—and nowhere would the impact be more dramatic than in the arena of class relationships. Some of the better-off immigrants filtered or fought their way into the city's upper and middling ranks, but the overwhelming mass of them piled into the laboring classes, ousting or overbearing their predecessors in almost every trade. By the late 1850s New York's predominantly Anglo-Protestant middle and upper classes would confront a reconstituted working class of which better than three-fourths were foreigners.

IMMIGRANTS AT WORK

New York's had long been a niche economy, its sectors colonized by competing social groups. Newcomers broke into (or were repulsed from) particular occupations depending on the skills and resources they brought with them and the degree of resistance or encouragement they faced from those already entrenched.

Bourgeois occupations remained relatively open to new arrivals, particular those with access to foreign capital or commodities. These included Gustav Schwab, who represented North German Lloyd, a steamship line that began direct service from Bremen to New York; Bavarian emigré Joseph Seligman, who in 1846 opened a successful drygoods importing house; and B. Westermann and Company, who distributed German books, pamphlets, and periodicals to the rapidly growing German-American market. By 1855 fully 25 percent of New York's top ten thousand taxpayers hailed from foreign countries.

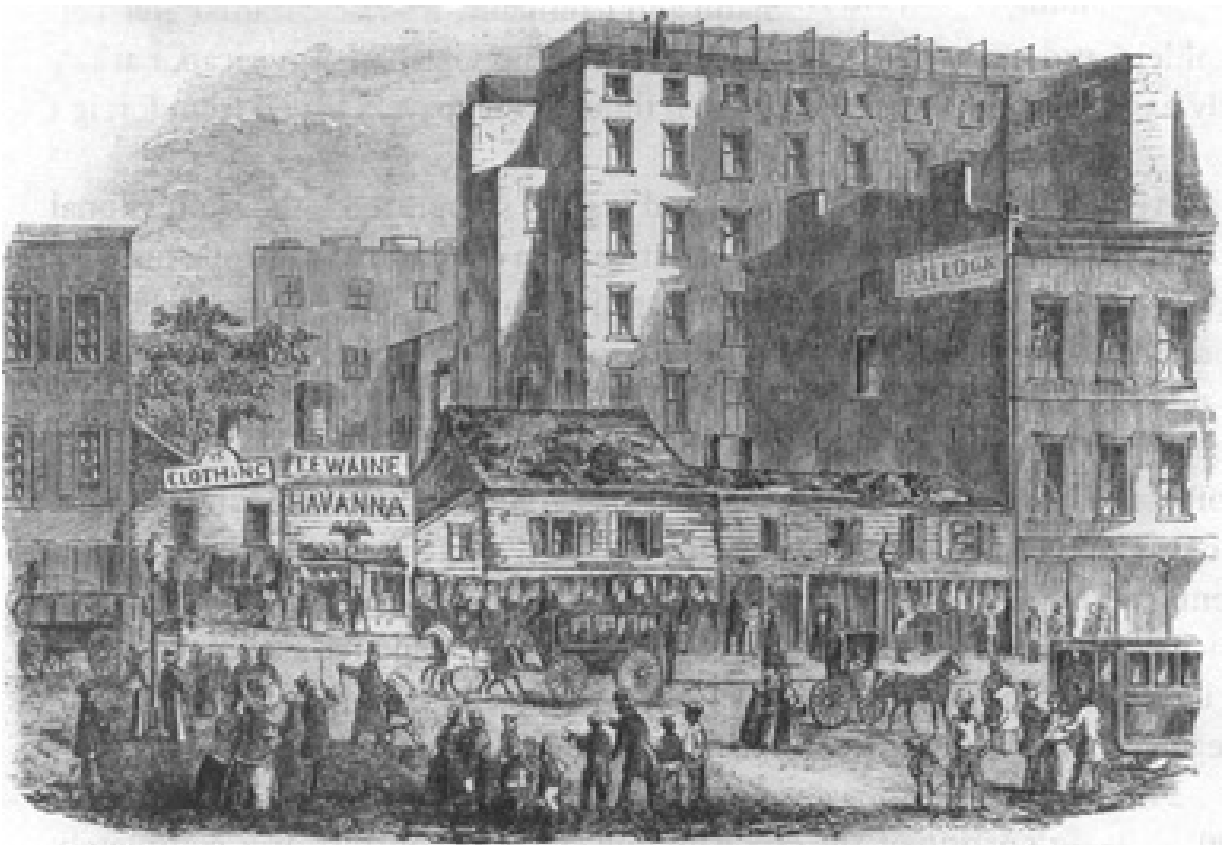

Fewer lawyers, pharmacists, ministers, and teachers migrated—the professional and clerical middle class remained 85 percent native born—but there were openings for people to service their respective ethnic communities. German journalists and editors found work at the many papers that sprang up to serve the German-language community. Twenty-eight appeared between 1850 and 1852 alone, including the *New Yorker Staats-Zeitung*, published by Oswald Ottendorfer of Moravia, who had fought on the barricades of Vienna in 1848: by 1860 it claimed the largest circulation of any German paper in the world. German doctors were in great demand to staff the Ward's Island establishment, and by the mid-1850s they constituted an estimated one-third of New York's physicians. Abraham Jacobi, who arrived shortly after being released from prison for his role in the Revolution of 1848, was readily accepted by his American counterparts and began a lengthy career promoting the new field of pediatrics at the College of Physicians and Surgeons.

The shopkeeping portion of the city's middle class, by contrast, was completely transformed, in considerable measure because the immigrants' arrival coincided with, and further exacerbated, a breakdown of New York's public market system. Guided by the new *laissez-faire* mentality, the municipality allowed existing markets to deteriorate—apart from Washington Market, which was so lucrative the city replaced it with a larger

one—and refused to build new ones in the emerging uptown areas (the farthest north the system reached was 10th Street).

This nonexpansion policy created a vacuum, which thousands of small retailers—chiefly immigrants—rushed to fill. Many started as peddlers: Irish women hawked vegetables from streetcorner stands, Germans purveyed small manufactured goods, and Italians sold fruit and flowers. Increasingly, however, Irish, Polish Jews, and arrivals from the mercantile regions of the lower Rhine valley opened independent corner grocery stores. By the mid-1850s the grocery business was dominated by Germans, some of whom had come with capital from the old country, others of whom worked their way up from peddling. Many in turn purchased their supplies from immigrant German farmers who commenced market gardening along the Brooklyn shore from Williamsburgh to Astoria, on well-tilled farms in Flatbush, and even in the pastures, meadows, and woodlands of upper Manhattan. Germans also made substantial inroads as butchers, tobacconists, and newsstand dealers, and by 1855 there were fifteen hundred German bakers, including nine Jewish bakers who could prepare matzo for Passover.

Immigrants moved into the dry-goods trade as well. Long-bearded Jews, recently arrived from Bavaria, Bohemia, Moravia, and Posen, opened used clothing stores along Chatham and Baxter Streets, creating a bazaar-like atmosphere where haggling was the rule. The Irish ran secondhand shops too but dealt more in iron, brass, and copper: by 1855 224 of the city's 245 junk dealers were immigrants. Successful secondhand clothiers often moved on to establish their own dry-goods stores. By the end of the 1850s German-Jewish shops lined Houston, Division, Bowery, Grand, and lower Broadway. Irish clothiers were fewer in number (eighty-one out of the city's 403 in 1855) but did very well indeed. By the 1850s Patrick Rogers of County Tyrone, who arrived in 1836 as a half-trained tailor, was running a prosperous men's clothing store at Nassau and Fulton, with a retail salesroom and a wholesale warehouse that dealt with merchants across the United States. And Charles Knox, a genius at self-promotion, rose from a basement contracting business to being New York's best-known hatter, personally fitting out rich Manhattanites with new silk toppers and purveying his goods to the nation.

This cluster of second-hand clothing shops along Chatham street reflected the movement of new immigrants—in this instance German Jews—into small-scale retailing during the 1850s. (© Museum of the City of New York)

Dealing alcohol was another route to middle-class status. Irish constituents of Tammany Hall found it particularly easy to get a liquor license from the Board of Aldermen. Many opened porter houses for day laborers, cartmen, and sailors, while others started taverns frequented by skilled artisans, clerks, and tradesmen. Germans specialized in beer halls and wine gardens. Most of these were “lokals,” lively family venues whose regulars came from particular neighborhoods, trades, vereins (organizations), or old country regions, but some were mammoth enterprises. The Deutsches Volksgarten, Atlantic Gardens, and Lindenmuller’s Odeon could seat twelve to seventeen hundred in frescoed halls, and the Concordia and Germania included meeting halls, bars, ballrooms, billiard rooms, and bowling alleys. Liquor flowed as well in half a dozen German-owned hotels, most famously Eugen Lievre’s Shakespeare

on Duane Street, rendezvous for literati, freethinkers, and socialists. According to Police Chief Matsell, fifty-five hundred establishments were licensed to sell liquor in 1855.

For all these entrepreneurial successes, the great majority of immigrants wound up in the manual labor force. Indeed they *became* the manual labor force: by 1855, only twenty-four thousand native-born whites (17 percent) were doing artisanal or unskilled labor, and a significant proportion of these were clustered in a handful of occupations, notably building and printing.

Immigrants dominated some trades by virtue of special skills. German brewers brought a new product with them. New Yorkers were accustomed to English top-fermented ales, porters, and stouts, which tended to spoil in the hot American summers. Frederick and Maximilian Schaefer, immigrants from Prussia, brought over some bottom-floating yeasts and began producing German lager at a brewery on Fourth Avenue between 50th and 51st streets. Lagers were more highly carbonated, less heavy and less intoxicating, and they kept better. By the 1850s New York had gone mad for lager, and competitors had launched operations in Williamsburgh, Bushwick, and the Bronx, where land was cheaper. By 1860 forty-six breweries were in operation, most consisting of a brewmaster and five to ten workers.

Pianomaking was another specialized trade in which Germans excelled. In 1849 Heinrich Steinweg dispatched his son, then facing reprisals for revolutionary activities, to New York City. His glowing reports about Manhattan's status as center of the growing U.S. piano industry fetched the elder Steinweg and family in 1850, and in 1853 they formed Steinway and Sons. (Steinweg anglicized the company name, because English pianos were reckoned the best, but kept his German name for some time and didn't bother learning English.) His timing proved perfect, as refined New Yorkers were demanding parlor accoutrements, and when sales blossomed, Steinway and Sons purchased (in 1858) a site virtually next door to Schaefer's brewery. The firm installed enormous steam boilers and a Corliss engine to run the plant's saws, lathes, planes, and elevators, becoming the first industry in New York to mechanize on such a grand scale; by 1860 the company employed three hundred workers.

Cigarmaking had been a substantial industry in Hamburg and Bremen, but in the 1850s the German men (many of them Jewish) who handcrafted

expensive cigars faced competition from poorly paid rural women churning out a cheaper product. Thousands migrated to New York City, and soon the old tobacco town became the capital of the North American cigar industry.

English machinists were in great demand to design and develop machine tools—a virtually brand-new trade requiring a knowledge of mathematics, metallurgy, and engineering. English, Scottish, or Welsh printers did well too, constituting nearly half the city's total in 1855. German printers brought their own fonts and printed prayer books and wedding certificates for German-Jewish synagogues; they also worked for German book, newspaper, and magazine publishers and for English periodicals, like *Frank Leslie's*, that started up German editions. (In 1851 Charles Dana, Greeley's associate at the *Tribune*, made a bid for German readers by hiring Karl Marx as a European correspondent.)

For many of these skilled craftsmen, life in boomtime New York was a distinct improvement on their former condition. In 1851, attempting to demonstrate immiseration, the *Tribune* printed a workingman's budget that allowed “only” 2.8 pounds of “butchers meat” (roasts and chops, not innards) per person weekly. But an annual consumption of 146 pounds of meat was three times that available to London's workers, and well-nigh unimaginable to new arrivals from devastated Ireland, used to grains and tubers. Enough Irish ate themselves sick on arrival for the Shamrock Society to warn against an “abundance of animal food to which [they were] unaccustomed.” Refugees' letters back to Ireland reveled in relating the sheer quantity, variety, and cheapness of food in the mouthwatering metropolis.

Many skilled workers could also afford inexpensive furniture (a bed, some chairs, a chest), a stove, perhaps even a swatch of carpet from Hiram Anderson, the Bowery dealer who billed himself as “Carpet Merchant of the People.” Better-paid Irish craftsmen could afford good quality ready-to-wears: “I wear as good a suit of cloths as any Gentleman in the City of Cork, and twenty dollars' worth of a watch in my pocket,” said an Irish boxmaker in 1852.

These luxuries, to be sure, were tentatively held: the slightest dip in the economy and the watches were off to the pawnshop. And most immigrant craftsmen fared far less well. German and Irish tailors, woodworkers, and shoemakers had fled proletarianization, hoping to reestablish themselves as

traditional artisans. But the same capitalizing process was at work in New York and was accelerated by their arrival. Some highly skilled German furniture makers, many with experience in the finest Paris workshops, did obtain custom craft work in firms like Duncan Phyfe's. Most, however, cranked out cheap chairs and cabinets in small "slaughter shops," with one to five employees. These outfits, competing desperately to sell their products at wholesale auctions or to large mercantile houses, underbid rivals by driving down wages so steeply that where in 1836 cabinetmakers had made from twelve to fifteen dollars a week, a decade later the majority made less than five. Shoemakers were reduced to putting-out work in cellar workshops, aided by their families.

The garment industry—the city's largest—was utterly reconstituted. By 1855 95 percent of New York's tailors had been born abroad; of that number 55 percent were Germans, 34 percent Irish. Some became petty contractors, bidding (and underbidding) for the right to transform the precut cloth supplied by big companies into finished suits and shirts. Some became cutters in the large firms. Most, however, sewed at home for a contractor, at piece rates so low that by the 1850s journeyman tailors, aided by their wives and children—"A tailor is nothing without a wife, and very often a child" went a maxim of German craftsmen—worked sixteen hours a day but seldom cleared more than ten dollars for a seven-day week.

Some Irish garment manufacturers did far better. Daniel Devlin came to New York in 1844 from Donegal, married the daughter of a wealthy Irish American, and did custom tailoring for the city's leading Catholics. Devlin also pioneered in manufacturing quality discount clothing—he was one of the first in the city to use the new sewing machine—and his line proved popular with upwardly mobile immigrants. By the late 1850s Devlin and Company's store, at the corner of Broadway and Warren, was the biggest men's clothier in New York after Brooks Brothers. But Devlin's accomplishments rested on a huge force of chiefly Irish workers—150 in-house cutters and clerks, and two thousand out-work tailors who labored in their boardinghouses. Devlin paid his men better than average wages by the standard of the day, but that standard was in free fall and soon plunged to seventy-five cents a day.

Female seamstresses might make as little as seventy-five cents a *week*—when they could find work at all in the highly seasonal and competitive

industry. By 1855 two-thirds of New York's dressmakers, seamstresses, milliners, shirtmakers and collarmakers, embroiderers, and those who turned out artificial flowers for the high-fashion hats of wealthy ladies, were foreign born (64 percent of them Irish, 14 percent German). Living right at the edge, some occasionally fell over. Two German sisters, Cecelia and Wanda Stein, migrated to New York in 1852, both unmarried, Wanda the mother of an illegitimate child. They labored at doing embroidery, but in 1855 their employer went out of business; times being particularly hard, they couldn't find other work. With the rent due and the larder empty, having borrowed all they could and being unwilling to take up whoring, the sisters spent their last pennies on some flowers, spruced up their dreary room, and got into their bed with the six-year-old, and all took a terminal drink of prussic acid.

Below the ranks of these skilled and semiskilled immigrants lay the battalions of Irishmen and German laborers whose sheer muscle power, as even the most xenophobic New Yorkers were prepared to agree, rapidly transformed the cityscape. In 1855 Irish immigrants made up 87 percent of New York's unskilled laborers; it was the largest single occupation for Irish males. Some slotted into existing industrial hierarchies at the bottommost ranks: at the Novelty Iron Works, they were hired for such part-time jobs as moving a newly cast thirty-five-ton bed plate through the yard and hoisting it into a ship's hull. Irishmen also carved out particular niches, especially in construction and transport, often at the expense of African Americans.

With construction booming, Irishmen opened lumberyards, stoneyards, and coalyards and established themselves as building contractors—ethnic middlemen who assembled and managed work crews. By 1860 there were 166 incorporated construction companies. These outfits afforded better-paid jobs for carpenters, masons, and stonecutters skilled in using the new planing machines and steam-powered stone-dressers. However, they relied chiefly on thousands of Irish laborers for the raw manpower needed to complete the Croton Aqueduct High Bridge, build the Hudson River Railroad from Manhattan's West Side up through the northernmost Bronx, and double-track the New York and Harlem up the Bronx River Valley to White Plains. In Brooklyn, Irishmen filled in the boggy Red Hook marshlands, erected the new docks there, deepened the Buttermilk Channel, and enlarged Fort Hamilton. In Queens they drained meadowlands, filled

swamps, and drove turnpike roads east from Hallet's Cove to Flushing Creek (one them being today's Astoria Boulevard) and south along the riverbank over Newtown Creek's first bridge through Greenpoint on to Williamsburgh (including today's Vernon and Manhattan avenues).

Irishmen reigned supreme in horse-reliant transport. They sat atop hacks, omnibuses, stages, and horsecars—in foul as well as fair weather—and piloted private coaches around town, often suited up in livery. Many found jobs taking care of animals—one agrarian skill transferable to the city—and by 1855 Irishmen accounted for 84 percent of immigrant hostlers. After 1849, when the Common Council, urged by businessmen seeking improved transport, ended ancient restrictions on the trade, Anglo- and Dutch-American one-horse entrepreneurs found themselves in competition with capitalist carting companies who hired immigrant wage-workers. By 1855 there were over eight thousand cartmen (up from thirty-four hundred in 1840), and the bulk of them were Irish.

Irishmen took over New York's docks as well. “Along the wharves, where the colored man once done [*sic*] the whole business of shipping and unshipping,” noted one African-American newspaper, “there are substituted foreigners or white Americans.” On any given day five or six thousand of these “alongshoremen” moved mountains of cargo off ships and around the port, roaming from pier to pier for the “shape-ups” at which native-born stevedores amassed work crews. The work was hard, poorly paid, and erratic. While waiting for ships to arrive or weather to clear, men hung around local saloons, took alternate jobs as teamsters, boatmen, or brickmakers, and relied on the earnings of their wives and children.

Others went to sea. Here too their arrival noticeably whitened the labor force. Captains relied increasingly on waterfront crimps to assemble crews, and these men, often Irish proprietors of taverns or boardinghouses, tended to favor their own. Black sailors were pushed to the bottom of an already wretchedly exploitative industry. (The glorious clippers were known to seamen as “blood boats.”)

It was much the same with service jobs. Gardeners on upperten estates overlooking the Hudson and Harlem rivers were 90 percent German, Scots, or French by 1855, and immigrants made deep inroads on traditionally black niches in barbering and hotel and restaurant work. Immigrant women competed with blacks for positions as hotel maids, waitresses, cooks,

nurses, and washerwomen. By 1855 more than twenty-five “intelligence offices” were placing streams of applicants as household domestics, usually young, single, and recently arrived Irish girls in need of a place to stay as well as work. It was hard work, and the fifteen- or sixteen-hour days, six and a half or seven of them a week, brought in only four to seven dollars a month plus room and board. Still, it seemed better than sweatshop labor, and by 1855 Irish women made up 92 percent of a domestic workforce once overwhelmingly black. “Every hour,” wrote black spokesman Frederick Douglass in 1853, “sees us elbowed out of some employment to make room for some newly-arrived emigrant from the emerald isle, whose hunger and color entitle him to special favor.” There was precious little satisfaction in noting that “in assuming our avocation,” as Douglass put it, the Irish have “also assumed our degradation.”

SETTLING IN

People had marveled at the almost overnight construction of uppertendom’s fashionable *quartier*, but they were boggled by the emergence of a huge German metropolis within their precincts. If Manhattan’s Germans had set up their own city in 1855, it would have been the fourth largest urban agglomeration in the United States—third largest if joined by Brooklyn’s Germans. New York City had become one of the three capitals of the German-speaking world, outranked only by Berlin and Vienna.

Roughly half these newcomers were crowded into a mammoth ethnic enclave known as Kleindeutschland (Little Germany). The phenomenon was new to New York, new to the United States. Never before had tens of thousands of foreigners, to whom the English language and American ways were virtually unknown, congregated in such close quarters.

At first, the nucleus of Kleindeutschland lay within a five-block span between Canal Street and Rivington Street. The cobbled or unpaved north-south arteries of Elizabeth, Bowery, Chrystie, Forsyth, and Eldridge were lined with two- to four-story buildings (many of wood) behind which, reached by a maze of alleyways, lay internal courtyards crowded with industrial workshops. From this initial base camp, immigrants pushed north above Houston toward 14th Street in the 1840s and 1850s and east from Third Avenue, through the alphabet avenues, down toward the East River

shore, which grew dense with breweries, coalyards, factories, shipyards, and slaughterhouses.

To outsiders Kleindeutschland, with its wealth of German shops, seemed a uniformly Teutonic mass, but the area was far from homogeneous. Quite apart from the admixture of Irish, English, and older American residents, the “German” residents in fact hailed from very different cultural and linguistic regions. “Germany,” after all, was a patchwork of thirty states, and on close inspection Kleindeutschlanders dissolved into a welter of Plattdeutsche and Hessians, Bavarians and Prussians. They were fragmented and spatially sorted along religious lines too. German Jews, for example, concentrated at first in the area bounded by Grand, Stanton, Ludlow, and Pitt. It was here, on Norfolk Street between Rivington and Delancey, that Anshe Chesed built its synagogue in 1849. In the 1850s Jews pressed north with their fellow Germans.

The remainder of the new Germans headed for the urban frontier and formed villages composed substantially of countrymen, much as did their peers who settled in Argentina and Chile. In Manhattan, Yorkville was the leading outer enclave. Between 76th and 100th streets—north of the fire district—cheap wooden housing was available. It was also possible to find work close by or to commute downtown by horsecar. In Brooklyn, Germans constituted two-thirds of the population of Williamsburgh as early as 1847, and Bushwick became known as Dutchtown, from a phonetic rendering of “Deutsch.” Those without local jobs in the tailoring shops or shipyards could float to work, reading their *Long Island Zeitung*, on steam ferries that arrived every five minutes at Kleindeutschland’s Grand Street. Up in Westchester, Gouverneur Morris II—his ancient manor lands now profitably accessible from Manhattan via the New York and Harlem Rail Road—began to sell off parcels to Germans, among others, and they flocked to villages like Morrisania, Mott Haven, Port Morris, and Melrose.

In Queens, College Point emerged as an industrial town that might well have been transplanted from Germany’s Ruhr region. After Conrad Poppenhusen’s Hamburg vat dyeing business was destroyed by fire, he moved his family to Williamsburgh in 1843 and began manufacturing whalebone brushes, combs, and corset stays. Just as whaling declined in the early 1850s, Poppenhusen learned that Charles Goodyear had figured out how to transform natural rubber into a whalebone substitute. As Goodyear

was also strapped for funds, Poppenhusen loaned him considerable sums in return for rights to *his* discovery. He then established the Enterprise Rubber Works at pastoral College Point and developed a company town around it. He drained marshes, built a cobblestone road to Flushing, brought in water, streets, and gas, and built homes for the employees whom Poppenhusen's agents recruited from among the disembarking German immigrants. The little town grew from a few hundred in 1853 to over a thousand in 1855 and two thousand by 1860.

Germans also flocked to satellite cities in New Jersey. Between 1840 and 1860 Newark's population soared from seventeen thousand to seventy-two thousand, Jersey City grew from three thousand to thirty thousand, and Hoboken boomed as well. Substantial percentages of these new urbanites were German (and Irish) immigrants— 40 percent in the case of Jersey City— attracted to the manufacturing establishments of Essex and Hudson counties.

Irish immigrants were less densely concentrated. Their only counterpart to imposing Kleindeutschland was the dilapidated stronghold of the Five Points. Here Hibernians clustered by kin and county—a clutch of Corkonians on Mulberry Street, a cluster of Kerryonians on Baxter. But while the Sixth Ward was more Irish than ever, most African Americans having departed, it remained home to Germans, Italians, Chinese, some remaining blacks, and a multinational assortment of sailors.

Rather than joining their compatriots, most incoming Irishmen settled wherever they could find work. As this was usually on far-flung construction projects, their communities were dispersed throughout the metropolitan region. In the Bronx, Irish laborers who built the Croton High Bridge settled in Highbridge; those who worked on the New York and Harlem opted for villages along its path—Melrose, Morrisania, Tremont; and those driving the Hudson River Railroad into the northwestern Bronx gravitated to Kingsbridge. In Queens, those building turnpikes and draining meadows were drawn to Astoria's "Irishtown," whose local byways bore names like Emerald or Shamrock Street. In Brooklyn, "Irish Town" referred chiefly to the substantial enclave around the Navy Yard, but there were others. Brooklyn Irish laid out Bedford's streets and horsecar lines, then stayed on as residents (immigrants constituted 70 percent of Bedford's population in 1855, and three-fourths of these were Irish). Red Hook

housed the Irishmen who built and worked its docks, brickyards, distilleries, warehouses, and factories. By 1855, out of Brooklyn's total population of 205,250, roughly a hundred thousand were foreign born (47 percent compared to Manhattan's 51 percent), and of these fifty-seven thousand were Irish, twenty-six thousand German, and eighteen thousand English.

The diversity of immigrant settlements was matched by the variety of housing conditions. While some immigrants' dwellings were quite substantial, certainly superior to those they had just fled, overall the standard of working-class accommodations in New York City went into steep decline. The 1837-43 depression had virtually halted new construction, so the vast numbers of newcomers were rolling into a seriously understocked city. Propertied New Yorkers responded to the sudden and intensive demand for shelter either by cramming newcomers into existing housing or by building a new kind of structure, the "tenant house" or tenement, designed specifically as a multifamily worker dwelling.

In lower Manhattan, especially around the Five Points, cramming was the strategy of choice. Landlords converted frame houses built for single artisan families into rabbitwarrened boardinghouses, jammed renters in, then jammed some more into sheds and stables. By 1850 an estimated twenty-nine thousand people, most of them Irish, had become unwilling troglodytes, living in cellars, often with two or three families sharing a single soggy space. The Five Points' Old Brewery alone housed hundreds of poor Irish and blacks.

Kleindeutschland too was carved up and stuffed full: the elegant five- or six-story buildings on the north end of Tompkins Square (now Der Weisse Garten) that developers had hoped would house the native upper classes were sliced and diced into crowded rooming houses. But in Little Germany, the cumulative market power of even poorly paid laborers and artisans was so great that tenement construction became profitable. Some of the new three- to five-story buildings, especially along Avenues A through D, were solid brick structures. Many, however, were, as former mayor Hone put it, "so slightly built that they could not stand alone, and, like drunken men, require the support of each other to keep them from falling." Many were in insalubrious locations, stuffed into back lots, nearly flush with the walls of existing houses and privies. Most were stripped-down, amenity-free versions of the row houses developers were raising for the middle and

upper classes elsewhere around town. Most lacked “modern improvements,” apart from stoves, and were seldom linked up with water or sewer mains: working people used bedpans and privies long after the respectable classes had switched to water closets.

Tenement areas were intensely crowded. A tenement twenty-five feet wide and seventy feet deep might have twenty-four two-room apartments, each with a ten-by-ten-foot “parlor,” facing street or yard, and a windowless interior eight-by-ten-foot room, big enough for a bed. Such buildings would house a minimum of twenty-four families (plus boarders), but often more—one all-black tenement contained forty families—and when they were organized as boardinghouses for sailors and laborers, densities shot up higher still. Such crowding magnified the dangers of fire and disease, and indeed mortality rates began climbing sharply in the working-class wards.

Given these alternatives, large numbers of immigrants preferred to squat in shantytowns on the periphery of the city. At Dutch Hill, a promontory at 40th Street and First Avenue overlooking Turtle Bay (now the United Nations), Germans and Irish lived in log cabins and recycled railroad cars, the men laboring in nearby quarries, the women and children gathering rags and bones. Farther north lay Harlem—a “third or fourth-rate country village,” the Board of Aldermen called it in 1838, whose lands were worn out after centuries of use, and whose marshes reeked so badly they could “knock the breath out of a mule!” Yet Harlem was also full of lovely hills, woods, brooks, and meadows with river views, and the land was cheap or free. Irish families built one-and two-story frame houses around 125th Street in the 1850s or squatted on mud flats at the river’s edge in cottages pieced together from bits of wood, twigs, barrel staves, old pipes, and tin cans hammered flat. Many raised animals for local markets—geese, cows, horses, goats and such a profusion of hogs that the area around 125th Street was known as Pig’s Alley.

Along the west side, after the Hudson River Railroad opened along Eleventh Avenue in 1851, many threw up shanties in vacant lots between 37th and 50th (the future Hell’s Kitchen). Here they raised pigs and goats, scavenged for food and firewood, hired out as day laborers, and found jobs in the industrializing area. Further north, so many Irish families planted themselves in the African-American community of Seneca Village (bounded by 82nd and 86th streets and Seventh and Eighth avenues) that by

1855 they constituted a third of it. One of the first to arrive was Pat Plunkitt, an Irish immigrant laborer whose wife, Sara, gave birth to George Washington Plunkitt, later a political luminary. Another was an itinerant veterinarian named Croker, who plied his trade among the area's animals and sired little Richard, the future boss of Tammany Hall.

By mid-century, unable to find adequate housing in the city, thousands of immigrants were crowding into shantytowns scattered around upper Manhattan, safely outside the municipal fire limits. (© Museum of the City of New York)

Many immigrants simply bedded down in the streets. One 1850 account reported that “six poor women with their children, were discovered Tuesday night by some police officers, sleeping in an alleyway, in Avenue B, between 10th and nth streets. When interrogated they said they had been compelled to spend their nights where ever they could obtain any shelter. They were in a starving condition, and without the slightest means of support.” After the establishment of the Police Department in 1845, precinct houses began accommodating homeless people. In one six-month

period during 1853 they sheltered roughly twenty-five thousand, a number that would rise dramatically in hard times.

JEWES AND HUGHES

Through the 1830s New York had remained a Protestant town. The 1840s and 1850s immigration ended that dominance forever. Jews went from being an ecclesiastical sliver (five hundred in 1825) to a respectable religious minority of forty thousand by 1859. Catholics, a respectable minority in the 1830s, became the largest denomination in the city—with two hundred thousand congregants in 1855—and a temporal power in metropolitan affairs.

The mass migration of Jews to New York City was triggered when various German states, especially Bavaria, imposed severe economic and social restrictions, making business, travel, and even marriage increasingly difficult. With the arrival of thousands of German- or Yiddish-speaking Jews, the number of synagogues rose rapidly, reaching a total of twenty-seven by 1860. The immigration also created considerable internal strains in what had been a relatively harmonious population. German Jews, especially the more educated and wealthy among them, objected to holding services in Hebrew, which few understood. They also wanted preaching by a rabbi, the introduction of instrumental music, and the integration of sexes. Those inclined toward such practices organized their own “reform” congregation—Emanu-El (God Is with Us)—which soon acquired its own “temple” (first on Chrystie, then on 12th Street) and its own cemetery (at Cypress Hills on Long Island). By the 1850s Emanu-El was challenging “orthodox” Shearith Israel and B’nai Jeshurun for leadership of the Jewish community.

Many German Jews, as verein-minded as other Kleindeutschlanders, flocked to secular groups as well. By 1849 the combined membership of the fifty-odd Jewish organizations—charitable, social, and fraternal—exceeded by far the combined membership of the synagogues. Among the most important was the Independent Order of B’nai B’rith (Sons of the Covenant). It resembled the Odd Fellows and Masons in providing members with mutual aid and burial benefits, and by 1860 it had ten lodges and a thousand members. A Jewish press emerged as well. The *Asmonean*, the first successful Jewish weekly in the United States, was joined, in 1857, by the *Jewish Messenger*. In 1855 the “Jews’ Hospital in the City of New

York” opened its doors (it would be known after 1866 as Mount Sinai). Initially a project of the older Portuguese and English, it soon added immigrant Germans to its board and became the most prominent Jewish organization in New York City. All factions attended its charity banquets and balls; the spectacular affair at Niblo’s in 1858, graced by the mayor’s presence, was the most extravagant event of its kind ever organized by New York Jews.

The emergence of a full-blown Jewish community raised relatively few hackles among other religious communities in a city where congregants of Shearith Israel had long been a respected presence. Anti-Semitic caricatures of Chatham Street’s clothing dealers and pawnbrokers were prevalent, to be sure. A character in Melville’s *Redburn* recalls “walking up Chatham-street” and seeing “a curly-headed little man with a dark oily face, and a hooked nose, like the pictures of Judas Iscariot.” But most found it hard to distinguish German Jews from other Germans, and when they did, it was apparent that the newcomers were intent on fashioning a brand of Judaism that would be “acceptable” to the gentile majority. By 1856 Temple Emanu-El had switched from German to English.

Where the arrival of the German Jews—modest in numbers and demeanor—provoked no backlash, the arrival of hundreds of thousands of Irish immigrants provoked strenuous anti-Catholic outbursts. Yet the newcomers were by and large only nominally Catholic. Most cleaved to pre-Christian Celtic peasant traditions. In Ireland, the official dogmas about sex and sin that would characterize the postfamine Church had, as yet, made inroads only among better-off tenant farmers. Peasants continued to hold boisterous celebrations, wakes, and saint’s-day festivals that appalled the clergy, who were spread far too thinly (one priest per three thousand parishioners in 1840) to have more than marginal influence.

This state of affairs was reproduced in New York City. Many immigrants were ignorant of the simplest Catholic rituals and skipped even Sunday Masses; those inclined to go couldn’t afford pew rents, an American invention. Most hewed instead to rituals like wakes—festive and largely social events that left no room for a priest. The metropolitan hierarchy and the more affluent and anglicized among the laity were eager to church the immigrants, to be sure, but Catholicism was even weaker in New York than

in the old country: here there were only eight churches, and one priest for every eight thousand Catholics.

John Hughes, self-proclaimed “bishop and chief” of the Irish community, set out to transform this situation. With considerable assistance from the international Catholic community, he succeeded brilliantly in welding his scattered and dispirited countrymen and women into a coherent body. One of the first great “brick and mortar” priests, Hughes embarked on a mammoth building program, particularly in the uptown industrial wards into which his would-be parishioners were moving. He provided churches for the railroad builders who settled in Harlem and Yorkville villages, built the Church of Annunciation at Manhattanville (1853) for the Hudson River Railroad crews, and erected St. Paul’s on 59th Street for the shantytown squatters on the city’s western edge in 1858. By the 1860s nine new Catholic churches had been organized between 14th and 42nd streets, the overall total had gone from eight to thirty-one, and plans had been set in motion to erect a spectacular new St. Patrick’s Cathedral on Fifth Avenue.

Nor were outlying areas neglected. St. Raymond’s, established in 1843, was the first Catholic church in the Bronx. In southern Brooklyn, St. John the Evangelist was founded in 1846, with services held in nearby stables until its tall wooden structure at 21st Street off Fifth Avenue was dedicated in 1851. Two years later Brooklyn became a separate diocese under Bishop John Loughlin.

German Catholics presented a special problem. Hughes opposed “national parishes.” He wanted to preside over a unified community, not a congeries of ethnic ghettos. Nor was Hughes comfortable with the Germans, whose piety was of a fervent counterreformation variety. Nevertheless, when the Germans pushed to construct their own churches and use their own language, Hughes did not stand in their way. In 1844 Manhattan Redemptorists raised the Church of the Most Holy Redeemer, whose original wooden structure was replaced in 1851 with what German New Yorkers called their “cathedral,” and indeed Most Holy Redeemer’s 250-foot tower dominated the Kleindeutschland skyline. In all, seven German churches were established by 1860, along with mutual aid groups independent of those provided by the Irish-dominated Catholic hierarchy.

Hughes’s second priority was to train a cadre of priests and nuns. To this end he built St. John’s College (later Fordham) on 106 acres near the

Village of Fordham, twelve miles north of the city, newly accessible by railroad. Opened in 1841, presided over by the Rev. John McCloskey (later, New York's first cardinal), St. John's began preparing young men from wealthier Irish families for the priesthood and other professions. Hughes knew, however, that he had neither the priests nor the money to sustain such an institution, so he turned to the Jesuits, his worries about allowing such a powerful religious order into his bailiwick overridden by his desire to have the prestigious organization run his college. The Jesuits, finding the idea of a base in New York City appealing, purchased Fordham from the diocese in 1846. The following year they opened St. Francis Xavier, on West 16th Street in Manhattan, also to prepare men for the priesthood, the bar, and the medical professions. The same goals motivated the Christian Brothers to launch Manhattan College in 1849. All three institutions would be supported by—and in turn help create—a Catholic middle class. For females, Hughes arranged for the Madames of the Sacred Heart to begin the Academy of the Sacred Heart (1841), which moved in 1847 to the grounds of Jacob Lorillard's estate in Manhattanville. By 1850 local graduates and arrivals from Europe had brought the ratio of priests to parishioners down from one to eight thousand to (a still overwhelmed) one per forty-five hundred.

Hughes's third enterprise was to bring the children of the immigrants into the Faith. With the city and state having refused financial support to Catholic schools, the bishop made organizing parochial schools his top priority. A crash program, which ran up an immense diocesan debt, brought the number of Catholic schools to twenty-eight by 1854, embracing ten thousand pupils. A decade later, fifteen thousand students were attending twelve select and thirty-one Catholic free schools in New York, and there were another twenty-eight institutions in the Diocese of Brooklyn.

To staff these schools, Hughes traveled to Ireland, England, and France seeking help from religious teaching orders. Several accepted his call. In 1848 the Christian Brothers from France opened their first two schools for boys, St. Vincent de Paul's Academy on Canal Street and De La Salle Academy on 2nd Street near Second Avenue; the order would run many others. For instructing girls, Hughes relied on nuns from, among others, the Sisters of Mercy, Sisters of Notre Dame, Sisters of the Good Shepherd, and, above all, Sisters of Charity.

Mother Seton's Sisters of Charity had become legendary in New York City for their work during the cholera epidemic of 1832. Like the other orders, it was not under Hughes's direct control. In 1846, however, thirty-two of the fifty sisters chose to form a separate community, the Sisters of Charity of St. Vincent of Paul. Now they reported directly to the bishop (and their superior, Mother Angela Hughes, the bishop's youngest sister). At his direction, the women organized the Academy of Mount St. Vincent. In 1847 they purchased the Jacob Dyckman estate at McGowan's Pass, five miles north of the city in the vicinity of 105th Street and Fifth Avenue. By the mid-1850s their convent had seventy sisters (half of them Irish born), eleven Irish servant girls, nine male employees (also Irish), several buildings with classrooms for nuns, and a free school for local children. In 1856 they moved again, to a fifty-acre tract fifteen miles from City Hall in Westchester County. Once part of Frederick Phillipse's confiscated lands, the Hudson River estate had been home most recently to the celebrated actor Edwin Forrest. In 1847 he had built Font Hill there, a Norman castle. Now it became part of Mount St. Vincent de Paul. By 1859 a great new red brick building housed a convent for novices and an academy for training the teachers who would staff many of the city's parochial schools (and other welfare institutions) from that day to this.

Last, Hughes secured ample final resting space for his parishioners. In 1848 the church purchased the old Alsop estate on the Maspeth side of Penny Bridge, which traversed Newtown Creek. Here Calvary Cemetery was laid out, and for the convenience of funeral corteges, steamboat service was inaugurated from East 23d Street. Other cemeteries quickly followed, such as Holy Cross in Flatbush (1849) and Mount Olivet on the old Hallett Estate in Maspeth (1851).

By 1850, reflecting Hughes's accomplishments, and the importance the Vatican increasingly attached to New York, the city was chosen to be an archdiocese, and Hughes was appointed its first archbishop. For all this, the Irish did not unreservedly accept Hughes as their chieftain. Hughes was certainly a hero to many working-class Irishmen—he had arrived a penniless laborer like themselves and yet achieved great things—and many in the Irish middle class, who saw him as savior and sponsor, snapped up busts of the Bishop turned out by a Greenpoint porcelain factory. Yet the majority of his parishioners were still only nominally in the fold. In the

1850s at least half the Sixth Ward Irish rarely attended Mass. Many parents were reluctant to send their children to parochial schools, fearing this would hamper their futures in the wider city. Substantial numbers preferred the public schools, which had also expanded vigorously and were now ward controlled, hence, in Irish neighborhoods, no longer a threat to their faith. Hughes also met resistance when he moved to seize power from the lay trustees who by custom and state law controlled church property. Their insistence on maintaining a democratic pattern of church governance left him at odds with many professionals, small businessmen, and skilled artisans, key elements of the fledgling Irish middle class.

The bishop also faced considerable opposition to his political stance on international issues. New York's hierarchy had already assumed the conservative cast that would characterize it for the next century, in part because the clergy had to compete with arriving radicals for the loyalty of the immigrant masses. In 1848 a group known as Young Ireland, impatient with Daniel O'Connell's failure to end English rule, seized on news of the revolution in France to organize for a rising. In New York City radical nationalists held rallies, raised money, purchased arms, and formed militia companies for anticipated action overseas.

New York's Irish-American republicans emerged as an alternative and at times oppositional voice. In 1849 Patrick Lynch launched the *Irish-American*, a moderate nationalist weekly. Its circulation soared from twenty thousand in 1854 to forty thousand by decade's end, and it was widely read aloud in Irish taverns. Lynch maintained an uneasy truce with Hughes, but he insisted that Irish-Americans believed firmly in the separation of church and state, and he grew incensed when nativists characterized Irish republicans as tools of an autocratic church. Hughes managed for a time to isolate those who advocated armed struggle against the British, but in 1858 militants formed the Fenian Brotherhood, a transatlantic underground organization devoted to raising money, arms, and soldiers for a future rebellion. The Fenians' numbers were small, and their attention was focused primarily on exile politics, but they would yet play a major part in the affairs of New York City.

RUDE B'HOYS

These divisions within the Catholic community were largely lost on nativists, from whose perspective it seemed that Hughes had constructed a monstrous phalanx and become its spiritual and temporal dictator. Their anxieties were further fueled by New York's newfound favor with the Vatican and by some intemperate remarks Hughes made in November 1850 before leaving for Rome to receive the pallium of office from the pope. In a sermon at St. Patrick's Cathedral, "The Decline of Protestantism and Its Causes," Hughes announced the coming triumph of Rome over Protestant nations everywhere, including America. Such missionary fervor confirmed many nativists' worst fears.

Beleaguered white artisans, in particular, facing an avalanche of immigrants and speeded-up proletarianization, reacted with hostility. Some organized the American Laboring Confederacy, whose paper, the *Champion of American Labor*, spoke out bitterly against the "swarms of needy adventurers, cut-throats and paupers of European jails and poor-houses, that, like the locusts of Egypt," were ravaging the New York labor market. In trade after trade, an 1847 petition argued, employers had beaten down wages "by reason of their having the cheap pauper labor of Europe ready at hand, to work for that price if Americans refuse."

Stopping or slowing the onrush seemed the only answer. If the government, through its tariff and other policies, could extend protection to "rich capitalists, to mammoth manufacturers, extensive railroad speculators and contractors in the public works," why not protect workers by putting a tariff on people as well as commodities? In the boom era, however, most erstwhile allies were nowhere in sight or actively opposed to immigration restriction. Many old-timers recognized that the faucets of imported labor power were fixed in a wide-open position, that the New York working class would soon be dominated by immigrants, and that nativism was a strategy without a future. Some native-born artisans, accordingly, set out to make common cause with English Chartists, German socialists, and Irish nationalists. Others would nevertheless continue to press restrictionist demands, and street violence would flare up in the 1850s.

Whenever the crackle of street fighting subsided—or perhaps precisely when it was most furious—combative young American, German, and Irish workingmen discovered they had much in common. Many shared a visceral distaste for bourgeois culture, with its exaltation of piety and sobriety, self-

control and industriousness, female domesticity and refined respectability. Many working-class men did embrace such virtues, of course, but others rejected definitions of male success that poorly paid proletarians found increasingly impossible to meet.

Some immigrants were drawn to the party of the refined; others joined the ranks of the rude boys—and transformed them into “b’hoys.” The b’hoy was a multiethnic construction, part native American rowdy, part Irish “jackeen,” part German “yunker” (Kleindeutschland grocery clerks who expressed their Americanness by greasing their hair and wearing loud checked clothes to dance halls, rather than wearing the old costumes and singing the old songs with their elders in the beer halls).

This new youth culture fashioned its self-image not at work but at play—and the bastion of b’hoydom was the Bowery, long a site of rough sports for adolescents and apprentices, more recently a center of commercial entertainment. After work, rambunctious young men, free of family responsibilities and with enough money in their pockets to indulge the less expensive pleasures, rolled out of their bachelor boardinghouses in the surrounding heavily male wards and headed for the Bowery’s theaters, brothels, and dance halls.

They were usually clad in colorful attire, not bourgeois black—either the red flannel of their volunteer fire company, the costume of their gang, or the regalia of a working-class dandy. B’hoys loved dressing “high,” in mocking parody of Broadway’s exquisites—sidelocks heavily greased with soap, stovepipe hat perched on head, cigar or chaw in mouth, red shirt, black silk tie, flaring trousers, high-heeled calfskin boots. And they preened and promenaded with swaggering bravado, not proper decorum: “He rolls down the Bowery a perfect Meteor,” said one observer.

Florid body language found its counterpart in “flash talk.” The word “slang,” meaning “illegitimate language,” first came into use around 1850, and Boweryites introduced slang terms by the bushelful: “chum,” “kick the bucket,” “going on a bender,” “pal,” “blow-out,” and “So long!” “Many of slang words among fighting men, gamblers, thieves, prostitutes, are powerful words,” Walt Whitman observed, and his poetry so reflected their defiant vitality that more than one reviewer observed: “He is the ‘Bowery Bhoy’ in literature.”

Many spent the bulk of their time in taverns, which the immigrants completely refashioned. In the 1840s the traditional English-style artisanal gathering place, where craftsmen passed a leisurely evening drinking ale and brandy and playing checkers, dominoes, or billiards, gave way to rural-Irish-style establishments, usually named for the owner. Most often found in a corner store or perhaps a cellar, these taverns—more often called “saloons” by the 1850s—consisted of a single long room dominated by a long straight bar along one wall. The saloons had few seats, which made it easier to accommodate the midday crushes of customers fostered by saloonkeepers who handed out free food to those purchasing beer—usually German lager. At night saloons served as jumping-off points from which to barhop, a peripatetic custom that allowed newcomers to learn their way around the neighborhood.

Though weddings and wakes were often celebrated at saloons, they were mainly centers of rough male conviviality. Amid a fog of tobacco smoke, men drank and spat, cursed and quarreled, played cards and told tales and offered toasts to the likes of Daniel O’Connell. The men treated one another in turn, spending lavishly what little they had to demonstrate their honor and bonhomie.

Lost honor, conversely, rapidly led to barroom brawls. Taverns became sites of ritual battles, in which men aired out personal quarrels, displayed courage, vindicated honor by shedding blood, and sustained reputation by demonstrating ferocity and support for chums. Macho touchiness, often heightened by differences of religion and ethnicity, made defending cultural turf a matter of personal—or collective—pride. Volunteer fire companies also offered a chance for real heroics and colorful display, and in the 1850s immigrants joined them in large numbers (the Irish were 14.7 percent of the firemen in 1850 and 37.8 percent in 1860). Battles between these volunteers escalated as well, in part because Irish immigrants brought over from Connaught and Munster the Gaelic peasant tradition of faction fights.

Neighborhood ethnic-based gangs, headquartered at a saloon or corner liquor grocery, also afforded opportunities to bolster identities in the metropolitan flux. Fights between gangs, especially at times of nativist anxiety, could be ferocious affairs, featuring stomping, brass-nailing, eye-gouging, and nose-biting their enemies. Guns began to appear too, for by mid-century cheap, concealable revolving pistols were becoming available.

Yet the code of the streets still decreed that a true reputation for grit and toughness had to be won barehanded. And it was precisely the value placed on fisticuffs—by immigrant and native alike—that accounted for one of the Bowery’s most spectacular contributions to the larger life of the city.

THE MANLY ART

Organized boxing (as opposed to mere brawling) originated in eighteenth-century Britain, where it appealed to both plebeian respect for raw physical courage and aristocratic fascination with ritual combat. Immigrants and merchant seaman brought the sport across the Atlantic in the early years of the nineteenth century, and during the 1820s a handful of prizefights took place in the United States. Around the same time, New York gentlemen began to experiment with “sparring” when William Fuller built a gym in the city and offered to teach law-abiding citizens to defend themselves on the streets against “insolent ruffians and blackguards.” Respectable opinion in the city ran strongly against the brutality of the ring, however, and local authorities exerted themselves to suppress scheduled bouts (in 1824 the King’s County sheriff had dispersed a Coney Island crowd with bayonets).

Fed by ethnic and communal rivalries, “the detestable practice of prize fighting” continued nonetheless to grow in popularity. After 1840 boxing contests and exhibitions became weekly events in New York, thanks in large part to the arrival that year of James “Yankee” Sullivan, an Irishman who had a minor career scrapping in the London prize ring. Sullivan set up the Sawdust House, a Bowery saloon where pugilistically inclined immigrants could slake their thirst, watch a fight or two and swap stories about the great bouts of bygone days.

Two years later, on August 29, 1842, ten steamboats ferried more than six thousand people to Hart’s Island in Long Island Sound for a bare-knuckle fight between Sullivan and William Bell. This was a rendezvous guaranteed to grab public attention, for not only was Bell an Englishman, he was also a sparring master who made his living teaching the “good people of Brooklyn” how to defend themselves against foreigners. In the end, after twenty-four rounds and thirty-eight minutes, Professor Bell proved no match for the hard-hitting Sullivan.

The event sent boxing enthusiasm soaring in the city. Fans packed into the Arena, a new saloon on Park Row, for nightly sparring matches, but the sport soon received a serious setback. Sullivan's victory had helped him promote a second Anglo-Irish fight, two weeks later in White Plains, between Thomas McCoy and Christopher Lilly. This time the Englishman, Lilly, emerged victorious—except that it took him a grueling two hours and forty-one minutes, and he beat his opponent to death, with McCoy literally drowning in his own blood in the 118th round. Outraged by this first fatality in an American ring, the authorities moved quickly to indict all concerned for riot and manslaughter. Lilly's friends hustled him out of the country, but Sullivan was packed off to Sing Sing after a sensational trial, crowded with urban street fighters and flashily dressed gamblers, in the White Plains courthouse.

An all-out press attack ensued on prizefighting as an attempt by immigrant barbarians to infect American youths—Greeley's *Tribune* led the pack against these “festival[s] of fiends”—but it proved impossible to keep down. By the late 1840s the thousands of arriving Irish immigrants underwrote a resurgence of such magnitude that boxing swiftly became the most important spectator sport in the country, and New York City became its national headquarters.

The revival was marked by the great fight in 1849 between Sullivan, now out of jail, and Tom Hyer, a native American butcher. As the sport was still illegal, the combatants had to travel south, to Maryland, and even there were forced to dodge local authorities and throw their hats into a hastily constructed ring. Hyer won the brief (sixteen-round) slugfest, and the new telegraph lines flashed the results to the metropolis. Newsboys hawked bundles of papers, lithographers sold pictures of the fighters, and saloonkeepers (especially at Hyer's haunt, the Fountain House on Park Row) did a booming business in postbellum merriment.

In the 1850s dozens of bouts took place each year, along with hundreds of sparring exhibitions. A sporting community blossomed, composed of fight connoisseurs, retired pugilists, and active boxers who opened taverns and sporting houses like Jim Gidding's Old Crib and James Regan's Clipper Shades. Boxing became big business. The saloon keepers at the heart of the pugilistic community became entrepreneurs: they arranged bouts, gave odds, took bets, chartered steamboats, sold railroad tickets. Fight managers

whipped up public excitement by publishing challenges in the paper (an echo of the old aristocratic dueling practice). Publishers played to the new audience by putting out cheap popular pamphlets like *The Life and Battles of Yankee Sullivan* (1854).

Boxing did not, for the most part, attract the upper classes. There was, to be sure, a coterie of sporting lawyers, brokers, editors, doctors, and clerks who attended the fights, as well as a wider circle of genteel men who followed them in print. Gentry enthusiasts were known as the “fancy,” from which “fan.” But for working-class pugilists and participants, boxing was far more than a thrilling diversion. For the winners, it could be the ticket out of poverty into the middle-class realm wherein saloonkeepers dwelled. And in a world where ordinary men felt increasingly powerless, a tough guy who battled to the top could become an instant hero to those still trapped below.

UNDERWORLD

Betting at ringside allowed b’hoys to display their skill as gamblers, demonstrating their courageous willingness to lose all. Gambling was also a major avocation in most saloons and public houses and, as an affair among friends, had an ancient lineage in the city. Now, however, gambling went pro. Full-time sharpers had begun filtering into New York back in the 1820s, plying its taverns, hotels, and racetracks. The first successful gambling house—a modest place with a few tables for dice, cards, and checkers—had been established in 1825, aptly enough on Wall Street, near the old Tontine Coffee House. Dozens more opened in the 1830s, featuring faro, roulette, and dice and card games. But it was during the 1840s, Bennett’s *Herald* charged in 1850, that the city became “the great head quarters of the gamblers in this country.” Greeley believed at least five hundred “gambling hells” were in nightly operation, with vast numbers of “ropers-in”—sometimes moonlighting policemen—haunting New York’s hotels, barrooms, brothels, and businesses, steering potential patsies toward their employer’s “hell.”

From the world of gamblers and boxers it was but a short step down to New York’s underworld, a term warranted by the numbers of criminals at work in the city, the emergence of a rough-hewn infrastructure of criminal operations, and the development among the fraternity of villains of a language peculiarly their own.

Chief of Police George Matsell compiled a 128-page *Vocabulum; or, The Rogue's Lexicon* (1859) whose words and phrases, arranged from A to Z, hint at the rich variety of opportunities (and perils) the port afforded the criminally inclined. Examples from the A-to-B range include “Air and Exercise” (working in the stone quarry at Blackwell’s Island or Sing Sing), “Amusers” (who use snuff or peppers to blind and rob victims), “Anglers” (who steal from store windows), “Badger” (one who robs a man’s pocket after he’s been enticed into bed with a woman), “Bat” (a prostitute who only walks the streets at night), “Boodle” (a quantity of counterfeit money), and “Booked” (arrested). Matsell also observed that this was a multiethnic jargon, spoken no matter what the thief’s nationality. The chief noted somewhat pridefully that in New York thieves “from all parts of the world congregate.”

Hangouts emerged that were patronized more or less exclusively by the criminal classes. One-Armed Charley, a noted thief, opened the Hole in the Wall, which became a place where robbers could meet with fences to plan jobs. Usually these fences were junkmen who moved stolen goods under cover of their normal operations, but there were innovators in this field too, like Fredrika ‘Marm’ Mandelbaum, who now launched her long career by peddling looted goods door to door. There were also noted female robbers. One-Armed Charley selected as his lieutenant “Gallus Mag,” a ferocious sixplus-footer who held her skirt up with galluses (suspenders). In addition to her considerable abilities as a mugger, Mag ran a tight ship at the Hole in the Wall. Seizing the ear of an excessively rowdy gangster in her teeth, she would drag him to the street or bite it off altogether and add it to the collection of pickled ears she kept in a jar behind the bar.

Much of the city’s crime was undertaken by individual entrepreneurs who hung around the waterfront, mugging boozy sailors as they exited dockside dives. Others sent female coconspirators to lure hapless landmen to deserted piers or alleys, where they were struck on the head with a slung-shot (a rudimentary blackjack), their pockets rifled, and their unconscious bodies tossed in the river, sometimes with fatal results. One homeless German immigrant was coshed, robbed of twelve cents, and thrown over the Battery wall, where he was found, frozen, in river ice the next morning. Murders remained a rarity, however—at least solved murders. There were only thirteen homicide convictions in the entire city between 1838 and 1851

(roughly one a year), so that when another thirteen were registered between 1852 and 1854, with guns increasingly in evidence, the city trembled.

“Horrible murders, stabbings, and shootings,” the *New-York Atlas* reported in August 1854, “are now looked for, in the morning papers, with as much regularity as we look for our breakfast.”

Some of the upsurge in fatalities could be traced to the burgeoning activities of so-called river pirates, gangs of professional predators who seized on the opportunities presented by the bustling port. Police Chief Matsell claimed in 1850 that there were over four hundred such robbers, organized into roughly fifty gangs, though his figures may well have been inflated in order to win creation of a harbor police force. Some river pirates simply prowled the wharves, snatching up unguarded property. Others were more venturesome—like the Daybreak Boys, named for their youthfulness (most were under eighteen) and their penchant for predawn operations. The Daybreakers would depart their headquarters (a gin mill at Slaughter House Point), head to the waterfront, and row to their objectives—ships at anchor—with muffled oars and greased locks. Once aboard, they rifled the cargo, rowed their booty ashore (at times to Brooklyn), and sold it off to fences. Between 1850 and 1852, it was claimed, the Daybreak Boys stole a hundred thousand dollars in property. Their career ended abruptly when, in the fall of 1852, a trio of Daybreakers shot a watchman who had surprised them on board his ship. Caught and convicted, Nicholas Howlett, nineteen, and William Saul, twenty, were condemned to death by the court but hailed as heroes by the Boweryites. When they were hanged in January 1853, hundreds showed up in the Tombs courtyard to shake hands with the condemned men on the scaffold.

“IF I DON’T HAVE A MUSS SOON, I’LL SPILE”

The b’hoys also adored theater, and immigrants were quickly incorporated into popular audiences. (Linguistic differences did generate a degree of ethnic segregation: the Bowery Amphitheater was rebuilt in 1854 as the twenty-five-hundred-seat Stadttheater, which presented classical German dramas, popular comedies, musicals, melodramas, and farces.) At a plebeian playhouse, the *Spirit of the Times* observed in 1847, “the pit is a vast sea of upturned faces and red flannel shirts, extending its roaring and turbid waves close up to the foot-lights on either side.” The most eager

pushed onto the boards themselves, “chanking peanuts and squirting tobacco juice upon the stage.”

Shakespeare remained a major staple of popular theater, but burlesques based on life in New York grew rapidly in working-class esteem. William Mitchell’s Olympic Theater became the most popular venue in town, in part for its low prices, in part for its regular diet of lampoons, parodies, and travesties involving well-known city figures and activities. In the 1843 *Macbeth Travestie*, for example, the king and attendants appeared as “nabobs of the 15th ward,” while the witches resembled the New York’s market women.

Minstrelsy in particular, said the *Literary World* in 1849, “convulse[d] the b’hoys and their seamstress sweethearts.” By the 1850s there were ten major minstrel halls or “Ethiopian Opera Houses” in town, and some became semipermanent features of the cultural landscape, E. P. Christy’s Minstrels (at Mechanics Hall) and Hooley’s Minstrels (in Brooklyn) each played for ten years straight. Minstrelsy too was a variety of social travesty. Its routines ridiculed the self-importance, pretentiousness, and hypocritical morality of New York’s middle and upper classes. One performer usually stood in for a nabob or reformer, whose high-flown diction the other actors delighting in puncturing, often via lewd buffoonery. Immigrants too took their knocks. To the dismay of Irish actors and the Irish-American press, comedians got easy laughs portraying stage Hibernians as ignorant, pugnacious, and drunken buffoons.

The foibles of stage Africans—whites in blackface, of course—received no such leniency. Vicious derision of blacks remained integral to the art form (albeit alloyed with fascination and envy). It afforded artisans and immigrant audiences, who feared their declining economic status might be seen as racial slippage, a chance to collectively display their whiteness by dissing their only inferiors. Whitman, a great fan of minstrelsy, was one of the few to see the racial intermingling underlying the insistence on racial separation—blendings at work behind the backs of the performers. One visitor to a black tavern observed that “in the negro melodies you catch a strain of what has been metamorphosed from such Scotch or Irish tune, into somewhat of a chiming jiggyish air.” While Whitman suggested such musical confluence presaged a “native grand opera in America,” it was tap

dancing that would later emerge from the admixture, in the Five Points, of African and Irish dance traditions.

Audiences that laughed at Zip Coon or chuckled at Paddy positively roared for Mose. In 1848 Francis Chanfrau took to the stage at the Olympic wearing a version of the standard fire-laddie outfit, complete with red shirt, stovepipe hat, and soaplocked hair. At first, there was puzzled silence. Then Chanfrau took his cigar out, spit into the wings, and growled, “I ain’t a-goin’ to run wid dat machine no more!” There was an instant “yell of recognition” from the pit and galleries. And well there might have been, for Benjamin A. Baker, the playwright, had put the Bowery itself on the boards. The play—*A Glance at New York in 1848*—revolved around a young Connecticut greenhorn who fell into a series of scrapes with assorted loafers and sharpers, from which he was extricated by Mose.

Baker realized he had a good thing going and redrafted the play, called it *New York as It Is*, and put Mose at its center. “I’m bilein’ over for a sousin’ good fight with someone somewhere,” Mose bellowed. “If I don’t have a muss soon, I’ll spile.” But Mose the tough guy was also Mose the protector of the weak. If pugilism was his avocation, firefighting was his mission in life. The plebeian hero rescued babies from burning buildings (played out onstage with elaborate sets and props), defended Bowery folk against urban corruption, saved Linda the cigar girl from molesters, helped a rural migrant cheated by city slickers, and—antiaristocratic hero that he was—thwarted effete and wicked gentlemen. The rough realism was a smash, crowds turned the theater into a frolicsome madhouse, and *New York as It Is* became one of the greatest successes in the history of the Manhattan stage.

Mary Taylor and F. S. Chanfrau in the roles of Mose and his ladyfriend, Lize, in the premier of “A Glance at New York,” 1848. (The New York Public Library for Performing Arts)

The fictional b’hoy’s nationality was ambiguous. In Baker’s play Mose was obviously a native-born worker, though the character also invoked Moses Humphrey, a wellknown fire laddie, brawler, and Irish Catholic printer at the *Sun*. But Mose was generally perceived as not an ethnic but an urban type—appropriately enough given that b’hoy youth culture, for all its internal stresses and strains, was a conglomerate affair. A mix of social fact and literary convention, Mose was the New York rude boy writ large, but as he liked to think of himself: opinionated, rowdy, but virtuous withal.

Over the next two years, as seven different Mose plays went on the national circuit, the image of Big Mose cohered into a cultural identity recognizable across the country. Lithographed reproductions of scenes from the plays then turned Mose into an international figure. The Bowery B’hoy—riotous and vociferous habitue of fire companies and theaters and prizefights and street corners—became as well known as the Wall Street Banker.

In the 1850s Mose cohered into a fabulous semimythic figure of the sort made popular by Davy Crockett (“half-horse, half-alligator, a little touched with snapping turtle”), and he took his place alongside the likes of Mike

Fink, swaggering riverboatsman. This urban Paul Bunyan was said to be eight feet tall, with ginger hair, a two-foot-wide beaver hat, and hands like hog hams, and he toted a fifty-gallon keg of ale as a canteen. He had the strength of ten: he could uproot iron lampposts and use them to smite rival gang members, lift a horsecar and carry it for blocks, leap the East River to Brooklyn with ease, and swim the Hudson in two mighty strokes (with six he could circumnavigate Manhattan).

As Mose grew larger than life, his roots in an adversarial milieu became fuzzed, his Boweryite critique of New York's elite blurred. But there would be no such ambiguity in 1849, when Mose's acolytes declared theatrical war against uppertendom and its associated thespians. That year real, not stage, blood ran through the streets of the city.

43

Co-op City

On May 7, 1849, William Charles Macready, the famous British actor, opened in *Macbeth* at the Astor Opera House. Macready did not go over well with many in the audience, who greeted him with wild hissing and a hail of rotten eggs. He did, to be sure, have his supporters, who cried, “Shame, shame!” cheered, and waved handkerchiefs. But Macready’s opponents responded relentlessly with loud groans, cries of “Down with the codfish aristocracy!” and a barrage of potatoes, apples, lemons, and copper coins. The remainder of the first act and all of the second proceeded in “dumb show,” the actors pantomiming their lines rather than trying to make themselves heard over the din. But then the crowd escalated. They howled and stomped on the newly installed red plush chairs, then hurled one from the second tier into the orchestra, whose occupants promptly fled. That did it for Macready. Escaping out the back door, he promptly and indignantly announced his intention to take the next steamship back to England and civilization.

Theater riots were commonplace in New York, and Bennett’s *Herald* was not alone in dismissing the affair as innocent and customary; an attorney would later note that “the right of hissing an actor has been exercised from time immemorial.” In the theater, consumers were sovereigns, their riotous displeasure attended to instantly. The May 7 affair was unusual, and about to get a good deal more so.

The objections to Macready went far beyond his acting style, though that was part of it. Macready had adopted a subdued, scholarly, genteel approach to his art, particularly in Shakespearean performances. He disdained vulgarity and wanted to elevate acting to the status of refined profession. Edwin Forrest, the great American tragedian worshiped by New York’s working-class theatergoers, had a very different method. His was a muscular, histrionic style that matched the demands of Bowery melodrama. Forrest specialized, moreover, in playing superpatriotic yeoman heroes who fought tyrants (domestic and foreign) and rescued helpless women. Like Mose, he incarnated b’hoydom’s self-image.

These contesting styles soon blossomed into personal animosity. Macready had let it be known that he thought Forrest lacked “taste.” Forrest, during a tour of Britain in 1846, had loudly hissed Macready in midperformance. The ensuing feud had been eagerly followed by the penny press, which showcased the combatants as it did pugilists and politicians. When Macready came to the states again, Forrest inflamed the rivalry by playing in competing productions during his tour, which culminated in New York City.

The contest had more serious overtones. The actors, in the popular imagination, were stand-ins for larger and more explosive issues. Macready was strongly identified with England and its aristocracy, at just the moment when New York’s Irish were at the height of their rage over the famine and Britain’s suppression of Young Ireland’s rebellion. When Forrest, at his own May 7 performance of *Macbeth* at the Broadway Theater, spoke Macbeth’s line “What rhubarb, senna or what purgative drug will scour these English hence?” the entire audience rose and cheered for many minutes.

Boweryites were even more furious about the theater chosen for Macready’s performance, the recently erected Astor Opera House. Its founders’ intention of creating an exclusive atmosphere—the dress code stipulated “freshly shaven faces, evening dress, fresh waistcoats, and kid gloves”—were well known and vehemently objected to by Boweryites. As a minstrel songwriter put it in 1849: “De Astor Opera is anoder nice place; / If *you* go thar, jest wash your face! / put on your ‘kids,’ and fix up neat, / For dis am de spot of de *eliteet!*”

“De spot” itself was provocative. During the recent metropolitan expansion, two parallel avenues had been driving north, constituting the cultural spines of two different class worlds. On the west: Broadway, with its retail shops, department stores, monster hotels, and porpoise-parade of the fashionable. On the east: the Bowery, the thoroughfare of sportsmen, dandies, gangsters, and fire laddies. The thoroughfares, however, were not exactly parallel. At one point—Astor Place, just south of Union Square—the two avenues, and worlds, collided. And at just that point of convergence, capping it and in a sense claiming it, entrepreneurs had erected a splendid opera house for the exclusive enjoyment of the Broadway world’s most self-proclaimedly aristocratic segment.

It was the combination of the “English” Macready and the “aristocratic” opera house that had so aroused the ire of native American and Irish immigrant alike, but it was not these animosities that made the May 7 affair (and its explosive aftermath) remarkable. What made this fracas different was the response of the city’s upper classes.

They were not amused. Against the frightening backdrop of the 1848 European revolutions and the alarmingly autonomous politics and culture of New York’s working-class quarters, the theater riot no longer seemed innocent. It appeared to signal a new aggressiveness, a willingness to break out of the Bowery world and invade Broadway’s. The elite had built an institution behind whose august portals they could take refuge from the vulgarity of the streets. Now a senseless mob had violated their inner sanctum. The barbarians were at—indeed well past—the gates. It was too much. It was time to act. It was time to draw a line and say thus far and no farther.

Forty-seven of the city’s most prominent citizens sent Macready a joint letter urging him to return to the opera house stage. They assured him “that the good sense and respect for order prevailing in this community will sustain you on the subsequent nights of your performance.” Macready agreed. Then they published the letter in the papers. Their gauntlet thus thrown down, they set about assembling the firepower necessary to sustain their challenge. They turned to the newly elected Whig mayor, Caleb S. Woodhull, and insisted he protect the lawful rights and personal liberty of actor Macready.

At a City Hall meeting on the morning of Thursday, May 10, with Macready scheduled to reappear that evening, Police Chief Matsell informed Mayor Woodhull that he lacked the force to quell a serious riot. Terrified of chaos on his second day in office, the mayor ordered General Charles Sandford, commander of the military forces in New York City, to have his men ready in Washington Square Park. Sandford called out two hundred of the elite’s crack militia, the Twenty-seventh Regiment—since 1847 renumbered and renamed as the Seventh Regiment—along with two troops of horse, one troop of light artillery, and two companies of hussars, 350 men altogether. In addition, 150 police were placed inside the theater and another hundred on its perimeter; still more were dispatched to guard nearby homes of the wealthy.

The Bowery responded to the challenge. Captain Isaiah Rynders swung into action. Forrest's most ardent backer, the man who had distributed tickets to barroom habitués and mobilized hundreds more for the initial May 7 affair, and the Tammany stalwart who had made a career out of exploiting resentment against the social and cultural elite, Rynders now salivated at the chance to embarrass the new Whig administration. Devising a handbill, he had copies printed, delivered to a Park Row tavern, and then distributed to runners, who on Wednesday, May 9, posted them at saloons and eateries throughout the city. "SHALL AMERICANS OR ENGLISH RULE IN THIS CITY?" it demanded to know, and it called on all workingmen to "express their opinions this night at the ENGLISH ARISTOCRATIC OPERA HOUSE!" It was signed by the "American Committee," a group headed by Rynders's chief assistant, Ned Buntline, author the previous year of *Mysteries and Miseries of New York*, saga of a city riven along class lines.

Tickets to the performance, along with marching orders, were handed out to assorted b'hoys at Jim McNulty's saloon, on the corner of Chatham Square and Dover Street. By show(down) time, Rynders's activists were in place, under Judson's field management, and thousands more had turned out to watch or participate; the majority were native born, but there was a considerable minority of Irish immigrants—butchers and laborers united in mutual Anglo-aristophobia.

Tight security screened out many of Rynders's ticket holders, and their yells about discrimination against those who didn't have "kid gloves and a white vest, damn 'em!" merged with the general roar. The play commenced promptly at 7:30. Anti-Macready forces as promptly disrupted it. The actors went into dumb-show mode while police made their way through the audience, seizing and arresting protestors.

Outside, the crowd, now grown to ten thousand, began hurling paving stones, which smashed through the windows and sailed into the audience. Massing their ranks, the crowd rammed at the doors, intent on breaking in. The police, way out of their depth, called on the militia for support, which arrived at 9:15 P.M. and took up positions. The crowd pressed forward, wrestling with the militia. Matsell warned the crowd that force would be used, a notification drowned out by enraged voices crying, "Burn the damned den of the aristocracy!" One fellow in a red flannel shirt bared his breast, screaming, "Fire, fire you damned sons of bitches; you durs'n't fire,

you durs'n't fire." But they did, first in the air, then directly into the bodies massed in front of them. Moving up Astor Place, they discharged several more volleys, working relentlessly now to clear the area.

Soldiers fire on rioters outside the Astor Place Theater, May 10, 1849. Lithograph by Nathaniel Currier. (© Collection of The New-York Historical Society)

When it was over, eighteen of the crowd lay dead, none of them Rynders's men, most bystanders. Four more would die within the week. Over 150 were wounded or injured, and 117 were arrested, mostly workingmen: coopers, printers, butchers, carpenters, servants, sailmakers, machinists, clerks, masons, bakers, plumbers, and laborers. Of the twenty-two killed, seven were Irish laborers.

Friday, May 11, the day after the riot, the streets bristled with a display of civilian and military power: a thousand special deputies, two thousand infantry, a squadron of cavalry, four troops of horse artillery. Handbills went up around town calling for a mass rally at City Hall Park that evening, and at six P.M. an enraged crowd cheered speakers who condemned the mayor,

police, and military. Rynders declared that mass murder had been perpetrated “to please the aristocracy of the city at the expense of the lives of inoffensive citizens—to please an aristocratic Englishman backed by a few sycophantic Americans. (Loud cries of indignation.)” Mike Walsh called for a murder prosecution, told the crowd to arm itself in future frays and said that only his high respect for the law restrained him from urging the crowd to emulate their European counterparts and mount the barricades. Several thousand auditors boiled out of the park, roaring for vengeance, and marched up to Astor Place to confront the troops again. They hurled stones from behind hastily erected barricades, but the militia leveled their muskets, fixed bayonets, and charged, and the crowd dispersed. The June Days were not to be replayed in Manhattan. Not yet.

The danger passed, the gentry rejoiced. The old Whig warhorse James Watson Webb applauded the troops in his *Courier and Enquirer* and underscored a larger message the bloody affair had delivered: “The promptness of authorities in calling out the armed forces and the unwavering steadiness with which the citizens obeyed the order to fire upon the assembled mob, was,” Webb declared, “an excellent advertisement to the Capitalists of the old world, that they might send their property to New York and rely upon the certainty that it would be safe from the clutches of red republicanism, or chartists, or communionists [*sic*] of any description.”

Some tender-hearted souls looked askance at the use of force—surely republics didn’t do this sort of thing! The *Democratic Review* noted that more lives had been lost than in many of the Mexican War battles in which b’hoys had served as volunteers. Nathaniel Parker Willis, of all people, noted in his upperten *Home Journal* that the riot was a protest “from Mose and the soap-lock-ery” against “aristocratizing the pit” and suggested the rich “be mindful where its luxuries offend.”

Future entertainment entrepreneurs would follow Willis’s advice, especially once the opera house itself proved a casualty of the affair. Burlesque shows were soon calling it the “Massacre Opera House” at “DisAster Place”; when it reopened in September, attendance was dismal, and it was eventually sold off. The upper classes relocated their sanctum a bit farther north, to the more defensible precincts of Union Square. In 1853 Moses H. Grinnell (a staunch Macready supporter) and others formed a corporation to build the Academy of Music at 14th Street and Irving Place.

Embodying the grandest metropolitan ambitions, it was the largest opera hall in the world when it opened in 1854. Like the ill-fated Astor, it boasted a plush interior and a small number of private boxes. But in a manifest bit of caution, enhanced by the need to fill the space, many of the four thousand seats were priced inexpensively, and management forswore all claims to aristocratic exclusiveness, insisting rather that its mission now was to cultivate taste and knowledge among the citizenry at large.

In the immediate aftermath of the riot, however, Judge Charles Patrick Daly, who presided over the trial of those arrested, pushed hard for their conviction, to serve notice that the old republican acceptance of crowd actions as inevitable, even legitimate, even functional, had come to a definitive end. Judson, convicted, got a year in jail and was treated as a hero on his release. Rynders got off with the help of attorney John Van Buren, the former president's son, a sign from Tammany that the party would look after its own.

What was clear to all concerned was that the Astor Place affair signaled (in the *Herald's* words) a "collision between those who have been styled the 'exclusives,' or 'upper ten,' and the great popular masses." It was left to a reporter from Philadelphia to sum up the newly hardened positions. The riot, he wrote, "leaves behind it a feeling to which this community has hitherto been a stranger—an opposition of classes—the rich and the poor—white kids and no kids at all; in fact, to speak right out, a feeling that there is now, in our country, in New York City, what every good patriot has hitherto felt it his duty to deny—a *high* class and a *low* class."

The riot at Astor Place, a frenzied challenge to the cultural authority of New York's nascent bourgeoisie, was swiftly followed by a far more disciplined attack on its right to set the city's economic agenda. Since at least the 1820s—the heyday of Thomas Skidmore, Fanny Wright, and the Workingmen's Party—plebeian New Yorkers had been fashioning analyses and programs to contest the degradation of their working and living conditions. Now another upheaval got underway, rooted in prior protests but boosted by thousands of feisty immigrant agitators who contributed their own radical traditions and energies. Laissez-faire polemics, it turned out, were not the only ideas capable of crossing the Atlantic.

TENANTS VERSUS LANDLORDS

One way to improve the quality of life in New York City, said the “land reformers,” was to get a lot of New Yorkers to leave town. Given the vast numbers surging into what was still an overwhelmingly rural continent, this approach had many advocates, but the leading tribune was George Henry Evans. The old workingmen’s spokesman of the 1830s had retreated to a New Jersey farm during the depression era, where he pondered the work of Tom Paine and Thomas Skidmore. Evans became convinced that labor’s problems, at home and work, were chiefly due to its swollen ranks. A surplus of workers allowed bosses to dictate low wages; a surplus of people seeking shelter allowed landlords to extract high rents. It followed that moving substantial numbers from city to country would improve the lot of those who stayed behind as well as those who departed. The chief obstacle, as Evans saw it, was that landlords—often large speculative companies based in New York City—were hogging the public domain out west.

The solution was to use labor’s political power to break the grip of land monopolists as President Jackson had broken the reign of bank monopolists. In 1844 Evans organized the National Reform Association, whose slogan was “Vote Yourself a Farm.” The idea was to give publicly owned land to actual settlers, free of charge, while barring speculators and absentee landlords. The government—crucially—would also subsidize construction of republican villages and build government-owned railroads to get settlers to them.

Immigrant radicals also liked land reform. In 1840 Thomas Ainge Devyr, who had been a leader of the Chartist movement in Newcastle-upon-Tyne, escaped to Brooklyn, where he began agitating for free public land grants, government-owned railroads, and laws restricting wealth and landownership, and in 1844 linked up with Evans’s National Reformers.

Evans and Devyr were soon joined by Hermann Kriege, a Westphalian journalist and member of the outlawed Communist Bund der Gerechten (which later would publish the *Communist Manifesto*). Kriege arrived in New York in 1845 and formed the Sozialreformassoziatin (Social Reform Association), which drew nearly a thousand members, making it the city’s leading vereine. The SRA soon had its own newspaper, the *Volks-Tribun*, and a Social Reform Halle on Grand Street that would remain one of Kleindeutschland’s most important public meeting places for decades to come. Kriege backed Evans’s free-land-for-settlers campaign, and soon land

reform societies had germinated in New York and cities across the country. This popular demand for access to western lands partly accounts for the enthusiasm with which many New York workers greeted imperial expansion into Mexico and Oregon.¹

For most city workers, however, garnering western lands at gunpoint, while perhaps symbolically satisfying, remained basically irrelevant. Without government support—as yet nowhere in sight—escape to the West was utterly impractical. Indeed some critics, who believed emigration schemes sidestepped rather than confronted New York’s housing problems, proposed tackling the land issue in the city itself. Mike Walsh, the Irish Protestant editor of the *Subterranean* (and Evans’s sometimes ally), believed that urban crowding was “the cause of more vice and misery, more suffering in every way, sickness, debauchery, seduction, assaults, and even murder, than all other causes put together.” But rather than blasting western monopolists, Walsh took aim at the most powerful landlords in New York City: Trinity Church and John Jacob Astor. Walsh declared Astor a “worthless wealthy drone” whose rent extortions amounted to a “legalized system of plunder,” and Trinity’s property, Walsh wrote in 1845, should be confiscated for public use, beginning with St. John’s Park. To encourage the Common Council to action, he blazed a direct action trail by climbing over the park’s fence and tramping on forbidden ground.

Astor’s death in 1848 at the age of eighty-five provoked others to pointed commentary. Bennett reprinted Astor’s will on the *Herald*’s front page and charged that at least half the estate’s enormous value was unearned. It was, rather, a by-product of the general rise in the value of New York City real estate, which in turn was due primarily to improvements effected by the city’s working people. Yet the millionaire’s legacy—apart from a bequest of four hundred thousand dollars for an Astor Library—passed not to New Yorkers in general but to Astor’s family, creating in the process a most unrepublican dynasty. Greeley took the occasion to propose limiting individual ownership of city land to a thousand acres. He also urged passage of an income tax law, on the grounds that it had been unjust for city government “to protect Mr. Astor’s houses, lands, ships, stocks, etc.,” without having exacted recompense from him commensurate to his income.

Such demands, which already transgressed the bounds of the politically possible, paled next to those promulgated by the Tenant League. In February 1848, with landlords cashing in on economic recovery and immigrant desperation, Irish radicals and native land reformers established what they hoped would become a citywide organization of wage-earning tenants. Its goal, they declared, was to attack the “system of landlordism” as “one of the most blighting curses that ever was inflicted on the human race.” Specifically, the Tenant League called on the legislature to limit landlord profit from rents to 7 percent of the property’s assessed valuation, guarantee security of possession to tenants who paid their “legal rents,” impose a city tax of 3 percent on all unimproved lots (to discourage owners from keeping them off the market for speculative purposes), and halt the incorporation of building companies, which allowed combinations of capitalists to oppress the poor.

Picking up on Evans’s ideas but applying them locally, the Tenant League urged New York City to sell its public “common lands” only to those who did not already own other lots; this would allow urban “homesteaders” to build their own houses on city soil. The league also asked the legislature to forbid the renting of cellar apartments and the building of rear houses that left no part of the lot uncovered. It called for repeal of the northward extension of the fire limits, calling it a “scheme of speculators” to push Irish shanty dwellers off leased land. It denounced Moving Day—still going strong—as a landlord trick to raise rents each May. It formed lodgers’ leagues and kept track of landlords who evicted tenants and charged high rents, creating a counterpart to the landlords’ blacklist of delinquent tenants. Finally, it demanded the city establish a housing code and oversee landlord compliance.

The Tenant League proposals, which flew in the face of laissez-faire ideology and the interests of the wealthy, proved beyond the ability of the radicals to organize. There would be no direct collective confrontation by tenants of landlord power in this era. Poor people unable to keep up with burgeoning rents settled for individual but achievable tactics—fleeing without paying, or searching out ever more squalid quarters. But ideas like rent control and taxation of speculative profits had been placed on the metropolitan agenda. They’d be back.

TOWARD A COOPERATIVE METROPOLIS

In the meantime, the working-class quarters were afire with even more startling challenges to the metropolitan status quo. For decades Europe had been buzzing with a variety of “socialist” notions, nowhere more so than in Paris, where Charles Fourier’s sweeping indictment of capitalist civilization as one based on fraud, waste, and exploitation resonated widely. So did his proposal that dissenters should withdraw into cooperative communities —“phalanxes,” he called them—that would be the seeds of an alternative society.

Fourierism had reached New York during the panic years, courtesy of Albert Brisbane. The idealistic son of a wealthy upstate merchant and landowner, Brisbane was no intellectual; he always looked, said Whitman, “as if he were attempting to think out some problem a little too hard for him.” But if his versions of Fourier’s teachings were glib, he promulgated them with tremendous energy and swiftly won a crucial convert in Horace Greeley. During 1842 and 1843, the editor gave Brisbane regular access to the *Tribune*’s front page and added his own explanations and plaudits for Fourierism.

Horace Greeley was no socialist. A staunch Whig, he was convinced that capitalist growth would eventually benefit the working-class, that the interests of employers and employees were ultimately in harmony, and that strikes raised the specter of class conflict and should be vigorously opposed. But Greeley was not prepared to dismiss depression-spawned misery as an inevitable by-product of the free market, and he refused to root the plight of wage-earners in their own moral deficiencies. Greeley reported so regularly on foul conditions in the capitalizing trades that his archrival, Bennett, took him to task in the *Herald* for “eternally harping on the misery, destitution and terrible sufferings of the poor of this city.”

It was, however, primarily from the middling classes that Greeley and Brisbane won most support—from people who concurred with their analysis of the negative impact of the “system of Free Competition” on life in the city. Charles Dana, Greeley’s assistant, deplored its economic fallout (“periodical crises and bankruptcies”), its psychological repercussions (“killing cares, harassing anxieties, hopes blasted, and unforeseen reverses and ruin”), and its ethical iniquity (fostering selfishness and duplicity). Most alarming was its tendency to concentrate economic and political power in fewer and fewer hands. Fourier had predicted that capitalism

would lead to “Commercial and Industrial Feudalism,” with producers in bondage to large corporations and banking houses. His American disciples pointed to New York City, with its “ascendancy of a monied oligarchy and a commercial feudality” and attendant “degradation of the laboring classes,” as clear vindication of the master’s theories.

Greeley didn’t buy Fourier’s solutions, but he did believe that a moderate version, dubbed Associationalism, would sort out the problems of capitalist society without impinging on property rights or fueling class resentments. If artisans simply pooled their talents and money and established cooperative workshops, they could control their working conditions, retain the profits of their labor, preserve republican traditions of mutuality, and still survive in the larger free market economy.

As promulgated by middle-class activists, Associationalism drew some modest support from urban mechanics—a band of Brooklyn artisans organized the first American phalanx—and the city’s most effective cooperative was established by professional musicians. In 1842 the men who played in local theaters created the New York Philharmonic, a self-governing and profit-sharing orchestra. The Philharmonic, significantly, was 42 percent German at its inception, a percentage that leapt to nearly three-quarters with the arrival of revolutionary exiles, who brought with them not only a proclivity for cooperatives but considerable experience in their formation.

When Louis Philippe abdicated in February of 1848, the Parisian working class, so instrumental in his overthrow, won establishment of a Second Republic with adult male suffrage. But socialist (or “red”) republicans like Louis Blanc had pressed for more profound changes, including a guaranteed “right to work” in government-backed “cooperative” workshops. Blanc’s message had wide appeal in 1848. The provisional government emptied Clichy prison of debtors and converted it to a cooperative association in which some two thousand tailors made uniforms for the new national guard. Soon saddlers, spinners, cabinetmakers, masons—eventually more than 120 Parisian trades—had formed nearly three hundred production cooperatives, which collectively enrolled some fifty thousand members. Some were brilliantly successful, others failed miserably, but all alarmed the moderate republican leadership and horrified the bourgeoisie. Few co-ops long survived the terrible “June Days” when

barricades went up and workers battled the army until being crushed in fighting that killed or injured over ten thousand.

When the refugees from this and other upheavals poured into New York City, among them was Wilhelm Weitling, a German tailor. Like thousands of his mobile countrymen, Weitling had spent time in Paris learning the skills of his trade and the language of socialism and had fought on the barricades in forty-eight. Now, in Manhattan, he proposed that New York workers create producer cooperatives, which would in turn sell their goods to a worker-run Trade-Exchange Bank. Co-op workers would be paid in paper money, valid in worker-run stores and warehouses, which would sell both finished products and raw materials. The profits gained from cutting out capitalists and middlemen would be plowed back into expanding the cooperative sector until, eventually, competitive capitalism would be superseded by a cooperative commonwealth. As vehicles for this transformation, Weitling launched the Arbeiterbund (Workers League) in 1849 and a newspaper called *Die Republik der Arbeiter* (*Worker's Republic*) the following year.

Weitling's initiatives resonated in New York's German community, where most people, whatever their politics, were culturally predisposed toward organizations. British radicals, too, were familiar with producers' cooperatives, which had been established in the north of England, and natives had already been inspired by the associationist and Fourierist movement of the mid-1840s.

Among the most powerful and militant groups to get behind the idea was the Turnverein—the gymnastics society—which combined a passion for physical culture with socialist activism. Thousands of Turners had fought in the 1848 uprisings. Now, as refugees, they formed the New Yorker Socialistischen Turnverein, whose newspaper, the *Turn-Zeitung*, promoted a wide range of radical programs, including Weitling's. Together with English Chartists, Irish nationalists, and American Associationists, the Germans set to work establishing cooperatives, and soon Manhattan blossomed with associations of tailors, cabinetmakers, upholsterers, cigarmakers, confectioners, shipwrights, bakers, shoemakers, and grocers.

In addition, the activists combined cooperative formation with labor organizing. In 1850, inspired by the ongoing degradation of the trades and by an inflationary spiral touched off by an influx of California gold that sent

prices and rents climbing, newcomers and old-timers alike resurrected New York City's union movement, all but demolished by the 1837-43 depression. (The *Turn-Zeitung* ran a series of historical articles informing readers about the 1830s labor movement in their adopted city.) This combination of resurgent unionism and militant cooperationism touched off an "uprising"—replete with mass rallies, marches on City Hall, and some bloody confrontation with the forces of order—that in a very modest way echoed the stormy June Days of Paris.

"WE DID NOT EXPECT TO FIND IN THIS FREE COUNTRY A RUSSIAN POLICE"

In March 1850 German cabinetmakers fanned out through the working-class wards, posting handbills in immigrant boardinghouses calling for a union and a strike. In short order two thousand had walked off work, marched around the laboring districts in grand parades, and forced many masters to increase wages and change work rules. By April unions had blossomed in almost every trade. Greeley reported on their meetings—the just-minted New-York Printers Union elected him its president—and promoted the new cooperatives as well. Weitling too was everywhere, giving speeches, penning exhortations in the *Republik der Arbeiter*. By month's end he had brokered formation of a Central Commission of the United German Trades, comprised of seventeen unions representing forty-five hundred members.

The Irish community's dander was up too. Irish tailors and hatters flocked to labor organizations or organized them where they didn't exist. Irishmen were prominent in initiatives by blacksmiths, boilermakers, porters, shoemakers, and construction workers. The *Irish-American* came out for co-ops, declaring that "the principles of Association, can, alone" better the conditions of labor. Unskilled workers took the biggest steps forward. Back in 1843 Irish builders had helped establish the Laborers Union Benevolent Association, New York's first mutual aid society by and for the unskilled. By 1850 it had enlisted over six thousand workers—many of them famine refugees, many with organizational skills honed in battling landlords. By far the largest organization of wage earners in the city, it supported the striking craft workers and called its own men out on behalf of higher wages and an end to the sweating system in the building trades.

Bosses and businessmen were convinced this upheaval was the work of outside agitators—Bennett’s *Herald* blamed the “vast importations of foreign socialists”—and indeed the overseas influence was decisive. But these “alien” ideas had local analogues. It was, after all, the “American” Brotherhood of the Union that in 1850 denounced the competition fostered by “capitalists, monopolists and tyrants” as tending to “divide, distract, and degrade Labor, and render the laborer and the mechanic a mere tool of those whose only God is Gold.”

During the upheaval, workers strove with considerable success to overcome national divisions. Many remembered 1846, when five hundred Irish laborers at the new Atlantic Docks had struck for an eighty-seven-cent hour and a ten-hour day, only to be replaced by greenhorn Germans provided to boss stevedores by the elite German Society, to the fury of German workers. Cabinetmakers issued their constitution in German, French, and English versions (“for the accommodation of all nations”) and conducted proceedings in several languages. German shoemakers forbade members to scab on their English brethren and adopted parallel wage demands. In virtually none of these cases, however, did labor ecumenicism stretch far enough to embrace African Americans or women.

New York’s white male workers of the world united more formally on June 5, 1850, when eighty-three delegates, representing seventy unions and twenty-eight reform groups, formed the Industrial Congress. The new organization sought an eight-hour day, a minimum wage on public works projects, and direct city hiring of workers rather than the use of private contractors. It also backed the land reformers’ initiatives, favoring a homestead law to open the West and a housing law at home to oversee construction and inspection of tenements to ensure they met appropriate standards of public health. Industrial Congress delegates also urged the municipal government to foster cooperatives, establish a labor exchange, and build reading rooms and public baths throughout the city. Such demands would remain at the core of New York’s labor movement for the remainder of the century.

The Industrial Congress also supported embattled strikers. On July 10, 1850, a mass meeting of German, Irish, and American tailors proposed a scale of prices, and on the fifteenth some nine hundred tailors turned out to enforce it. On July 22 three hundred strikers, most Germans, marched to the

Nassau Street offices of Longstreet and Company, one of New York's largest clothing manufacturers, a firm notorious for low wages and antiunionism. A brawl ensued. Police waded in with nightsticks and arrested the strikers. Organized labor swung into action. On the twenty-seventh thousands swarmed to City Hall Park for a rally. Radicals and unionists denounced the police ("We did not expect to find in this free country a Russian police," declared the Central Committee), and the Industrial Congress started a campaign to boycott any clothing firm that rejected the tailors' bill of prices. At another City Hall rally, on August 3, some went farther and called for a general strike. If butchers and bakers were to cut off supplies, "then the aristocrats will all starve," one militant argued, for "they are the drones and the idlers."

On August 4 three hundred German tailors marched to 38th Street and Ninth Avenue, where strikebreaking subcontractors were at work. There, according to the *Staats-Zeitung*, police attacked the tailors; according to English papers, tailors ransacked the nonunion outfit. All agreed that a melee ensued, in which two tailors were killed and dozens severely wounded. Thirty-nine unionists were convicted of rioting and dispatched to prison. For the first time in U.S. history, urban American workers had died at the hands of the forces of order in a trade dispute. The event only outraged and strengthened the strikers. By month's end almost every employer had come to terms with the union, and three thousand German and Irish tailors had formed a Cooperative Union Tailoring Establishment.

But this would be cooperation's high-water mark. Marx and Engels—Weitling's opponents in the European radical wars—had derided such efforts as Utopian wishful thinking, and in New York, certainly, their tough-minded analysis proved correct. Businessmen attacked cooperative shops as the opening wedge of socialism. Wholesalers refused to buy their goods. Banks denied them capital or credit. The legislature wouldn't grant co-ops the legal protections it afforded corporations, leaving individual members liable for collective losses. And with artisan-run shops unwilling to slash their own pay to subsistence levels, they were unable to compete with capitalists willing and able to exploit cheap immigrant outworkers.

By 1852 such obstacles had become evident to all, and mass defections produced a general collapse. Those co-ops that survived did so by accepting individualistic approaches. The one thousand members of Industrial Home

Owners Society Number One (1849), determined to escape the orbit of Manhattan land monopolists, bought a 367-acre tract in Westchester County along the New Haven Railroad line, divided up the land into a gridwork of quarter-acre parcels, then distributed plots by lot. As of 1854 these suburban pioneers had built over three hundred homes, planted shade trees, built a commercial section around the railroad station, and incorporated their community as Mount Vernon. This was the kind of land reform that bankers and builders could live with, and legislators had no hesitation in authorizing such associations to incorporate; by 1852 there were nearly seventy. In 1859, similarly, Germans set up the Deutsche Sparbank, and within a year ten thousand depositors—the majority of them tailors, shoemakers, cabinetmakers, and grocers—had put in \$2.5 million. For now, the most “cooperative” enterprises would be the corporations themselves, but the vision of a cooperative municipality survived and would be resuscitated repeatedly.

The unions proved far more durable. Some, on winning their immediate goals, did lapse into dormancy or continue on as mutual benefit societies only. But with employers constantly reneging on recent agreements, and inflation biting deeply into wages (the cost of necessities rose 30 percent between 1853 and 1854), unions old and new continued to launch strikes. The mid-1850s witnessed initiatives by omnibus drivers, horsecar drivers on the Third Avenue Railroad, pilots of the Union Ferry Company, Erie Railroad workers, hatmakers, cigarmakers, coopers, printers (now part of a nationwide organization, their local known as Typographical Union No. 6), hotel waiters, drygoods clerks, housepainters, machinists, carpenters, gilders, typesetters, and the German Pianomakers Union of New York City, proud possessors of the flag carried by journeyman pianomakers of Paris “upon the barricades during the stormy days of the French Revolution.”

Good interethnic relations remained an important goal. The Longshoremen’s United Benevolent Society, formed in 1852, had fourteen hundred members by 1854. Though overwhelmingly Irish, the Longshoremen’s Union boasted a banner decorated with the flags of France, Germany, the Netherlands, Sweden, Ireland, Denmark, Hungary, and Italy, all bound together under an American flag and the word “Unity.” African Americans, again, were conspicuously excepted.

Many, though by no means all, of these strikes were successful. Influential bourgeois opinion tolerated nonviolent protests; there was so much money floating around that union demands seemed both legitimate and affordable. As *Harper's* put it in the summer of 1853: "It is reasonable and natural, that in view of the splendid trappings of our growing houses, and our metropolitan hotels, that the gas-fitters, and cordwainers and ladies' shoemakers, and saloon-servants should hold out their hands for their share of the excess."

Many unionists accordingly stuck to fighting for wages and work rules and avoided larger political initiatives: this was the guiding philosophy of a new central labor congress established in 1853, the Amalgamated Trades Convention. However, others continued to believe that only broad-based pressure on city and state authorities would effect fundamental change.

Joseph Weydemeyer was among the leaders of those calling for creation of a fullfledged labor party. Newly arrived in 1851, Weydemeyer was a former Prussian army officer who had been converted to socialism and was now a close colleague of Marx and Engels. In New York, Weydemeyer first wrote for the *Turn-Zeitung*, then (by January 1852) established *Die Revolution*, which that spring published Marx's masterly postmortem of the 1848 Revolution, *The Eighteenth Brumaire of Louis Bonaparte*.

In March 1853 Weydemeyer put out a call "To the Workers of All Trades!" for a March meeting at Mechanics Hall, to which eight hundred German-American house-painters, tailors, shoemakers, cabinetmakers, cigarmakers, Turners, and members of Weitling's Workers League responded. Those assembled endorsed formation of the Amerikanische Arbeiterbund (American Workers League). It issued a call for what by now had become the standard set of working-class cultural, political, and economic demands. These included the ten-hour day, abolition of child labor, free higher education and day care, opposition to temperance, enactment of a mechanic's lien law, unification of workers across national lines, and establishment of political clubs in working-class wards in order to "strive for the organization of the working class into a cohesive and independent political party." The organization established a base of support in Kleindeutschland and German communities in Brooklyn, Williamsburgh, and Staten Island but failed to reach much beyond them, although an Irish

Societies Convention also emerged in 1853 to push for some of the same reforms.

Though nothing like the scenarios envisioned by enthusiastic immigrant revolutionaries would come to pass, their campaigns, coupled with the Astor riot and patently appalling slum conditions, would have a tremendous impact on reform-minded members of the city's upper classes, the men and women who though reaping the benefits of the boom were increasingly alarmed by some of its consequences.

Into the Crazy-Loved Dens of Death

As New York's propertied classes surveyed the new metropolitan landscape, their pride in the city and its power was laced with a sour frustration, even revulsion. All around them stretched noisome urban marchlands where the writ of gentility hadn't run in years—Five Points, Corlear's Hook, Dutch Hill, the black enclave around Bancker Street, Kleindeutschland, the Hudson River waterfront, and the sprawling eastside industrial precincts between 14th and 23rd streets—nurseries every one of unionism, radicalism, Catholicism, pugilism, vice, squalor, and disease. Take care, respectable citizens, when you descend into these haunts of "rum-degraded human beings," warned Solon Robinson in *Hot Corn* (1854), a popular collection of sunlight-and-shadow vignettes. "You may meet someone, perhaps a man, perhaps a woman, who in their drunken frenzy may thrust you, for the very hatred of your better clothes, or the fear that you have come to rescue them from their crazy-loved dens of death."

In fact no part of town seemed safe anymore. Prostitutes, homeless urchins, vagabonds, beggars, and other "social rats" had free run of the streets, and legislators investigating conditions in Corlear's Hook worried that the cancerous horrors of the slums were spreading relentlessly through New York's "veins and arteries." If nothing were done, they continued, "the heart and limbs of the city will sooner or later suffer, as surely as the vitals of the human system must suffer by the poisoning or disease of the smallest vehicle." Once bucolic suburbs weren't immune from infection either, thanks to the ease of travel by railroad and steamboat. On summer Sundays and holidays, growled George Templeton Strong, "the civic scum" washed over Long Island, Staten Island, and New Jersey. "All conveniently accessible hotels and boarding houses are overrun by the vermin that hot weather roasts out of its homes in towns." Most of his friends, Strong added, never went out at night without a revolver.

Every year, indeed, brought shocking new testimony—from physicians, health inspectors, hospitals and medical dispensaries, orphanages, courts, police officials, and legislative commissions—that confirmed a horrifying expansion of poverty and disease and crime in the metropolis. Yet

concerned elites were no longer certain what they could or should do about it. Many held fast to traditional moralizing while others found the pressure of circumstances (and working-class radicalism) forcing them to reconsider some cherished assumptions about the causes of poverty and the role of government in responding to it.

“PENITENTIAL TEARS”

The merchants and industrialists who ran the Tract Society and Bible Society continued trying to convert tenement dwellers, particularly Catholic ones, to Protestant piety and bourgeois social virtues, though increasingly they shifted from relying on volunteers (who found the immigrant localities “very repulsive”) to using full-time salaried workers. To churn out bulk shipments of Holy Writ for Sunday schools, poorhouses, prisons, orphanages, and immigrant depots—and to manage what was increasingly a worldwide crusade—the American Bible Society erected a grand new Bible House that took up the entire block between Third and Fourth avenues and 8th and 9th streets.

The Home Missionary Society similarly kept on spreading gospel civilization to heathen savages from the African veldt to the American West and working for the Christian redemption of New York City. They were joined in this by Episcopalians (who revived their Missionary Society) and Congregationalists (Beecher’s Plymouth Church opened several waterfront missions), but the boldest initiative came from the Ladies’ Home Missionary Society (LHMS) of the Methodist Episcopal Church.

In 1850, backed by wealthy contributors like Daniel Drew and Anson G. Phelps, the LHMS opened a Five Points Mission in a rented room diagonally across from the infamous “Old Brewery.” There, under the leadership of the Rev. Louis M. Pease, the ladies ran prayer meetings and Bible study classes, opened a charity day school, sponsored temperance speakers, and went out to comfort the sick. Closely attuned to the virtues of publicity, they issued regular accounts of their work—filled with stories of miraculous conversions and deathbed repentances—and on Thanksgiving Day paraded hundreds of scrubbed Sunday school students before benefactors. Then the ladies fed their charges turkey dinners, inaugurating a ritual that would lead, a decade later, to Thanksgiving’s establishment as an official (and feminized) holiday.

In 1852, drawing again on the ample resources of Phelps and Drew and on a thousand-dollar contribution from the Common Council, the LHMS purchased the Old Brewery itself and announced that the notorious “pest-house of sin” would be replaced with a proper “school of virtue.” To dramatize its demolition, the LHMS ran candle-lit tours of the rookery’s fetid interior, “where miserable men, women, and children . . . moodily submitted to the gaze of the strangers in that community of degraded outcasts.” The residents were then evicted and the building razed; in its place rose the new Five Points Mission, complete with chapel, schoolrooms, baths, and twenty apartments for the homeless—a bow to the poor’s material needs.

Some missionaries learned unexpected things in the working-class quarters. One day, the Rev. Pease was preaching to a group of “profligate” women—“respectably, some even genteelly dressed,” he remembered, “yet their character was readily perceived.” Suddenly they turned on him. “Don’t talk to us of death and retribution and perdition before us; we want no preacher to tell us all that,” they cried. “Give us work and wages!” These “sotted wretches,” Pease discovered, could not afford to pay the security deposit clothing manufacturers required before handing out garments to sew. Pease decided to help. Converting the mission’s evening prayer room into a daytime sewing workshop, he collected the piecework himself and offered employment to all who would pledge themselves to temperance and a moral life. The LHMS, believing Pease had gone too far, denounced him as a Fourierist and severed their relationship. But Pease won the backing of the Episcopal Church of the Ascension, and in 1854 his new Five Points House of Industry set up shop on Anthony Street.

By the late 1850s there were seventy-six missions in the metropolis, almost saturating the working-class quarters, yet for all this earnest activity, there was a growing sense that it was little more than an expensive dead end. A vigorous and self-assured workingclass culture seemed to shrug off evangelical efforts as easily as did Middle Eastern Muslims. In 1855, when New York’s population was 629,924, there were only 138,678 communicants in metropolitan churches.

And of these over half, 78,488, were Catholics, a statistic not calculated to warm Protestant hearts. The Irish, long inured to proselytizing by British Protestants, kept evangelicals firmly at bay—a task made easier by the

missionaries' obvious disdain for what they regarded as a cult of medieval superstition and idolatry. (In their determination to guard Christian souls from the clutches of Rome, evangelicals forbade inmates of their homes and shelters to see a priest, even if they were on their deathbeds.) Catholics boycotted "Old Pease's School," cursed the redoubtable ladies of the LHMS, and threatened bodily harm to representatives of the Tract Society.

Besides such grass-roots opposition, the evangelicals had the Catholic hierarchy to contend with. Redeeming the poor from "bondage" to Protestant charity was "the noblest work for Catholic charity," said their spokesperson *Freeman's Journal*, and the Church set out to establish a rival aid network. In 1846 Father Varela, pastor of Transfiguration, introduced the St. Vincent de Paul Society to New York City; other parishes quickly established chapters or started their own missions. In 1849 the Sisters of Mercy opened a House of Mercy, which accommodated two hundred destitute women each evening and gave food and clothing to great numbers of the needy. That same year Archbishop Hughes, infuriated that Protestant hospitals blocked priests from visiting Catholic patients, got the Sisters of Charity to launch St. Vincent's Hospital. (The German Sisters of the Poor would follow suit with St. Francis Hospital.) St. Vincent's charged a modest admission, in part to remove the stigma of receiving charity, and by 1858 a physician at New York Hospital admitted that "most of our domestic servants prefer" St. Vincent's.

Catholic and Protestant elites saw eye to eye, however, on the evils of demon rum, being dispensed (as of 1849) at 5,780 licensed liquor groceries, porter houses, taverns, and fancy saloons. The New-York Temperance Society and Bishop Hughes alike welcomed Cork's famous Father Theobald Mathew to Manhattan, where he spent much of a year preaching against alcohol and inspiring formation of the Roman Catholic Total Abstinence and Benevolent Society. Even pleasure-loving Knickerbocker patricians listened more attentively now to temperance claims that "the cheap wines of France" had been responsible for "insubordination and revolution" in 1848.

Yet here too reformers found themselves up against formidable opponents, starting with the immigrants themselves. When advocates opened a mission next door to a German beer garden in 1860, its outraged customers "evinced their displeasure by throwing water into the open

windows, shouting, making noises in the hall, casting stones against the door, and other disorderly conduct; so that the aid of the police became necessary.” In addition, alcohol purveyors ranging from merchant importers to waterfront barkeepers mobilized into a formidable pressure group—the Liquor Dealers Protective Union had eight hundred members by 1855—and sponsored mass meetings to mobilize antiprohibition sentiment.

Balked, temperance advocates turned to the state. “Ought law to conform to public sentiment,” Horace Greeley rhetorically asked delegates assembled in 1853 for the World’s Temperance Convention, “or ought law to be based upon essential righteousness, and then challenge a public sentiment to act in conformity therewith?” The reformers answered by successfully pressuring the state legislature into passing the 1855 Act for the Prevention of Intemperance, Paupers, and Crime, a law that, among other things, authorized keeping persons arrested for public drunkenness locked up until they agreed to testify as to the source of their intoxicant. The statute aroused immense hostility in New York City, touching off mass rallies at Tammany Hall and bringing declarations from Bennett’s *Herald* that it would ruin New York business to the benefit of wet New Jersey. The mayor refused to enforce the law, and in 1856 the state appellate court declared it unconstitutional.

Setbacks in missionary and temperance work were accompanied by abject failure to check the spread of gambling. Jonathan Harrington Green, a reformed gambler turned professional lecturer on tricks of the sharpster’s trade, helped set up a New York Association for the Suppression of Gambling (ASG) in 1850. The board of ministers and businessmen directed executive agent Green to undertake a thorough survey of the problem. He reported back that there were 6,126 gambling houses in town—defined broadly enough to include the first-class “hells” where rich merchants played faro in luxurious surroundings, the dimly lit “penny-poker dens” where small-time thieves congregated, the lottery offices, the policy offices, and indeed anywhere bets were placed, including ten-pin alleys, billiard rooms, saloons, cockfighting pits, and shooting galleries. Green also noted the rarity of arrests: in the previous six years a grand total of fifty-nine people had been indicted for gambling.

The ASG professed great concern about the impact of these establishments on vulnerable young men, and it was true enough that

gambling, like much else in New York, had rapidly shifted its nature in recent years. In the past, most recreational betting had been done with peers; monies won generally remained in circulation within the neighborhood. Now much of the wagering went on in commercial settings, organized by oftunscrupulous professionals who lived off customers' losses. But Green and the ASG proved to be less troubled by gambling's impact on youths than by its consequences for employers. In general, they bemoaned the gambling-propagated lust for quick wealth that was undermining the industry and sobriety businessmen wanted in their labor force. In particular, they bewailed the rising number of gambling-addicted clerks who dipped into their employers' tills to make up losses.

Green's contemporary, a young merchant named George H. Petrie, had visited London for business and to see the Crystal Palace, discovered the Young Men's Christian Association there, and brought it back to New York in 1852 to "ralley around the young stranger and save him from the snares of this wicked city." With the help of Mercer Street Presbyterian's Rev. Isaac Ferris, Petrie set up a temporary sanctuary in two rooms on the third floor of the old New York City Lyceum at 659 Broadway. Clerical workers, many of them new to the city, flocked to the YMCA, attracted by its library and meeting place, network of friends and surrogate family, and help in finding housing, churches, and jobs with YMCA businessman backers. Such men, in turn, responded warmly to the argument (cogently expressed by the Rev. George W. Bethune at the second annual meeting in 1854) that the organization was "a principle of insurance to their interests," a way "to make their servants—I mean those who are in their employ—faithful to their duty."

For all its promise, the "Y"—which would itself evolve in unexpected directions—was not intended to transform the immigrant masses in the present but to contend with them in the future. It was wonderful, Bethune said, that "after all this infusion of foreign admixture, the Anglo-Saxon element pervade[s] and rules" New York, but maintaining that predominance required advance planning. The YMCA would train up what Bethune called a cadre of men "calm, resolute, armed, drilled and prepared for the fight, taking their position as the guardians of the city," but even if successful, such troops could have no immediate impact on a rapidly deteriorating situation.

“TO EXPEL IDLENESS AND BEGGARY FROM THE CITY”

The “scientific reformers” at the Association for Improving the Condition of the Poor were not doing much better than the moralizers they tended to belittle. By the early fifties the AICP, with roughly four thousand contributing members—including some of the greatest bankers, merchant princes, and industrialists of the day—was the most influential organization of its kind in New York. Its program of centralized philanthropy to manage city indigents was in full swing; nearly four hundred employed visitors had logged hundreds of thousands of visits; and executive secretary Robert Milham Hartley professed himself mightily pleased with the elaborate structure. “Its machinery,” Hartley boasted, “though extensive, is easily managed, and works with admirable precision, economy and effect.” Surely it couldn’t fail “to expel idleness and beggary from the city.” Here, he crowed, was America’s answer to the recently published *Communist Manifesto*.

Hartley *had* succeeded in expelling many of the most wretched from the city, in a sense. They’d been swept from Manhattan’s streets and dispatched to Blackwell’s Island, by 1850 a 1.75-mile-long laboratory for scientific management of the classified poor. Yet no matter how many grand (and costly) new establishments got constructed on Blackwell’s, they were immediately (and expensively) swamped with inmates, 60 percent of them Irish. Many were elderly discharged domestics who, having spent their lives in service, had no children to look after them nor community support networks to rely upon in their old age. Between 1853 and 1856, caring for the seven thousand people crammed into the new almshouse drove the costs of operation up by 240 percent, from \$385,000 to \$925,000.

The sick and immigrant poor, meanwhile, were shoehorned into Bellevue Hospital. Of the 3,728 admissions in 1850, 2,596 had been born in Ireland and only 647 were native born. A substantial minority were relegated to the floors until a new wing, added in 1855, brought the number of beds to twelve hundred; by the mid-1850s Bellevue was treating four to five thousand patients annually. The place had a fearsome reputation, however, partly because the private hospitals and other poor-relief institutions continued to dump their terminal cases there and then slander the facility for its mortality rate. Ardent efforts brought in-house deaths down somewhat, but in the late 1850s Bellevue remained rat-infested, lice-

ridden, and, like many of the other overcrowded institutions, wracked by epidemics of puerperal fever (which carried off parturient women) and ophthalmia (which led to blindness in large numbers of children).

Public and private reformers made heroic efforts to respond to the crisis. A tiny smallpox hospital was opened on Blackwell's southern tip in 1848, then replaced by a much larger version in 1856. The Blackwell's Island Lunatic Asylum, a mammoth and intricately designed hospital at the northern apex, was the largest such institution in the country when it opened in 1839 but was quickly overburdened with inmates; it was replaced by two new buildings in the late 1840s. Three-fourths of these inmates were immigrants, two-thirds of whom were Irish. Insanity proved especially prevalent among young immigrant women, one sympathetic physician wrote, who were simply overwhelmed by "the combined moral and physical influences of their leaving the homes of their childhood, their coming almost destitute to a strange land, and often after great suffering."

The idle and dissolute—"paupers" and "vagrants"—were sent to the new (1855) workhouse, which reformers had been clamoring for for years. There they were set to productive labor, isolated from the respectable almshouse poor with whom they had once been promiscuously mixed. The utterly "debased" and "depraved" were incarcerated in the fortresslike penitentiary near the island's southern end, with one wing for males, another for females; at times, however, the crush of vagrants in the workhouse was so great that its overflow—twenty-five hundred people in 1851—had to be confined along with the convicts.

Most of these establishments imposed a rigorous and moralistic order on their "inmates." They required the able-bodied to work: men labored in the quarry, rowed ferryboats to the mainland, and were on occasion loaned out to clean sewers; women cooked, washed, ironed, sewed; expectant mothers scrubbed floors. But these tasks, originally intended to inculcate values while offsetting costs, soon degenerated into devices for maintaining discipline or imposing a punitive routine. Rehabilitation had given way to warehousing.

"IDLE AND VICIOUS CHILDREN OF BOTH SEXES"

The reform community's greatest efforts were devoted to rescuing children of the poor—now, more than ever, considered a threat to civic stability. In 1849 George Matsell, New York's chief of police, alerted residents to a “deplorable and growing evil” that threatened the very survival of the city. “I allude,” he wrote, “to the constantly increasing number of vagrants, idle and vicious children of both sexes, who infest our public thoroughfares.” The three-hundred-pound Matsell was detested in workingclass neighborhoods—Mike Walsh called him “a degraded and pitiful lump of blubber and meanness”—but his warning inflamed the imaginations of middle- and upper-class reformers. The Rev. Edwin Chapin quite agreed that “the children of the Poor create an appeal to *prudential* considerations,” as they “form a large proportion of those groups known in every city as ‘The Dangerous classes.’”

By the late 1840s children under fifteen constituted almost one-third of the city's population (comparable to London's 31.9 percent though far more than Paris's 19.6 percent). The virtual disappearance of apprenticeship with its provision of room, board, and steady work had freed many from traditional constraints, and working-class families, who expected children to earn their keep from early on, routinely sent their young into unsupervised street trades.

Even more alarming than the swarms of children working the streets were those who lived on them as well. Many were orphans—poor parents often died young—but others simply didn't like working-class family life, with its enforced sharing and cooperation, its parental discipline, often its parental violence. The streets beckoned the discontented with their alluring range of things to buy and places to go; even boys with homes slept out for weeks at a time, swelling the ranks of vagrant children.

The AICP's solution was similar to the one they fashioned for adult immigrants: round the children up, then slot them, depending on character, into reformatories, schools, or bourgeois-type homes. To accomplish the first goal, the AICP drafted a model Truancy Law and, with help from the Female Guardian Society, got the state legislature to pass it in 1853. The law empowered police to arrest vagrant children between the ages of five and fourteen. If they proved to be orphans, they were to be made wards of the state and institutionalized. If not, they were to be turned over to their parents, who were enjoined to send them to school—an injunction given

teeth by making school attendance a condition of family relief. If parents still failed to live up to their responsibilities, authorities were authorized to seize the children “and place them under better influences, till the claim of the parent shall be re-established by continued sobriety, industry and general good conduct.”

The legislation was less effective than it might have been in banning children from the streets, as it was so harsh that in practice many policemen refused to make arrests. But those who were picked up in the dragnet got consigned to a range of specialized institutions.

The hard cases were packed off to the House of Refuge, founded in 1824 and still going strong, though newly relocated in 1854 to Randall’s Island. There, isolated from the wicked city and adult prisoners alike, youthful vagrants were set to laboring alongside convicted juvenile delinquents and rebellious sons and defiant daughters who had been committed by their working-class parents. In the House of Refuge, the AICP noted approvingly, twelve-year-olds were “trained in habits of industry” by being compelled to make sixty pairs of ladies’ shoes a day, which sold briskly in retail shops, undercutting adult shoemakers.

The AICP did worry, however, that inmates who were hardened reprobates would drag down into delinquency those who were as yet merely vagrant and neglected. So the organization proposed and helped institute the New York Juvenile Asylum (1851), dedicated to teaching disobedient and idle children “self-discipline of body, mind, and heart” and then apprenticing them to employers. The asylum, unfortunately, proved no more effective an agency of reform than did the House of Refuge, and it too came to serve primarily a custodial function.

The reformers vested their major hopes for saving the salvageable in the school system, which underwent a major reorganization in these years. The Public School Society, the private board that had been running the free schools with public money, was subordinated to, and then in 1853 subsumed by, the popularly elected Board of Education. The public system launched an ambitious building program, constructing some schools capable of holding a thousand or more, and hired women as teachers, to keep costs down. Most innovatively, the board, seeking to provide an alternative to theaters and saloons, provided an evening school program that

by 1856 had enrolled nearly fifteen thousand, some four thousand of whom were females, taught in separate classes.

The board's pedagogical agenda remained that of the old Public School Society—the president announced in 1852 that he sought the “cultivation of habits of ready obedience”—and many of the new ward-school teachers, old PSS veterans, brought along their emphasis on mechanical memorization and Protestant indoctrination. The schools, accordingly, had a mixed record in accessing the immigrant poor. Over half of those registered never showed up, and perhaps fifty thousand went utterly unprovided for. What the institutions did best was protect and encourage children of middle-class character; youths who failed to measure up were weeded out rather than reformed.

The Sunday School Union had its own problems with the immigrant poor, though it did reaffirm (in 1856) its commitment to the “wretched progeny” of the “refuse population of Europe” as well as the “offcast children of American debauchery, drunkenness, and vice.” However, as the union admitted, “our object has always been to reach the masses, but we cannot get to them.” More and more, the Sunday schools became adjuncts of middle-class congregations, and most outposts in the working-class districts were eventually written off as failures.

The era's most creative educational initiatives were aimed at older youths and adults. In 1846 the Board of Education's Townsend Harris, a prosperous crockery merchant, proposed establishing a college for those who “have been pupils in the common schools.” It would offer studies relevant for the “active duties of operative life” rather than the classics courses Columbia and NYU considered preparatory for “the Pulpit, Bar, or the Medical profession.” The Free Academy was authorized in 1847 by an act of the legislature, but under pressure from “friends of the present expensive colleges [who] dislike it and are trying to crush it,” its fate was made conditional on winning a referendum.

In a whirlwind thirty-day campaign, Tammany posted placards all over town urging a “Free Academy for the poor man's children” while Whigs opposed the idea on several grounds. Some complained of the cost. Others suggested that workers lacked the intellectual capacity to absorb higher education or, conversely, that they *would* absorb it and then become “too proud of their superior education to work either as clerks or mechanics, or

to follow any active business except what is termed professional.” After all, as “Plain Truth” argued, “in every organism there must be diversity of members. There will be head, and hands, and—we must venture to say it—feet, too.” Finally there was the blanket ideological objection that the proposed expansion of free public services was really the opening wedge of a “mongrel Fourierism.”

Overriding these complaints, the citizenry passed the Free Academy referendum by 19,305 to 3,409. Architect James Renwick was set to designing a Gothic structure on Lexington and 23rd, and at the formal opening, in January 1849, a speaker hailed the “system of popular education for the common man” as solid evidence of the “growing democratization of American life.” Mike Walsh denied this, predicting that few laboring-class children would ever grace its Gramercy Park precincts, for most could not afford not to work, and the academy, while free, offered no stipends. Walsh’s prediction proved only slightly overstated. Talented sons of laborers, cartmen, craftsmen, and clerks did enter (though few from the ranks of Irish or German immigrants), but most were indeed forced by indigence to drop out and take jobs. The vast majority of graduates were scions of merchants, ministers, lawyers, doctors, brokers, or clergymen, and most were of English, Dutch, or Huguenot descent. Nor were any graduates women, no matter what their ethnic and class credentials, for despite an 1854 legislative grant of authority to extend free higher education to females, raucous opposition within and outside the board blocked formation of the female Normal School (later Hunter College) for another decade and a half.

Peter Cooper set out to do better. Long inspired by the adult education programs offered by lyceums and mechanics’ institutes in the United States and abroad, Cooper, while PSS leader, had helped inaugurate the public schools’ evening classes back in 1848. Now he decided to erect an institute that would offer free education in the mechanical arts and sciences, with an emphasis on practical education, for men and women of the working classes. In 1853, on a plot of land between Astor Place, Third Avenue, Seventh Street, and Fourth Avenue, he laid the cornerstone for Cooper Union; he spent \$600,000 completing it over the next five years. Its open-admission night classes were available to all comers, regardless of previous education; those lacking rudimentary knowledge were sent to the public

evening schools. Two thousand people responded avidly—clerks, salesmen, bookkeepers, machinists, carpenters, and cabinetmakers predominated—filling every class immediately, though over six hundred soon dropped out. The courses were coed—though 95 percent of the students were male—and Cooper also opened a daytime Women’s School of Design to teach engraving, lithography, drawing, and painting on china. Cooper Union’s program was strictly nonsectarian, despite Cooper’s strong history of opposition to Catholics’ receiving state funds for education, and the school drew high praise from Bishop Hughes. The Great Hall, to the alarm of some, became a place where civic issues were debated from many (including radical) points of view. And its well-stocked reading room—unlike those of the neighboring Astor Library (which opened at 6th and Lafayette in 1854) or the Mercantile Library (now housed in the old Astor Opera House) or the New York Society Library (newly installed on University Place in 1856)—was kept open until ten P.M., making it accessible to working people.

WESTWARD HO! (CHILDREN’S VERSION)

Despite the defects of existing child-saving programs, the Rev. Charles Loring Brace insisted that this was a time for decisive action, not despair. Brace believed, as did the moralizers and schoolmen, that the “existence of such a class of vagabond, ignorant, ungoverned children” represented a massive danger “to the value of property” and even “the permanency of our institutions.” But his mission work with the Rev. Pease in the Five Points had convinced him that “the old technical methods—such as distributing tracts, and holding prayer-meetings, and scattering Bibles”—were now useless. “The neglected and ruffian class which we are considering are in no way affected directly by such influences as these. New methods must be invented for them.”

Brace also dissented sharply from the AICP approach. The street urchin, Brace agreed, having “grown up ignorant of moral principle as any savage or Indian,” would eventually “poison society,” yet while fearing those he called “barbarians” and “street rats” Brace also admired the “independence and manly vigor” of the newsboys, bootblacks, match sellers, even the petty thieves. Their creative entrepreneurial energy suggested they might be little businessmen in the making—if only they could be instilled with a ” ‘sense

of property,' and the desire of accumulation, which, economists tell us, is the base of all civilization."

Clearly the first step was to isolate urchins from their working-class milieu—the "engine runners, cock fighters, pugilists, and pickpockets," the "low theatres, to which he is passionately attached," the "vicious career of [his] parents." But the next step, Brace insisted, was not to place them in asylums or schools, whose obsession with "drilled and machine-like" conformity would only break their spirit and render them "unused to struggle."

The better solution was to extract them from the city altogether and ship them off to the interior, where they would be boarded in "kind Christian homes in the country." This would submit them to the moral tutelage of some pure woman: "No influence, we believe, is like the influence of a *Home*." It would also set them to work, having the additional advantage of sending "laborers where they are in demand" while relieving "the overcrowded market in the cities." Clumped in New York, the children were a festering menace; dispersed over the continent, their individualism and opportunism could be put to good account.

To this end, in 1853 Brace set up the Children's Aid Society, on Astor Place on Fourth Avenue (near the headquarters of the AICP and the YMCA). At first, after screening both children and potential families, it shipped youths to farms in the nearby countryside. Later, when the railroad system penetrated deeper into the interior, they were sent all the way to Illinois, Michigan, and Iowa. By 1860 the society had placed out 5,074.

Brace's approach attracted a good deal of support from socially prominent merchants, bankers, and lawyers (though not, despite some help from the Unitarians, from the ministerial community, a sign of the growing secularization of the reform movement). Working people were of a more mixed mind. The program had its appeals: enterprising youths were attracted to its promise of a western adventure; emigration schemes were in the air; and the Irish, in particular, were well accustomed to seasonal migrations of adolescents as farm laborers and domestic servants. On the other hand, there was a widespread (and often justified) sense that the children were being exploited as cheap labor by shrewd western farmers. And unlike the land reformers' voluntary homesteading plan, the Children's Aid Society approach had the unappealing aspect of something *done* to one.

Moreover, just as African Americans had long resisted Colonization Society efforts to “solve” the racial problem by deporting them en masse, Catholics vigorously resented a policy that seemed, in the words of the *Freeman’s Journal*, to be “seizing them in the name of charity and of religion, and carrying them away to be brought up aliens to the Catholic faith.”¹

The New York Archdiocese, accordingly, redoubled its own children-saving efforts. By 1858 the assets of its massive parochial school system were valued at over two million dollars, and soon there were nearly fifteen thousand attending twelve select schools and thirty-one free schools. Some of these were artfully counterplaced: when crowds of Catholic parents prevented children from entering Pease’s House of Industry in the fall of 1853, they redirected their youngsters to a parochial school that had been deliberately set up nearby. New orphanages rose, to prevent Catholic children being consigned to Protestant asylums and “brought up in hatred of that religion which was the only and last consolation of their dying parents!” The most spectacular countermeasure was launched in 1863 when the enormous Catholic Protectory was inaugurated on 114 acres of farmland in the Bronx—a rural training center where city boys could be rescued from the wicked city and the Children’s Aid Society alike.

ENTER THE ENVIRONMENTALISTS

In 1842 John H. Griscom, a learned and pious Quaker physician who served on the AICP’s first executive committee, issued a scorching report on sanitary conditions in the city. Griscom had seen the effects of living in cellars and tenements close up during his years of service at the New York Dispensary and New York Hospital, and after he was appointed to John Pintard’s old post of city inspector in 1842, he embarked on a comprehensive survey of city health.

Griscom concluded that a good deal of metropolitan mortality was avoidable. To his mind, “first among the most serious causes of disordered general health” was the city’s crowded and poorly ventilated housing, especially its rear courts and cellars (he found some that housed as many as forty-eight persons), and he bitterly condemned the cupidity of those who had taken advantage of abject destitution to convert their basements “into living graves for human beings.” Griscom’s second-ranked killer was the omnipresent filth, which resulted from obscenely overused facilities (often

fifty people shared a single privy) and from abysmal drainage and sewerage.

After carefully demonstrating the connection between unsanitary living conditions and poor health, Griscom argued for preventive action. Like his predecessors, he wanted common nuisances eliminated. But he went farther, citing studies of Edwin Chadwick and other English health reformers, and urged construction of a comprehensive sewage and drainage system and free provision of Croton water to the entire population. Griscom also sought public regulation of housing. Going far beyond the existing fire-related statutes, he asked for legislation to protect residents “from the pernicious influence of badly arranged houses and apartments.” Griscom wanted to require landlords to provide tenants with adequate space and fresh air (at least ten cubic feet per minute per adult). He urged banning the use of cellars, limiting the number of residents per building, and holding landlords accountable for keeping buildings clean. To ensure compliance, he proposed replacing politically appointed health wardens with nonpolitical medical experts—a Health Police, authorized to make routine inspections and, if necessary, close down places found unfit for human habitation.

The aldermen did not take kindly to Griscom’s proposals, which among other things would lop off lots of patronage positions, and the doctor was not reappointed as city inspector. But a group of reformers including Peter Cooper put together a fund to publish an expanded version of his 1842 study, and *The Sanitary Condition of the Laboring Population of New York*—a landmark in the history of public health—came out in 1845.

Among Griscom’s many striking departures from conventional bourgeois wisdom was his refusal to blame the poor for their wretched housing. He knew that lack of fresh water and adequate sanitation made it impossible for residents to keep clean and pious homes, even if they wanted to, and he even declined to blame laboring men for escaping from such hovels to the grogshops. For Griscom, dirt was a symptom of poverty, not its cause.

On the other hand, he didn’t blame the rich, as the land reformers did. Rather he appealed to them to provide decent housing, not just as “a measure of humanity, of justice to the poor,” but as a matter of self-interest. Bad housing meant sick workers, and sick workers meant lower profits, higher relief outlays, and higher taxes. Ultimately, too, slums fostered the

growth of “a class in the community more difficult to govern, more disposed to robbery, mobs, and other lawless acts, and less accessible to the influence of religious and moral instruction.” Griscom was convinced that such rational appeals would have weight because the problem seemed to stem from lack of understanding: “One half of the world does not know how the other half lives.”

The comfortable half didn’t pay much attention to Griscom, however, until rudely reminded of the costs of inaction. In June 1849, scant weeks after the riot in Astor Place, James Gilligan, an Irish laborer, was found dead, sprawled on the dirt floor of a rear basement room he shared with four women on Orange Street; by next day three of his fellow tenants were dead too.

The previous December the packet ship *New York* had arrived in quarantine from Le Havre with cholera as a passenger. Three hundred steerage customers had been hastily sequestered in commandeered customs warehouses, but many escaped to the city in small boats. Within a week cases had begun appearing in crowded immigrant boardinghouses. The cold winter had slowed its spread; now the disease roused itself and leapt out of the Points, sending the city into plague mode. The Board of Health struggled to find space for a makeshift hospital; turned down everywhere, they seized a colored public school. Railroads and steamships pulled in with no passengers aboard. Hotels emptied out. Business stopped.

The wealthy escaped to the country, leaving the disease to claim over five thousand of their poorer compatriots (another 642 died in Brooklyn). Bodies lay in the streets for days. Eventually they were rowed over to Randall’s Island and dumped in an open trench, at which point a gruesome public health device came into play as thousands of rats swam over and gnawed the flesh from the carcasses before they rotted.

As in 1832, many declared the cholera God’s retribution for sin—notably that of being Catholic. (Had not over 40 percent of the casualties been born in Ireland?) Indeed the *Herald* was amazed to find victims “among the respectable, *including even ladies*.” Overall, however, the cholera—together with the Astor riot and rising radicalism—strengthened the hand of those who argued that moralizing was no longer a sufficient response to social crisis. The relationship between ethics and environment had to be reconceptualized as an interactive rather than a one-way affair.

“The physical and moral are closely allied,” announced the liberal Protestant *New York Independent* in 1850, trying out the new thinking: “The habit of living in squalor and filth engenders vice, and vice, on the other hand, finds a congenial home in the midst of physical impurities.” Poor people tended to be sick people, a group of state officials noted, and vice versa. Even Hartley began to temper his moralizing and to admit that substandard housing, inadequate sanitation, and other environmental or circumstantial factors might be causes as well as consequences of poverty.

The implication for action, Charles Loring Brace concluded robustly, was that “Material Reform and Spiritual Reform must mutually help one another.” But the former would prove as difficult to obtain as the latter, especially as the municipality and state, smitten with *laissez-faire*, had dismantled much of their eighteenth-century regulatory apparatus. Still, the patent social breakdown registered by the crudest of social indicators—corpses stacked like cordwood—gave newly enthused reformers the chance to make a considerable impact on the urban landscape.

Another pig round-up, from *Frank Leslie's Illustrated Newspaper*, August 13, 1859. (© Collection of The New-York

Historical Society)

Starting with hogs. The 1849 catastrophe jolted the city into taking up arms once again against the immemorial foe. Overcoming sometimes violent resistance by impoverished owners, the police flushed five to six thousand pigs out of cellars and garrets and drove an estimated twenty thousand swine north to the upper wards that summer. (At the same time, in an exterminating frenzy spurred on by municipal bounties, 3,520 stray dogs were killed in the streets, mostly by small boys with clubs.) The authorities, moreover, kept up their campaign year after year, banishing from lower Manhattan (in 1851—2) all bone-boiling works (along with the putrefying carcasses piled high in their yards). In the late 1850s Hog Town was invaded and the westside piggery complex between 50th and 59th streets dismantled. By 1860 New York's porkers had been definitively exiled north of 86th Street and transformed into a distinctively "uptown" menace.

Cows were another story. Absent refrigeration, the city's on-the-hoof meat supply had to be kept close at hand. Besides, the Common Council was reluctant to limit the entrepreneurship of powerful butchers. An 1853 ordinance did ban cattle drives south of 42nd Street (at least in the daytime), but that still left 206 slaughterhouses open for business, which butchered over 375,000 animals annually (usually draining excess blood to the gutters). Then there were the eleven public markets, the 531 private markets or butcher shops, the tanneries with their piles of putrid hides, and the beasts—usually five thousand a year—who simply dropped dead in the streets from natural causes. In August 1853 alone, the city's contract scavenger reported clearing away 690 cows, 577 horses, 883 dogs, 111 cats, fourteen hogs, and six sheep—plus 1,303 tons of "butchers offal" and sixty-two tons of refuse bones from the slaughterhouses.

Then there was shit. The mercantile boom had vastly expanded the horse-based transport system—in 1854, there were 22,500 horses pulling public vehicles alone and countless others hauling private ones—collectively plopping tons of manure in the streets each day. Humans contributed their share via thousands of overflowing privies and cesspools, especially in the densely overpopulated tenement districts, where absentee landlords were disinclined to waste profits on tenant amenities, and tenants lacked money to pay privy cleaners. Where night scavengers did make pickups, they often spilled much of their cargo along the lanes as they

jounced their way to the waterfront. There they dumped their loads onto (or off of) the wharves, where poorly designed slips held the effluent fast to the shore and were themselves rendered almost impassable to vessels, to say nothing of the stench.

That New York was drowning in garbage was in large measure a by-product of the explosive and unregulated growth that few were willing to impede. But the problem was compounded by the city's having turned street cleaning over to private contractors in 1842, convinced this would bring improved service and lower costs. In the real world, collection contracts were often handed out as political plums to recipients who felt little compunction to make more than token swabs on the main streets; or they were awarded to the lowest bidders, often unprincipled sorts who hadn't the slightest intention of doing any work whatever.

Ironically, Croton water, so recently hailed as savior, only made matters worse. The rich built water closets in profusion, which when flushed with Croton water overflowed their cesspools even more rapidly. They consequently clamored for the right to plug directly into the sewers, which had been built for draining storm water from the streets. In 1845 the Common Council permitted such hookups. However, the pipes had been laid at right angles or awkward grades that could handle swift-moving rain runoff but couldn't cope with thick and sluggish wastewater. The result: impenetrable blockages, clogged pipes, and rampant flooding.

This problem was in turn resolved—in part—by building new sewers. The drawback here was that sewers, financed by assessments on adjacent property owners, were built only when resident proprietors or speculative realtors petitioned for them. Unlike the water supply, which had been designed as a system and paid for out of the common treasury, sanitation was reserved to those who could afford it. Sewer pipes slithered up Lexington, Second, and Third, where horsecar lines had facilitated better home construction, but most Irish and German areas remained bereft. Even where trunk lines did penetrate working-class quarters—along Stanton, Rivington, Delancey, Broome, and Grand—landlords refused to connect up with them, just as they resisted paying the Croton Aqueduct Department's installation fee and its annual water rent of ten dollars. In 1854, however, in yet another concession to environmentalists, the Common Council ruled

that residences had to be connected to sewer lines. And in 1856 it passed an ordinance limiting construction of new buildings to lots serviced by drains.

Nevertheless, in 1857 (the AICP noted), only 138 miles of the city's five hundred miles of paved streets had been sewered. This left two-thirds of all New Yorkers still reliant on backyard and basement privies, whose overflow continued to seep to the water table, infect public wells used by the poor, flood cellars, and leave missionaries and physicians routinely horrified to find children playing and mothers hanging the wash in yards coated with human excrement and swarming with flies. Against all this, the pioneering Bath and Wash House opened by the AICP in 1852 was a worthy but woefully insufficient response.

Foul milk, like foul water, proved durable and deadly. Dairy herds, like beef cattle, had to be kept near consumers and were most densely concentrated on the west side near 16th Street. Often, to keep costs low, they were placed next to distilleries, allowing "swill," the boiling-hot waste product of fermentation, to be fed directly into stable troughs in the cramped quarters. Swill had nutritive value but required supplementation with hay and grain. Few profit-conscious owners bothered to provide it. Nor were they overly concerned that disease ran rampant among their confined herds. They continued extracting thin blue milk from rotting and ulcerous cows until the animals died (at which point they were sold for meat). Then they doctored the product with magnesia, chalk, and stale eggs and passed it on to consumers, felling infants by the thousands.

Griscom and Hartley campaigned vigorously against swill milk, proposing city inspection, but neither city nor state was inclined to interfere with the workings of the free market, especially when the wealthy could afford good milk from farms in Westchester and Queens. By 1856 an estimated two-thirds of all milk sold in New York City was coming from distillery dairies. In 1858 Frank Leslie began a visual expose in his *Illustrated Weekly Newspaper*, depicting the milking of sick cows, detailing dairymen's profits, and decrying lobbyist payoffs to aldermen. The Common Council reluctantly authorized an investigation, then dropped the matter. Not until 1862 would environmentalists win a swill-milk law from the state legislature, and it proved to be full of loopholes.

TENEMENT TROUBLES

Housing reformers too ran into brick walls, though some of their difficulty in finding a solution stemmed from their own misdiagnosis of the problem. John Griscom had focused his ire on the “merciless inflation and extortion of the *sublandlord*.” The AICP agreed that slumlords tended to be unscrupulous immigrants or, at best, first-generation Americans—petty exploiters, often operators of saloons, brothels, and gambling dens—difficult to distinguish, in other words, from their wretched tenants.

It was true that large landlords commonly sublet their buildings to middlemen, leaving to them the chore of extracting high rents, rather as big garment shops left small contractors to do the direct sweating of labor. It was also true that many of these intermediaries were lower-middle-class proprietors (grocers, tavern keepers, building tradesmen) who had jumped into the real estate game or were professional real estate agents (often unemployed building tradesmen) who for a 5 percent commission let apartments and collected rent. In either case, landed grandees were effectively distanced from their tenants, few of whom knew that their ultimate landlord might be an Astor.

But the bottom line was determined from above: sublandlords had to pay chief landlords what Griscom blandly termed “a sum that will yield a fair interest on the costs.” But “fairness” was defined in relation to the returns their capital could fetch elsewhere. New York’s bourgeoisie had many outlets for accumulated cash—finance, industry, transportation, and western lands—and would invest in local real estate only if they could garner comparable profits. The same logic dominated the building industry, where the newly incorporated construction companies bid for capital from individuals and institutions; forced to pay high interest rates, building companies cut costs elsewhere, usually by slashing wages of construction workers, lowering housing standards, or both.

Griscom nevertheless believed he could convince “the benevolent capitalist” to build decent housing at a fair rate of profit. The AICP vigorously promoted a bricks-and-mortar discussion among builders and capitalists by circulating plans of “model” tenements gleaned from English sources. Well maintained and properly managed, it was argued, they could bring the owner a legitimate 6 percent return. Alas, even respectable Christian businessmen preferred to invest in upper-class housing that brought in 10 percent, new tenement housing that could garner 15 to 25

percent, or old crammed-up artisan housing that could reap 50 to 75 percent, though much of that had to be split with others.

When distressingly few businessmen stepped forward to begin construction, the AICP decided, again taking its cues from English and Continental philanthropists, to do the job itself. In 1855, after frustrating delays and false starts, it opened the largest multiple dwelling yet built in New York City, a six-story structure for eighty-seven families at Mott and Elizabeth streets, just north of the Five Points. Known as the Workingmen's Home and often described as the city's first model tenement, it had water closets on each floor, gas lighting, and Croton water. All the apartments were rented to African American New Yorkers, since "they are usually forced into the worst kind of dwellings, and are deprived of most special privileges, and consequently were specially deserving commiseration." The experiment wasn't successful, however. Though many rooms lacked windows, and all were absurdly cramped (bedrooms measured eight feet by seven and a half), rents, ranging from \$5.50 to \$8.50 per month, proved too high for most tenants yet too low to ensure the promised 6 percent. After a dozen years of losing money (and continuing trouble with the "inmates"), the Workingman's Home was sold to the Five Points House of Industry as a residence for working women.

As it became clear that tenement reform wouldn't attract private investors, the AICP began to consider the need for government regulation of the housing market. Joined by fire insurers, who thought a stricter building code would reduce their risk exposure, by concerned physicians, who were also seeking to enhance their standing as public experts, and merchants worried about the city's sinking reputation as a healthy place to do business, the environmentalists persuaded the legislature's Tenement House Committee to launch a full-scale investigation in 1856.

The legislators proceeded to immerse themselves (a la Dickens) in places like Corlear's Hook and were duly shocked. "Though expecting to look upon poverty in squalid guise, vice in repulsive aspects, and ignorance of a degraded stamp," the investigators recounted in conventional sunshine-and-shadow prose, "we had not yet formed an adequate conception of the extremes to which each and all of these evils could reach." The committee's Tenant House Report of 1857 declared that housing in New York's Tenth Ward was "without room sufficient for civilized existence" and that some

dwellings in the Eleventh Ward were so bad “it is astounding that everyone doesn’t die of pestilence.”

The legislators, however, were no more prepared than Griscom or the AICP to ask tough questions about the larger economic order that gave rise to the slums. The mismatch between rising rents and falling wages was not on the table. Nor was the premise that housing had to be provided as a commodity: the land reformers’ notion of government-underwritten urban homesteads was literally unthinkable. They did, however, recommend passage of regulatory housing laws, and their work led to the drafting of the state’s first housing code.

Drafting, but not adoption: the prospect of regulation raised an enormous hue and cry from builders and owners, forcing the legislature to retreat, and another decade would pass before it summoned the nerve to try again. Housing was left to market forces—with the predictable result that the thirty-four blocks along Fifth Avenue between Washington Square and 42nd Street housed a mere four hundred families in virtually agoraphobic comfort (twelve families per block) while on the East Side seven hundred families jammed themselves into one tenement block.

When added to inaction on the garbage and sewage fronts, the result (said a legislative committee) was that “death is making an alarming inroad upon [our] population.” Cholera raced through the tenements again in 1852. Typhus, an immigrant disease of dirt and overcrowding, grew endemic, then turned epidemic in 1852. Deaths from consumption (tuberculosis) soared in the black and immigrant communities. Between 1845 and 1854 the city wide mortality rate hovered at an all-time high of forty deaths per thousand city residents, and the gap between bourgeois and working-class districts widened dramatically: in 1855 the Sixth Ward had the highest death rate in New York. The flood of corpses manifested itself in a grisly version of the law of supply and demand. With the number of unclaimed bodies growing faster than medical schools’ need for cadavers, their prices dropped accordingly. Corpses had cost twenty-five dollars in the early 1800s, but in 1848 a certain Dr. Reese was selling bodies of dead patients as a sideline at five dollars apiece.

The infant mortality figures were particularly horrifying. Pulmonary diseases drove the rate to a record high of 166 per thousand between 1850 and 1854, with the casualties (the AICP noted) “chiefly amongst the

children of the poor, in the most filthy parts of the city.” Between 1850 and 1860 more than half of those under the age of five died each year—seven of every ten under the age of two—figures equal to the worst of the English factory districts.

By 1856 more New Yorkers were dying each year than were being born. Without the continuing torrent of immigration, said the city inspector, “the city would in a few years be depopulated.”

“LUNGS OF THE CITY”

In the end, only one environmentalist enterprise succeeded fully, though its public health component would constitute a small part of a project that for a wide variety of other reasons enlisted the backing of some very powerful New Yorkers.

In October 1848, only months after the revolution in the streets of Paris, landscape architect Andrew Jackson Downing proposed the creation in New York of a mammoth (five-hundred-acre) People’s Park. Until then Downing had concentrated on providing country gentlemen with picturesque retreats and editing the *Horticulturist*. But the European upheavals alarmed him. They seemed to herald similar convulsions in a New York that, to his dismay as an old-school republican, had been dividing up into social classes that no longer comingled one with the other as they once had. New York desperately needed a place where classes could regain comity. Parks, he thought, would facilitate interactions no longer available on the street. Such social intercourse, Downing believed, would, as reformers wished, uplift the lower orders. “Every laborer is a possible gentleman,” Downing argued. It wanted only “the refining influence of intellectual and moral culture,” which a park might make available, to raise up “the man of the working men to the same level of enjoyment with the man of leisure and accomplishment.” In addition, Downing said, coupling his concerns to the demands of the growing public health movement, the park’s material as well as moral environment would be beneficial: the open space would serve as the “lungs of the city.”

Merchant and AICP sponsor Robert Bowne Minturn reached a similar conclusion by a somewhat different route. After returning in the winter of 1849-50 from an eighteen-month grand tour, he and his wife, Anna Mary

Minturn, were struck, as so many other well-off travelers had been, with the mortifying contrast between what Downing called New York's "mere grass-plots of verdure" and Europe's grand green spaces. Minturn became the nucleus of a group of largely Whig gentlemen, many of whom had made their fortunes in international trade, that came to agree that Manhattan needed a public space worthy (as William Cullen Bryant put it) "of the greatness of our metropolis."

A proper park, these gentlemen said, would advance New York's commercial interests, counter the attractions (like Brooklyn's Green-Wood) offered by rival cities, and offer a pastoral and healthy retreat from the disorderly city. It would also provide the respectable classes a place to promenade that was far from crowded Broadway, where cultivated ladies like Anna Minturn were finding themselves "stared out of countenance by troupes of whiskered and mustachioed chatterers" (a *Post* correspondent noted). Even better, a spacious park would allow the gentility to roll about in their fabulous new carriages, rectifying what Nathaniel Parker Willis had long ago singled out as New York's great deficiency "as a metropolis of wealth and fashion": the "lack of a *driving park*."

Placing a park at the spot favored initially—the iso-acre plot bounded by 66th, 75th, Third Avenue, and the East River known as Jones' Wood—would, moreover, reap additional advantages. Uptown property owners had been expressing considerable dismay at finding Irish, German, and African Americans forced northward along with hogs, bone-boiling establishments, and dung heaps. The Harlem Rail Road, too, was fostering a rapid growth of up-island brickworks, ropewalks, and paint manufactories. By removing a substantial chunk of uptown territory from the marketplace, landowners believed, a park would protect their terrain from further encroachment. Establishing the "character" of the surrounding neighborhood would also "materially improve Real estate" and make possible the profitable construction of terraced villas like those facing Regent's Park in London.

Unfortunately, the Joneses and Schermerhorns who owned the Wood were unwilling to sell, scenting bigger profits in more commercial and river-oriented uses. So in 1851 James Beekman, a wealthy Whig state senator, who himself owned property near Jones' Wood and was generally regarded as uptown's representative in the legislature, introduced a bill to

seize the land by eminent domain. Backed by Minturn and other prominent merchants and bankers, Beekman's proposal passed quickly into law.

Despite this fast start, the Jones' Wood plan now triggered vigorous opposition from other downtown merchants who castigated it (said one irate *Tribune* contributor) as "a scheme to enhance the value of up-town land." Fiscally conservative gentlemen like U.S. Senator Hamilton Fish also objected to the way Beekman's plan shifted the method of paying for the park: away from the traditional practice of assessing the neighboring landowners who would be the chief beneficiaries, and toward putting the burden on all taxpayers. There were additional reservations about the unnervingly massive and worrisomely precedent-setting expansion of state intervention in the land market.

Unionists, land reformers, and environmental reformers had their own objections. The Industrial Congress was on record as saying that if the city was to build parks, they should be placed in "vacant squares in the more thickly populated districts"; Mike Walsh and others were particularly keen to enlarge the Battery as a people's promenade. The *Staats-Zeitung* also preferred "many smaller parks in different parts of the city" to one big one for "the heirs of the Upper Tondoms," and it rejected as "complete humbug" the claim that a landscape park three miles north of the congested center would somehow lower the mortality rate. Dr. Griscom agreed that eight parks of a hundred acres each, or sixteen of fifty, "would certainly be less aristocratic; more democratic, and far more conducive to the public health." Better, said physician and land reformer Hal Guernsey, to use the public's money for building cheap homesteads on uptown land.

Finally, upper *westside* landowners made clear that they too were unhappy about the growth of immigrant and poor communities in their domain—places like Seneca Village—and demanded a park in their neck of the woods lest it soon "be covered with a class of population similar to that of Five Points" (as uptown assistant alderman Daniel Tiemann put it). They proposed an alternative, more "central" mid-island location, whose rocky topography made it unsuitable for building houses, grading streets, or digging sewers. The land would be much cheaper, and the municipal corporation already owned 135 acres in the area. It would therefore be possible to build a much bigger park, indeed one of the largest in the world,

that would have “ample room for riding and driving therein with Horses and Carriages.”

After two years of debate and maneuver, the coalition backing the central park location won out. In 1853 the state agreed to use eminent domain to take 778 acres (expanded to 843 a decade later) from the 561 proprietors who controlled the site, 20 percent of which was owned by three families. Over the next two years a commission of estimate surveyed and assessed the thirty-four thousand lots, finally authorizing payment of five million dollars for the parcels (three times what advocates had claimed the entire park would cost). Compromising on the funding mechanism, it decreed that one-third of the expense would have to be covered by assessing adjacent landowners, generating screams and (ultimately unsuccessful) lawsuits from men like Archibald Watt, who nevertheless cleared a 1500 percent profit on land he’d bought only twenty years earlier. The sixteen hundred or so Irish, Germans, and blacks who lived on the land—dismissed and disparaged as “vagabonds and scoundrels”—were evicted by 1857, though the Sisters of Charity were allowed to remain in their Mount St. Vincent retreat until 1859.

Also in 1857 the state legislature established a Board of Commissioners of the Central Park, which sponsored a competition for choosing the park’s layout, touching off a new controversy over design. The commissioners were drawn to Downing’s old vision of a park that could foster interclass harmony, but many in the city either doubted that such coexistence was possible or feared that comingling would end with the lower orders imposing their vicious habits on their betters. The *Times* detested the notion of providing Boweryites with free access: “As long as we are governed by the Five Points, our best attempts at elegance and grace will bear some resemblance to jewels in the snouts of swine. Rather the Park should never be made at all if it is to become the resort of rascalians.” Far better, some said frankly, to design a space that catered to distinctly upper-class needs—a new trotting course for sporting types, a carriage drive for the fashionable, a pastoral space cleansed of commercial excess and social disorder for the genteel—which would also anchor northern Fifth Avenue as a residential preserve for the wealthy.

Tribunes of popular culture like *Frank Leslie’s Illustrated Newspaper* countered by calling on the commissioners not to “allocate to aristocratic

pride and exclusiveness, a place which they may strut and parade in a solitary state, but [to create] a spot for all classes of our fellow citizens” that would allow “the labouring classes to have cafe concerts, cirques, ambulatory exhibitions, and shooting galleries.” The *Irish News* wanted a “commons” area—in the vein of such pleasure gardens as Niblo’s or the Elysian Fields—that would allow for plebeian pleasures like picnics, festivals, sports, games, militia drills, theaters, fireworks, and circuses.

In the end the commissioners chose the Greensward Plan offered by Frederick Law Olmsted, whom they had just appointed superintendent of the park, and Calvert Vaux, a London-born architect who had suggested the competition idea to them in the first place.

Olmsted, son of a prosperous dry goods merchant from Hartford, had been set up by his father on a 125-acre Staten Island farm (on Raritan Bay) as a scientific agriculturalist. He had also written on rural design for Downing’s *Horticulturalist* (including a piece on Liverpool’s Birkenhead Park), published travel books on the social landscape of England and the American South, and in 1855 become a managing editor of *Putnam’s Magazine*, which by 1857 was foundering. When family friend and park commissioner Charles Elliott encouraged him to apply for the position directing the park’s labor force, he swiftly gathered endorsements from editors, writers, reformers, and friends, including Brace, Greeley, Cooper, and Irving.

One thing that helped him secure the position was his anti-laissez-faire conviction—very much in tune with the newest reform currents—that properly designed environments like English-style landscaped parks could elevate the character and condition of the poorer classes. Olmsted was also convinced of the value of class intermixing and in 1854 had urged his Yale chum and traveling companion Charles Loring Brace to “get up parks, gardens, music, dancing schools, reunions which will be so attractive as to force into contact the good and the bad, the gentlemanly and the rowdy.”

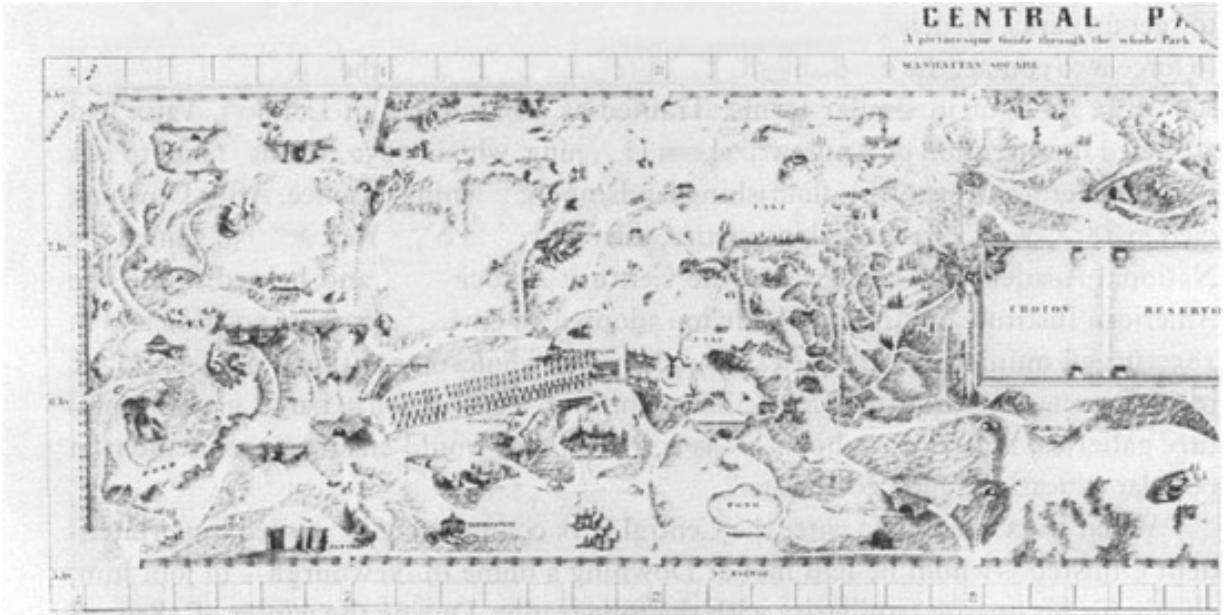

Vaux thought in similar terms. Trained as an architect in London, Vaux had attracted the attention of Andrew Jackson Downing, who in 1850 recruited him to run the architectural wing of his flourishing landscape-gardening practice. After Downing died in 1852, Vaux carried on his practice, then moved to New York in 1856, joined the National Academy of Design and the Century Association, and helped found the American

Institute of Architects. He too adopted an environmentalist position and in 1857 urged municipal authorities to underwrite wholesome rational play —“public baths, gymnasiums, theatres, music halls, libraries, lecture rooms, parks, gardens, picture galleries, museums, schools”—as activities that would ensure “a refinement in popular education” and “good taste.”

When Vaux decided to enter the Central Park competition, he invited Superintendent Olmsted—whom he had met at Downing’s home in Newburgh—to join him, chiefly for his on-site familiarity with the topography. During the winter of 1857-58 they worked on a plan that would apply their social philosophy to the barren and rocky mid-Manhattan terrain. Evenhandedly rebuffing both working class desires for ball fields and aristocratic longings for a raceway, their Greensward Plan proposed a reformer’s vision—a space designed to school both patrician and plebeian cultures by transmitting, almost subliminally, civilized values and a “harmonizing and refining influence.”

To achieve this, they called for exiling the normal business of urban life to beyond the park’s perimeter. Coal carts, butchers’ carts, dung carts, and fire engines that had to cross the park were to be diverted to sunken transverse roads (rather as servants and tradesmen were kept out of sight in genteel mansions). Also banished was Manhattan’s grid, and with it the kind of streets that were “staked off,” as Olmsted put it, “with a rule and pencil in a broker’s office.” Here therapeutically romantic curves were to be the rule. Pedestrians and carriages would meander along paths affording ever-changing vistas, rather like a succession of Cole or Durand canvasses, intended to invoke decorous contemplation of nature, in the manner of Bryant’s poems. In addition to spectatorship of civilizing scenery, the plan encouraged genteel pastimes such as skating and boating and was particularly attentive to the needs of ladies. The park was to be a sanctuary, a retreat from the city’s competitiveness and congestion akin to the bourgeois-home-asdomestic-refuge, a place to set aside at least temporarily the “habit of mind, cultivated in commercial life, of judging values by the market estimate.” For all this sniping at the marketplace, Olmsted, in particular, stressed that Central Park would “greatly accelerate the occupation of the adjoining land,” pleasing wealthy Fifth Avenue landowners, and increase tax revenues, a claim calculated to warm the hearts of city officials.

The Greensward Plan was far less welcoming to the working classes. It banned not only their conventional recreations but their republican political culture. Olmsted and Vaux forbade martial displays, civic processions, and public oratory. The Mall was reserved for promenades: silent and apolitical encounters. Nor, for all the emphasis on the virtue of interclass mixing, was there much of it. Transport was neatly segregated: the middle class moved through the park space by carriage and horse, the working class on foot.

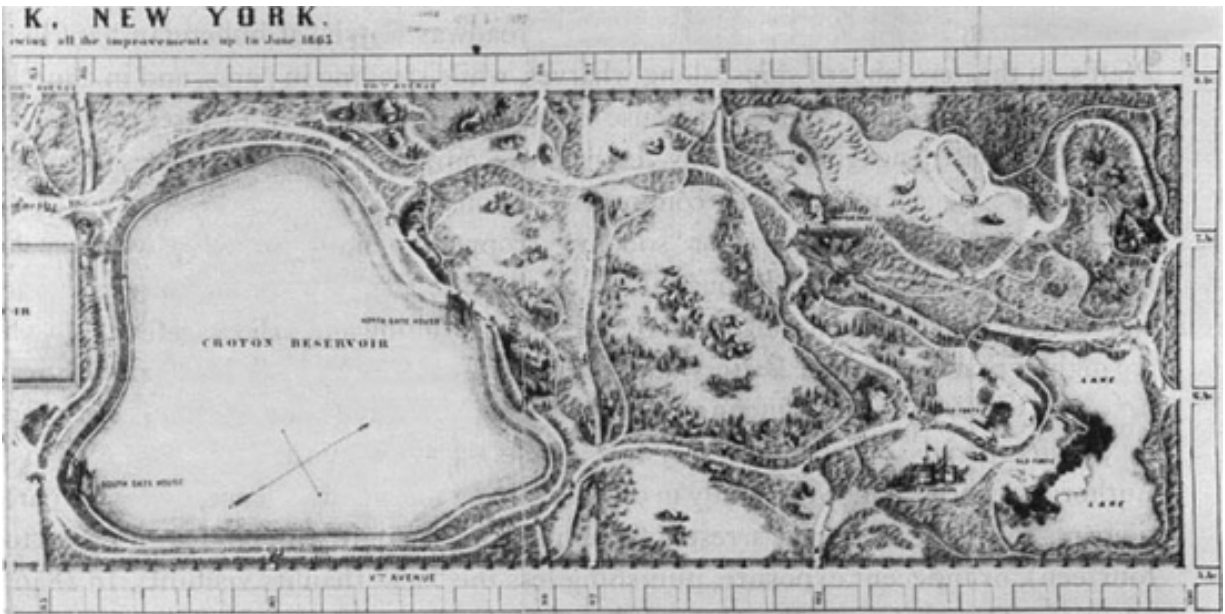

Central Park, New York, “a picturesque guide through the whole Park showing all the improvements up to June 1865.” (Map Division. The New York Public Library. Astor, Lenox and Tilden Foundations)

Olmsted also took patrician anxieties about potential plebeian rambunctiousness to heart. “A large part of the people of New York are ignorant of a park, properly so called,” he wrote. “They need to be trained to the proper use of it.” Doubting that the park’s deep structure would sufficiently discipline the unruly, Olmsted established regulations that, in marked contrast to the laissez-faire streets of the city, soon blanketed the park terrain with 125 varieties of directive and injunctive signs and posters. He also instituted park police—“keepers”—who would “respectfully aid an offender toward a better understanding of what is due to others, as one gentleman might manage to guide another.”

For the time being, an apparatus to enforce proper canons of behavior was hardly necessary. The nascent park was too far north of the Bowery, and public transport too expensive, for it to attract many laborers apart from those busy constructing it. But the design and regulatory structure reassured the elite that it would in time become a gathering ground for the civilized. The value of surrounding property skyrocketed accordingly: by 1860 assessed values had risen by two-thirds of their 1856 levels.

This complacency was in fact misplaced. Working-class citizens would soon be contesting Greensward notions of proper usage. However, to the degree that Central Park did for the moment remain an upper-class playground, it represented yet another defeat for the larger reform project. Once again a cultural enterprise designed to mitigate the divisiveness of metropolitan life had served only to exacerbate it.

45

Feme Decovert

New York in the 1840s and 1850s was an intensely homosocial city. Men clubbed, ate, drank, rioted, whored, paraded, and politicked together, clustered together in boardinghouses and boards of directors, even slept together. Whitman spent much of his time in the company of handsome young workingmen, occasionally bringing them home for the evening, and whether or not he and they engaged in sexual intimacies, other men certainly did.

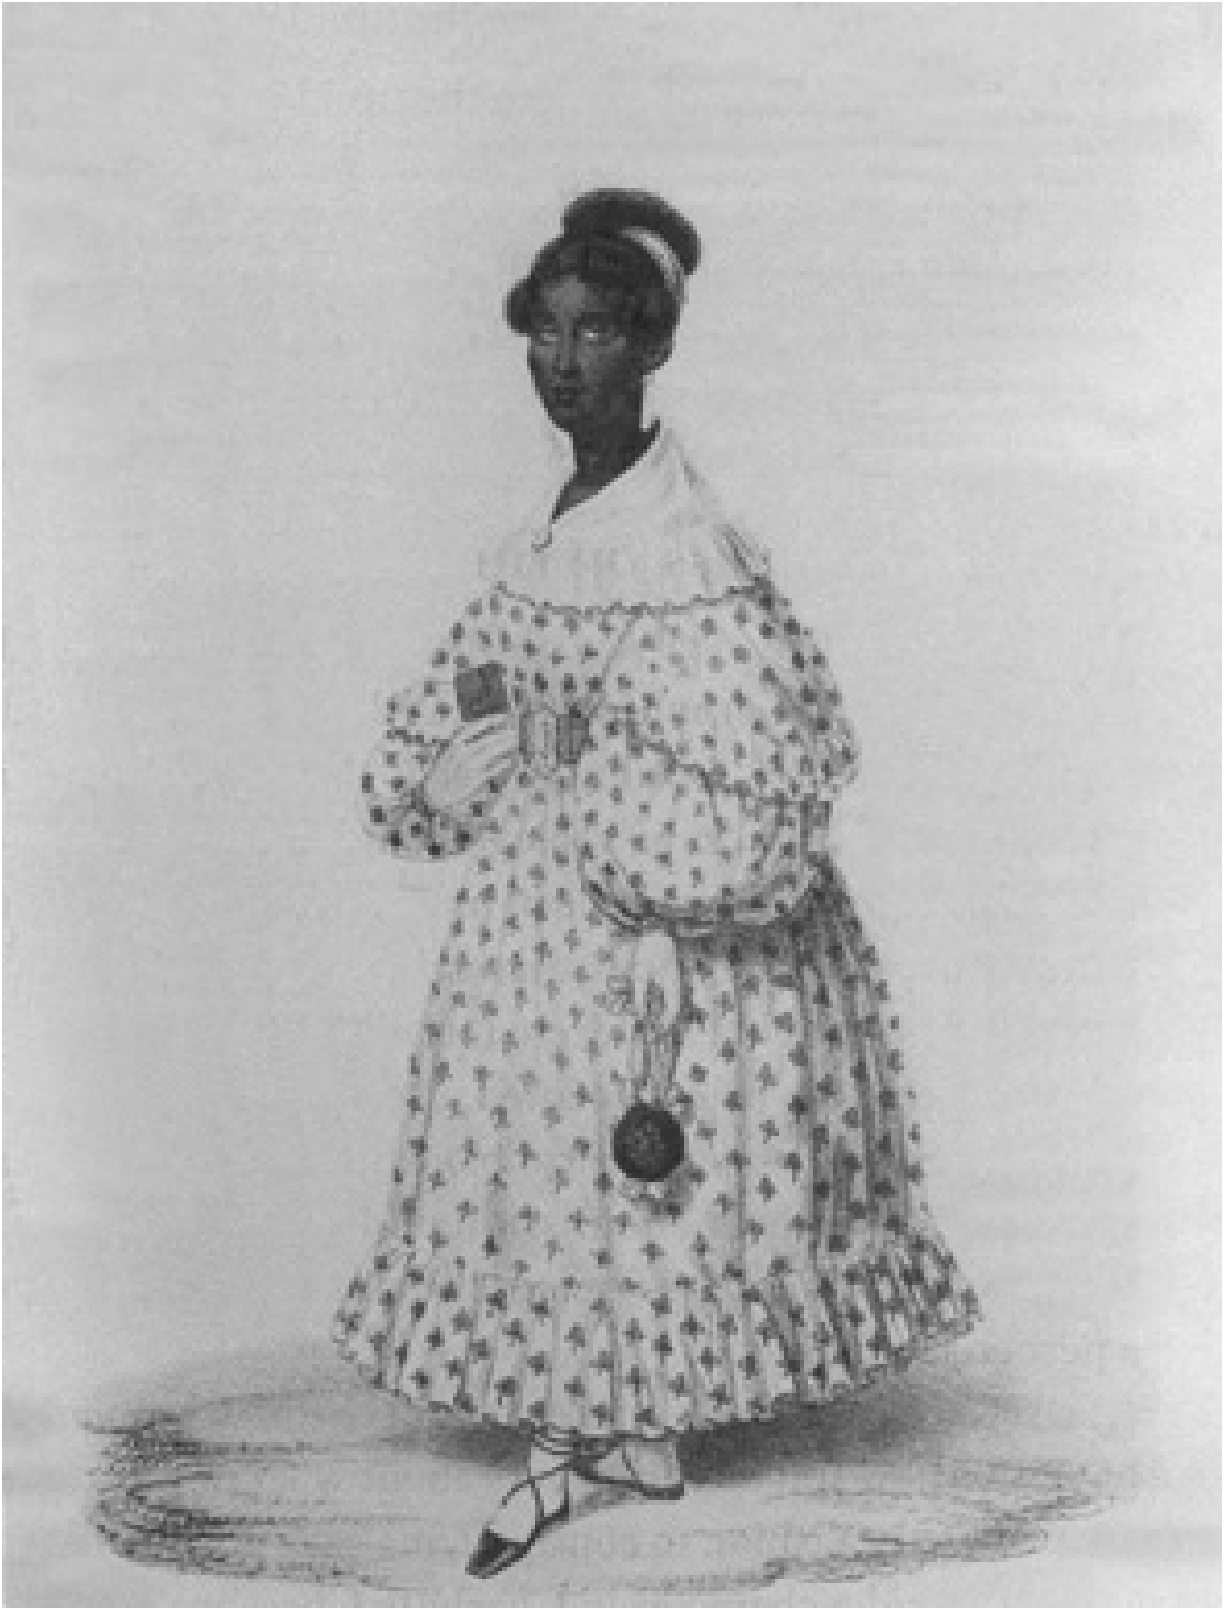

New York provided many opportunities for same-sex encounters. Vast numbers of men lived outside traditional families in all-male boardinghouses. Casual acquaintances could be struck up in bathhouses near the Broadway hotels, at bohemian bars like Pfaff's, in theaters, aboard ships, along wharves, while strolling in parks, and in church (in 1846 two men who had met in a house of worship lived together for three months in a boardinghouse, engaging in nightly "carnal intercourse"). Passing references to "male prostitutes" suggest more strictly commercial options were available.

When reports of "buggery" or "sodomy" cropped up in the press they were usually accompanied by traditional abuse. Thus in 1846 the *Herald* excoriated a respectable storekeeper who had been caught "in one of those revolting and disgraceful acts which are nightly practiced on the Battery or in the vicinity of the City Hall." City authorities, however, were remarkably unconcerned. Consensual buggery was seldom prosecuted by public officials. There were only five arrests for sodomy throughout the 1850s. Authorities usually intervened only in cases involving force and violence, underage participants (in 1857, a man was arrested for committing sodomy with boys aged eleven to fourteen), or indecent exposure, punishing less the "act" than its visibility. In 1846, when one Thomas Carey alleged that Edward McCosker, a young Irish policeman, had accosted him while he "was making water in Cedar Street" and "commenced indecently feeling his privates," the mayor, after a hearing, dismissed McCosker from the force but took no criminal action.

Homosexuality wasn't a crime. It didn't even exist. The very notion of "homosexuality"—understood as a category describing a person's sexual *being*—was not invented until the eighties. And while same-sex *acts* still fell under ancient proscriptions, "consenting to sodomy" would not be criminalized in New York law until the end of the century. In an era when passionate male bonding was universal, and all-male gatherings the norm, a little buggery between friends might well have been taken as an extension of existing norms rather than a flagrant transgression of them.

What really alarmed critics of same-sex behavior was males who adopted "feminine appearance and manners"—men like Peter Sewally, a.k.a. Mary Jones, a black New Yorker who lived in a Greene Street brothel where he cooked, greeted patrons, and dressed in female clothes because, he explained, he "looked so much better in them." The unnerving thing about cross-dressing was that it transgressed the frontier between gender domains, which same-sex displays of affection reinforced.

Males were the most vociferous about keeping spheres separate—no surprise, given that the distribution of gender perquisites so heavily favored their sex. But upper-and middle-class women spent much of their time weaving and sustaining densely homosocial associational networks, forming intense friendships, hugging, kissing, sleeping with, and ardently proclaiming their love for one another. They trooped to one another's homes for visits and teas. They offered extensive support at crucial moments in a woman's life: marriage, pregnancy, birth, nursing. They spent entire days on joint shopping trips, moved in with one another while husbands were away, shared summer vacations. They apprenticed their daughters in housewifery and motherhood at a time when apprenticeship in the male trades was collapsing. They built together a world that provided the emotional warmth and connection absent from the increasingly stiff relations across the gender divide.

(1836). (© Collection of The New-York Historical Society)

City space manifested these delineations. The downtown worlds of politics and business remained physically off limits to ladies, and many of the civic parades that trooped through lower Manhattan streets were totally masculine events. When genteel women ventured out into heterosexual terrain, they found a network of safe spaces and corridors awaiting them. By the 1850s New York had a Ladies’ Oyster Shop, a Ladies’ Reading Room, a Ladies’ Bowling Alley; banks and post offices had special ladies’ windows. There was even a ladies’ eatery: Taylor’s, at Broadway and Franklin Street, grew from being a humble ice creamery to serving three thousand women on the average weekday at over a hundred black walnut tables (“the restaurant of the age,” the *Herald* called it). Olmsted made sure that when his Central Park skating rink opened in 1858 it included a “ladies’ pond” where the timid could tumble without blushing, and his park regulations strictly prohibited “boisterous or indecent conduct or language.”

Much as many bourgeois women may have appreciated the provision of such accommodations, and others may have found honor, dignity, even a modicum of power in presiding over their sphere, others felt increasingly restless and constricted. As they watched male fields of action expand so dramatically in the boom years, the balance between the gender spheres was coming to seem increasingly unequal, even unjust.

“THE UTTER IDLENESS OF THE LADY CLASS

Nowhere was this new sensibility more in evidence than in the separate sphere of women’s literature that had emerged, in the 1840s and 1850s, with such astonishing rapidity. The books that hundreds of thousands of female buyers boosted to bestseller status (dwarfing Dickens’s sales) included domestic novels that explored the pleasures and trials of running a modern household (including struggles with servants and husbands), dreamy romances that celebrated decked-out and adored young heroines, weepy tales of dying children, and illustrated guides to the latest fashions. Much of what made it into print accepted, even glorified, the sentimental stereotypes of female passivity. Susan Warner’s 1850 blockbuster *The Wide Wide World* urged readers to seek spiritual strength in submission and obedience, and

that same year author Grace Greenwood defined the feminine genius as “timid, doubtful and clingingly dependent; a perpetual childhood.”

Yet what was most striking about the new women’s literature was how angry much of it was, how full of complaints about what one 1856 novel called “that living death to which it is the fashion to consign females of the wealthy middle-class.” “I feel like rushing out,” said a character in Charlotte Chesebro’s *Children of Light* (1853). “But here I am, only a woman—a housekeeper . . . to be kept in my ‘proper sphere’ and ‘place,’ and never to stir an inch out of it in any direction, for fear that all creation would turn against me, and hunt me down, as they would a wild beast!” Many novelists fumed at men they saw as jailers. A host of masculine villains paraded through their plots—neglectful fathers, cruel husbands, and assorted gamblers, alcoholics, philanderers, failures, or murderers—with whom courageous and creative women did combat or from whom they fled.

Authors ritually agreed that the “Home” was “woman’s empire” and that the work women did there raising republican children was indispensable, but in go-ahead New York City, the action was patently elsewhere. Urban society celebrated producers—the men who made ships, built railroads, traded stocks and commodities, got on with business. Some New York women, too, were censorious of what one British visitor called “the utter idleness of the lady class.” Novelist Catharine Sedgwick found her peers as little trained for the actual business of life “as if we had been born in the royal family of Persia.” Women didn’t choose idleness, insisted Lydia Maria Child, they were pressed into it.

What particularly galled writer and editor Child was the dictum that women “must not study, because gentlemen do not admire literary ladies.” Worse, the conventional male assessment (particularly that of medical “experts”) held that mental acuity wasn’t really possible for women, driven as they were by their wombs, not their heads. But growing numbers of women were in fact receiving rigorous intellectual training at institutions around the metropolitan area. The Brooklyn Collegiate Institute for Young Ladies insisted its charges be educated “as carefully, as substantially, and as liberally” as men, and the Rutgers Female Institute, incorporated in 1838, taught belles lettres, history, mathematics, and philosophy. Such academies were not intended to prepare graduates for careers or roles in the public realm, to be sure, but rather to help them attract and later assist the right

kind of husband. Yet without denying their special responsibilities to home and family, some ladies began to argue they should be allowed to enter the occupations and professions into which their brothers were flocking.

The notion that respectable and educated females might undertake gainful employment ran up against the reality that, as an 1846 article in the feminist *Advocate for Moral Reform* put it bluntly: “Men have monopolized almost every field of labor. They have taken the learned professions, they have entered every department which commerce opens, and indeed, almost every place where skill and talent is required, they have excluded women.” While the city’s flourishing publishing industry had proved hospitable to women, other suitable professions were growing *more* restrictive, notably medicine.

Childbirth had long been a jealously guarded female domain. New York midwives had to swear they would not reveal “any matter Appertaining to your Office in the presence of any Man.” Since the development and use of obstetrical forceps, however, male doctors had begun to assist midwives at difficult births and then, slowly, to displace them in the birthing room. To consolidate control over this lucrative practice, they refused to train midwives in the new methods, claiming women were too emotional to make cool judgments in medical emergencies. Midwives dwindled, male obstetricians multiplied.

They did not, however, sweep the field, in part because examinations by male doctors continued to outrage female modesty. Many physicians were forced to communicate with their patients on delicate issues through elderly female intermediaries. In this context, female doctors constituted a serious threat, one reason women were barred from medical college. Those who did receive medical training attended unorthodox institutions, like the New York Hydropathic and Physiological School, which in 1856 graduated thirty males and twenty females. Such women could be dismissed as quacks. Dr. Elizabeth Blackwell could not.

Blackwell, an English immigrant, had gotten into an upstate medical school and received the first American M.D. degree ever conferred on a woman. But when she returned to New York City in 1851, physicians prevented her from practicing in city hospitals and dispensaries, and she became the target of hate mail. In 1853 Blackwell opened what would become the New York Infirmary for Women and Children, in a oneroom

dispensary on 7th Street near Tompkins Square. She would be assisted by Dr. Marie Zackrzewska, former chief midwife of Prussia's largest hospital, who had emigrated to New York City convinced that "only in a republic can it be proved that science has no sex." Poor women flocked from all over Manhattan and Brooklyn to this first medical charity in the United States staffed by female physicians. The New York Infirmary took root, despite vitriolic opposition from the city's male medicos, though its efforts to add a women's medical college would be thwarted until 1868. It would be the Women's Hospital of New York (1855), organized by male physicians to treat female disorders, that would receive significant appropriations of money and land from state and city.

A FAMILY WAGE

Working-class women faced quite a different problem. The same booming economy that was tempting some of the lady class into the workplace was driving poorer women into it willy-nilly.

Many female Irish refugees, large numbers of whom came over on their own, tried to reconstruct familiar domestic arrangements, but a good man, any man, was hard to find. Though Irish females only slightly outnumbered males on the immigrant ships, in New York there were 125 women of marrying age for every hundred men. The demand for Irish brawn was continental in scope, and many males swirled in and out of the city to great construction projects in surrounding states and points west. "The immense majority," noted a New York Irish paper in 1859, were "as yet but a mere floating population, migrating from place to place, wherever they may find a market for their labor." Irishwomen, on the other hand, found it relatively easy to get jobs as domestic servants with affluent New Yorkers and tended to stay in the metropolis. The gender imbalance created by male mobility was exacerbated by male mortality, as dangerous jobs chewed up Irish laborers.

Germans, whose flight was less chaotic, found it easier to reconstruct existing families and create new ones. Though early in the exodus 60 percent of the mostly youthful arrivals were male, by the late 1850s the gender ratio had evened out at fifty-two to forty-eight, and over two-thirds of the community were settled down in families. As a general rule, the higher uptown in Kleindeutschland one went, the more likely one was to

find married couples predominating over boardinghouse singles. Yet those who did marry hardly lived middle-class lives. Some skilled craftsmen's wives could afford to tend to their parlors, but with male incomes low and sporadic, women had to work if their families were to get beyond the basics or, in some cases, even to survive. Taking in boarders was one solution: over half the working women in the Sixth Ward over thirty did so in 1855. Taking in garment piecework was another, and young unmarried German daughters worked alongside their parents in tenement workshops. Even then, poor immigrant wives were, of necessity, out and about the town far more than their middleclass counterparts. And many immigrant women were forced to live and work in other people's families: servants boarded with employers in sufficient numbers to give the genteel wards a decidedly feminine majority.

Among Irish women, moreover, the ranks of those who *could* not marry were increasingly bolstered by those who *would* not, or who delayed doing so as long as possible. Violence, drink, poverty, desertion: all these devalued matrimony for Irish women, continuing a Famine-generated retreat from traditional marriage patterns. Males and females in Ireland increasingly led sex-segregated lives—in the family circle, at church, and in places of recreation—and convents flourished in post-Famine Ireland. They thrived in New York too, because they offered sisters an appealing combination of spiritual fulfillment, power, respect, significant work (most orders being activist, not contemplative), and freedom from subordination to husbands and the dangers of childbirth.

A growing numbers of jobs—products of the city's development as a publishing, communications, manufacturing, and fashion center—provided young and childless women with the wherewithal to survive outside traditional family units. For exploited seamstresses, this autonomy could be a miserable experience. For the old, the frail, and those with children, life without male support could be catastrophic. But others carved out a decent independence by doing “women's work,” such as hairdressing, photographic tinting, etching, engraving, jewelry making, cameo cutting, enameling, toymaking, and bookselling. In addition, the city's commitment to public education (and its desire to cut costs) created new opportunities. The ensuing demand for teachers was increasingly met by women, who

worked for far less than male counterparts, and soon three-quarters of the thousand public school teachers were women.

Such jobs allowed single young females to live apart from parents. One survey of single working women in 1855 found over half living on their own in boardinghouses or sharing tenement rooms with siblings, cousins, or workmates. Conditions could be spartan, even harsh, with half a dozen factory girls crammed into a single garret. On the other hand, they were no longer obliged to cook, wash, haul water, and carry wood for their parents after they had finished their paid jobs for the day.

Efforts to improve wages and working conditions in female trades continued to go nowhere. Not only did the great labor upheavals of the 1850s almost completely exclude women, but the Industrial Congress adopted rigid positions on “woman’s place” and said female wage work was “incompatible with the true dignity and nature of woman.” The real solution was for men to be paid a “family wage” that would allow them to keep their wives at home, as did the men of the bourgeoisie.

Some German socialists adopted a feminist stance. Weitling’s *Republik der Arbeiter* formally acknowledged women’s rights, and the labor societies he led included a few women—among them Mathilde Giesler Anneke, daughter of a wealthy Westphalian landlord and mine owner. Estranged from her class, she married forty-niner Fritz Anneke, arrived in 1852, joined Weitling’s organization, and regularly lectured at workers’ vereins in New York City and Williamsburgh on her view “that the social question could only be solved by the emancipation of women.” Few rank-and-file socialists agreed. The hausfrau should be a companion but stick to guarding the proletarian family. German radicals defended the family wage and scorned feminists as dupes of Manchesterian liberal economics, thus elevating domesticity to the status of scientific principle.

That this stubborn rearguard battle to keep women out of wage-work would prove costly was already evident in the printing trade. Male typesetters were understandably dismayed that mechanization had allowed poorly paid young women to replace highly skilled men, but rather than include them in the union, men argued women should be banned from the business. The result was that in 1853, when the union struck the *Day-Book*, it had little recourse after the publisher established crash typesetting courses for women and hired graduates as strikebreakers.

“... GROWS RICH ON THE HARD LAHORS OF OUR SEX.”

By decade's end, women's trade unionism had been obliterated; it would not revive until the twentieth century. With working women unable to speak for themselves, some middle-class feminists proposed to speak for them. “Every woman in misfortune,” wrote Caroline Kirkland, “is the proper object of care to the happier and safer part of her sex.” Indeed, Kirkland suggested, “women should consider themselves as a community, having special common needs and common obligations.” But the effort to throw womanly bridges across the class divide would prove far more difficult than nascent feminists imagined.

In 1845 the all-female editorial staff of *the Advocate of Moral Reform*, newspaper of the American Female Moral Reform Society, declared that “the ordinary rate of wages for female labor is unjust and oppressive.” They excoriated male employers who “drive the young and unfriended to dens of shame, while they fill their coffers with the avails of unrequited toil.” Catharine Beecher (Henry Ward's sister) was less flowery and more specific. “Capitalists at the East avail themselves of this excess of female hands,” Beecher wrote. They got work from poor women “at prices that will not keep soul and body together; and then the articles thus made are sold for prices that give monstrous profits to the capitalist, who thus grows rich on the hard labors of our sex.”

In 1848, the Reform Society established a four-story Home for the Friendless and House of Industry, uptown on Fifth Avenue between 29th and 30th streets. Here the “unprotected female whose only crime is poverty and the need of employment” could learn a trade as well as the precepts of religion and morality. The American Female Guardian Society, as it now renamed itself, also established an Industrial School for those too poor to attend public school, which taught sewing and provided free lunches. The idea was quickly replicated at a German Industrial School, a Brooklyn Industrial School, and across the United States.

Even these limited efforts by affluent women to reach out across class lines to their poorer sisters were—as in the case of analogous projects by their male counterparts—hampered by elite fears and prejudices. The notion of laboring women as active and equal partners was unimaginable. The lady class would succor shivering seamstresses, but only if they bore their ills in

silence and maintained a grateful and deferential demeanor to their benefactors. Proper recipients, moreover, had to uphold (or at least aspire to) bourgeois domestic standards, keeping their houses and raising their children in a manner of which ladies approved. But as this was virtually impossible in the clamorous and grimy tenement quarters, genteel visitors tended to see Five Points females as less than truly women. Above all, there was the religious gulf, drawn deep and wide. For Protestant missionary women, Catholics were priest-ridden heathen with whom no accommodation short of conversion was possible.

FASHIONABLE STORE.

ONE OF THE FIRST LADIES IN THE CITY. "Is it customary to allow such low people to frequent your establishment? It is so annoying to overhear such vulgar remarks, as wishing to buy a three dollar shawl even, when they know that every cent they can earn should be expended on something to eat, and not to wear. Such people ruin themselves by imitating their betters in dress; in fact, it has entirely disgusted me with buying this sort of article. Just observe Fido! he can never bear the sight of those miserable creatures. Dear Fido!"

HANDSOME CLERK. "Mr. Smasher will attend to her case. Indeed, Madam, it is very disagreeable, I assure you. We will guard against such annoyances again in the future."

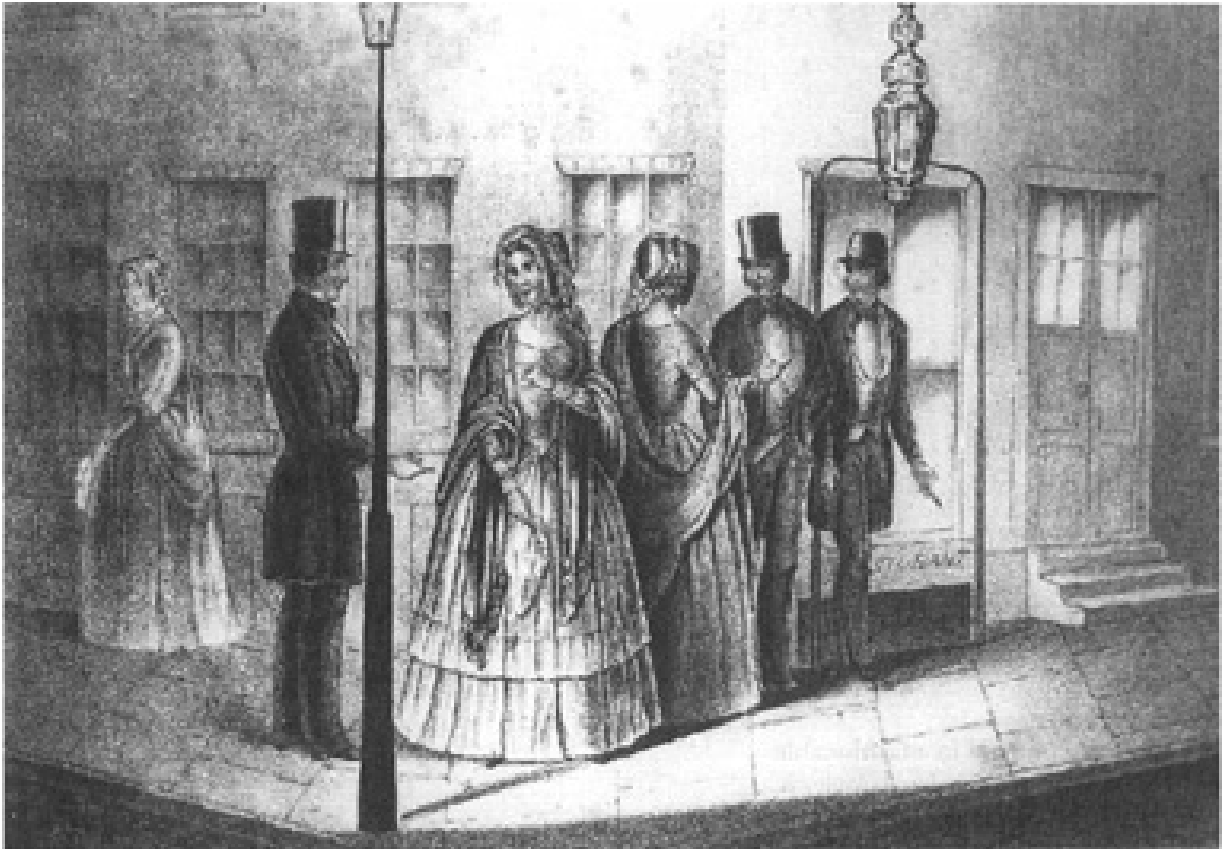

Class lines are enforced in a fashionable store, (*torn Harper's Weekly*, January 8, 1859. (© Collection of The New-York Historical Society)

In the end, while genteel feminists did provide tangible services to immigrant women, they themselves were the primary beneficiaries. Reform projects justified respectable women's claim on city space. Social housekeeping was deemed a legitimate extension of women's sphere into the public arena, accepted (at times hailed) by wealthy males of their own class. It allowed them to create and run large, complex organizations that commanded considerable assets. Like the women writers who (with the help of readers) had secured a position in the marketplace, so female reformers (with the help of reformees) secured a place in the civic and charitable arena. A feminist alliance would remain elusive, however, not least because women of different classes were as far apart on issues of sexuality as they were on those of economics and theology.

CITY OF ORGIES

In 1857 the Reverend William Berrian had been for three decades the rector of Trinity Church, the most prestigious pulpit in the United States. In a sermon that year he admitted to his congregation that "during a ministry of more than fifty years I have not been in a house of ill-fame more than ten times!" Perhaps even more remarkable than this pronouncement by such a model Christian was the fact that what startled his listeners was not that he had gone whoring at all but that he had gone so infrequently. For the years of his ministry had seen a luxuriant growth of prostitution in New York City—marked by the widespread patronage of eminently respectable bourgeois men—to the point that the metropolis had become the wide-open national capital of commercialized sex.

In the 1840s and 1850s, when Broadway between Canal and Houston streets emerged as the city's grand shopping and entertainment boulevard, New York's bawdy houses trekked northward too. They clustered directly behind the commercial strip, in the small cobbled streets of Mercer, Greene, Howard, and Wooster—present-day SoHo. In the evening, scant hours after the afternoon promenade of fashionable ladies, Broadway filled with fashionable streetwalkers, who sauntered past the hotels, paused at the gas-lit shop windows, loitered outside the theater entrances. As the fifties wore on, these *femmes de pavé* invaded the daylight, cruising Broadway after shopping hours, casting inviting glances at passersby.

“Hooking a Victim,” streetwalkers on Broadway, c. 1850. The adoption of the term *hooker* as a synonym for prostitute may have been inspired by the proliferation of brothels and streetwalkers on the Corlear’s Hook waterfront. (© Museum of the City of New York)

The SoHo brothels, most of them run by entrepreneurial madams, were stylish affairs, noted for attractive women, luxurious furniture, fine liquor, and black servants, some of whom doubled as piano players. Different houses had distinctive clienteles (southerners, Germans, Astor House visitors) and particular specialties: Mrs. Hathaway’s “fair Quakeresses,” Mrs. Everett’s “beautiful señoritas [who] are quite accomplished,” Miss Lizzie Wright’s “French belles.” Carnally inclined males kept abreast of the possibilities by perusing handbooks such as Charles DeKock’s *Guide to the Harems*, Free Lover’s [sic] *Directory of the Seraglios*, and Butt Ender’s *Prostitution Exposed*. They could also consult the newspapers, the calling cards brothels dropped off at hotels, or the city directories (in 1855 sixty-nine women listed themselves as “prostitute”).

The ethnic composition of women “on the town” reflected the larger transformation in working-class demographics. In 1855 Dr. William Sanger, chief resident physician at Blackwell’s Island Hospital, carried out a statistical survey with the aid of the police. He estimated the total number of prostitutes as 7,860. Of these 38 percent were country girls (most of whom worked in brothels), while 35 percent were Irish and 12 percent German (most of whom plied the streets). These numbers included children. Not only was pedophilia a popular gentleman’s vice, but the likelihood of contracting disease and producing pregnancy was thought to be lessened by intercourse with prepubescent girls. Conveniently, the age of menarche was approximately fifteen, the age of consent but ten.

Dr. Sanger administered a questionnaire to two thousand prostitutes, asking survey participants why they had entered the trade. Many cited “destitution,” which had usually resulted from being seduced, abandoned, widowed, orphaned, or otherwise deprived of male support. But a sizable percentage cited “inclination”; they preferred prostitution to a father’s or husband’s drunken abuse, a mother’s nagging, the monotony of a rural existence, or the miserably paid life of a seamstress or servant. Where the latter might make two or three dollars a week, an elite courtesan could pull in ten to fifty dollars for a single trick. As the city’s highest-paid women workers, they were able to avail themselves of fancy clothes and urban entertainments. Prostitution had innumerable drawbacks—syphilis and gonorrhea not the least of them—but it afforded poor women their best chance for autonomy.

The demand for commercial sex, like its supply, had broadened dramatically since the 1820s. New York was inundated with transient males: country storekeepers, gentleman travelers, and suburban ferry commuters. Roughly sixty thousand ship crewmen (oystermen, steamboat deckhands, sailors from whalers and naval vessels, canal boatmen) passed through town each year by the late 1850s. Thousands of single male immigrants settled here, and hundreds of thousands more paused in the city on their way west.

Workingmen seeking sex could find it in Kleindeutschland basement bars, Five Points interracial brothels, and the waterfront area of Corlear’s Hook, where halfexposed women sat on stoops of tenements and former mansions along Walnut, Water, Pearl, and Cherry streets, beckoning

nautical males and men from the nearby shipyards, coal dumps, sawmills, and ironworks.

A prominent new venue was the “concert saloon,” a hybrid entertainment place that combined music, drink, and sex. The concert saloon had emerged in the depressed 1840s when taverns drummed up business by converting back rooms or cellars into small concert halls, which put on specialty acts to encourage drinking. By the 1850s many old theaters or three- or four-story brownstones were being rigged up with a long bar and a curtainless stage at the rear. The entertainment was a pastiche of French vaudeville, Italian opera, German beer garden, and English theater. When vocalists sang, the audience, waiters, and “waiter girls” (frequently full- or part-time prostitutes) joined in the chorus. Between acts, performers sat in the audience and solicited customers for prostitution in private rooms upstairs.

In SoHo, at the top of the commercial sex chain, second-class brothels for clerks and “the higher class of mechanics” could be found near the district’s lower end. Farther north lay the rows of patrician and middle-class establishments, which were, the *Tribune* noted, “frequently visited by gentlemen of the best standing,” a category including “aldermen, judges, lawyers, assemblymen, state officers, country merchants, and others.” From Saturday night through the Lord’s Day and on into Monday morning, SoHo’s streets were filled with expensive carriages. The sidewalks were lined as well, with young men who had strolled over from Broadway, all camped out in front of their favorite brothels waiting their turn. Editor Walt Whitman contended that nineteen of every twenty males—including “the best classes of Men” in Brooklyn and New York—visited brothels regularly.

Some men justified brothels as “safeguards to the virtue of maidens, wives, and widows, who would otherwise be exposed to violence and outrage.” “Sporting men” went farther and celebrated brothel culture, calling it an essential part of sophisticated urbanity. Their ranks included stylish Bowery soaplocks, young clerks on the make, and “fast” gentlemen who set up their shopgirl, milliner, or servant “sweethearts” in brownstone apartments. Sporting males detested matrimony, which turned men into “captives” of women, and read sporting papers like the *Flash*, the *Libertine*, the *Rake*, the *Whip*, and the *National Police Gazette*, which featured up-to-

date information about New York underworld offerings (along with ads for the cure of venereal disease).

Many respectable women were enraged that their husbands and brothers so casually flaunted a sexual code that women were forbidden to transgress. Theoretically both sexes of the bourgeoisie agreed on finding in sexual repression a badge of their moral superiority to class inferiors. True, it was supposedly easier for women to adhere to these standards—medical texts insisted that most “are not very much troubled with sexual feelings of any kind”—so marriage manuals urged wives to assist husbands in subduing their passions. Some husbands went along with the dictates of propriety or agonized over their lapses when they didn’t, but many cheerfully bifurcated their sexual lives, turning for fun to working-class women who embraced sexual pleasure, or were forced by circumstances to pretend they did.

With males’ self-assumed prerogatives negating whatever control respectable women had gained over the sexual system, they set out to rein in prostitution. The traditional approach—redeeming or rescuing prostitutes, thus helping dry up supply—was carried on by the Female Benevolent Society, founded in the early thirties. In 1838 the society built a refuge in Yorkville, several miles outside the city, where residents could learn useful trades. It also began to take in the “friendless female orphan, when no way is left for her to obtain a livelihood but that of prostitution.”

Other women reached out to prostitutes in prison or immediately upon their release. The male Prison Association of New York set up a Female Department, which later, having come to believe “women could work best independently for the redemption of their own sex,” split off to form the Women’s Prison Association (1854). These ladies opened a refuge on Tenth Avenue for former inmates; it housed over a hundred women, on condition they forsook smoking, drinking, and cursing and took up sewing, laundering, and “religious study.” The ladies promised to “whisper hope to [each exconvict] amid her despair, teach her lessons of self-control, instill into her ideas of purity and industry”—then get her a job as a maid. In its first twenty years the refuge sheltered 2,961 women and placed 1,083 with private families, finding only 480 to be “unworthy” or hopelessly recidivist.

Reformers also crusaded tirelessly against male “licentiousness.” “Every man who will sport with female virtue,” declared the *Advocate*, should be fixed with “an eternal stigma.” Virtuous females were asked to boycott

seducers: “Let them be regarded as enemies to the sex.” The Female Moral Reform Society turned to state power to rein in forward males. After a lengthy struggle, including a petition campaign that drew thousands of “virtuous mothers and daughters” from around the state, the legislature passed an Act to Punish Seduction as a Crime (1848). “Any man who shall under promise of marriage seduce and have illicit connection with any unmarried female of previous chaste character shall be guilty of a misdemeanor,” the law proclaimed. But with redress available only to women willing to prove their virtue in court, and with the “testimony of the seduced female, unsupported by other evidence,” being insufficient for conviction, the seeming triumph fizzled. It was a rare year in which more than one or two rakes were arrested under its provisions.

Prostitution per se was not outlawed by statute, but the police could and did arrest “all common prostitutes who have no lawful employment” as vagrants or “disorderly persons” and send them to either the almshouse or penitentiary for six months. However, though the police periodically raided Sixth Ward brothels and often hauled in streetwalkers from predominantly immigrant areas, elite brothels were almost never disturbed: the New York district attorney charged a grand total of seven during the entire decade of the 1850s.

Prostitution proved irrepressible because New York males supported it, patrons and profiteers alike. The latter included landlords who collected hefty rents from madams, municipal tax collectors who skimmed their share of landlord revenues, and two new beneficiaries: pimps and politicians. Madams had begun hiring men to protect their employees from assault by drunken packs like the one, forty strong, that in 1851 trashed Catherine Cauldwell’s place on Lispenard Street. But streetwalkers were far more vulnerable and were soon dominated by their protectors. By the 1850s pimps had become a common sight, lounging in front of the monster hotels or in nearby bars, waiting for women to hand over their earnings.

Politicians too leached off sex workers. The local ward bosses who relied on muscle to dominate the polls also used it to extort revenue, often in conjunction with local police. Tammany gang leaders like Isaiah Rynders and Thomas Hyer levied tribute from brothels, saloons, and gambling dens and in return extended them “protection.” In 1850, when police rounded up brothel keepers in the Points, Alderman Patrick Kelly scurried to their aid.

By mid-century prostitution had become deeply imbricated in the business life of the city. Dr. Sanger calculated its aggregate annual revenues as exceeding three million dollars and if liquor sales and rental income were added, the figure doubled, to an annual cash value just below the garment industry's \$7.5 million. For all the feminists' efforts, New York would remain a "city of orgies."

"MISTRESS OF ABOMINATIONS"

While respectable women fruitlessly battled the sex trades, they barely held their own in another arena, control of their own fertility. The average number of children born to white New Yorkers surviving to menopause continued to decline, dropping from seven or eight in 1800 to five in 1860. But abortion, one of the leading weapons in women's birth control arsenal, came under heavy censure, touching off a public struggle over sexuality in the city.

Abortions were legal if done before "quickening"—a woman's first awareness of fetal movement, usually late in the fourth month. Given most people's assumption that a fetus was not human before this, the procedure's morality was not generally an issue. Most considered abortion akin to contraception, and white, married, native, middle and upper-class Protestants dramatically expanded their reliance on it in this era. Catholics aborted far less frequently—their lower rate and later age of marriage provided an effective substitute—but there is no evidence of any public activity against abortion by the city's Catholic leadership. By the end of the 1850s, according to one estimate, perhaps 20 percent of all New York pregnancies were being aborted, a substantial increase from earlier in the century.

Since 1828, however, abortion *after* quickening had been a crime. A person convicted of performing one—though not the woman herself—could be found guilty of second-degree manslaughter and given a year in jail or a hundred-dollar fine. This law, passed at the insistence of regular doctors, stipulated that postquickening abortions could be done legally if necessary to save the mother's life, though only if two regular doctors attested to such necessity. The law, part of a larger package physicians had pushed through the state legislature in an effort to clamp down on their "irregular" competitors, had little practical effect throughout the 1830s.

Indeed, at decade's end abortion had become a public commercial enterprise. Practitioners began advertising in newspapers. In March 1839 a notice in the *Sun* suggested it was neither moral nor desirable for families of any class to grow beyond their means, nor was it necessary "when a simple, easy, healthy, and certain remedy is within our control." Those interested in limiting the size of their families need only come by the Liberty Street office of Mrs. (soon to be Mme.) Restell and pick up some pills, which could "be used by married or single, by following directions."

Mme. Restell was the public persona of Ann Lohman, an English immigrant seamstress who had married Charles Lohman, a printer at Bennett's *Herald* and an avowed admirer of Robert Dale Owen's writings on birth control. Charles and Ann set to producing preventive pills and powders—not placebos but potent drugs. If they didn't work, as they often didn't, Mme. Restell offered more extensive services along with "private and respectable board." For an income-adjusted fee (twenty dollars for the poor, a hundred for the wealthy), she would use instruments to pierce the amniotic sac and induce a miscarriage, at which point the woman would go for further treatment to her regular doctor.

Restell was a spectacular success, especially with the carriage trade. Soon she had six pill outlets in the city, an enlarged Greenwich Street lying-in facility for aborting a fetus or bearing a child, branch agencies in Newark, Philadelphia, and Boston, and salesmen on the road marketing her abortifacients and making referrals to the New York clinic. Rivals set up shop, including a Madame Costello, who also pretended to a Parisian background, and a Mrs. W. H. Maxwell, whose clinic on Greene Street offered abortions, treatment for venereal disease, and a "sanctuary to which to flee" for the unfortunate.

Commercialization afforded new ease of access for women seeking abortions, but it also brought their changing sexual habits forcibly to public attention. Before 1840 there had been virtually no mention of abortion in the popular press. Now one George W. Dixon, owner and editor of a weekly named the *New York Polynathos*, started a campaign to expose Restell as a malefactor. Dixon, a self-appointed scourge of lax public morals, was less concerned with the life of the fetus or health of the mother than with the presumed threat to female virtue. Spouses could now commit adultery without detection, Dixon warned. Worse, a man about to wed a professed

maiden could well discover that “Madame Restell’s Preventive Powders have counterfeited the hand writing of Nature; you have not a medal, fresh from the mint, of sure metal; but a base, lacquered counter, that has undergone the sweaty contamination of a hundred palms.”

In 1841 a carman with the Harlem Rail Road claimed his dying wife had accused Restell of a botched abortion. Restell was arrested, accused of murder, and confined to the Tombs. In the end, however, she was convicted of only two minor infractions, and the publicity garnered her additional business. She was indicted again in 1844; though none of her wealthy clients dared defend her in public, Restell boldly argued her own case in letters to the public press and again got off without serious penalty.

As she grew wealthier Restell took a certain delight in her notoriety. She rode daily along Broadway in a showy carriage with four superb horses and a liveried coachman, brushing aside press depictions of her as a “she devil.” But now Restelle came up against more powerful enemies. Medical doctors had been arguing that a fetus was alive from the point of conception, not the moment of quickening. Abortions were therefore immoral at any stage and should be recategorized as murder and outlawed. Doctors also claimed abortions were dangerous (and there *were* incompetent and avaricious practitioners, though the operation remained far less hazardous than childbirth). Physicians backed Dixon’s charge that abortion fostered sexual license among females; “Madame Restell,” one doctor claimed, “offered to those who would not control their appetites, impunity.” Doctors neglected to mention their concern that female abortionists were undermining male efforts to dominate the lucrative new field of obstetrics and gynecology.

Physicians set out to persuade the state legislature to criminalize the procedure and eradicate New York City’s burgeoning reputation as the nation’s abortion capital. Dr. Gunning S. Bedford, professor of midwifery and diseases of women and children at the University of New York, led the attack. He and his colleagues had substantial influence, and the combination of medical pressure and sensational publicity won passage of a new abortion law in May 1845. It declared the death of a fetus or its mother to be second-degree manslaughter if quickening had taken place, a crime punishable by four to seven years in the state prison. It also made the mother herself liable for seeking and submitting to an abortion or for

performing one on herself—an unprecedented revocation of women’s common-law immunity from punishment.

Madame Restell demonized in *the Police Gazette*, March 13, 1847. She is shown holding a bat with a dead baby in its jaws. (American Antiquarian Society)

With law in hand, press and physicians stepped up their assaults. The new *National Police Gazette* denounced abortionists as murderers and alleged they ran a lucrative side business selling their victims' bodies to surgical clinics. Dixon, Restell's old nemesis, incited the public to force her from the city, and in February 1846 a crowd of several hundred descended on her Greenwich Street quarters, yelling, "Where's the thousand children murdered in this house?" and "Hanging's too good for the monster!" Forty policemen, commanded by Chief Matsell, prevented mayhem, but city authorities proceeded to station men outside her office who followed callers home and noted down names and addresses.

In 1847 Restell was arrested again, indicted for manslaughter in the second degree, and tried before a crowded courtroom that included numerous lawyers from other states, among them Senator Stephen A. Douglas of Illinois. Dr. Bedford was a leading prosecution witness at this first highly publicized abortion trial in U.S. history. Restell was found guilty, though only of a misdemeanor, and to the applause of spectators, she was sentenced to a year on Blackwell's Island. It seemed a decisive victory for antiabortion forces.

It wasn't. Restell did easy time—a featherbed instead of the usual straw mattress, food from the keeper's table—and after she was freed, in June 1849, promptly resumed her advertisements and practice. More remarkably, throughout the 1850s the authorities and general populace alike virtually ceased hostilities against her and her competitors. Some attributed this to behind-the-scenes support from a combination of influential gentleman-patrons and to politicians and policemen won over by campaign contributions and bribes. Restell was certainly wealthy enough to afford payoffs. In spring 1857 she and her husband bought the northeast corner of Fifth Avenue and 52nd Street—outbidding Archbishop Hughes, who had wanted to build an official residence there—and began erecting a mansion. Now, to the prelate's dismay, the future St. Patrick's Cathedral would have the city's foremost abortionist as its neighbor.

Abortion thus remained in place as a leading option for women seeking birth control. But if the women who used such services were relieved, the feminists crusading against prostitution were not. Like Dixon, they feared its regularization would facilitate adultery (though they feared husbands would be the errant parties). Indeed in 1847 the American Female Moral

Reform Society had rejoiced at the arrest of Mme. Restell, the “mistress of abominations,” and visited the “heroine of licentiousness” in her cell to encourage her to Christian contrition—with singular lack of success.

So female reformers turned to promoting alternatives to abortion, though once again their initiatives were hampered by religious and class convictions. New York City lacked a lying-in hospital where unwed mothers could bear illegitimate children and receive medical attention in private. Many European cities had such institutions, so as not to box pregnant women into choosing between abortion and disgrace. In Catholic Ireland, Dublin’s lying-in hospitals freely admitted all of the thousands who applied each year, never asking if they were married. The New York Asylum for Lying-in Women on Orange Street also offered poor pregnant women a midwife’s services and postpartum care, but the “lady managers” accepted only “reputable married” females—lest they encourage “criminal improvidence”—and demanded references in advance, ideally from a “respectable New York citizen.” Once admitted, moreover, patients were treated like servants: forbidden to have visitors, to leave without permission, or to use liquor or profane language. A female matron enforced deference and decorum, with violators subject to dismissal. After delivery, the asylum placed many of the mothers as wet nurses with respectable women, assuring prospective employers that their candidates’ breasts were in good condition and that “their characters [had] already [been] investigated by the Visiting Committee.”

The sole alternative to the asylum was the almshouse, and poor women preferred the former to the latter. It was nearer their homes, was reputedly safer, and protected them from having to associate (and be associated) with prostitutes, and its wet-nurse employment service provided them with a year-long “situation,” even if it did require they nurse only their employer’s baby and farm out their own. Most avoided both if possible.

New York had no place that would take in foundlings, either. No hospital (again excepting Bellevue) would accept deserted or abandoned children, or even admit a sick child under two. Bellevue paid poor women to care for these unwanted children—usually less than it cost them to do so—with the result that nearly 90 percent of those farmed out died. According to the Almshouse commissioner, nearly one thousand babies perished each year between 1854 and 1859.

Awakened to this situation by a personal experience, Mary Delaneld DuBois, wife of a well-to-do Gramercy Park lawyer, joined with Anna R. Emmet, wife of a famous New York specialist in the diseases of women and children, and in May 1854 they opened a Nursery for the Children of Poor Women in a small house on St. Mark's Place. It became the first institution in the country devoted primarily to day care, taking in the children of working women (including wet nurses) so their mothers could "go out to service." Yet here too the pioneers drew back from establishing a Dublin-style opendoor institution. They would only accept the progeny of an unwed woman if it was her first lapse and she could demonstrate victimhood: "The mother must produce evidence of having borne a good character until the dark shadow of him who ruined her fell across her path."

Beyond these efforts, women unhappy with existing sexual codes and practices would not or could not go. Public discussions about erotic matters remained difficult or impossible, and only those wrapped head to toe in the mantle of purity dared address such issues at all. It was left to a tiny handful—the men and women of the Free Love movement—to issue a more frontal challenge to the conventional order, and the rough handling they received served as a warning to others to keep silent.

Free Lovers rejected coercion in sexual relations, whether from male lust or legally prescribed duties of marriage. Stephen Pearl Andrews, a philosopher influenced by anarchism and Fourierism, argued that only "passional attraction"—spiritual holy love—should bind two individuals. The state had no business in the bedroom. Legal marriage, like many other governmental or religious institutions, was inherently enslaving, little more than a form of legalized prostitution, and ought to be abolished. Decisions about engaging in sexual relations should be left to the "well developed conscience," with women having an absolute right to refuse such connections.

Free Lovers by no means advocated promiscuity. Most considered themselves particularly chaste and pure and rejected sex apart from procreation. Respectable sorts assumed the opposite and denounced them as sexual libertines. When Andrews and Fourierist Albert Brisbane founded the New York Free Love League in 1853, Henry Raymond's *New York Times* accused its five to six hundred members of holding regular "orgies" at its 555 Broadway clubhouse, though his own news columns admitted

that, whatever their theories, their social events were refined gatherings, little different from “an ordinary family party.” But it was precisely the theory that alarmed Raymond, who saw in it an assault on the family; he kept up his sensational coverage and prodded police into raiding the club and arresting some members. The cases were thrown out of court, and the circle continued in existence, but from then on, respectable and conventional feminists would find themselves charged with being Free Lovers, stifling further discussion.

New York women thus faced substantial obstacles when they tried to loosen some of the constraints that bound them. They were barred from most professions, banned from labor unions, balked in their efforts to limit prostitution, excluded from many public activities and spaces. City life did afford women new avenues of expression, however, wherever an expansion of female possibilities suited the needs of the marketplace.

“FASHION’S DESPOTIC RULE”

As rapidly as republican simplicity was scrapped in urban architecture, it waned even faster in the field of feminine attire. Nowhere was this more striking than in New York City, capital of America’s clothing industry and portal for *la mode parisienne*. Fashion was the affluent woman’s metier, a way to display her expertise (as well as her husband’s wealth). Devotees of fashion redeployed old words to describe new looks: “elegant” gained currency from 1845, “stunning” from 1849, and “chic” from 1856.

The pursuit of fashion also validated expanded female claims on city space. Shopping was irreproachably legitimate, and respectable women could wander the Broadway commercial district without reproach in search of commodities. This “midtown” terrain, easily accessible from uptown’s female zone yet satisfactorily distant from downtown’s all-male turf, emerged as an acceptable heterosexual domain (as would Central Park).

Fashion provided women farther down the social scale with expanded employment opportunities. Quite apart from the thousands employed in the garment industry itself, milliners and dressmakers blossomed, most of whom affected fancy French names, though most were Irish working class. They subscribed to French fashion magazines, kept up with current French designers, and maintained correspondents in Paris who dispatched dress

dolls in the latest styles. Cosmeticians did a thriving trade too, now that New York women had abandoned the old republican association of painted faces with aristocrats or whores. Some professional hairdressers in the 1850s opened their own shops, and others were attached to hotels for out-of-towners, but most still attended wealthy patrons in their homes. On New Year's Eve hairdressers went from house to house, crimping with heating irons, working through the night until noon next day when visiting began; those clients done early might sit up all night so as not to spoil their hairdos.

Working women were consumers too. Immigrants might arrive at Castle Garden in traditional costume, but those who could afford it shed such garb with great alacrity and slipped into something fashionable. Stylish dress could signal one's aspirations, attract an upward-striving husband, and erase (or at least smudge) sartorial discrepancies of class. When Irish maids donned hoopskirts and flowered bonnets, one observer noted, they were "scarcely to be distinguished from their employers." Irritated mistresses agreed, and some insisted their employees wear costumes adapted to their station in life.

Democratization of fashion led to contestation as well as imitation. The bourgeois model of beauty favored a pale-complexioned, heart-shaped face with a "rosebud" mouth (the right degree of pucker was obtained by repeating the mantra "peas, prunes, and prisms"). It required a tiny eighteen-inch waist (whose stylish circumference was achieved with the aid of straitlaced corsets). Bowery g'hals paid little attention to these conventions. They opted for the "plump and hearty" look, reported George Foster, and whenever they thought about the "poor, pale-faced creatures of Broadway, they actually and heartily pity them."

Shopgirls, milliners, and dressmakers' assistants—professionally well versed in prevailing styles—mischievously parodied elite fashions. They adopted startling color combinations, ornate hats, and elaborate decorations even gaudier than those favored by the wealthy. By recycling fashions of the 1820s, they essayed a retro look. G'hals, like ladies, promenaded in public space, sashaying along the Bowery after working hours with girlfriends or young men, indulging the pleasures of city life, reveling in new freedom from customary constraints.

Yet fashion could restrain women as well as liberate them, and a largely female band of feminists, writers, editors, reformers, and advice givers

pointed to its more problematic aspects. They found prevailing styles cumbersome and imprisoning. Layers of petticoats weighed down the wearer, long skirts dragged through the mud, and corsets were positively hazardous to health. Emily Thornwell, in her *Lady's Guide to Perfect Gentility in Manners, Dress and Conversation* (1856), was one of many who deplored tight lacing as causing coughing, consumption, headaches, heart palpitation, deformed ribs, uterine and spinal disorders, and “an extreme heaving of the bosom, resembling the panting of a dying bird.”

Fashion was unrepublican, the handmaiden of aristocratic luxury and self-indulgence. It valued consumption over production, appearance above character, idleness over industry. “Do we not see females in every fashionable circle,” queried Mrs. A. J. Graves in her *Woman in America* (1843), “who fill no loftier station in social life, and who live as idly and as uselessly as the gorgeously attired inmates of the harem?”

Fashion was expensive. It undid hardworking husbands. Magazine writers often depicted bankrupt businessmen as victims of their wives’ pursuit of lavish wardrobes. The pursuit itself opened women to ridicule. Anna Cora Mowatt’s popular play *Fashion* (1845) presented a parvenu Mrs. Tiffany who, in her attempts to become a woman of fashion, made a complete fool of herself until set straight by Adam Trueman, her virtuous friend from the country.

Stylish women, finally, were slaves to fashion, which is why feminist reformers attuned to the politics of dress declared that “our sex should rise above subserviency to fashion’s despotic rule.” Determined to take grass-roots control of the mode, the women boldly proposed an alternative costume. Picking up on a gymnastic uniform promoted by the New York City *Water-Cure Journal* during the 1840s, two upstate women, Elizabeth Cady Stanton and Amelia Bloomer (editor of the *Lily*, a temperance paper) began to wear and publicize a seemlier version in 1851. It consisted of a simple woolen dress, shortened to midcalf or knee, worn over billowing Oriental pantaloons—a blend of Turkish and Quaker. Soon many feminists were wearing the reform attire, which journalists promptly labeled “bloomers.”

The initiative came under instant and ferocious attack. Men were outraged to see women wearing trousers, a patent transgression of gender boundaries. Little boys wore dresses until five years of age, when they

ritually signaled their departure from the female community by donning trousers. Strong women who disagreed with their husbands had long been accused of trying to “wear the breeches.” Men jeered at bloomer wearers in the street. Boys pelted them with snowballs in winter, apple cores in summer. They were the butt of vicious caricatures and sexist jokes.

Women didn’t much care for the new style either. Conservative women saw it as a threat to their sphere. Fashionable ladies sniffed because it hadn’t come from Paris and no society leader (or even actress) would take it up. Style-conscious working-class women agreed: when a manufacturer of painted window shades urged his female employees to wear bloomer dress, as their voluminous skirts were brushing against the still-wet product, they refused, accepting dismissal rather than don the outfit. Truth to tell, even Bloomerites found the costume unattractive, and when the hoop skirt arrived, bearing the endorsement of Empress Eugénie of France, Bloomer herself adopted it, declaring that its doing away with heavy petticoats was an acceptable enough reform. Stanton hung on alone until 1853, then gave up.

Soon the hoop skirt was all the rage. With firms like Douglass and Sherwood of Broadway churning out four thousand of them daily, it was clear that the bloomer movement had run up against more than gender stereotyping and bad design. The fashion system was as deeply imbricated in New York City’s economy as was prostitution, and the profitable matrix of designers, department stores, fashion entrepreneurs, garment manufacturers, and the clothing trade would prove highly resistant to tampering.

“LINDOMANIA” AND “HIGH-FLYER STAMPEDES”

In the world of commercial entertainment it was much the same. The imperatives of profit opened new pathways for city women, though only if they stayed within prescribed patterns and places of consumption.

Barriers tumbled quickest in the midtown entertainment district. Where it had been quite improper for a woman of refinement to enter a public eating house, feeding ladies became a lucrative business. Some restaurants allowed mixed dining, others arranged special accommodations (ladies’ dining rooms, separate ladies’ entrances), and some (notably ice cream

parlors like Taylor's) became completely identified as women's spaces. The explosion in the number of women travelers speeded this transformation, as such visitors were obliged to eat in public. Many of the new hotels established reserved drawing rooms. Astor House went farther, refusing to admit any lady unless accompanied by a gentleman: while this offended reputable single women, it effectively excluded prostitutes.

The presence or absence of prostitutes was key to theatrical developments too. Playhouses wanted to draw more respectable women. They courted such ladies by installing special lobbies in which they could promenade between acts and by keeping lights on halfway during performances so they could take one another's measure. But the third tier remained a galling obstacle, and many women boycotted theaters that retained one. Instead they flocked to musical venues like the Astor Opera House, the Academy of Music, and the New York Philharmonic Society, where, as Lydia Maria Child noted, "no degraded corner is reserved for unveiled vice." Seeking respectable patronage, the Park Theater substituted a "family circle" for its third tier in 1848. Most theaters refused to follow suit. Convinced that the presence of prostitutes was crucial to profitability, many handed out free tickets in the brothels.

It was left to the shrewdest impresario of them all to demonstrate the lucrative possibilities in marketing respectability. P. T. Barnum had observed that women patrons considered content as crucial as audience. When Lola Montez came to town, her reputation as mistress of the king of Bavaria preceded her, and when she appeared onstage as dancer or actress, New York's ladies were as one in boycotting her scandalous person. So, in the late 1840s, Barnum sanitized his American Museum. He banned prostitutes, prohibited liquor, cracked down on raucous audiences, and cleaned up his acts. He introduced matinees and continuous performances and pointedly featured "moral" presentations: scriptural dramas, the occasional Shakespeare play "shorn of its objectionable features," and temperance melodramas like *The Drunkard* (1850), which ran without interruption for over a hundred performances, breaking all New York records. Women and entire families streamed in, proving to Barnum's satisfaction that he was tapping new portions of the populace.

The readiness of ladies to attend recitals of European concert artists suggested that still fatter profits lay in finer art. In 1849 Barnum began

preparations to bring over Jenny Lind, a Swedish singer. Since her 1844 debut in the Berlin Opera House, Lind had gone from triumph to musical triumph while establishing a reputation for piety, modesty, charitable good works, and a spotless private life. Barnum enticed her across the Atlantic with a guarantee of \$150,000 (plus very considerable expenses) for 150 concerts, which Lind, herself no mean bargainer, required him to bank in advance. Barnum mortgaged all he owned and borrowed more. Then he set out to guarantee success.

Barnum launched an unprecedented press campaign to acquaint Americans with Lind's voice—and, more important, her virtues—concentrating on winning over homemakers and charity ladies and writers of sentimental fiction. Biographies from N. P. Willis and George Foster emphasized Lind's morals rather than her musicianship, stressing “her intrinsic worth of heart and delicacy of mind.”

Next Barnum orchestrated her arrival. In September 1850 he arranged one of the most tremendous welcomes in the history of New York City. Thousands swarmed to the Canal Street dock from which Lind, pelted with flowers and accompanied by twenty companies of firemen, was conveyed under triumphal arches to the Irving House Hotel opposite A. T. Stewart's store; there 150 musicians serenaded her into the wee hours. In the next days, Barnum had Lind visit Brady's gallery, meet Archbishop Hughes, and stop in at the *Herald* to see its Hoe presses at work. “Reputation was manufactured for her, by wholesale,” a rival impresario grumped, and Barnum gleefully agreed: Lind “would have been adored if she had had the voice of a crow.”

The first concert was held September 11 at Castle Garden. The huge event—five thousand turned up—was handled with perfect decorum. A hundred hired policemen kept order; color-coded tickets matched color-coded seats. Willis rhapsodized at “the clockwork precision” with which people were seated and the “quiet dignity of their egress.” When Lind gave local New York charities her share of the evening's profits—ten times what she'd made in any single European appearance—Hone declared that “New York is conquered; a hostile army or fleet could not effect a conquest so complete.”

As Lind moved out into the country, to continued adulation, some commentators expressed concern at the rampant “Lindomania.” Barnum's

ability to whip up publicity was a wholly new order of event. He had made use of an assortment of New York institutions—press, photography, hotels—to transform reputation into commodity, to package the first superproduct in the emerging marketplace of popular commercial culture. “Jenny Lind is a celebrity,” said one magazine, using a noun of relatively recent coinage, and there were those who worried that the business of celebrity creation might prove to have its downsides.

Barnum had demonstrated something else. Lind’s earnings were unprecedented in the history of American entertainment. Her New York concerts alone grossed nearly \$290,000. Barnum personally cleared half a million on her tour and became a rich man. Clearly, conventional androcentrism had been proved wrong. Big bonanzas awaited those who tailored their entertainments to the precepts of bourgeois morality, and particularly to the hitherto underestimated audience of respectable females.

The entertainment marketplace also welcomed working-class women. German immigrant men and women piled together into immense beer halls like the Deutscher Volksgarten, the Atlantic Gardens, and Lindenmuller’s Odeon where, at rough tables and wooden benches, surrounded by gaudily painted frescos, they drank, sang, and watched amateur theatricals. Women were also present at melodrama, burlesque, and blackface performances, dime museums, ice cream parlors, oyster shops, and lecture halls. But they were most in evidence (as was true for the bourgeoisie) in venues devoted to music, especially dance halls.

Dancing in the past had usually been held under organizational auspices—the annual balls of fire companies, militia units, and political clubs. Now it became a commercial proposition. Girls were admitted free; men paid twenty-five cents. Seamstresses and servants threw themselves into dances that were as acrobatic as they were graceful. George Foster noted that the “high-flyer stampedes” drew the East Side’s “unmarried womanhood” in all their finest clothes and declared that “New York is undoubtedly the greatest place for dancing in all Anglo Saxdom.”

On the Bowery, g’hals could enjoy a pleasurable evening away from the prying eyes of neighbors or keep an eye out for a permanent partner, amid a far wider constituency of eligible men than was accessible through family and community networks. Such independence could be risky. The crowds that shielded her from neighborhood scrutiny also left her exposed to

seduction-bent males. Some of the b'hoys extended a rough courtesy to women and adopted a protective stance, particularly against "aristos"—gentleman rakes looking to pick up working girls. But there were plenty of workingclass sporting men, for whom conquest remained a source of self-esteem. Many still considered women in public a scant step from prostitution. They were quick to assume that women in dance halls were "rowdy girls," willing to trade sexual favors for the provision of beer and oysters. Ruffians often hung around fire stations and rumshops, insulting and abusing women passing by. "Bloods" camped out on street corners, shouting out: "An Angel, by H——s!" "Dam'd fine girl, by g——d!" "Where do you lodge, my dear?" Predatory tavern rowdies and waterfront gangs dragged off lone women, especially those who appeared both vulnerable and independent, and subjected them to brutal group rapes, a male prerogative known as "getting our hide." Such belligerence served as a stark reminder that women's newfound access to public space remained subject to masculine veto.

FEME DECOVERT

When Lydia Maria Child asserted that women's legal status was akin to that of slaves, the analogy seemed more compelling than when white working-class men used it. Female subordination, after all, was deeply inscribed in the law, and had been since the British Empire overrode Holland's more tolerant approach to gender issues. Quite apart from not being allowed to vote, the doctrine of *feme covert* meant that a married woman could not sign contracts, control her own earnings or inherited property, or be the legal guardian of her children. Her legal identity was subsumed in her husband's. Under the law, as a later judicial summary recalled, "the husband and wife were one and the husband was the one."

In the 1840s feminist New Yorkers began to protest this state of affairs, starting with the laws blocking women from owning property. The premise underlying such statutes, the *Advocate* said in 1846, was that "women do not know enough to take care of [property], and therefore the laws and customs of society virtually say they shall have none to protect." Radical feminists argued that "free Christian enlightened women" needed their property and earnings if they were not to be forced into economic subservience. More conservative women emphasized that such a right

would protect wives against drunks and gamblers who would squander their property.

Initially, legislators resisted, leery of undermining the sexual order, but it was increasingly clear that the vicissitudes of contemporary capitalism dictated some gender adjustments. The first convincing arguments for a married women's property bill were made during the Panic of 1837, in the context of debtor relief. Too many respectable families had been wiped out after husbands sank their wives' money into illchosen investments. Given the growing centrality of stocks and credit to New York's economy, was it really wise for a wife's property to be subject to her husband's debts?

This was part of a larger problem: *feme covert* was hampering development of new kinds of capitalist industry. Life insurance companies had been stymied because wives were not allowed to own life insurance in their own names or to hold any benefits they received free from claims by their husbands' creditors. In 1840 New York State had solved both problems with a stroke of the legislative pen, simultaneously giving the life insurance business a boost and feminists their first triumph.

Another powerful group of males—scions of old and propertied families—had a different problem, keeping the family fortune from falling into the hands of predators. Since the seventeenth century, when the English gentry had first grappled with this problem, wealthy New York clans had been insulating a wife's property by conveying it to a trustee, reserving to the wife powers that ranged from full authority over her property to complete dependence on the designated trustee. In 1844 Philip Hone's daughter Emily married Frederic G. Foster, but Hone made Frederic De Peyster the trustee over the dowry she brought, and her husband was forbidden to touch the principal.

New York's equity judges had been going along with this modification of *femecovert*, but obtaining their approval on a case-by-case basis was a costly and cumbersome business, and even wealthy gentlemen preferred to have such rights guaranteed across the board. It was an era, moreover, when republican-minded citizens and lawyers sought to scrap equity courts as feudal and colonial remnants and to replace arbitrary judge-made law with a uniform statutory code. They succeeded in 1846, when the state constitutional convention abolished the office of chancellor and put equity under jurisdiction of the common-law courts.

It was in this context that a small but aggressive group of feminist campaigners, led by Elizabeth Cady Stanton and Ernestine Rose, a recently arrived Polish-Jewish immigrant, struck up an alliance with patrician and propertied men and pushed for a married women's property statute. Women had long been aware that prenuptial contracts held great potential for them, in that a woman with assets (and the permission of her intended husband) could create a trust that she herself controlled. When Sarah Willis ("Fanny Fern") took James Parton as her third husband, he signed an agreement stipulating that her property and the proceeds of her writing would belong solely to her and her children. However, few women had the assets or legal sophistication to negotiate such a bargain, and feminists wanted the same rights granted to all.

Resistance to such legislation came from those who feared the gender consequences might outweigh economic benefits. Might not husband and wife come to see their interests as antithetical? Might not a wife compete with her husband in trade? Become the partner of his business rival? Might not such a law incite women to invade bench, bar, pulpit, and dissecting room? Supporters of the law countered that it was not an attack on the economic foundations of patriarchy but rather a way to extend men's ability to protect dependent women. Their arguments carried the day, and in 1848 the state legislature made a wife's possessions her own and not subject to her husband's debts.

The women's rights advocates who gathered that summer in the upstate New York town of Seneca Falls hailed the law but recognized its limitations. Wives might control their property, but husbands continued to command their earnings. Besides, taken as a whole, marriage still entailed the surrender of a woman's legal personality. They pressed on.

Further successes came in areas where women's desires dovetailed with the needs of powerful businessmen. In 1850 a new law allowed married women to control their bank deposits. The act was primarily designed to protect the banks and keep a wife's deposits out of reach of her husband's creditors, but it further enhanced women's financial standing. Next year the legislature decreed that a married woman who owned stock could vote it herself, making all stockholders equal regardless of sex or marital status. Again, this pleased wealthy fathers, who were bequeathing stocks to their daughters.

What did not please them, or nearly any males, was the next proposition women advanced: that all people capable of owning property should be allowed to vote. In 1848 a bare majority of the delegates at Seneca Falls had agreed to include Elizabeth Cady Stanton's call for the suffrage in their Declaration of Sentiments. Over the next decade, as it became ever clearer that moral suasion had failed to transform men or society and that electoral politics were becoming the crucial instruments for resolving national and local issues, more and more feminists began demanding access to the ballot. Such claims were greeted with tremendous hostility, and nowhere more so than in New York City.

Since 1850, inspired by the Seneca Falls meeting, feminists had begun holding annual Women's Rights Conventions. The first three met upstate or outside New York altogether, but in 1853, attracted by the opening of the Crystal Palace and the simultaneous gatherings of the Anti-Slavery Society and the World's Temperance Convention (whose clergyman organizers excluded women), organized feminism ventured into the metropolis for the first time.

On September 6 three thousand delegates from eleven states as well as England and Germany packed into the Broadway Tabernacle on Worth Street. Female speakers shared the platform with male abolitionist luminaries in town for their own meeting. Together they advocated women's right to enter public life, to engage in any profession, to wear what they chose (Lucy Stone donned "bloomers"), and to vote. Men, they declared, must be forced to abandon their privileges by an aroused public sentiment.

But "public" sentiment—if one was to judge by the crowds that jammed their way into the galleries—was cholericly against them. The audience interrupted each speaker with shouts, hisses, stomping, cheering, rude remarks, and free-for-all fights. Sojourner Truth, back in town for the event, handled the rowdies pretty well: "We'll have our rights," she warned. "You may hiss as much as you like, but it is comin'." Soon, however, cacophony reigned again, and amidst a yelling, laughing uproar, the meeting was forced to adjourn.

Greeley and Bryant condemned the crowds, but the *Times*, the *Herald*, and the *Courier* applauded them. James Watson Webb of the *Courier* jeered at the "antiquated and very homely females" who "made themselves

ridiculous by parading the streets in company with hen-pecked husbands, attenuated vegetarians, intemperate Abolitionists and sucking clergymen, who are afraid to say 'no' to a strong-minded woman for fear of infringing upon her rights." Even men as sympathetic as Whitman found feminism unnerving. "What a queer medley of women's rights meetings at present!" he wrote in 1858 in the *Daily Times*. "Women in breeches and men in petticoats—white, black, and cream-colored—atheists and free-lovers, vegetarians and Heaven knows what—all mixed together, 'thick and slav,' until the mixture gets a little too strong, we should think, even for metropolitan stomachs."

Many women also remained unconvinced or in active opposition. Some traditionalists simply denounced women's rights as contrary to divine law, but others argued that deep-rooted social inequalities made it extremely difficult to survive without a man. Where male antifeminists balked at sharing their prerogatives, females feared losing the few they had. "Women never aim so suicidal a blow against their own interest," wrote one women's magazine, "as when they try to do away with or revolt against. .. [the] doctrine of their inferiority," for in so doing, they "absolve the lords of creation from that protection which they are so willing to afford."

Working-class women were not so much opposed as indifferent to the feminist project. Upper- and middle-class calls for feminine solidarity meant little to tenement mothers and factory girls, especially given the condescension and religious bullying many feminists displayed in the autonomous women's institutions they established, and for the moment these sets of sisters would remain unaligned. Indeed some feminists resorted to anti-immigrant rationales, hoping to win over wealthy men and women. Stanton and Susan B. Anthony toured the summertime spas at Saratoga and Ballston, arguing that female suffrage would bolster Anglo-Saxon civilization and win passage of temperance laws. Stanton complained to the state legislature that the current suffrage arrangements exalted "the ignorant and vulgar above the educated and refined—the alien and the ditch-digger above the authors and poets of the day." But legislators held the line. The inferiority of women (and the necessity of maintaining their public subordination) was one thing on which men of different classes could agree.

Progress came only when feminists trimmed their demands to seek, as the *New York Times* delicately put it, the “legal protection and fair play to which women are justly entitled” while abandoning “the claims to a share of political power which the extreme advocates of Women’s Rights are fond of advancing.” Finally, in May 1860, the legislature accepted a bill drafted by Susan B. Anthony that permitted a wife to own property acquired by “trade, business, labor, or services,” to be the joint guardian of her children, and to bring legal actions in her own name (and to *be* sued as well). Every provision of this act had been a specific goal of the women’s movement.

At the Tenth National Women’s Rights Convention, held on May 10 and 11, 1860, at New York’s new Cooper Institute (with historian Mary Louise Booth serving as secretary), feminists were jubilant about this triumph. They would soon find that its effects were limited, as judges undid in the courts gains won in the public arena. *Feme covert* was buried deep within the Anglo-American legal tradition and would prove hard to root out.

Louis Napoleon and Fernando Wood

After the defeat of the workers' uprising in June 1848, a frightened French bourgeoisie and peasantry elected Louis Napoleon to the presidency, then acquiesced when he overthrew the newly established republic and declared himself head of a Second Empire. As Napoleon III he swiftly established an authoritarian state and then, power secured, commenced the reconstruction of Paris.

In June 1853 the emperor handed a map of the capital to Baron Georges Eugene Haussmann, his newly appointed prefect of the Department of the Seine. On it he had sketched a network of wide, straight boulevards he wanted Haussmann to ram through the old city center. His goals were threefold: to unblock clotted medieval capillaries that were obstructing the circulation of commodities; to shift the city's primary link to the outside world, from the Seine River to railheads converging on Paris from the countryside; and to forestall future construction of barricades and allow the emperor to mow down his enemies with artillery.

Haussmann duly plowed Napoleonic avenues straight from the new train stations to the commercial center, treating Paris as an engineering obstacle. The process deindustrialized much of the inner city and forced many working people to the periphery. As one class went out, another came in. The bourgeoisie roosted along the new boulevards in grand new apartment houses—modeled on the *palais* of urban aristocrats—whose heights and facades were reassuringly regulated by the state.

The state also undertook massive infrastructure projects: it built Les Halles and other giant markets, dug an enormous maze of underground galleries with space for sewers, water lines, and gas pipes; and made the Bois de Boulogne—with its curving roads, lakes, and bridle and pedestrian paths (some staked out by the emperor himself)—the new standard for metropolitan parks. Indeed command of the authoritarian state was crucial to every aspect of this urban renewal enterprise, from overbearing small property owners who resisted improvements, to mobilizing a scheme of

debt financing, to promoting better housing for working people in an attempt to win their support.

The Parisian model would be copied repeatedly in the ensuing decades, not only by French provincial cities but by Brussels, Stockholm, Barcelona, and Madrid; soon Mexico City would be graced by Parisian boulevards (courtesy of the French-installed Emperor Maximilian). But it would not be copied in New York. There would be no grand design, for there was no grand designer, no political authority able or willing to unilaterally reorganize the flow of people and goods or impose a unified order of architecture. New York's bourgeoisie, inconvenienced but not as yet significantly threatened from below, retained their republican distaste for centralized authority. When Lajos Kossuth came to town in 1851, the leader of Hungary's rebellion against Austrian and Russian despotism was given a hero's welcome at Castle Garden, on a par with those afforded Washington and Lafayette.

New York's merchants, bankers, and industrialists were content to pursue their interests within the framework of a democratic polity, in part, because they had done so quite successfully, certainly at the national and state levels. Though differing sectors of the city's propertied classes had different and sometimes opposing interests, and though New Yorkers in Washington had to negotiate with southern slaveholders and western farmers, and in Albany to tussle with upstaters—overall, the results had been satisfactory. Governments provided banking and currency legislation, tariff laws, protection for investments (especially in western land), judicial procedures for enforcing contracts, land for railroads, and subsidies for steamship operators. Much of their port's expansion in this era was underwritten by the federal government. The U.S. Coastal Survey charted a new channel into the harbor; federal engineers cleared away obstructions in the Hudson and East rivers; federal largesse underwrote lighthouses and provided half a million dollars for work on the harbor's forts and Navy Yard. Clearly, there seemed to be no inherent contradiction between capitalism and popular suffrage.

To sustain their access to and influence upon national and state governments, bourgeois New Yorkers participated personally in government, often serving as congressmen or state legislators. Chiefly, however, the wealthy worked in and through political parties, though

continuing to differ on which was more suited to their interests. In the early 1850s, perhaps 75 to 90 percent of the merchants, industrialists, and bankers active in party politics were Whigs—attracted particularly by that party's support for infrastructure development. Still, the oft repeated line "The Democratic merchants could have easily been stowed in a large Eighth Avenue railroad car" was seriously overstated, for New Yorkers were powers in the Democratic Party too (beguiled by its antitariff policies, among other things). Democrats, like Whigs, established their national headquarters in New York, for ease of access to campaign contributors and organizational talent: banker August Belmont, head of the Democratic National Committee, was instrumental in running and bankrolling James Buchanan's presidential campaign.

TAMMANY'S TOWN

In New York City itself, however, the upper classes were far more ambivalent about democratic politics. From their perspective, municipal government had fallen into the wrong hands. Once upon a time wise and enlightened gentlemen like themselves had ruled in the public interest. Now, as they saw it, sleazy self-interested politicians had secured a lock on local affairs.

The mayoralty, to be sure, remained a bulwark of respectability throughout the period, as both parties felt impelled to select leading businessmen as nominees. The problem lay with the Common Council. Between 1838 and 1850, the percentage of merchants serving in this body dropped by half, to 15 percent. The ranks of aldermen and assistant aldermen were dominated by ambitious petty entrepreneurs (slaughterhouse operators, grocers, dealers in coal or hardware) or skilled craft workers (boatbuilders, carpenters, printers, sailmakers, hatters, tailors, saddlers, bakers, and chairmakers). Many councilmen, officeholders, and party activists had their political base in the liquor trade; it was said that one way to break up a meeting of Tammany's Executive Committee was to open the door and yell, "Your saloon's on fire!"

Such men rose to power not from boardrooms or drawing rooms but from the intensely maculinist working-class streets. Rising politicians like William Magear Tweed often developed personal followings—as the gentry once had—by displaying their courage and generosity in leading volunteer

fire companies. Tweed, born in 1823 to a Protestant, third-generation Scottish-American family, grew up on Cherry Street, studied bookkeeping, worked in the brushmaking business in which his father owned stock, then joined the family chairmaking firm. A brawny young man with clear blue eyes, an amiable smile, and a fabulous memory for names and faces, Tweed was a gregarious chap (and a good dancer to boot). In 1847 he enlisted in the International Order of Odd Fellows; he was later initiated as a Mason and in 1849 joined some friends in organizing a fire company. He seems to have chosen its name—the Americus Engine Company, Number 6 (more popularly known as “Big Six”)—and its symbol as well, a snarling red tiger. In 1850, Big Six’s seventy-five red-shirted, intensely clannish members elected him foreman, and Tweed, dashing in white firecoat, led his loyal men in “running with the machine” to battle blazes. Unfortunately they also battled other companies, and in 1850 chief engineer Alfred Carson, who personally accused Tweed of leading an ax-wielding assault on rivals, managed to get him expelled. Still, his exploits had provided a stepping-stone into politics, by bringing the vigorous and ambitious twenty-six-year-old businessman to the attention of Seventh Ward Democratic politicians. In 1850 they ran him for assistant alderman. It was a Whig year, and Tweed lost, but the following year he ran for alderman and won, embarking on a fateful career.

Like fire companies and saloons, gangs were important recruiting grounds for party activists. Candidates for ward offices were chosen at wide-open, walk-in primaries, held in local saloons and hotels. These meetings also selected the ward’s delegates to nominating conventions, which in turn proposed candidates for state offices, county offices, city departments, city judgeships, the U.S. Congress, and the mayoralty—at a time when nomination was often tantamount to election. Those intent on dominating these gatherings—held during August and September, when respectable folk were out of town—simply packed them. For the requisite muscle, political entrepreneurs turned to “shoulder-hitters,” the same men who for a price would keep opponents from the polls and guard (or stuff) ballot boxes.

Political gangs were, in their own way, open to talent. In the late 1840s John Morrissey, a Troy ironworker, came down to New York, walked into Captain Rynders’s Empire Club, and offered to fight any man in the house.

He was immediately beaten to a pulp, but Rynders—Tammany boss of the Sixth Ward—admired his bravado and offered him a spot as a shoulder-hitter and emigrant runner (a task that involved meeting immigrants at the docks, getting them naturalized, and finding them homes and jobs, in return for their votes).

The *Whig Tribune* was correct in claiming that Democrats regularly rigged elections with the aid of “a dozen of beastly ruffians in each ward, hired to do the voting and knock down any one who should presume to interfere with the play.” But Whigs too turned to gang leaders, like “Butcher Bill” Poole, a celebrated brawler and eye gouger who ran his own Ninth Ward gambling and drinking place. A nasty piece of work, whom even his friends considered deceitful and bloodthirsty, Poole periodically set his thugs to contesting Morrissey’s men at the polls, until his assassination in Stanwix Hall in 1855, which some suspected Morrissey of masterminding.

Once successful, an alderman had much more to offer his followers than bonhomie and booze. Tammany councilmen, in particular, were ardent in

protecting immigrants and their customs and regularly denounced nativists as “bigots and fanatics in religion.” They also attended diligently to immigrant sensitivities: green flags and much bombast flew from the steps of Tammany Hall on St. Patrick’s Day. The newcomers were not naive about the depth of this commitment, but, as the *Irish American* noted, though the Democrats had their anti-Irish prejudices, at least “they act as if they loved us.”

In the end, however, patronage was the lubricant that kept the still-rickety political machines in running order. The mayor appointed all policemen but had to choose them from a nominating list submitted by ward aldermen; the need for annual reappointment kept cops attentive to councilmen’s wishes. Supporters could also be rewarded with carting licenses, saloon licenses, and appointments as health wardens, street sweepers, and a myriad of other minor city positions. Councilmen handed out municipal contracts for school, dock, sewer, and street construction to builders, utilities contractors, stonemasons, and carpenters (a good many of them Irish), who returned the favor by mobilizing their grateful employees at election time.

Aldermen, imbued with the era’s entrepreneurial spirit, also asked what government could do for them, and found many answers. They could require contractors to present padded bills and then split the excess among themselves. They could award contracts to firms run by relatives, or in which they were partners, or owned entirely by themselves. The really big money, however, came from the ability of a newly autonomous *political* elite to force the city’s *economic* elite to pay for things it had once commandeered more directly. Market-oriented politicians set about selling off public assets to the highest bidder.

There was plenty to sell. The Common Council merrily leased out city piers, sold off profitable riverfront properties, and granted ferry franchises to a favored and responsive few. Corruption was hardly new, of course —“There never was a time when you couldn’t buy the Board of Aldermen,” Tweed once remarked—but it was the arrival of the street railroads, with their attendant scramble for franchises, that brought civic chicanery to new heights (or depths).

Since the Harlem Line had been initiated back in the 1830s, aldermen had generally rejected requests to run horsecars through the city’s streets,

usually at the behest of politically influential omnibus operators determined to avoid competition. As the potential profits in accommodating the railroad interests became clear, they changed their minds. First, however, they had to beat back proposals that the city itself lay out a unified rail system, to keep fares low and earn profits for the city. Laissez-faire aldermen indignantly denounced public ownership—it would never be able to impose “a system of responsibility that private enterprise alone can arrange and insist upon”—and then got down to the lucrative business of handing out franchises to clamorous (and rivalrous) entrepreneurs.

The turnaround on railroads largely coincided with the accession to power—in the November 1851 elections—of brushman-chairmaker William Tweed and a host of other petty entrepreneurs including a tobacconist, saloonkeeper, stonecutter, butcher, saddler, timber dealer, fishmonger, fruit vendor, and proprietor of a livery stable: men who had watched their “betters” get rich and were determined to get their cut. Working amid the cloud of lobbyists that swarmed each day about City Hall, the Common Council set about earning its nickname of the “Forty Thieves.”

Among other initiatives during their two-year run for the money (1852-53), the magistrates spurned an offer to pay the city fifty thousand dollars for the exclusive right to collect dead animals from the streets and gave the contract instead to one W. B. Reynolds, paying *kirn* sixty-three thousand a year (out of which, a grand jury later found, he made disbursements to aldermen and the city inspector). The Common Councilmen leased city-owned piers at giveaway rents to favorites. They sold off Gansevoort Market, among the most valuable pieces of real estate in the city, for much less than it was worth, allegedly pocketing between forty-five and seventy-five thousand dollars for themselves. Witnesses testified before a grand jury that ferry leases were awarded in return for payoffs. In the case of the Wall Street ferry, the aldermen overrode the mayor’s veto and gave the plum to Jacob Sharp, one of their favorites, for much less than other applicants were willing to pay, then lowered his rental costs still farther the following year. Council members also perfected the art of “ringing the bell”—proposing nuisance ordinances that brought the threatened parties running with payoffs.

Most significant, 1852 brought a deluge of railroad projects, and an obliging council liberally handed out charters—which were to be held in perpetuity—on terms unfavorable to the city. One line up Second Avenue went to a group that included Tweed’s father-in-law; another, up Third, was awarded to a combination that included prominent Democratic politicians. Thus did the council establish—without even minimal planning, much less coordination on a Haussmannesque scale—the transportation system that would dominate the city for decades. In addition, its charters created quasimonopolistic agglomerations of corporate power, like the Third Avenue line (capitalized at over a million dollars), whose impact on the city, including the flagrant corruption of civic politics, would long outlast Tweed and his cohort.

MUNICIPAL POLITICS INDICTED

Many businessmen pragmatically accommodated themselves to this de facto partnership with politicians. For those in a position to outbribe their rivals, the situation had the positive advantage of allowing their money to talk loudest. Councilmen were also useful at ensuring that unwanted things did *not* happen. Whether from principled attachment to laissez-faire dictums or inspired by more tangible inducements, aldermen routinely blocked government actions (housing codes, labor laws, horsecar construction) that might hamper favored entrepreneurs. In 1850, against the backdrop of widespread radical and union agitation, a newly established Gas Consumers Association demanded the Common Council build and operate a municipal gas plant. Hostility to the two old monopolies that divided the business had long been building. The rates of the New York Gas-Light Company (1823), which supplied districts south of Grand Street, and the Manhattan Gas-Light Company (1830), which handled territory north of Grand, were much higher than those charged by counterparts in Philadelphia. Friendly authorities quashed the program for public power, however, and indeed forestalled the chartering of any new competitors—until 1855, when powerful entrepreneurs won establishment of Harlem Gas and Metropolitan Gas. Even then, City Bank’s Moses Taylor, a Manhattan Gas director, proved able to negotiate an amicable agreement with the new outfits, forestalling potentially ruinous competition (and lower gas prices as well).

If particular enterprisers were prepared to treat corruption as a routine cost of doing business, a far broader constituency was enraged by what it considered a more pernicious consequence: higher taxes. The Forty Thieves managed to increase city spending by 70 percent in their two years—including a marked upswing in expenditures for gas and lamps, street cleaning, and the purchase of real estate (up 400 percent)—and taxes had jumped accordingly, up by 54 percent between 1850 and 1853. The Common Council had also raised money by drawing on new techniques of railroad finance to sell revenue anticipation bonds. This practice had been going on since 1843, but where it once covered just 27 percent of the city's expenditures it now (by 1856) paid for 47 percent of a sharply higher outlay, calling into question the security of investments in city bonds.¹

Lost in the outcry of property-owning taxpayers was any awareness that while corruption certainly siphoned off funds, most city money went for street extension and paving, police stations and prisons, and many other items for which the bourgeoisie itself had pushed. Alderman Tweed, responding to critics at the end of his term, noted indignantly that half the appropriations made by the Common Council in 1853 were for mandated items, especially the almshouse and schools. "I ask the people," Tweed went on, "if a city such as ours, daily receiving an immense population of the idle, degenerate, vicious, and good from all parts of the world, could be governed at less expense?"

Reformers worried about more than taxes, however. They were dismayed by what they saw as the Forty Thieves' encouragement of lawlessness and disorder. In the summer of 1852, for instance, the aldermen used their judicial powers to discharge over fifteen hundred of the two thousand men arrested for street fighting and disorderly conduct—many of them loyal party activists—at just the moment when an epidemic of "garotting" (mugging) seemed to be sweeping Manhattan. Reformers were also appalled that council-dominated police officers were taking money to leave underground entrepreneurs alone. This was evident from the throngs of thimble-riggers and three-card monte men who worked the streets openly (and particularly thickly near City Hall) and from the gambling joints on Barclay, the Bowery, and Ann Street (between Broadway and Nassau) that were jammed with volunteer firemen, shoulder-hitters from Tammany Hall around the corner, and gangsters from the Bowery and the Points.

Cordial relations with politicians were key to the gamblers' survival, and indeed the line between the two was often hard to spot. After working for Rynders, John Morrissey went on to a career as a bare-knuckle prizefighter; he took on Yankee Sullivan in an indecisive brawl in 1853, which the umpire gave to Morrissey, and no sooner had he become top dog of the boxing world than he opened his own faro parlor and taproom. Michael Norton, another pugilistic politician, established an entire community of outlaws on the far westerly end of Coney Island (soon known as Norton's Point), which quickly attracted gamblers, sporting men, and others with a distaste for law and order.

If bourgeois New Yorkers were alarmed at losing control of the police—an increasingly critical government agency, given employers' strained dealings with labor unions in the mid-1850s—they were equally dismayed by deficiencies in the fire department. Between 1837 and 1848, notwithstanding the introduction of Croton water, New York suffered twenty-five hundred fires, and some of the worst took place in downtown business wards: the great blaze of 1845, which rivaled that of 1835, destroyed one hundred buildings. Disgusted observers blamed brawling (a la Tweed), the companies' steadfast refusal to introduce steam engines (the first was not adopted until 1857 and was the gift

of a fire insurance company), and, most of all, the councilmen who protected the politically potent firemen.

Environmental reformers joined the indictment of municipal politics. They insisted that inefficiencies in sanitation, and thus the soaring mortality rates, stemmed from aldermanic disbursal of cleaning and scavenging contracts to incompetents or crooks. In 1852 John Griscom denounced as well the failure of council-appointed health wardens to enforce such sanitary laws as existed. Merchants in general increasingly feared (as one said in 1854) that "men will go with reluctance to make money in a city where pestilence or violence renders life unsafe."

The growing power of politicians, moreover, seemed to coincide worrisomely with the growing public presence of immigrants. The St. Patrick's Day parade had been a small and insignificant affair up until 1849, when it suddenly swelled to a reported fifteen hundred marchers, in part because of a feisty newcomer, the Laborers United Benevolent Association.

By 1851 seventeen societies, including other new labor organizations, had formed a Convention of Irish Societies, which reorganized the parade under a grand marshal. By 1853 it had grown big enough to bring city business to a virtual standstill and politically puissant enough so that when St. Patrick's Day paraders tromped into City Hall Park, they were reviewed by the mayor and city officials.

Such acknowledgment grated on nativist nerves, but it was when the Irish decided that same year to march on July 4 as well—staking a claim to American nationalism—that violence erupted. Anti-Catholics had been wrought up already by the arrival in June 1853 of papal nuncio Monsignor Gaetano Bedini, a notorious reactionary who had helped brutally suppress the 1849 republican revolution in Rome. Nativists were convinced his mission was (as Bishop Hughes had boasted) to subjugate the American republic. Tempers were taut, therefore, when the Ancient Order of Hibernians announced it would hold its own Independence Day parade, which would then link up with the official one.

Early on the Fourth, five hundred marchers clad in green scarves and green badges set out from the Hibernians' headquarters, arrayed in eight divisions. Proceeding west on 14th Street toward Eighth Avenue they held aloft a twelve-foot-high banner depicting George Washington shaking hands with Daniel O'Connell. At 10:30 A.M., the Hibernians reached Abingdon Square in Greenwich Village, a community still dominated by native-born artisans and professionals. An altercation with a stagecoach driver annoyed at having his way blocked by Catholics exploded into violence. Led by a notorious nativist gang called the Short Boys, a huge crowd of local nativists, including local volunteer firemen summoned by ringing bells, descended on the marchers, screaming, "Kill the Catholic sons of bitches!" and brandishing knives. A mass of enraged men—Hibernians in green scarves, nativists in red shirts—were swirled in battle when the unabashedly nativist Ninth Ward police arrived and waded in against the Hibernians. Scores of Irish were bloodied, their Washington-O'Connell banner was shredded, and thirty of their number were subsequently indicted for riot.

Street skirmishes became commonplace that fall when evangelical Protestant preachers, most of them obscure artisans and laborers, ventured into Irish neighborhoods spewing incendiary views about the "Scarlet

Whore of Babylon” and the morals of Irish women. Other preachers held forth at the East River shipyard owned by Mayor Jacob Westervelt, where they were hailed by throngs of cheering Protestants and heckled by crowds of Catholics, in assemblages reaching twenty thousand people.

Kleindeutschland too was on the move, as were its enemies. For their 1851 celebration of Pentecost, commemorated in Germany by festivals in the woods, some ten to twelve thousand assembled at City Hall Park, then crossed to Hoboken. The Short Boys showed up and overthrew tables and insulted females until a disciplined contingent of Turners in sharply pressed white uniforms drove them off. When the revelers headed back to the ferry, however, the Short Boys struck again, reinforced by Jersey nativists armed with pistols, swords, clubs, and spike-covered poles. The Turners launched a counterattack, and a sanguinary two-hour battle ensued; at least one was killed and dozens wounded before the military arrived from Jersey City.

The Turners promptly demonstrated their fearlessness by returning to Hoboken for their own Turnfest, a gymnastics jamboree. It became an annual event, one of the most popular in German New York, and from then on Turners marched at the head and tail of almost all Kleindeutschland parades (except religious processions). In addition, the Germans formed *Schiitzenvereine* (shooting clubs) and militia companies. By 1853 there were seventeen hundred German militiamen, 28 percent of the city’s total force; added to the twenty-six hundred Irish militiamen and contingents of French, Scotch, Italians, Portuguese, and Jews, this meant that more than two-thirds of New York’s six thousand uniformed militia were foreign born. The immigrants were establishing their rights to city space; their enclaves would not be ghettos.

REFORM

In this atmosphere not only did Napoleon and Haussmann look good, but some New York elites looked with interest at a direct action model pioneered by their counterparts in San Francisco. In 1849 and 1851 the prominent men of that city had organized a Committee of Vigilance, which issued warnings to criminals, then banished some and hung others. Dissolved in 1853, it was reborn in 1856 as the San Francisco Vigilance Committee, still dominated by leading merchants. It not only hung crooks and shut up gambling houses but fought corruption in city government—by

which it meant wresting control from the dominant Irish Catholic Democratic machine. This had been set in place back in 1849, when David C. Broderick, an old Tammany hand and Gold Rush migrant, had transplanted Manhattan's political methodology, especially its ward-based apparatus, to the West Coast. Not only were the bulk of the vigilantes middle- and upper-class Protestants—either Whigs or nativists—but most of their victims were Catholics.

In New York, though some were tempted by vigilante or authoritarian models, most opted for exclusionary devices. In 1849 a group of nativists founded the Order of the Star Spangled Banner, a secret society with clandestine meetings, rituals, signs, distress calls, and handshakes. In 1853 the group was informally christened “Know-Nothings” by E. Z. C. Judson (Astor riot leader) after their habitual response to questions about their underground operations. The Know-Nothings' aboveground operation, the American Party, aimed to eliminate all foreigners and Catholics from public office, to impose a twenty-one-year residency requirement for naturalization (time enough to reeducate victims of papist and monarchist delusions), to deport foreign paupers and criminals, to require Bible reading in the public schools, to ban the use of foreign languages from schools and public documents, and to break up all military companies “founded on and developing foreign sympathy.”

The nativists won support among respectable New Yorkers too, some of whom had been wondering if the city's newest residents weren't perhaps beyond redemption—so inferior to their predecessors, both morally and physically, as to constitute a separate species. Watching an Irish crew dig the cellar for his new home, George Templeton Strong remarked on the “prehensile paws supplied them by nature with evident reference to the handling of the spade and the wielding of the pickaxe.” The occupants of Union Square town houses and Fifth Avenue mansions were in fact nearly obsessed by the “brutish” or “simian” physiognomy of the Irish, vesting it with a range of political and social meanings: that Paddy was born, not made; that his physical and moral defects were hereditary; that like blacks, Indians, and women, he was inherently unsuited for republican citizenship. Yet despite some mutterings about disfranchising the immigrants, the city bourgeoisie still lacked the inclination to abandon republicanism—or the

power to do so had it wished. Instead it chose to do combat in the political arena.

In 1852 William Dodge, John Harper, Stephen Whitney, and others determined to recapture the municipal ship from the pirates who had boarded and seized it launched not a vigilante group but a City Reform League. By March 1853 Peter Cooper had signed on as President (he would lead the reform movement for the next twenty years) and a host of dignitaries had agreed to serve as vice-presidents—including shipbuilder William Webb, rentier Peter Stuyvesant, Simeon Baldwin (then president of the Merchants' Exchange), banker Moses Taylor, *Times* editor Henry Raymond, and several merchants, like William Aspinwall and Henry Grinnell, whose own methods in winning federal mail subsidies wouldn't have borne close examination. Blasting the use of muscle and corruption, denouncing municipal extravagance, and warning that high taxes would drive businessmen out of the city, they set about the work of reform.

First they changed the charter. The City Reform League prevailed on the legislature to propose, and the electorate to ratify (in June 1853), a drastic reduction in aldermanic power. The Board of Assistant Aldermen was scrapped altogether and replaced by a sixty-man, annually elected Board of Councilmen—on the theory that so many councilmen could not be “bribed but in battalions.” (The penalties for bribery were strengthened, just in case.) This body was given charge of all legislation regarding expenditures—the aldermen being limited to suggesting amendments—and required to award all contracts in excess of \$250 to the lowest bidder at public auctions.

On the law-and-order front, the councilmen were stripped of their right to sit as judges in municipal courts and lost the power to appoint policemen. Control of the force shifted to a Board of Commissioners (mayor, recorder, and city judges). Also in 1853, the police were given permanent tenure during good behavior and ordered into blue uniforms; in 1854, arrests jumped 40 percent.

The new charter also strengthened the mayor somewhat, by giving him a stronger veto that only two-thirds majorities of both legislative chambers could override. But the city's chief magistrate was no Bonaparte. Since 1849 the nine executive departments had been controlled by independently elected heads, not answerable to the mayor, and they, not he, controlled most patronage, in conjunction with the legislature.

The charter secured, the City Reform League turned to the fall 1853 elections and backed those members of the regular parties (mainly Whigs) who agreed to run as reformers. In the nativist atmosphere, the reformers did well, with victory at the polls stemming in large part from a de facto alliance with the resurgent anti-immigrant movement. The Forty Thieves were swept out of office and into obscurity—except for William Tweed, who in 1852, while still an alderman, had run for Congress and won. The reformers were ecstatic; reclaiming the polity from the politicians seemed eminently feasible.

Holding it proved tougher. The new councilmen didn't grant questionable franchises, nor did they interfere with the newly reorganized police department, yet neither did they succeed in holding down spending. Paying for those new policemen and the burgeoning school system helped boost taxes 25 percent higher in 1854 and 1855 than in Tweed's two-year term. The disgusted Reform League repudiated its political progeny.

Worse, their alliance with the nativists, and the temperance forces active at the same time, tarnished their image, giving them a narrow and persecuting taint. Given that by 1855 nearly half of the eighty-nine thousand legal voters in New York City were naturalized immigrants, this boded ill. Their reputation was further sullied by continuing nativist street violence. In June 1854 a sailor named John S. Orr, calling himself the Angel Gabriel, clad himself in a long white gown, flourished a brass trumpet, and led a crowd of a thousand nativists to Brooklyn on Catholic-bashing expeditions. The Irish fought back with clubs and stones, then guns came into play, forcing Brooklyn's mayor to call in the National Guard. Such disorders helped speed Know-Nothingism to total collapse the following year.

In addition, the reform movement split apart in 1854 when a critical mass of the membership, especially old Democrats like Peter Cooper and William Havemeyer, decided that Tammany had come up with a candidate they could live with: a businessman of considerable wealth and a reformer who promised to clean up New York City with Napoleonic efficiency.

“OUR CIVICHERO”

Fernando Wood had commenced his business career in the 1830s, as the owner of a grocery and grogshop near the waterfront, and his political career in 1840, when his immigrant longshoreman patrons sent him to Congress for a term. Returning to New York, Wood had invested his liquor store profits in three small sailing vessels and, by the late 1840s, established himself as a shipping merchant, leasing ships and engaging in the coastal trade with southern markets. A sharp practitioner, he was accused of fraud in 1839; although not convicted, he would be dogged from then on by a (probably deserved) reputation for duplicity. Nevertheless, Wood did well in the Gold Rush trade and parlayed his profits—and the comfortable inheritance of his second wife, Anna Richardson—into a still greater fortune by adroit land speculation. Beginning in 1848 with a substantial upper west side tract, he bought land and built and sold homes, offices, and stores in nearly every ward. (“I never yet went to get a corner lot,” Tweed said later, “that I didn’t find Wood had got in ahead of me.”) These profits in turn were pyramided into investments in banks, railroads and insurance companies, and by the end of the 1850s he was a millionaire.

In 1850 Wood ran for mayor as a “true friend of the Irish” but was beaten back, partly by allegations of business dishonesty: Wood, Philip Hone wrote, “instead of occupying the mayor’s seat, ought to be on the rolls of the State Prison.” But in 1854 he recaptured the Democratic nomination and won, despite hysterical opposition from nativists to the candidate of Rum and Rowdyism. His strongest support came from the working-class wards (particularly the Irish Sixth, where he harvested four thousand more votes than there were voters). His enemies, however— a combination of prohibitionists, Know-Nothings, and Whigs—secured control of the Common Council and many of the critical patronage-dispensing departments.

Until the very day of his inauguration, January 1, 1855, many considered Wood the incarnation of evil, a Cataline with a long and sorry record. Yet immediately on taking office, Wood became the very model of a reforming mayor. He announced his intention to establish frugal government and maintain public order. He commenced a modest crusade against prostitution in lower Broadway and violators of Sunday closing laws. He went on to call for clean streets, new stone municipal docks, effective building codes, sanitary police, market inspectors, metering of an expanded Croton water

system, uptown steam railroads (and uptown development in general), a new City Hall, a full-size Central Park (resisting would-be trimmers), and creation of a great university and a free academy for young women. All in all he championed a thorough reconstitution of the city that would, he said, make New Yorkers proud of their “citizenship in this metropolis” and enable them to “say with Paul of Tarsus, ‘I am a citizen of no mean city.’”

Even beyond this astonishing advocacy of proposals advanced over the years by Griscom, Cooper, and others, Wood announced a determination to *govern*. Just as Louis Napoleon was beginning his top-down reconstruction of Paris, the new mayor declared he would vigorously make use of the powers provided his office by the new charter to bring efficiency and order to New York, and indeed appealed for still greater authority. “I am satisfied,” he proclaimed, “that no good Government can exist in a city like this, containing so many thousands of the turbulent, the vicious, and the indolent, without a Chief Officer with necessary power to see to the faithful execution of the laws.” In the short term, Wood set out to turn the newly reformed police department into a highly centralized and disciplined civic army, connecting all station houses to the chief’s office by telegraph. The *Tribune* was thrilled at the department’s new capability “of being quickly concentrated by the magical telegraph wires on any given part of the city” and pronounced it “a terrible warning to. . . the ruffianism which has so long beset our city.”

The reformers rubbed their eyes, convinced they were dreaming. But no, Wood had been transformed. He even *looked* the part: tall, erect, urbane, with a commanding presence. Strong was amazed that this “man whose former career shews him a scoundrel of special magnitude” had become “our Civic Hero.”

Not everyone was entranced. The more astute reformers noticed that Wood’s antivice crusades were highly selective. His men rounded up streetwalkers but left brothels alone, raided the grubbier gambling dens but not the fashionable establishments, and bypassed Sunday saloonkeepers who voted the right way. Nor did hard core prohibitionists appreciate the deft way he finessed a draconian 1855 temperance law, casting his refusal to enforce it on constitutional rather than proliquor grounds. In addition, his monopolization of patronage, reputed use of strong-arm tactics at the polls, and repeated demands for an increase in his constitutional power (especially

greater control over the police) seemed to some to herald a turn to French-style despotism.

Equally disturbing was his continuing popularity with the immigrant laboring classes. Wood established a “Complaint Book” in which citizens could register charges against crooked or exploiting employers, or obnoxious policemen and public officials. He appointed Irishmen to the police in growing numbers (by 1855, they constituted 27 percent of the force and outnumbered native-born members in heavily Irish wards).

Temperance, but no Maine Law, Pi. Fay's 1884 depiction of the interior of the Gem Saloon, a fashionably rococo establishment that stood on the corner of Broadway and Worth Street. The top-hatted man shaking hands in the center is Mayor Fernando Wood, who opposed adoption of a state prohibition law and subsequently refused to enforce it on constitutional grounds. (The Metropolitan Museum of Art. The Edward W. C. Arnold Collection of New York Prints, Maps and Pictures)

Most alarming of all, when the economy buckled, Wood called for aiding the unemployed with public assistance and public jobs.

In the winter of 1854-55, the great boom faltered badly. A string of commercial failures and a flurry of frauds and defalcations failed to touch off a full-scale depression but did precipitate a recessionary crisis. Factories, shipyards, and the building trades laid off massive numbers of employees. As a cold wave drove the temperature to minus ten Fahrenheit, charities tried to succor the suffering. Soup kitchens set up by rich merchants fed twelve thousand a day—A. T. Stewart opened one in the basement of his Marble Palace—but most relief givers were quickly overwhelmed. The AICP warned in January it had nearly exhausted its treasury helping some fifty thousand needy, and issued what for the laissez-faire organization was a humiliating plea to the Municipal Almshouse Department to increase public spending on outdoor relief.

Meanwhile, thousands were listening to more radical solutions to their plight. Rallies in City Hall Park and elsewhere around the city hailed speakers who denounced unemployment, high prices and rents, and speculators in land and bread. Mass meetings passed resolutions calling on the city to “secure to us our right to labor” by providing jobs on public works, including an immediate start to construction on the Central Park reservoir “to furnish employment to those who do not covet the degradation of beggary.” Demonstrators called for an urban homestead act, asking the Common Council to distribute common lands to workers and appropriate half a million dollars with which to build “inalienable homes.” They also wanted evictions of the destitute stopped, with landlords to be indemnified out of public funds, and a three-million-dollar loan fund established to transport idled workers west. These were hardly extrava-

gant demands, one shoemaker noted, at a time when “Louis Napoleon had given four millions and a half to build houses for the workingmen.”

The unemployed rebuffed the wealthy’s offer of charity and insisted on public aid as a citizen’s right. “Need pounds with heavy fists on the door of public attention,” thundered Wilhelm Weitling, “which has offered only beggars-soup in response. Beggars-soup! Beggars-soup!! In America it has already come to that.”

The *Herald* recoiled from demonstrations by “unwashed and greasy workmen” and attacked their presuppositions. It was a fallacy, the paper argued, that it was the business of the state to care for the unemployed. “This principle, which is of French origin, has been widely disseminated among the operative classes by a set of political imposters.” It was absurd; it flew in the face of modern science: “To render any class or set of men responsible for the existing state of things is obviously to ignore the first principles of political economy.”

Labor spokesman William West countered such laissez-faire objections from the standpoint of a well-thought-out, alternative moral economy. It

was obvious that “private capital is insufficient to satisfy the demands of labor,” West said in laying a mass meeting’s proposals before the Common Council. “Unless you, therefore, substitute the public for private capital, in the employment of these thousands of compulsorily idle workmen, it must be apparent that the men cannot live except upon charity (which they will not ask and are very reluctant to receive) or by theft (which is their last alternative).”

Reformer Peter Cooper agreed, and in an open letter urged that the city either provide land or put men to work quarrying marble for the construction of new docks and piers. Even the *Times* came out cautiously for public works, while denouncing demonstrators as a “miscellaneous crowd of alien chartists, communists and agrarians.” But it was Mayor Wood who spoke most boldly of all, in his January 1855 inaugural during the height of the panic winter. “Do not let us be ungrateful as well as inhuman,” said the mayor, who supported Cooper’s dock-work plan. “Do not let it be said that labor, which produces every thing, gets nothing and dies of hunger in our midst, while capital, which produces nothing, gets every thing, and pampers in luxury and plenty.”

These opposing worldviews, poised for an all-out clash, never arrived at a confrontation. The economy lurched upward again. Unions returned to narrowly focused issues. Some radicals, discouraged, moved elsewhere: Joseph Weydemeyer headed west to agitate in 1856.

Wood pressed ahead with his reform program. When opponents in the state legislature threatened to curtail his power, particularly over the police, Wood was supported by two mass meetings of the wealthy and powerful including William Havemeyer, James Watson Webb, Commodore Vanderbilt, Horace Greeley, and City Reform League president Peter Cooper. Even the *Times*, more critical than most, remained beguiled by Wood’s energetic course: “Most of the objects of a city administration are far better carried out,” it declared in best Napoleonic style, “by a vigorous and arbitrary police system than by a representative assembly.” As his term ran out, a hundred wealthy bankers and merchants asked Wood to run again in 1856. Which he did, defeating his Know-Nothing opponent with heavy support from the East Side’s German and Irish precincts, helping send that party into steep and rapid decline. Taking no chances, Wood had also released some patrolmen from normal duties to help with his campaign and

furloughed others on election day so that friendly hoodlums had a free hand menacing opposition voters. Despite some outcries, these lapses were not enough to alienate the bulk of the respectable classes, most of whom were overjoyed that Wood seemed capable of maintaining an electoral mandate from the poor at so little cost to the rich.

STATE OVER CITY

Balked in New York City, die-hard nativists, temperancites, and good-government men turned to Albany, where they staged not a Napoleonic coup but something almost as effective.

Upstate New York was a much more congenial stamping ground for such reformers. Not only were nativist and temperance forces far stronger in the countryside, but widespread rural animosity toward the burgeoning metropolis had created a host of potential allies. Upstaters denounced what seemed to them an urban trampling of the rights of man. On the one hand there was the expanding power of New York's monied classes and the "subtle invading power of [its] gigantic corporations," which actively threatened Christian and republican America. On the other there was the deplorable barbarism of the poor and the power of the political demagogues. Saving the republic required that the metropolis be brought under control of the good people of the state. As one upstate legislator declared in 1853, "the time has come when it is to be settled whether New York City is an empire—a community by itself."

The vehicle for achieving an upstate-downstate alliance was a new political formation, the Republican Party. A northern phenomenon, it came together in New York State in September 1855 when a mix of Seward Whigs, Free Soil Democrats, and disaffected Know-Nothings joined hands on a variety of national issues, chiefly resistance to the western expansion of southern slavery. In the fall of 1856 state voters elected a Republican governor, John Alsop King (son of Rufus King and brother of banker James Gore King), and a Republican majority in the Assembly. In short order, Republicans in Albany set out to wrest New York City from the Democrats. Some were driven by dreams of harvesting its rich fields of patronage and building up their new organization. Others were reformers determined to implement their program from the State level. All were convinced that as

masters of the state they had the legal authority to become masters of the city.

A series of recent decisions by the New York Court of Appeals had put paid to Manhattan's lingering claims to special status as a municipal corporation, with independent powers derived from colonial-era charters. City property, the judges ruled, was held entirely in trust for the public. The corporation as such had no inherent authority over even the city's streets, and the state legislature could interfere at will in its affairs. The government of New York City—like that of even the smallest upstate village—existed only to the extent the state granted it governmental authority.

In ruling thus, the judges completed a legal revolution, begun back in the 1780s, that distinguished between public and private corporations. The two had long been considered kin in both having rights—rooted in charters—which in varying degree insulated them from central authorities. Now only private corporations (as fictive persons) were deemed to have rights against the state and immunities from legislative intervention. Municipal “corporations,” their name to the contrary notwithstanding, were declared mere agencies of the state, with no legal autonomy whatever. In 1857 the legislature underscored its awareness of the new legal situation by declaring itself free to intervene at will in the affairs of the municipality—and promptly proceeding to do so.

The legislature changed the city charter yet again—although this time, unlike earlier revisions, it was not submitted to the people of New York for their approval. Again, the Common Council was stripped of power, this time over finances, with authority to administer the city's real estate, audit its accounts, oversee its disbursements, and collect its taxes being transferred to the comptroller. Again, ostensibly, the mayoralty was strengthened, this time by being given the power to appoint and remove most heads of departments, with consent of the aldermen. But in fact the legislature took dead aim at the office and its current occupant. Mayor Wood was required to stand for reelection in December 1857—his term slashed in half while the comptroller, a Republican, was allowed to finish out his second year. Then the legislature erected a series of state agencies to administer city affairs that were utterly free from control by municipal representatives (and the immigrant masses to whom they owed allegiance). When added to the already existing state boards that oversaw the

almshouse, the asylums, and the Croton Aqueduct, these new institutions gave Albany control over three-fourths of New York City's budget.

The new agencies spanned a wide spectrum of public affairs. The New York Harbor Commission was given control of the port, including authority to block further encroachments into the rivers by defining a permanent bulkhead line. Command of the building of the city's new park, together with its enormous patronage opportunities, was handed over to a Board of Commissioners of the Central Park, a self-perpetuating entity appointed by the state legislature. Another body was given the right to administer construction of a proposed new City Hall.

At the urging of environmentalists, the legislators expanded the purview of the Croton Aqueduct Department beyond its existing responsibility for water supply and sewerage to include street pavements, pumps, and privy vaults, but in leaving intact the Common Council's jurisdiction over public works, they thwarted the department's ability to impose systemic reforms. In Brooklyn, however, they created a Board of Sewer Commissioners and empowered it "to devise and carry into effect a plan of drainage and sewerage for the whole city, upon a regular system," which it did. In addition, a local Board of Water Commissioners oversaw establishment during 1856-58 of a system that tapped streams and ponds on the southern shore of Long Island (leased or purchased by the City of Brooklyn), ran the water through a brick conduit (along today's Conduit Avenue), and pumped it up the glacial moraine (at today's Force Tube Avenue) into Ridgewood Reservoir (in today's Highland Park) from which it flowed down to the city in iron mains. A secondary distributing reservoir atop the higher Prospect Hill (within today's Mount Prospect Park near Flatbush Avenue and Eastern Parkway) supplied those parts of Brooklyn above the level of Ridgewood.

State Republicans were able to make as much headway as they did because state Democrats were divided into contending factions, and those who feared Wood's growing power—he was being talked of as the next Democratic candidate for governor—were prepared to back Republican wing-clippers. In the city itself, many Tammanyites, fearing that Wood's ascension would help immigrants expand their base in the machine, considered him a greater threat than the Republicans, who were weak in the metropolis itself.

Among Wood's Democratic opponents was William Tweed, who had returned from two unhappy and undistinguished years in the House of Representatives, a largely forgotten man. Determined to bid for power by striking at the existing leader, Tweed was given his chance by the Republicans, who in their eagerness to curb metropolitan power unwittingly provided him with a base of operations. In yet another reform, legislators enhanced the power of the New York County Board of Supervisors, created as a check on city government, by giving it authority to audit county expenditures, supervise public works, oversee taxation and the various city departments, and appoint the inspectors of elections. In an effort to underline the purity of their intentions, they incautiously made the twelve-person board (six elected, six appointed by the mayor) bipartisan. Among those who climbed on board in 1857 was William Tweed. Within a year he had formed a "ring," a combination with other equally unscrupulous supervisors, which began levying a systematic 15 percent tribute on all vendors who furnished the county with supplies. Tweed also used his new status to dramatically enhance his standing among ward leaders and to promote friends to office, including, by 1858, George Barnard (recorder), Peter Sweeny (district attorney), and Richard Connolly (county clerk).

In the meantime, Republican reformers, unaware of what they had spawned, decided to press on with their campaign against the miscreant metropolis. Utterly heedless of the possible impact on even sympathetic Democrats, they proceeded to pass two acts, on April 15 and 16, 1857, that drew a moral line and provided the muscle to make the city toe it.

Their new Liquor Excise Law was an attempt to circumvent judicial decisions that had stymied their 1855 effort at straight-out prohibition of alcohol. The act required saloonkeepers to obtain a license. Applicants had to submit, to a Board of Excise Commissioners, vouchers attesting to their good moral character signed by thirty resident freeholders (those with absolute ownership of an estate), post a bond, and provide boarding facilities and stables. The *Herald* surmised such requirements would force out of business thirteen of every fourteen saloons in the city, and probably ninety-nine of every hundred in the lower wards where few freeholders lived. The law also banned the sale of liquor on Sunday or election days, further foreclosing working-class access to spirits, and—in a quasi-feminist intervention into hitherto sacrosanct family life—provided that on a wife's

complaint, a husband could be put on a list of known drunkards to be distributed to all liquor dealers.

Republicans, perfectly aware that if enforcement was left to New York's current municipal leadership (i.e., Mayor Wood) it would swiftly become a dead letter, passed a complementary piece of legislation, the Metropolitan Police Act, which shifted effective control of the force from the (Democratic) mayor to a Metropolitan Police Commission controlled by (chiefly Republican) state appointees. The new law also dropped the requirement that officers serve in the ward where they resided, seeking (as had London) to sever the connections between cops and communities. The new commissioners—whose domain included Kings, Richmond, and Westchester counties as well as Manhattan—were given tremendous powers. Not only had they authority to enforce the Sunday closing laws, but they had complete control over the election machinery of New York and Brooklyn.

This legislative one-two punch produced instant furor. In May 1857 a Democratic mass meeting in City Hall Park attacked the Republican “principle of governing by boards” as despotic. Just the right word, thought the *Irish News*, which denounced the Republican laws as “specimens of despotic legislation which Louis Napoleon, with his legion of spies, a garroted press and an army of mercenary bayonets at his back, would hardly attempt in Paris.”

Democrats were not alone in their outrage. *Harper's* said the laws resembled those imposed “on revolted districts or conquered places.” The *Herald* evoked city-versus-country sentiments when it branded the upstate legislators as “archaeological curiosities” who “daren't trust themselves alone with a loaded pistol, or a gin bottle, or a pretty girl. . . without a good stout law to protect them and keep them in bounds.”

But it was Mayor Wood who emerged as municipal champion. Blasting the excise law as “another of the encroachments upon individual rights for which the dominant party are so much distinguished,” he called for resistance to an insolent state centralism that would make of New York a “subjugated city” and plunge its citizens into a “feeble state of vassalage.” Claiming the laws violated home rule rights guaranteed by the Dongan and Montgomerie charters, Wood ordered all policemen to reject the authority of the new metropolitan commissioners, at least while he instituted legal

proceedings to get the law declared unconstitutional. Those who defied him he fired.

To bolster his position, Wood got the Common Council to establish a separate Municipal Police force, composed of all pre-1857 officers, under direct mayoral control. There were now *two* official departments, and between late May and mid June 1857 policemen of the various wards were forced to choose up sides. In the end about eight hundred cops and fifteen captains stayed with Wood's Municipals and three hundred cops and seven captains opted for the Metropolitans (splitting more or less on ethnic lines). Each of the rival forces then proceeded to fill up its vacancies (again ethnically, the Mets tending to appoint Anglo-Americans, the Munis leaning toward the foreign born).

Chaos ensued. Criminals had a high old time. Arrested by one force, they were rescued by the other. Rival cops tussled over possession of station houses. The opera bouffe climax came in mid-June when Metropolitan police captain George W. Walling attempted to deliver a warrant for the mayor's arrest, only to be tossed out by a group of Municipals. Armed with a second warrant, a much larger force of Metropolitans marched against City Hall. Awaiting them were a massed body of Municipals, supplemented by a large crowd (characterized by George Templeton Strong as a "miscellaneous assortment of suckers, soaplocks, Irishmen, and plug uglies officiating in a guerrilla capacity"). Together, the mayor's supporters began clubbing and punching the outnumbered Metropolitans away from the seat of government. "The scene was a terrible one," a *Times* reporter wrote; "blows upon naked heads fell thick and fast, and men rolled helpless down the steps, to be leaped upon and beaten till life seemed extinct." The Metropolitans gained the day after the Seventh Regiment came to its rescue, and the warrant was served on Wood. This setback for the mayor was followed by another: on July 2 the Court of Appeals ruled in favor of the state law. Wood knuckled under and disbanded the Municipals late in the afternoon of July 3, leaving the Metropolitans in possession of the field.

The ultrareformers had triumphed over Wood, but it proved to be a shaky victory. Exactly how shaky became clear the very next day.

July 4, 1857, promised, like most Independence Days, to be given over to massive parades, democratic rhetoric, hard drinking, and street brawls. The unenviable task of maintaining a minimal degree of order and decorum

was now to be shouldered entirely by the Metropolitans. Their ranks were notably untested. The victorious department refused to hire those who had backed the losing side, choosing instead to swear in a host of special officers, with little or no experience, to flesh out their ranks. All in all, no more than a hundred had had even a month's experience.

When a small party of Mets patrolling the Chatham Square area in the predawn hours suddenly found themselves under attack by a crowd of young men and boys, they broke and ran. One sought shelter in the saloon headquarters, at 40 Bowery, of the Bowery Boys, a nativist gang, who succeeded in repelling the assailants. At this point, the Dead Rabbits—the Irish Sixth Ward gang whose members were known as ardent Wood supporters—opened up another front on Bayard Street, between Mulberry and Elizabeth; together with the neighborhood's Irish inhabitants, they attacked a group of thirty Metropolitans. Once again, the on-the-job trainees had to be rescued by a phalanx of two hundred Bowery Boys. While the policemen straggled away from the scene, the gangs and their supporters escalated their encounter. Barricades went up, assembled out of carts, barrels, lumber; brickbats flew (women, it was said, gathered and broke up stones and carried them to their menfolk on the front lines or atop the tenement roofs); then the guns came out. The battle raged for hours, drawing thousands to the scene, and was ended only by the exhaustion of the participants. Twelve died outright or soon thereafter, and thirty-seven were injured. It was the worst riot since Astor Place back in 1849.

The next day, Sunday, violence flared again, but this time it was put down by the

The Dead Rabbits barricade on Bayard Street, from *Frank Leslie's Illustrated Newspaper*, July 18, 1857. (© Collection of The New-York Historical Society)

National Guard (with Metropolitans placed at the head of the regiments). The streets were swept clean. The Sunday closing laws were enforced.

On Thursday, July 9, fifteen hundred turned out for a meeting at Hamilton Square that had been called to consider “effecting a division of the state, by organizing a new one from the five southern counties.” The mayor showed up but told the crowd it must obey the legislature’s laws. (As a potential gubernatorial candidate, secession of city from state was not, at this point, in his interest.) Passions lowered to a simmer.

They boiled over again the following Sunday, July 12, this time in the heart of Kleindeutschland, at Avenue A and 4th Street. Several thousand Germans taunted the Metropolitans and met their efforts to close saloons and clear streets with clubs and brickbats. Reinforcements—three regiments and most of the police force, massed five abreast—drove them back; a blacksmith was killed in the process. The next day a funeral procession, ten thousand strong, marched up Broadway under a banner reading OFFER DER METROPOLITAN-POUZEI (victim of the Metropolitan Police), accompanied by a dirge-playing band. A mass meeting denounced the tyrannical laws.

Order was restored. But no one, least of all the police, imagined that popular hatred of the new laws, and their defenders, had been other than driven underground for the moment. The superintendent of the Metropolitans recommended that ten officers in each ward be armed with revolvers—"for the suppression of riots." Ominously, the state decided to build a new armory at 35th Street and Seventh Avenue, more than a mile closer to City Hall (and the Sixth Ward) than the existing one.

It seemed as if long-accumulating tensions were coming to a head, as if a cultural crossroads had been reached. On one side was the growing immigrant working class, with its own culture, its own politics. On the other side was a wealthy and anxious bourgeoisie, trying not very successfully to impose its vision of domestic and civic relations on those below.

For a time, it had looked as if Mayor Wood might be able to mediate this clash, but the upstate victory of the ultrareformers had put him in an impossible position. Either he enforced the liquor and police laws and lost his immigrant constituency, or he rejected reform and lost the fragile support of the rich and powerful. Faced with that choice he opted to secure his political base. In this he succeeded; in October, Wood, an idol to Democratic voters, gained Tammany's renomination for the mayoral race. But the summer's events had cost him dearly. Many reformers now turned away from him. Still, Wood might have been able to salvage the situation; he retained important upper-class support. But at just this point, the city was rocked by an economic earthquake that made glaringly apparent just how deep the fissures in civic life had become, just how wide a gap now yawned between the contending cultures, and just how unbridgeable they were by even the most heroic of political efforts.

The Panic of 1857

At the end of August 1857, little more than a month after the Dead Rabbits riot, the New York branch of the Ohio Life Insurance and Trust Company suddenly closed its doors. It soon transpired that the putatively rock-solid institution had been deftly looted by its manager, Edwin C. Ludlow. Worse, it had made loans with abandon to speculators playing the stock market—and done some gambling itself in railroad stocks, which had been gliding steadily downward. Since the Crimean War had ended the previous year—restoring Western Europe’s access to Russian grain—demand for American wheat had dropped steadily, shipments east had tapered off considerably, and railroad earnings (and stock prices) had dipped disappointingly. Farmers and merchants too had been squeezed; by the spring of 1857 metropolitan merchants found it difficult to collect on midwestern debts.

In August, unfortunately for Ohio Life, European farmers harvested a bumper crop, and the sudden glut threatened to further depress world farm prices. Worried midwestern businessmen had begun telegraphing New York banks, including Ohio Life, asking for the return of their surplus funds (which they had, as was customary, parked in the metropolis to garner high interest rates). Ohio Life, courtesy of Mr. Ludlow, was caught short, and the firm failed, leaving behind seven million dollars in debts. But Ohio Life had not been the only New York financial institution shoveling out shakily secured loans—indebtedness had reached an all-time high earlier in August—and many Manhattan banks had loaned funds to Ohio Life. Now, finding themselves suddenly and dangerously overextended, the banks panicked. Terrified that soon other institutions (or even their own) might be proved rotten, they demanded payment of all matured loans from all their debtors. In the ensuing fiscal *sauve quipeut*, “stony-hearted directors and inflexible cashiers” refused (as George Templeton Strong noted) to make loans on promissory notes or bills of exchange, despite pitiful pleading from straitened merchants, and went so far as to demand certified checks from even the bluest of their blue chip customers. The banks thus jammed on the credit brakes at precisely the moment businessmen were in direst need of

accommodation. The financial institutions, especially banks newly hatched during the boom, saved themselves but forced merchants into bankruptcy.

Panic spread quickly. “The Foundations of financial confidence appear to have been knocked from under the Stock and Money markets,” worried the *Times*. In the days that followed, hundreds of other firms failed as well, and panicky brokers were observed pummeling one another with their fists on the floor of the Stock Exchange. Each day brought new lists of failures or suspensions, with each misfortune posted in large type on the bulletin boards in front of newspaper offices, attracting crowds. Handbills with the latest lists of broken banks and suspect banknotes were cried about in the streets by boys at “a penny a piece.”

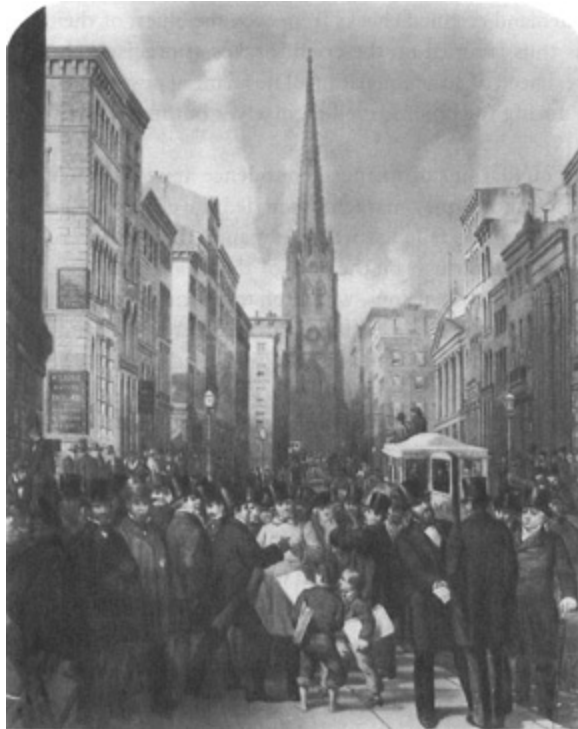

Depositors lined up to withdraw gold. By mid-September the specie reserves of New York banks had shrunk from \$94.5 million (in August) to \$75.8 million. Desperate to augment their holdings, they demanded payment from stockbrokers of call loans, exacerbating the crisis at the Exchange, and pressed small banks in the interior for payment, generating a widening pool of failures. New York bankers hoped a forthcoming gold shipment from California would relieve the pressure, but just at the moment when everyone was scrambling for specie, and a heavy payment was due English creditors, word came that the steamer *Central America* had gone down on September 12 in a terrible hurricane, with the loss of four hundred passengers and crew, and \$1.6 million worth of precious metal. The catastrophe precipitated a new wave of failures.

Now the banking system itself began to buckle. Philadelphia’s institutions suspended—refused to honor their legal commitment to redeem paper for gold—and banks across the nation were forced to follow suit, with legislators duly authorizing their actions. As credit dried up, manufacturing and transport wound down, construction ceased, produce was neither demanded nor shipped, and prices of western staples and southern cotton plummeted. By the first week of October, the nation’s trade was at a standstill. Only New York banks held out, and they were under siege, with tens of thousands of noteholders thronging Wall Street demanding redemption. “We seem foundering,” Strong wrote on October 10. “People’s faces in Wall Street look fearfully gaunt and desperate.”

The “excitement today is fearfull,” Brown Brothers officials advised their London partners on October 13. “Some banks have stopped and we

don't know whether the balance can hold out." Broadway omnibuses were packed with people trying to get downtown. By three P.M. eighteen banks had suspended specie payments, and crowds milled from Water to Broadway, numb with fear and disbelief. Prices plunged on the stock market as investors dumped thousands of shares in a vain race to stay ahead of the avalanche. As sell orders were telegraphed to exchanges elsewhere, the crisis spread like a "malignant epidemic" across the country. Soon almost half the brokers on Wall Street, including Jacob Little, were wiped out.

The "bursting of bubbles in New York," the *Chicago Tribune* had soothed at first, "need not alarm anybody in the West," for regional prosperity rested on solid foundations. But as the panic radiated outward from the metropolitan center, howls were heard

Wall Street, Half Past 2 O'clock, October 13, 1857, by James H. Cafferty and Charles G. Rosenberg. Among the nervous bankers and brokers gathered outside the Merchants Exchange are Cornelius Vanderbilt, on the far right with a walking stick, and Jacob Little, in the light coat, center. around the country. The *New Orleans Crescent* railed against New York —“the centre of reckless speculation, unflinching fraud and downright robbery”—the city whose “rotten bankruptcies” were “permeating and injuring almost every solvent community in the Union.” The impact proved far greater than that, however.

The panic soon reached London and Paris, affecting more than a third of the stocks traded on Lombard Street and the Bourse. In Britain, only Bank of England intervention held the line. Modern communications sped the panic along to northern Germany, then Scandinavia, leaving a trail of bankruptcies and unemployment. From Europe, the crisis hopscotched back across the Atlantic to South America. Though the ensuing depression had many causes, New Yorkers could (had they wished) have taken a perverse pride in having managed to trigger a crisis of the entire world capitalist system. Karl Marx, then ensconced in the British Museum writing the *Grundrisse*, forerunner to *Das Kapital*, was ecstatic. To Friedrich Engels he wrote: “Despite my financial distress, I have not felt so cozy since 1848.” Engels’s response was similarly gleeful: “The general aspect of the Exchange here was most delicious in the past week. The fellows grow black in the face with rage at my suddenly rising good spirits.”

“APPALLING PICTURE OF SOCIAL WRETCHEDNESS”

Spirits recovered rapidly on Wall Street, however, as suspension of specie payments, in freeing banks from the pressure of their own creditors, gave them time to bolster their reserves. This they did with dispatch, and by December 14 New York had gone back on a hard money standard. Several financiers had meanwhile seized the opportunity to profit from the failure of others: Moses Taylor, president of City Bank, gobbled up railroad stocks and the city’s largest gas company; Commodore Vanderbilt began to move in on financially troubled railroads, starting with the New York and Harlem, a course that within a decade would make him master of the mighty New York Central; and his partner-to-be Leonard Jerome became a millionaire by the simple expedient of selling short during the crisis.

For everyone else in New York, however, the recession was just getting under way. By December 985 merchants had failed, with losses totaling \$120,000,000, and the shock waves from their collapse had toppled many other kinds of enterprises.

J. A. Westervelt and Company defaulted; one of the city's largest shipbuilding firms, it was headed by a former mayor. Maritime construction collapsed in general, laying off between two-thirds and three-quarters of the city's shipbuilders. The clipper ship industry, already weakened by tremendous competition from railroads and steamers, would never recover from the panic, and the city's merchant marine, which lost federal subsidies in 1858, went into steady decline, losing much of its mail, passenger, and freight traffic to British rivals within a few years.

The New York and Erie Rail Road was forced into receivership, halting work on its Jersey City terminal. Foundries laid off hundreds of mechanics. Four-fifths of the city's coopers lost their jobs. Textiles were badly hurt: the giant Hanford and Lewis collapsed, Brooks Brothers let go a thousand workers; the mantilla and cloak industry collectively laid off two thousand more. Garment workers who retained their jobs found their wages cut from \$1.25 to eighty-five cents a day. Retailers suffered accordingly. "Almost every shop has its placards," said Strong "announcing a great sacrifice, vast reduction of prices, sales at less than cost," and, as in 1837, the stock of bankrupt tradesmen was snapped up by more fortunate merchants. Even "Chinamen who peddle cigars" and Italian "organ grinders" were hard hit, noted Bryant's *Post*.

The communications world was pummeled. *Putnam's Magazine* went under, and Putnam's publishing house nearly followed, but Washington Irving helped rescue it by giving Putnam the plates for his Collected Edition. The printers' union lost two-thirds of its members by 1858; female lithographers were virtually wiped out. Cyrus Field's paper business suspended, and only his neighbor Peter Cooper kept him afloat.

The building boom halted abruptly, leaving even Fifth Avenue mansions half completed and masses of construction laborers out of work. Merchant princes cut costs by firing servants in droves. Seagoing black cooks and stewards found themselves drydocked in the Coloured Sailors Home—its proprietor wrote—given "the great revulsion in the commercial affairs."

By September 1857 estimates of New York unemployment ran as high as forty thousand. By late October *Hunt's Merchant Magazine* calculated the figure in Manhattan and Brooklyn had risen to a hundred thousand. As word on local conditions reached Europe, immigration damped down from 460,474 in 1854 to 123,126 in 1858.

Unions proved powerless to halt or slow the devastation. Indeed most laboring organizations broke up altogether, and trade union activity virtually ceased. Out-of-work mechanics pawned their tools; women their household goods, with one paper noting that “many a worthy home this winter will be half-stripped of the cherished things on which the good wife had prided herself.” Army recruiters were besieged by unemployed men. Women had no such option, though their need was greater—the contraction having cut female employment by almost half, versus 20 percent for males. At one point in midpanic, an advertisement ran for girls willing to work in the West, and within a week, over a thousand applied. Other “opportunities” lay closer to home: Dr. William Sanger estimated that the recession drove perhaps a thousand women to street whoring, and the numbers of women in prison rose accordingly.

Joblessness meant homelessness: adamant landlords turned out those who didn’t pay their rents. The AICP estimated that during three severe winter months of 1857-58 forty-one thousand were forced to seek shelter in police stations. Thousands more were forced out of respectable lodgings into crowded tenement apartments, and slum conditions surged. Industrial Home Owners Society Number One foundered in the hard times, as did many of the cooperatives, caught between soaring interest rates and assorted swindlers, and many participants lost their life savings.

One thing that did *not* collapse was the price of food, as the breakdown of the credit system prevented eastward shipments of western grain. Standing amid the economic ruins, even the AICP’s Hartley was forced to admit that New York “presented a more appalling picture of social wretchedness than was probably ever witnessed on this side of the Atlantic” and that “we were now brought to realize something of the distress which, at times, has often been experienced in European cities.”

“PAPER BUBBLES OF ALL DESCRIPTIONS”

Analyses of the crisis varied. James Waddell Alexander, pastor of New York’s largest Presbyterian church, announced that the panic was God’s work. Many Wall Streeters agreed and hied to their churches to pray for relief. By mid-winter, merchants and clerks were jamming lunch-hour prayer meetings at the local John Street Methodist Church. *The Journal of Commerce* encouraged more readers to participate: “Steal awhile away from

Wall Street / and every worldly care, / And spend an hour about midday / in humble, hopeful prayer.” By February 1858 the noonday prayer meetings were attracting huge crowds. Soon a full-scale revival was in progress, an urban camp meeting in which bookkeepers and bankers, their wives, and their children huddled together and sang the old hymns, trying to create an island of stability amid the economic storm.

Horace Greeley adopted a structural explanation, though lacing his economic analysis with a dose of moralism, and the *Tribune* editor’s listing of presumed causes is all the more impressive for having been issued in the summer of 1857, several weeks before the collapse. One of the country’s biggest problems, Greeley argued, was its excess of imports over exports, an imbalance he believed had been fueled by the buying binge of luxury-mad New Yorkers (and other Americans), who expended millions “in fine homes and gaudy furniture” and “hundreds of thousands in the silly rivalries of fashionable parvenus in silks, laces, diamonds.” These purchases had been made possible, Greeley further suggested, by the booming sale of railroad securities and the tremendous levels of speculation in stocks and real estate (“government spoils, public defaulters, paper bubbles of all descriptions”).

The ill effects of this adverse balance of payments, the fiscally astute James Gordon Bennett noted, had been staved off by exporting California gold and importing European capital. But this precarious equilibrium had begun to wobble in the mid-1850s, when Europeans had begun to cut back sharply on investment in the midwestern railroad boom. Capital transfers to the United States dropped from fifty-six million dollars in 1853 to twelve million dollars in 1856. Partly this was in intelligent response to signs of an overheated American economy; the Barings started to liquidate their holdings after the 1854 mini-crisis, and British funds shuttled into less speculative, often more remunerative English securities. The money was also needed at home for imperial expenses: the Crimean War, campaigns in China and Persia, and the suppression of the Indian Mutiny of 1857. The selloff helped drive down the price of shares on the New York Exchange, which in turn weakened the American banking system by reducing the value of assets supporting it. Bennett feared that the drying up of European capital might force the railroads into bankruptcy, then drag down the poorly capitalized banks. “What can be the end of all this,” he wrote before the

crisis, “but another general collapse like that of 1837, only upon a much grander scale? The same premonitory symptoms that prevailed in 1835-6 prevail in 1857 in a tenfold degree.”

Bennett, Greeley, and many others put particular emphasis on the overbuilding of the railroad system. The expansion had been at the core of prosperity but the free-for-all way the job was done undermined that prosperity. Railroad company promoters issued vast amounts of watered stock, way beyond what actual assets or dividends could support. Legislatures were pressured (or bribed) into granting charters, buying bonds, and donating land to underwrite the construction of unnecessary and overlapping lines. Promoters formed construction companies and awarded themselves contracts, siphoning off profits.

The superheated expansion—pointed out J. S. Gibbons in his 1859 postmortem, *The Banks of New-York, Their Dealers, the Clearing House, and the Panic of 1857*—had been underwritten by a too liberal granting of credit, engineered by the new banks and the booming Stock Exchange. Between 1851 and 1853 alone, twenty-seven new banks had been established, most of whose aggregate capital of over sixteen million dollars was fictitious book debt. Nevertheless, the banks attracted new deposits, upon which they issued additional credit, until by August 1857 over forty million dollars were out in loans, a good two-thirds of which Gibbons deemed ill advised.

Easy money encouraged speculation: as the boom wore on, greater profits were to be won by financing, promoting, and speculating in railroads than by building them. “All confidence is lost, for the present, in the solvency of our merchant-princes—and with good reason,” wrote Strong, as “it is probable that every one of them has been operating and gambling in stocks and railroad bonds.” Speculation spilled easily into manipulation; men like Jacob Little made fortunes in short selling, arranging rumors to drive stock prices down, and then clean up. (Bennett’s warnings were in part ignored because he was associated with Leonard Jerome, who, as a bear, stood to benefit if stock prices were driven down by gloomy prognosticators.) From manipulation to straightout corruption was but a short and easy step. Editor Freeman Hunt grew convinced that it was now necessary “to deal with every man and woman, so far as business is concerned, as if they were rogues.”

WOOD REDUX

New Yorkers disagreed on how to respond to the crisis. On October 21 a thoroughly alarmed *New York Times* wondered if perhaps the metropolis needed a civic hero to rescue it—a Louis Napoleon who would put the unemployed to work rebuilding the city into a second Paris. The very next day, Mayor Fernando Wood, with at least one eye on the upcoming elections, volunteered for the role, proposing to the Common Council that the city both accelerate existing projects and launch new ones. Specifically, he urged the municipal government to build and grade streets, construct engine houses and police stations, repair docks, construct a new reservoir, forge ahead swiftly on the new Central Park, and buy fifty thousand barrels of flour, and a similar amount of cornmeal and potatoes, to be given to laborers on the public works in lieu of money. The cost of this crash program would be covered by issuing long-term 7 percent bonds, redeemable in fifty years.

To mobilize the upper classes behind this agenda, Wood argued that it was in their self-interest. Only swift action could prevent another 1837 riot or 1848 Paris-style upheaval. “Give no man excuse for violence or depredation upon property, that he must have bread for his children,” Wood counseled. “If the present want of employment continues many must rely upon either public or private charity, and I fear that not a few will resort to violence and force rather than submit to either of these precarious and humiliating dependences.”

At the same time, Wood appealed to the affluent’s sense of responsibility, in language (echoing his 1854 remarks) that was also calculated to demonstrate his sympathy for the poor. “In the days of general depression,” Wood argued, workers “are the first to feel the change, without the means to avoid or endure reverses. Truly it may be said that in New York those who produce everything get nothing, and those who produce nothing get everything.” “Is it not our duty,” Wood asked, “to provide some way to afford relief?”

Some merchants supported his program, if not his rhetoric. John Dix, a prominent railroad financier who knew where of he spoke, acknowledged that men of his class had engaged in frenetic speculation, were partly to blame for the panic, and had a responsibility to help their innocent victims:

though he condemned the mayor for inflammatory language that might “excite the laborer against the capitalist, the rich against the poor.”

Others totally rejected the proposal. The *Evening Post* castigated its political premise: “Despotic governments do incur such obligations,” Bryant’s paper said, “but our republican system of government. . . incurs no obligation to take care of the vicious and the thriftless and improvident.” The notion that the state should provide work, the *Post* fulminated, was “one of the most monstrous doctrines ever broached in revolutionary France.” There was, perhaps, a duty “to relieve the poor and to succor the distressed,” but that was “a Christian duty, not a political duty.”

For all the talk of succoring the distressed, the rich—held firmly in check by the Association for the Improvement of the Condition of the Poor—did less of it than ever. The AICP loathed Wood’s proposals, fearing his “words would excite the harassed unemployed rather than allay their fears and lead to humble forbearance.” Hartley was determined that in 1857, unlike 1854, almsgiving would be kept in private and tightfisted hands. He successfully blocked formation of independent ward relief committees, which freed him from having to set up rival AICP branch offices in working-class neighborhoods. He was thus able to force the unemployed to travel to a central office, where trained personnel imposed rigorous means tests, which three-fourths of those applying for aid failed. Though eight thousand families were given assistance in October this was 25 percent *fewer* than had been helped in the previous prosperous year, a statistic of which Hartley later boasted. The AICP also made some ineffectual efforts to find jobs for the unemployed with farmers outside the city; and Charles Loring Brace of the Children’s Aid Society, too, urged the jobless be directed “into one great channel—that of EMIGRATION.” But Hartley’s main suggestion was that the laboring classes “bear with manliness what they must bear.”

“WE WANT WORK!”

Albert Komp, James McGuire, and Ira B. Davis thought differently. In October 1857 Komp, an associate of Joseph Weydemeyer’s, gathered together some fellow radical forty-eighters into a *Kommunisten Klub*, which in turn helped revive the dormant *Amerikanische Arbeiterbund*. The Germans then joined forces with McGuire, an Irish labor leader, and Davis,

an old Loco Foco man and cooperative movement activist, in an effort to organize the unemployed of all nations. As McGuire said, “If one man suffer, it don’t matter whether he is an all American or a foreigner—they all suffer.”

This working-class movement claimed state assistance as a right, not as charity or patronage, a call that resonated powerfully even amongst nonsocialists, especially in an Irish immigrant community profoundly scarred by the recent Great Hunger. As the *Irish News* wrote: “When famine stares fifty thousand workmen in the face—when their wives and little ones cry to them for bread, it is not time to be laying down stale maxims of economy, quoting Adam Smith, or any other politico-economical old foggy.”

Tired of upper-class bickering while the crisis deepened, the revived American Workers League announced a “work and bread” demonstration to protest the Common Council’s failure to act on Mayor Wood’s suggestions. On November 5 four thousand radicals, unionists, and land reformers gathered in Tompkins Square and marched to City Hall Park behind a banner emblazoned ARBEIT!(work). While a speaker perched on the fountain basin pointed out that “ladies throng Broadway every day buying silk robes, while the wives and children of honest laborers are starving,” a “Mass Petition for the Unemployed” was presented to Mayor Wood.

“Every human being has a RIGHT to live,” it declared, “not as a mere charity, but as RIGHT, and governments, monarchical or republican, MUST FIND work for the people if individual exertion prove not sufficient.” Specifically the unemployed demanded a program of public works at a guaranteed minimum wage, aimed at launching the new Central Park, sewerage the city’s streets, “or any other public works so indispensable for the sanitary condition of the people and the comfort and safety of the wealthy themselves.” They also called for municipal construction of low-income housing on city-owned land and for an injunction against evictions of the unemployed. When Wood responded he would give the petition to the aldermen the following week, a spokesman named Bieler said of the massed jobless outside, “We cannot warrant that, their patience being exhausted, they will not help themselves by employing physical power with its accompanying brutalities.” Thus prompted, Wood passed on the plea that evening, and the councilmen announced they would advertise for bids to undertake the project of leveling Hamilton Square.

The next day, November 6, the fight was carried to Wall Street. A procession of five thousand chanting, “We want work,” trooped to the steps of the Merchants’ Exchange and demanded bankers lend funds to businessmen who would employ the poor. Workingmen, a blacksmith named Bowles warned, did not intend to starve while tens of millions in specie was lying unused.

Crowds were bigger than ever on Monday, November 9, and demonstrators flooded into City Hall itself. Councilmen agreed to authorize a \$250,000 bond issue for Central Park but rejected further direct relief. Wood, himself troubled by the growing throngs, now decided to post police guards around government buildings and—remembering 1837—the flour warehouses. The next day, when another mass meeting at Tompkins Square dispatched a delegation to confer with the mayor, it found City Hall Park ringed by three hundred police and stocked with a brigade of militia. A few blocks further south, moreover, the federal government had deployed soldiers and sailors under Mexican War hero General Winfield Scott to guard the Custom House and Sub-Treasury Building.

Despite the array of armed might and editorial calls to “shoot down any quantity of Irish or Germans” necessary—“Rioters, like other people, have heads to be broken,” cried the *Herald*, “and bodies to be perforated with ball and steel”—thousands again swarmed into Tompkins Square, and this time some of the desperately hungry broke discipline and launched a bread riot, seizing bakers’ wagons and invading food shops. Increasingly, however, protesters redirected their attention uptown, gathering in front of Superintendent Frederick Law Olmsted’s office carrying white muslin standards reading WORK/ARBEIT and WE WANT WORK and demanding men be hired from their ranks. The park commissioners, however, were also inundated with four thousand letters from job seekers, and in conjunction with local politicians they proceeded to divide up the patronage positions among this vaster body. By January 1858 a thousand men had been set to work clearing debris from the site; ten months later twenty-five hundred were so employed; by the following year, on a peak day in September 1859, thirty-six hundred were laboring away.

WOOD REMOVED

The winning of job openings—together with the patent inability to wrest further assistance from city government—dissipated the protest movement. By the end of November 1857, the crowds in Tompkins Square had virtually disappeared, and so had the massed police and military presence. Nevertheless, Wood's combination of class rhetoric and public welfare cost him his remaining elite support. He was now, in their eyes, thoroughly identified with the subterranean city ("the *canaille*" in Strong's word).

Days after the first demonstrations, and a scant three weeks before the December 1 election, powerful merchants in the Democratic Party's inner circle bolted. Men like August Belmont, John A. Dix, William Havemeyer, and John Van Buren made common cause with Republicans, former Know-Nothings, and leaders of the old civic reform movement like Peter Cooper. A Wall Street mass meeting of merchants, industrialists, and bankers—claiming "our metropolis is the worst governed city in Christendom"—nominated Almshouse Governor Daniel F. Tiemann, a Democrat and wealthy German-American paint manufacturer, to run against Wood. Disgruntled Tammanyites (including William Tweed) were happy Tiemann was of their party, Republicans liked his opposition to slavery, and Know-Nothing men applauded his well-known nativism (tempered by a German background).

Spurned by the upper class, Wood garnered support from the organized workers. Ira B. Davis denounced the Wall Street Democratic renegades, noting that none had objected when the state government bailed out the banks: apparently what was "virtuous in them" was "a crime in Mayor Wood or the workingmen." At a meeting in Steuben Hall on November 26, James McGuire announced: "We mean to make labor the plaintiff and capital the defendant."

In the December election, Wood carried the heavily German and Irish eastside wards, but enough Democrats deserted him (especially in Tweed's ward) to narrowly cost him the election. The fusion coalition's 51.4 percent to 48.6 percent victory was probably aided as well by Republican state-appointed election inspectors, who closed the polls before workmen could leave their jobs to vote.

Over the next two years, business conditions slowly improved. Specie stocks rose as gold shipments began arriving again. Credit eased, and trade expanded steadily if unevenly, with far stronger European demand for

cotton than for wheat. Foreign capitalists cautiously began buying securities again, though foreign laborers remained bearish and immigration stayed low. With a reviving economy—by spring 1859 the worst was clearly over—the labor movement girded itself to restore wages to their prepanic level. A new German labor federation was established in 1859, paced by cabinetmakers and pianomakers, and it embarked on a series of strikes.

Still, the fierce animosities the panic had fanned subsided for the moment, muted by exhaustion, political catharsis, and rising public and private employment. But the divisions the crisis had illuminated did not knit themselves up; fear and rancor smoldered, awaiting only a new crisis to rekindle them. It was not long in coming, for even as New York was congratulating itself for having survived the economic maelstrom, a political hurricane was about to slam into the city.

The House Divides

The Panic of 1857, coining on top of the frenzied expansion of the boom years, increased the pressure on the nation's poorly soldered-together political system. The weakest seam did not lie along the Mason-Dixon line; in their direct dealings, North and South had managed to maintain the balancing act begun two generations earlier at the Constitutional Convention. Rather the crisis came out west, where the vast territories won from Mexico in 1848 were proving difficult to digest. In 1850 another deal was cobbled together, whose provisions included admission of California as a free state and the passage of a Fugitive Slave Act facilitating the extradition of escapees. But powerful forces in both slave and free states were no longer willing to settle their differences by a Solomonic divvying up of the spoils of empire. Neither side was willing to be excluded from the trans-Mississippi territory; increasingly, each side wanted it all.

During the long period of prosperity the South had gotten expansionist. As British industrial demand sent cotton prices soaring, planters sought to spread slave production west, along with the legal and political support system slavery required. They were seconded in this by white small farmers, squeezed into marginality by the pressures of competition with big planters and hoping migration would improve their condition. Even though some of the new western lands were not fertile grounds for cotton production, the planters nevertheless wanted new slave states carved out of them in order to maintain the balance of political power in the Congress and Electoral College.

The North had promoted expansion as well. Dynamic capitalists had grand visions of an integrated and nationwide industrial economy, stitched together by rail lines; they also dreamed, less loftily, of speculative bonanzas in cheap government lands. Small farmers wanted to reserve the new states for "free labor": they didn't want to compete with huge factories-in-the-fields staffed by slave labor and suffer the fate of southern poor whites.

The North was also growing more culturally aggressive. To the liberal bourgeoisie the global capitalist boom seemed conclusive proof that slave societies were contrary to history's march—morally undesirable, economically inefficient, and doomed. While “respectable opinion” still backed away from the abolitionist call to assault the institution in its southern lair, it listened with increasing enthusiasm to the new Free Soil movement's counsel: leave slavery alone in its heartland but block its westward expansion; penned up, it would eventually die.

Far-sighted Southerners experienced anticipatory suffocation and demanded immediate breathing room. Some went beyond insisting on the right to open new plantations in the West to calling for equal access to the North itself—regaining the right, for instance, to travel freely with their slaves. They grew ever more vehement, too, in their insistence on an explicit veto power over Democratic Party policy and federal government activity and successfully blocked programs many northerners desired: a protective tariff, a homestead bill, a northern transcontinental rail route. On the cultural front southern ideologues matched the North's denigration of their society with a vigorous defense of paternalistic slavery as morally *superior* to heartless capitalism.

As each side grew more convinced that the nation could no longer exist half slave and half free, that it must become all one thing or all the other, the divided American house began to crumble. In the end it was the center—the Kansas-Nebraska Territory—that failed to hold. On January 4, 1854, Senator Stephen Douglas (Democrat from Illinois) introduced a bill looking toward the entry of the territory into the Union, which left the question of its slave or free status entirely up to a vote by local residents. This sounded democratic (“popular sovereignty” he called it), but in fact it shredded the old Compromise of 1820 in which Congress had banned slavery in that part of the continent no matter what the desires of its residents. This (to Free Soil eyes) treacherous blow, together with ensuing proslavery initiatives such as the 1857 Supreme Court Dred Scott decision, which barred Congress from forbidding the transport of slaves to northern states, seemed conclusive evidence of a Slave Power design to make slavery lawful in *all* the states, North as well as South.

Free Soilers decided that if slavery in Kansas was to be decided by its residents they would rush northern settlers to the territory in time for the

vote. Southerners countered with their own westward race. In short order, rival groups of settlers, in a kind of election riot writ large, were shooting their way toward majoritarian status. It was in outraged response to the bloodbath in Kansas that the Republican Party had crystallized—a definitively sectional organization that fused antislavery Whigs and Democrats. It also had a strong (though not dominant) nativist streak. Republicans tended to see the Roman Church and the Slave Power as corporate monoliths that restricted individual freedom and to condemn Irish immigrants and white planters alike for lack of economic enterprise or self-discipline.

The new party ran General John C. Fremont for president in 1856 on a platform dedicated to northern capitalist and small farmer interests (tariffs, homesteads) and the extirpation of the “twin relics of barbarism” (slavery and Mormon polygamy). Fremont lost, but the party picked up powerful adherents. New York’s William Seward signed on; the Whig senator had been an early opponent of the Slave Power and by 1858 was convinced that “an irrepressible conflict between opposing and enduring forces” was at hand.

The idea of an irrepressible conflict between North and South did not warm many hearts in New York, that most southern-connected of northern cities, and the metropolis would prove to be a fierce opponent of Republicanism-with-a-capital-/. But the new party’s antisouthern militancy did attract two strategically placed constituencies, whose affiliation would have resounding local impact: the tiny African-American community and a small but extremely influential coterie of professionals and businessmen.

BLACK REPUBLICANS

In 1860 the city’s 12,574 African Americans had no territorial base, no cultural stronghold. The Irish had pushed them out of the Five Points, and they were strewn about the city in isolated, vulnerable clumps. Some had migrated east to streets abutting the East River docks. Others (perhaps about five thousand) had drifted north to the area bounded by Houston on the north and Canal on the south, concentrating in Greenwich Village streets—Minetta Lane, Bleecker, Thompson, Sullivan, and MacDougal—near to jobs as servants for the Washington Square gentry. Others still, perhaps fifteen hundred, had pressed on farther, into blocks west of Sixth

Avenue between 23rd and 40th streets, or to Seneca Village before it was dismantled to make way for Central Park.

In Brooklyn more than a hundred black families had trekked out to Weeksville and Carrville, the settlements begun on former farmland back in the 1830s and 1840s, to Crow Hill (the future Crown Heights), and to Fort Greene, where work was to be found in the nearby shipyards. Here too the black population was dwarfed by the inrush of white immigrants: where in 1800 one of every three people in Kings County had been black, by 1860 the proportion had dropped to less than one in fifty. In Staten Island a black community grew up at Sandy Ground (near today's Woodrow) in the late 1830s, after free blacks migrated north from the Eastern Shore of Maryland to work the oyster beds in nearby Prince's Bay. In Queens there were African-American communities in Flushing, Newtown (in today's Corona), and Jamaica (near the Green at today's Douglas Avenue between 171st and 175th streets).

Work opportunities had continued to contract. In 1852 the newly formed Longshoremen's United Benevolent Society announced its intention to reserve waterfront jobs to its own (overwhelmingly Irish) membership and to "such white laborers as they see fit to permit upon the premises." By 1855 few blacks worked the docks, apart from occasional strikebreaking stints under the protection of city police. It was much the same with other unskilled positions. As the *African Repository* reported in 1851, "the influx of white laborers has expelled the Negro almost en masse from the exercise of the ordinary branches of labor. You no longer see him work upon buildings, and rarely is he allowed to drive a cart of public conveyance. White men will not work with him."

For black women domestic service remained an option, though in 1855 only 3 percent of the city's servants were African Americans, and many of these worked either for the very rich or in brothels, as laundresses, charwomen, and maids. Black men did hold on to jobs as waiters in the dining rooms and kitchens of the great hotels and restaurants and, indeed, organized a union that won higher wages. Other remaining possibilities included laboring for Brooklyn and Queens farmers, going to sea, and working in skiffs for white oystermen (as did the Sandy Grounders) culling mollusks with iron rakes.

Despite—and in response to—these handicaps, a semiautonomous African-American community flourished, organized around black churches. Methodists remained numerically dominant. Mother Zion's new 1840 edifice was perhaps the largest blackowned Protestant house of worship in the world, and AMEZ churches formed the nuclei of communities at Weeksville, Sandy Ground (near Crabtree Avenue), and Flushing (still extant in a downtown parking lot).

Presbyterians, fewer in number, were extremely influential, thanks in part to the dynamic series of leaders who succeeded Sam Cornish as pastor of the First Colored Presbyterian Church. The Rev. Theodore Wright stayed nineteen years and transformed a struggling institution into a formidable establishment, and when he died in 1847, the community held a mammoth funeral march. Under the Rev. James W. C. Pennington—an escaped slave who had worked as a blacksmith, taught himself to read and write, and became a teacher and minister—the church changed its name to Shiloh Presbyterian and moved to a building at Prince and Marion that could hold sixteen hundred.

Pennington was followed by Henry Highland Garnet, whose family had also escaped to New York from a Maryland plantation. Garnet's father, a shoemaker, became an important member of the African Methodist Episcopal Church and sent his son to the African Free School #1, until financial straits forced the youth to sea in 1829 as a cabin boy. While Henry was away, a relative of Garnet's master came to their home determined to seize them all. His father and mother jumped from an upper-story window and escaped. His sister was caught and taken before the city recorder but with the help of white abolitionists was able to prove herself a resident of the city. Henry returned to find the family home abandoned, the furniture destroyed or stolen, and his father still in hiding. Enraged, he bought a huge knife and dashed up and down Broadway hunting for slavecatchers, until his friends spirited him out of town to save his life. Garnet became a militant abolitionist and pursued a ministerial career under the wing of Theodore Wright. After holding pastorates upstate and winning acclaim for an incendiary address at the 1843 National Negro Convention in which he urged armed uprising on southern bondsmen, Garnet assumed Wright's old pulpit in 1855.

In the meantime, Charles B. Ray, another blacksmith turned clergyman, had established the tiny Bethesda Congregational Church (1845), having previously served as editor and proprietor of New York's *Colored American*, the short-lived (1837-41) successor to *Freedom's Journal*. Yet another important newcomer emerged in 1847, when six Brooklyn residents who were members of Manhattan's Abyssinian Baptist Church bought lots in downtown Brooklyn and erected the Concord Street Baptist Church of Christ.

New York's African-American churches were too poor to support substantial social welfare programs, but their members did take a hand in supporting an establishment, dedicated to the black community, that had been founded by white Quaker women. In 1836 Anna M. Shotwell and her niece May Murray had discovered two little Negro orphans on the steps of an old house. On learning that no existing nurseries accepted blacks and that the almshouse relegated black children to a squalid cellar, the women established a Colored Orphan Asylum, got the Common Council to donate twenty lots on Fifth Avenue between 43rd and 44th streets, and by 1843 had opened an impressive structure there, the first of its kind in the United States.

The Colored Orphan Asylum received support from the city, the state, and private organizations (when the old Manumission Society finally dissolved in 1849, it transferred all its assets to the asylum). The black community too gave aid, via regular collections at Mother Zion, St. Philip's, and Abyssinian Baptist and an occasional fair by "Colored Friends" of the institution. In addition, James McCune Smith, the city's leading black doctor, served as its attending physician throughout the era. Smith, born in New York City of free black parents in 1813, had been educated at the African Free School, tutored privately in the classics, and in 1832 had gone to Scotland for a five-year course of study at the University of Glasgow, earning three degrees. On his return, though barred by white doctors from the New York Academy of Medicine, Smith practiced medicine and ran an apothecary shop.

This cadre of black ministers and doctors organized a remarkable number of ad hoc and ongoing organizations. When southern spokesman and Secretary of State John C. Calhoun alluded snidely to the "vice and pauperism of the African race in the north," a protest meeting designated

Dr. Smith to draft a pamphlet that took vigorous and welldocumented exception to Calhoun's remarks.

When education for black children was neglected by the city, the New York Society for the Promotion of Education Among Colored Children (whose president was Charles B. Ray) won some modest improvements from the Board of Education, though not the dismantling of segregated schools they sought.

Antisegregationist activists made greater headway combating discriminatory practices in public transportation. Black ministers had long protested omnibus and horsecar company policies that forced black passengers to ride outside on the front platform or wait for a vehicle bearing the sign COLORED PEOPLE ALLOWED IN THE CAR—known as a “Jim Crow” car after Daddy Rice’s minstrel character, which had become an allpurpose derogatory label for blacks. Many walked rather than be humiliated, but this option had grown more onerous as the city expanded: the Rev. Wright’s fatal illness was brought on from the exhaustion of walking miles uptown to see prospective donors and then miles back downtown, “under the full muzzle of the July or August sun.”

The first major breakthrough came thanks to the gritty determination of a twentyfour-year-old schoolteacher. On a Sunday afternoon in July of 1854, Miss Elizabeth Jennings, on her way to play the organ at services of the First Colored Congregation Church on Sixth Street near the Bowery, attempted to board a Third Avenue car at Pearl and Chatham. The conductor told her to wait for the colored car, but after an altercation he grudgingly allowed her entrance, though saying: “Remember, if any passenger objects, you shall go out, whether or no, or I’ll put you out.” Jennings’s response—“I am a respectable person, born and brought up in New York, and I was never insulted so before”—roused in turn the conductor’s ire: “I was born in Ireland and you’ve got to get out of this car,” he said. She refused, he tried dragging her out, she clung to the window. He called on the driver to help, and together they pried her loose and threw her to the street. Though badly hurt, Jennings climbed back on. Finally the driver galloped his horses down the street until he found a policeman, who ejected her.

The young woman reported this to her church and to her father, Thomas Jennings, a successful tailor with a long record of activism in the black

community. Born in New York in 1798, Jennings had dug trenches to help protect the city during the 1812 war, worked in the African Society for Mutual Relief, and helped found the Abyssinian Baptist Church. Now the Jenningses sued the Third Avenue line and were represented by attorneys from the firm of Culver, Parker, and Arthur, including Chester A. Arthur, a twenty-four-year-old recent law school graduate and future president of the United States. When the case came to trial in February 1855, the judge instructed the jury that the company was a common carrier and bound to carry all respectable persons, including “colored persons, if sober, well-behaved, and free from disease.” The jury awarded Jennings \$225. After this, most Manhattan railroads ceased discrimination.

Most, but not all. When Shiloh’s Rev. Pennington, encouraged by Jennings’s victory, set about testing other lines, he was forcibly expelled from a Sixth Avenue car. Three weeks later blacks organized the Legal Rights Association—with Thomas Jennings as president—to raise funds for Pennington’s (and similar) cases. When this suit reached Superior Court in December 1856, however, the judge decided for the company, saying it had every right to decide who rode its cars. The decision encouraged the Eighth Avenue Railroad to hold fast to segregation until 1856, when Peter S. Porter, treasurer of the Legal Rights Association, after being beaten, kicked, and banged about “most ferociously,” brought suit and won an out-of-court settlement allowing blacks to ride on the same terms as whites.

The African-American community’s most ardent struggle, however, was (as it long had been) against slavery itself. Blacks were active in the American and Foreign Anti Slavery Society. In addition, numbers attended mass abolitionist meetings like those held in Morris Grove, Brooklyn; supported the nationalist *Weekly Anglo-African*, founded in 1859 by two black printers in the city; worked in the Liberty Party; and helped raise funds for the defense and repatriation of the Mendi Africans who had seized their slave ship, *La Amistad*, and secured their freedom.

Their riskiest enterprise was harboring runaway slaves and helping them on their way to Canada. The New York Vigilance Committee was still going strong—presided over by Wright, then Ray—with funds gathered by Garnet and Pennington on speaking tours in the British Isles and at annual fairs black women held at the Broadway Tabernacle. New York became a major way station on the Underground Railroad; Ray dealt with over four hundred

runaways in one fifteen-month period during 1848-49. City blacks provided sanctuary, food, and clothing—in private homes, in the Mutual Relief Hall (said to have a secret room the length of the building), in the boardinghouse on Dover Street run by passionate abolitionist William P. Powell for “the better class of colored seamen,” and in the churches of Manhattan and Brooklyn: notably Mother Zion, Siloam Presbyterian, Bridge Street Methodist, and Concord Baptist.

After 1850, when President Fillmore signed the Fugitive Slave Law, their work became considerably more dangerous. As the act applied *ex post facto* to former runaways, many escapees who had remained in New York now fled town—the number of blacks in the city dropped from 13,815 in 1850 to 11,840 in 1855—or went to ground. In 1850 James Hamlet, a thirty-year-old fugitive, had been working for the past three years as a porter for the merchant firm of Tilton and Maloney. Seized on the street, Hamlet was arrested and returned to his Baltimore owner, leaving behind his wife and two children. Days later, on October 2, 1850, enraged blacks and sympathetic whites crowded into Mother Zion for a protest meeting. Presiding officer William P. Powell asked: “You are told to submit peacefully to the laws; will you do so? (No, no.) You are told to kiss the manacles that bind you; will you do so? (No, no, no.)” Eight hundred dollars was raised to purchase Hamlet’s freedom, and on October 5 five thousand blacks cheered, sobbed, and sang hymns as they welcomed him home to New York.

Despite these occasional successes, the 1850s were dark days for African-Americans. Even some of the most militant began to abandon hope for a future in the United States and to reconsider their opposition to colonization. Henry Highland Garnet, despite his impeccable antislavery credentials, had become convinced, as had many western land reformers before him, that emigration might provide opportunities unavailable in New York City. In the summer of 1858 Garnet became the first president of the African Civilization Society, a group that included wealthy whites, and he promoted efforts to develop black colonies in Africa.

Garnet was vigorously opposed by those like Frederick Douglass, Dr. James McCune Smith, and the Rev. James Gloucester (of Brooklyn’s Siloam Presbyterian Church) who preferred to stay and struggle within the political arena. This was no easy matter, however, as most blacks were still

barred by stiff property requirements from voting at all. Such eligible voters as existed had organized themselves, in 1838, as the Colored Freeholders of the City and County of New York. During the 1840s and 1850s they met periodically with other such groups from around the state to demand universal suffrage. By the late 1850s there were forty-eight local suffrage clubs in Manhattan, eighteen in Brooklyn, and an umbrella organization, the New York State Suffrage Association. In 1860 they succeeded in getting the legislature to submit the question to the voters. James Gordon Bennett—who the year before had called for the reenslavement of northern blacks—rallied the opposition, urging “white men” not “to consummate the act of self-degradation which will bring them down to the level of. . . the niggers of the Five Points.” The referendum lost by only 337,900 to 197,000 at the state level. But in New York City, it was rejected by 95 percent of the voters.

Given this generally dismal situation, it is not surprising that the rise of the Republican Party kindled hopes in the black community. In September 1858, at a New York Negro Suffrage Convention, the majority urged the state’s eleven thousand eligible black electors to vote Republican to ensure the “defeat and ruin of the so-called Democratic party, our most inveterate enemy.” But Garnet noted that Republicans loudly protested they had no intention of abolishing slavery in the South and that even those who did support equal suffrage rights, such as Horace Greeley, routinely disparaged blacks as “indolent, improvident, servile and licentious.” Garnet counseled support for the Radical Abolitionist Party, the favorite of white abolitionists like the Tappans. Nevertheless, African Americans would overwhelmingly identify with—and be identified with—the Republican Party, to such a degree that it would be called by its enemies the “Black Republican” Party.

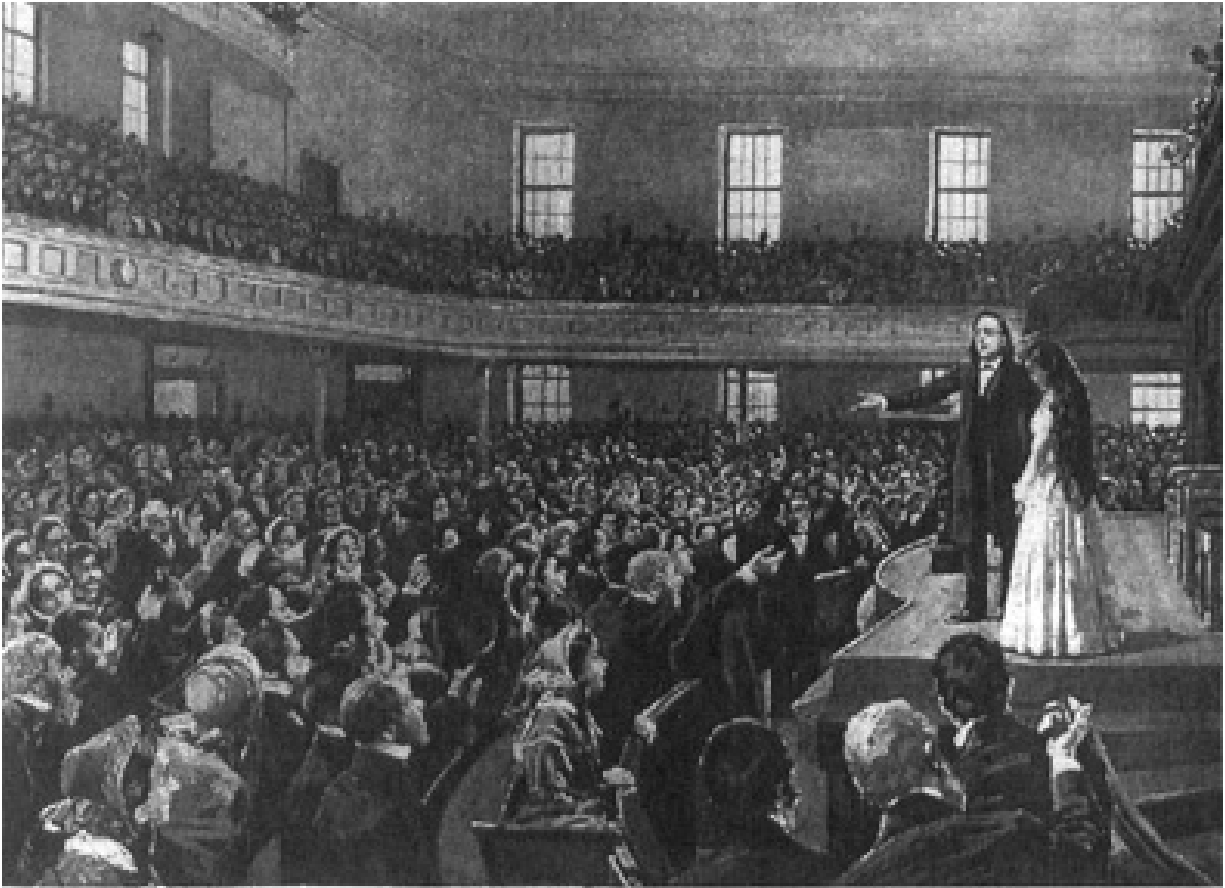

WHITE REPUBLICANS

Among the city’s earliest white converts to Republicanism were journalists and ministers. Before taking up his Central Park duties, Frederick Law Olmsted had won prominence as a commentator on the southern way of life. In a series of books about his travels below the Mason-Dixon line, Olmsted had cast a critical eye on the world the slaveholders had made, less for its effect on suffering slaves than for its inefficiency. Horace Greeley of the *Tribune* stressed slavery’s barbarity more than its supposed

unprofitability. Citing British and Dutch precedents, he pronounced slavery a retrograde movement, contrary to the laws of motion of Christian civilization, and condemned planters—who loved posturing as cavaliers—as violent, degraded, and ignorant. Greeley also condemned New York’s support for slavery—“In order to line our pockets, must we utterly stifle our souls?”—and was seconded in this by William Cullen Bryant of the *Post*, who departed the Democrats for ceasing “to serve the cause of freedom and justice.”

The Rev. Henry Ward Beecher had swung into the Free Soil camp in the mid-1840s, though he remained opposed to abolitionism and feared liberating the South’s “vast horde of undisciplined Africans.” In 1848, however, Beecher began appearing at the Broadway Tabernacle, crucible of the antislavery crusade, and speaking out with Lewis Tappan and Frederick Douglass. After 1850 he urged defiance of the Fugitive Slave Act—“We are determined to break any law that commands us to enslave or reenslave a man, and we are willing to take the penalty”—and he began holding sensational (and titillating) mock “slave auctions” at Plymouth Church, in which weeping men and women of his prosperous Brooklyn congregation heaped cash and jewels on collection plates to buy the freedom of light-skinned young women and children. Beecher also called on New Yorkers to extend the rights of citizenship to their own black citizens and refused to ride any streetcar line in Brooklyn that segregated its passengers. When Kansas became a battleground, he told northern emigrants heading there that “Sharpe’s rifles are a greater moral agency than the Bible,” and soon the Free Soilers smuggling guns to the territory took to calling them “Beecher’s Bibles.” By 1856 Plymouth was hosting the most radical abolitionists—like Wendell Phillips, who had been refused a venue by virtually every church and hall in both cities—and in that same year he became a Republican (his congregation gave him two months off to campaign for Frémont).

Republicanism made inroads in the business community too. Some Wall Streeters—particularly financiers promoting a transcontinental railroad and merchants whose trade dealings were not southern oriented—joined Beecher in attacking attempts to introduce slavery into Kansas. Such men gave financial aid to send free-state settlers to the territory or turned out for protest meetings in City Hall Park, and some entered the

Beecher Selling a Slave Girl from Plymouth Pulpit. (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

new Republican Party. These were chiefly former Whigs, like clothing manufacturer and merchant George Opdyke, sugar and coffee importer Edwin Morgan, banker Simeon Draper, and flour and tea merchant George Griswold, though Democrats too joined up, like Isaac Sherman, a millionaire involved in western trade and railroads. Others were led to the Republican fold via their religious convictions, including William Dodge and Pelatiah Perit.

In the 1856 presidential campaign, a small nucleus under the leadership of Moses H. Grinnell set out to win Wall Street converts. In addition to offering a moral and cultural critique of the South, they stressed the practical business advantages a Republican victory might bring. They invited N. P. Banks, speaker of the House of Representatives and a recent convert to Republicanism, to address a crowd of twenty thousand from the

steps of the Merchants' Exchange. Banks argued that the election of Democrat James Buchanan would hurt trade with Cuba (because a prosouthern administration would try to annex it for slavery), block a northern transcontinental rail route in favor of a southern one (diminishing New York's chances of capturing the China trade), and slow up river and harbor improvements.

Banks's appeal failed. The critique of the South might tug at moral and cultural heartstrings and speak to particular practical interests, but the facts of New York's situation dictated a continuing southern alliance.

METROPOLITAN DIXIECRATS

Whatever their private views about the southern social order, the city's key economic actors—the shipowners who hauled cotton, the bankers who accepted slave property as collateral for loans, the brokers of southern railroad and state bonds, the wholesalers who sent goods south, the editors with large southern subscription bases, the dealers in tobacco, rice, and cotton—all had come to profitable terms with its slave economy. Their attitude had been reinforced by the aftermath of the Panic of 1857, when the South rebounded far more quickly than did the West—clear evidence that European demand for cotton was higher than that for foodstuffs. “Cotton is King,” said the editor of *Scientific American* in 1858.

One merchant spelled out the implications to Samuel J. May, a prominent abolitionist: “Mr. May, we are not such fools as not to know that slavery is a great evil, a great wrong. But a great portion of the property of the Southerners is invested under its sanction; and the business of the North, as well as of the South, has become adjusted to it. There are millions upon millions of dollars due from Southerners to the merchants and mechanics alone, the payment of which would be jeopardized by any rupture between the North and the South. We cannot afford, sir, to let you and your associates endeavor to overthrow slavery. It is not a matter of principles with us. It is a matter of business necessity,” he concluded: “We mean, sir, to put you abolitionists down, by fair means if we can, by foul means if we must.”

May's correspondent perhaps overstressed the cynicism of the prosouthern commitment. Many businessmen had close personal as well as

commercial ties to southern planters and refused to stereotype them as barbarian slaveocrats. New York merchants vacationed with planters at Saratoga and other watering spots, intermarried with them, and, for all their official republican disapproval of aristocratic manners, were themselves often closet cavaliers. In October 1860, when the nineteen-year-old Prince of Wales (later Edward VII) and a retinue of British peers paid the city a visit, the elite fell all over itself to do him honor. Shops closed down. Business was paralyzed. A huge crowd turned out to acclaim the procession of the resplendent prince and his party up Broadway (with the notable exception of Colonel Michael Corcoran's Sixty-ninth Irish Regiment, which refused to join the line of march). At a grand ball next evening at the Academy of Music, a glittering crush of nabobs gathered to jostle and squeeze the royal person—so many that a section of the floor collapsed.

But interests remained fundamental to the alliance, including some quite nasty ones. From January of 1859 to August 1860, nearly one hundred vessels left New York harbor on slave trade business. Many had been built here, as shipbuilders hurt by the panic turned to the production of slavers. The profits could be enormous—\$175,000 on a single voyage—as steamers could carry many more slaves than had the old sailing vessels.

While it was commonly held that some of the biggest merchants in the city were in the trade, it was hard to pin this down. Merchants were unwilling to admit to their own participation in the illegal trade. Transactions were carried out through Cuban gobetweens, and captains used Spanish or Portuguese crews. But merchants were not reticent when it came to opposing all efforts—such as Seward's in the Senate—to get more effective control over the trade. At the annual meeting (in May 1860) of so pious an organization as the American Tract Society, Daniel Lord and Hiram Ketchum led a large group of merchants in shouting down a resolution condemning the slave trade. And the *Day-Book* was indignantly amazed that anyone could find fault “simply because somebody takes a few niggers from the jungles of Africa to Cuba.”

Given this matrix of interest and ideology, most New York City merchants worked through the decade to banish the slavery issue from politics. The Kansas controversy did provoke a temporary outcry, in large measure because it seemed southerners were not keeping faith with the sectional truce, but for most the militancy didn't last. The rise of the

Republican Party seemed a far deadlier threat to the Union, and few New York City Whig merchants followed Seward, Weed, and Grinnell into the new party. In the 1856 campaign, therefore, most old-line Whigs either sat out the election or voted for Democrats and Know-Nothings; Fremont came in a poor third. Upstate, however, went overwhelmingly Republican, and Fremont carried New York by the huge majority of eighty thousand votes. That year was also the one in which Republican John King won the governorship and Republicans in the Albany legislature began hacking away at New York City home rule.

Democratic merchants continued to press hard for conciliation with a South given to ever-escalating threats of secession. In October 1859—at a mass meeting in Cooper Union attended by two thousand merchants—August Belmont, William B. Astor, Moses Taylor, William F. Havemeyer, and attorney Samuel J. Tilden organized the Democratic Vigilant Association, dedicated to battling Seward’s Republicans and convincing the South that New York merchants could still be depended on.

Republicanism found few adherents among workers, either. The artisan radicals who had been drawn to abolitionism in the 1830s had been alienated in the 1840s with its domination by upper-class evangelists, their inveterate enemies. By the 1850s few laboring groups strongly opposed slavery, apart from the Communist Club and several of the *Turnvereine* (whose defense squads protected antislavery meetings); fewer still joined the Republicans.

Like businessmen, workingmen believed that New York’s economy, and thus their jobs, depended on a southern connection that Republicanism endangered. There were other bases for antipathy. Many Republicans were anti-immigrant bigots. Working people were also deeply suspicious of the Republican project of creating a nationwide “free labor” regime. To the Republicans, it seemed, “freedom” meant simply self-ownership, the fact of not being a slave. A laborer was fully “free,” Republicans argued, when he was able to sell his labor, able to move from job to job in accordance with the changing demands of the marketplace.

Some Republicans—like Abraham Lincoln, a rising Republican luminary in Illinois—admitted that wage-work was incompatible with true freedom but argued that the free labor system allowed workers to climb out of their dependent and propertyless situation. This notion made sense to

Lincoln's (and Seward's) rural and small-town constituency of farmers, craftsmen, and small businessmen; it didn't resonate in the big city, where most workers were trapped in permanent proletarian status, and knew it.

Workers also resisted Republican doctrine that unions were despotic institutions, on a par with the Slave Power and the Catholic Church in their coercion of individuals. Workers, the new party said, like reformers of old, would do better to advance themselves individually, by adopting proper habits and values. To people who depended on collective modes of organization and action for survival, this smacked of pious hypocrisy, especially when it came from wealthy employers.

Finally, white workers rejected Republicanism because it was Black Republicanism. Working-class racism, already deeply held, was strengthened each time employers used African Americans as strikebreakers; that their own racial animus helped sustain the divisions that facilitated this practice was not an easily achieved insight.

When opponents of Republicanism looked about for a vigorous champion, the likeliest candidate—back from the political dead—appeared to be Fernando Wood. In 1858 Wood had bolted Tammany Hall and organized his own independent Democratic organization, known as Mozart Hall, after its meeting place at the corner of Bond Street and Broadway. In 1859 he ran again for mayor, with the powerful support of Bennett's *Herald*.

This time it was his opponents who were divided. The monied members of the Democratic Vigilant Association, including Belmont, Tilden, and Havemeyer, demanded that Tammany nominate one of their own, on pain of withholding vital funding. The Hall selected Havemeyer, allowing Wood to present himself as the protector of the true Democrat, the workingman, and the immigrant, against the “kid glove, scented, silk stocking, poodle-headed, degenerate aristocracy.” Republicans tried to fuse with Tammany, but the deal fell through and they ran their own candidate, George Opdyke, a wealthy importer. Wood blistered the Republicans for interfering with home rule in New York City and for threatening to estrange the South. “The South is our best customer,” Wood declared. “She pays the best prices, and pays promptly.” When the *Times* raised the old charge of excessive ambition—Wood wanted to become “Our Municipal Emperor,” Raymond said—the ex-mayor retorted: “Better have an iron rule than no rule at all, as

is now.” When Wood won (with 38.3 percent to Havemeyer’s 34.6 percent and Opdyke’s 27.4 percent), his victory was hailed in the South by such organs as the *Richmond Examiner*.

All things considered, it was not altogether inappropriate that what would become the South’s national anthem had its premiere in New York City that year. Dan Emmett’s “I Wish I Was in Dixie’s Land” was first aired at the April 4, 1859, performance of Bryant’s Minstrels in Mechanics Hall. It was then published by the New York firm of Firth, Pond and Co. and later made its way down south. (In a further irony, Emmett may have drawn upon the work of the Snowden Family Band—an African-American touring group—in composing the song.)

JOHN BROWN’S BODY

The metropolis was committed to the status quo. As ever, however, the status quo refused to stand still. On October 16, 1859, convinced that “the crimes of this guilty land, will never be purged away, but with Blood,” John Brown struck at Harper’s Ferry.

Some New Yorkers had known of Brown’s plan. He had appealed to Henry Highland Garnet and Frederick Douglass for help, but African-American abolitionists had decided against participating in what seemed a suicidal exercise. When Douglass met with Brown just before the raid, however, he did pass along a contribution of twentyfive dollars from Elizabeth and James Gloucester (pastor of Brooklyn’s Siloam Presbyterian Church) and their letter of support urging Brown “to do battle to that *ugly foe* of slavery.”

New York’s white abolitionists, adhering to their nonviolent principles, had also backed away from John Brown. “Would not one Uncle Tom do more good by his pious submission to God,” Lewis Tappan had said to Brown’s request for arms, “than a score or a hundred men who should act exactly opposite?”

But from the moment news of Brown’s raid and capture arrived in New York on October 18, and through the ensuing weeks of his trial, the black and white abolitionist community was alive with prayer and sympathy meetings. Thomas Hamilton, editor of the *Weekly Anglo-African*, staunchly defended Brown’s right of insurrection, and “the colored women of

Brooklyn” wrote Brown in his Virginia jail cell that we “recognize in you a Saviour commissioned to redeem us, the American people, from the great National sin of Slavery.” When Brown was hanged, on December 2, Henry Highland Garnet’s Shiloh Church held a large memorial meeting, and the colored women of Brooklyn and New York sent donations to the martyr’s widow and to the wife of his black compatriot, Lewis Leary. At the Broadway Tabernacle Church, Henry Ward Beecher produced the chains that had bound Brown to the scaffold, threw them to floor, stomped them with his heel, and cried, “The fate of the slaver states!”

Mainstream reaction was something else again. Businessmen denounced Brown as a madman. Bennett’s *Herald* said the “lawless violence” tolerated by Republicans on the Kansas frontier had come back east to haunt them. Fernando Wood excoriated Brown as a “fiend” and his “fanaticism” as a threat to the Union. The Democratic Vigilant Association called the raid a logical outgrowth of Sewardism and urged the business community to show the South they repudiated Republicanism’s pernicious principles.

The South didn’t bother waiting. New York drummers were expelled from several states. Many firms canceled outstanding northern orders. Others called for boycotting abolition-tainted firms and shifting business to “friendly” concerns.

Thoroughly alarmed, several thousand metropolitan businessmen gathered at the Academy of Music on December 19 to denounce Brown’s crimes and Seward’s ideas. Leading merchants thronged the speaker’s platform. The night rang with vigorous defenses of slavery as a positive good, ordained by nature.

49

Civil Wars

The atmosphere in New York was still poisonous when Abraham Lincoln came to town two months later. Lincoln, having emerged as a serious contender for the 1860 Republican nomination, had attracted the attention of Horace Greeley and William Cullen Bryant, on the lookout for a candidate to block Seward. The Young Men's Central Republican Union of New York City (a group run by such youngsters as Bryant and Greeley) originally intended to have him speak at Beecher's Plymouth Church in Brooklyn but shifted the venue to the more overtly political Cooper Union in New York. Lincoln's run through the celebrity production mill also included a stop at Mathew Brady's studio for an official campaign portrait.

In his talk at Cooper Union Lincoln disavowed Brown, struck a conciliatory pose toward the South, and denied the Republican Party was a sectional organization. But he also remained adamant on the need to stop the expansion of slavery, emphasized there were overarching moral issues at the crux of the sectional confrontation, and displayed oratorical gifts—"Let us have faith that right makes might"—that thrilled his audience. By the time he boarded a train for New England, Lincoln had demonstrated that a western man had appeal in the East, a crucial step toward his triumph at the Chicago convention.

In the ensuing campaign, most Republicans wrote off New York City as a lost cause and indeed boasted of their antiurban animosity in a bid for rural support. Campaigning in the West, Seward reminded audiences that "there is no virtue in Pearl Street, in Wall Street." Greeley's *Tribune* said the "moneybags of Wall Street" feared Lincoln because the "rich Jews and other money lenders," along with the "great dry goods and other commercial houses," were in league with slaveholders.

Some Republican politicians did try to make headway in the metropolis itself. They argued that the West—finally recovered from the 1857-59 recession—might be a better market, and political partner, than the South. They emphasized Republican support for internal improvements and tariffs, positions that won over some industrialists.

Still, most leading businessmen worked for Lincoln's defeat. The richest bankers and largest merchants forced contending Democratic candidates to fuse into a joint Union ticket, then promoted it vigorously. One group of dirty tricksters rigged a stock market panic, hoping to scare the country into thinking a Republican victory would create financial chaos. Anti-Lincoln editors escalated their racist rhetoric. The *New York Daily News*, edited by Fernando Wood's brother, Benjamin, said that if Republicans won, "we shall find negroes among us thicker than blackberries swarming everywhere," and Bennett warned workingmen that "if Lincoln is elected you will have to compete with the labor of four million emancipated negroes."

On election day thousands of stores closed and hung out signs urging patrons to vote the Union (Democratic) ticket. Many businesses circularized their employees, saying that if Lincoln were elected "the South will withdraw its custom from us and you will get little work and bad prices." New Yorkers gave the Union ticket a majority of thirty thousand and cast 62 percent of their votes for candidates other than Lincoln. The Republican *Tribune* blamed the showing on the "very general enlistment of the Mercantile and Capitalist classes in the Fusion cause."

But once again, success in the city was negated by Republican landslides upstate, which in turn helped put Lincoln over the top nationwide. Southerners read the Republican triumph as undermining their ability to veto federal threats to their institutions. South Carolina moved toward secession.

In New York, on December 15, over two thousand panicky city merchants crowded into a Pine Street establishment to draft a resolution of conciliation and reassurance to southern leaders, stressing their racial solidarity: one merchant declared that "if ever a conflict arises between races, the people of the city of New York will stand by their brethren, the white race." They vowed to defend slaveowner rights in the Union but declared that if southerners chose secession they should be allowed to depart in peace.

GRASS IN THE STREETS?

On the day before Christmas South Carolina swept out of the Union. Other Deep South states followed over the ensuing weeks. By early February the rebels had formed a government, the Confederate States of America.

One of the first rebel projects was to repudiate debts owed the North, with Manhattan's businessmen the principal target. Southern nationalists remembered that New Yorkers, with their charges for credit, commodities, insurance, shipping, and storage, had creamed off forty cents of every dollar Europeans paid for southern cotton. As the *Vicksburg Daily Whig* put it, New York "sends out her long arms to the extreme South; and with avidity rarely equalled, grasps our gains and transfers them to herself—taxing us at every step and depleting us as extensively as possible without actually destroying us." Now revenge was at hand. "What would New York be without slavery?" James Dunmore De Bow asked, and answered gleefully: "The ships would rot at her docks; grass would grow in Wall Street and Broadway, and the glory of New York, like that of Babylon and Rome, would be numbered with the things of the past."

Southern secessionists, in calculating whether they could win a military test of strength with the North, factored in what they believed to be the inherent contradictions and structural weaknesses of capitalism. These included Wall Street's financial instability—vividly witnessed in the 1857 panic—and the class and ethnic conflicts evident in New York City.

During the 1860 campaign, militant secessionist Edmund Ruffin concocted an eerily prescient fantasy he called *Anticipations of the Future to Serve as Lessons for the Present Time*. "When the Civil War began," Ruffin's narrator-in-the-future recalled, "loss of the lucrative southern trade caused massive unemployment in the industrial cities of the North." The jobless organized vast demonstrations, which turned into riots. At first these were put down by police and militia, with heavy loss of life. But "with the northern forces suffering military defeat and the northern government floundering in financial difficulties, the number of unemployed rose and the price of food spiraled." The city of New York "broke into open rebellion. Banks were broken open and their vaults robbed. Churches were looted. The avenues were filled with terrified refugees, struggling to escape the mob. . . . Drunk and gorged with plunder, the mob set the city on fire. A high wind whipped the flames into a hurricane of fire, and when morning came New York was a blackened, charred ruin." In the end, riots in other

towns forced the northern government to abandon its efforts to conquer the South.

Ruffin's first predicted catastrophe arrived as if on cue. Triggered by the interruption of southern commerce, a panic struck New York City in 1861 that in some respects was more severe than that of 1857. Southern debts went unpaid, ruining northern creditors. Merchandise went unordered, and newspapers filled with ads from merchants frantically trying to sell goods originally destined for southern ports. Prices of commodities dropped steadily. Money dried up despite cooperative efforts by bankers to halt the panic. The *Herald* computed northern losses at \$478 million. President Buchanan tried to reassure the city's capitalists and bankers by appointing one of their own, John A. Dix, as secretary of the treasury. But the crisis worsened. Some, like the Rev. Henry Bellows, feared secession was triggering social breakdown, "driving our populace into panic for bread and violence toward capital and order."

In early January two delegations—one Republican, one Democratic—left for Washington to plead for compromise with the South. Both efforts failed. At month's end thirty metropolitan leaders tried again, clambering aboard a special train with a monster memorial signed by forty thousand New York businessmen. Despite a respectful hearing from Republican congressmen over supper at Willard's Hotel, they made little impact. Indeed the Republicans soon introduced the Morrill tariff, which raised duties sharply, in some cases by 100 percent.

Some New Yorkers tried to use their financial muscle to force Republicans to compromise, saying they would otherwise refuse to buy the government's loans. Enraged Republicans countered that if a few wealthy businessmen tried to negate the democratic will, the government would issue bonds directly to the people: Horace Greeley said money could "be raised without difficulty, and in spite of Wall Street." The would-be capital strike collapsed.

LINCOLN REDUX

At this juncture, on February 19, Abraham Lincoln, on his way to Washington to be inaugurated, made his second visit to New York City. He arrived at three P.M. on the Albany train at the Hudson River Railroad

Company depot on 30th Street at Tenth Avenue. From here he was taken, in a procession of hackneys escorted by the Metropolitans, past crowds almost equal to the turnout for the prince of Wales, to Astor House, across from City Hall Park. Nearby buildings were thick with spectators. Barnum's Museum across the way was bedecked with bright flags and banners. From the top of a Broadway omnibus gridlocked in traffic, Walt Whitman watched Lincoln step out on the sidewalk, stretch his arms and legs, and scan the crowd of thirty to forty thousand. There was, he remembered, "a sulky, unbroken silence. . . . I had, I say, a capital view of it all, and especially of Mr. Lincoln, his look and gait—his perfect composure and coolness—his unusual and uncouth height, his dress of complete black, stovepipe hat push'd back on the head, dark-brown complexion, seam'd and wrinkled yet canny-looking face, black, bushy head of hair, disproportionately long neck, and his hands held behind him as he stood observing the people. He look'd with curiosity upon that immense sea of faces, and the sea of faces return'd the look with similar curiosity."

The next morning at eight o'clock, accompanied by Thurlow Weed and James Watson Webb, Lincoln was driven to the Fifth Avenue home of Moses Grinnell's daughter, where he breakfasted with a hundred of the city's most prosperous merchants. Present were the leading Republican proponents of compromise. Someone remarked to Lincoln on the number of assembled millionaires, pointedly underscoring the city's financial clout. "Oh, indeed, is that so?" countered Lincoln deftly, underscoring his political muscle. "Well, that's quite right. I'm a millionaire myself. I got a minority of a million in the votes last November."

During the remainder of the day Lincoln made short remarks to Mayor Wood and the City Council before huge throngs at City Hall while his wife visited Barnum's and received ladies at the Astor House. At night he took in an evening reception, an elaborate dinner, a performance of Verdi's new *Un hallo in maschera* at the Academy of Music (to which he wore black kid gloves, a gaffe at which the press snickered next day), and a midnight serenade. The following day he left for Washington.

A week later anxious businessmen followed him there. William E. Dodge, industrialist and financier, explained that New Yorkers were nervous about the position he would take toward the South in his forthcoming inaugural and wanted to know "whether the grass shall grow in

the streets of our commercial cities.” Lincoln responded pleasantly that “if it depends upon me, the grass will not grow anywhere except in the fields and meadows.” But when Dodge pressed him, asking if this meant he would yield to the just demands of the South, Lincoln replied grimly that the Constitution must be “respected, obeyed, enforced, and defended, let the grass grow where it may.”

THE REPUBLIC OF NEW YORK?

Stymied by Lincoln’s intransigence, some New Yorkers argued that if the Union could not be preserved, the southern states should be allowed to depart in peace, and the city should follow them out the door.

Back in January Mayor Wood had proposed to the Common Council that if the Union dissolved, New York should consider declaring—in the words of the Dongan Charter—that “New York be, and from henceforth forever hereafter shall be and remain, a free city of itself.” Wood considered the national Republican assault on southern institutions, and the state Republican dismantling of metropolitan home rule back in 1857, to be co-equal assaults on local self-government. A declaration of independence by Manhattanites would liberate them from the meddling and plundering of upstate Puritans and free them as well from federal-dictated tariffs. By making theirs a duty-free port—apart from a nominal levy on imports that would cover the cost of local government and allow the abolition of local taxes—New Yorkers would retain an “uninterrupted intercourse with every section,” including “our aggrieved brethren of the slave states,” and rise to new heights of prosperity.

While Wood’s idea was denounced publicly, it was debated privately in business circles. It had its appealing points. Some cited Hamburg, Lubec, Bremen, and Frankfurt as models. Rumors spread that some merchants were moving beyond contemplation to action. John Forsyth, a Confederate commissioner, wrote Confederate President Jefferson Davis that influential and wealthy men planned to seize the federal government’s Navy Yard, warships, and forts.

Nothing of the sort materialized. Most businessmen calculated that New York’s departure would simply trigger a further round of secessions, and the city would soon find itself cut off from West and South alike by tariff walls.

Besides, the city hadn't the material base to sustain independence. As Lincoln dryly remarked, it would be "some time before the front door sets up house-keeping on its own account."

Wood's fantasy died abruptly in March 1861 when the provisional government of the Confederacy announced its tariff policy. After April 1 duties on imports arriving via New Orleans, Charleston, or Savannah would be lowered to half the rates federal law required New York City to impose. It would soon be cheaper for St. Louis or Cincinnati to import European goods through southern ports. The certain result, wrote a horrified *New York Times*, would be that "we shall not only cease to see marble palaces rising along Broadway, but reduced from a national to a merely financial metropolis, our shipping will rot at the wharves, and grass will grow in the streets." Worse still, the Confederacy abrogated federal coastal trading laws, thus expanding foreign access to southern ports, allowing the new nation (as the *Charleston Mercury* put it) to bypass the "New York money changers" and "trade directly with our customers."

Faced with the specter of the South's appending itself to the British Empire, the repudiation of millions in outstanding debts, and the disruption of trading and financial networks built up over a century, New York's bourgeoisie, virtually overnight, opted for war.

BEAT! BEAT! DRUMS!

At 4:30 A.M., before dawn on the morning of April 12, 1861, Edmund Ruffin pulled the lanyard on one of the shore batteries aimed at federal troops occupying Fort Sumter in Charleston harbor. Twenty hours later and eight hundred miles to the north, Walt Whitman heard the report. At midnight, walking down Broadway after leaving a performance of Verdi's *A Masked Ball*, he bought a paper from newsboys crying an extra and stopped to read the story under the gaslights outside the Metropolitan Hotel. Civil war had begun.

On Monday, April 15, Lincoln declared that an "insurrection" existed in the South and called on seventy-five thousand men to volunteer for three months to put it down. That very evening a group of "the largest capitalists and most influential citizens" (according to the *Tribune*) met on Pine Street and set up a committee to organize a gigantic mass meeting on Saturday,

April 20. Throughout the week the business community's various institutions—the Stock Exchange, the Board of Currency, the Clearing House and, on Friday, the Chamber of Commerce, in the largest assembly in its history—gathered to say farewell to conciliation. “We are either for the country or for its enemies,” proclaimed the Chamber's president. The Seventh Regiment, composed of young merchants, bankers, professional men, and clerks, left its Tompkins Market armory and marched down Broadway to the Jersey City ferry and off to defend the city of Washington, at that point virtually cut off and wide open to Confederate attack.

On Saturday the twentieth, what was reputedly the largest assemblage ever seen on the continent—somewhere between 100,000 and 250,000 people—flooded into Union Square. (In the war years, Union Square would replace City Hall Park as the center of civic life.) It was, all agreed, “a red, white and blue wonder.” Five stands swathed in the official colors groaned with speakers (including Major Robert Anderson, the hero of Sumter). The new bronze statue of Washington was wrapped in the flag that had been fired upon at Sumter. And Broadway emporiums from Stewart's (at Reade) to Lord and Taylor's (at Grand) were similarly bedecked as the city's trade and benefit societies marched behind bands and flags of their own. Virtually every workshop in the city sent a delegation to the rally.

The meeting (as banker John Austin Stevens recalled) had been planned and orchestrated toward having the populace entrust “the guidance of their action” to “the merchants of the city, the chief representatives of its wealth and influence.” As expected, those assembled ratified establishment of a Union Defense Committee (UDC), composed of thirteen Democratic and twelve Republican businessmen. These gentlemen set about launching the war effort.

On Sunday, April 21, Lincoln, impressed by the New Yorkers' dispatch, surreptitiously ordered the transfer of two million federal dollars into UDC hands, with which to unofficially purchase arms, steamships, and supplies and to use in enlisting and dispatching troops to open the road to Washington. At the urging of none other than

The Great Union Meeting in Union Square, April 20, 1861. (© Collection of The New-York Historical Society)

Mayor Wood, recent advocate of municipal secession, the Board of Aldermen authorized borrowing another million and a half from the Bank of New York and other financial institutions to pay for volunteers and for the relief of their families while they were away. Within a week the UDC started funneling this \$3.5 million into chartering ships, procuring supplies, and forwarding troops to Annapolis in armed convoys via the Potomac River and Chesapeake Bay. New York was established as headquarters of the army's Department of the East, and four military depots were set up to

process recruits. By Tuesday, April 23, six regiments had been dispatched. The following weeks witnessed virtually continuous ceremonies honoring departing troops. Bowery photographers did a booming business printing thousands of pictures of new soldiers decked out in their “regimentals.” By the end of 1861 the UDC had placed sixty-six New York regiments in the field and aided almost twelve thousand volunteers’ dependents.

THE B’HOYS AT WAR

The German community was aflame with war fever. A huge meeting at Steuben House on the Bowery had already established enlistment stations all through Kleindeutschland. Three-fourths of the New York Socialistischen Turnverein signed up, forming an all-Turner outfit, and many other units—such as the Seventh Volunteer Regiment (Steuben Guard) and Colonel Louis Blenker’s German Rifles—were also manned by veterans of the 1848 Continental wars. Blenker’s Regiment received a regimental flag at City Hall from Mrs. August Belmont, feasted at the Bowery’s Atlantic Garden on sausage, dark bread, and beer, then set off to war.

Hungarians and Swiss flocked to join George D’Utassy’s First Foreign Rifles, which swiftly merged with the Italian Legion formed by Alexander Repetti (who had served under Giuseppe Garibaldi in the Italian reunification struggle of 1848-49). The merged unit—the Garibaldi Guard—followed European practice and equipped wives of members as *vivandieres*. Dressed in red flannel basques and blue skirts, it was their job to lead troops in dress parade and sometimes into battle, as well as to serve as nurses, cooks, laundresses, soldiers’ confidantes, and matrons of the company in camp. Several young working women from Jersey City ran away from home to serve, marrying men on the spot in order to sail with the Garibaldians. Escorted to the dock and off to war by the Teutonic and Germania societies, they would later be followed by the DeKalb Regiment, composed entirely of German clerks, and by the Polish Legion.

No group surpassed the Irish in enthusiasm. The Sixty-ninth, which had refused to honor the prince of Wales, voted unanimously to enlist under Michael Corcoran. Within days, an additional sixty-five hundred were pleading to serve under the Donegal-born Fenian leader. On April 23 the regiment was blessed by Archbishop Hughes at St. Patrick’s Cathedral and

marched off to the ferry. After their ninety-day service was up, which included honorable duty at First Bull Run, they returned to the Battery on July 27 for an uproarious welcome from Irish fire companies, the Ancient Order of Hibernians, the Sons of Erin, and bands blaring “The Cruiskeen Lawn” and “St. Patrick’s Day in the Morning.” Most reenlisted immediately and inspired yet another wave of Irish to join up.

Corcoran himself, wounded and captured at First Bull Run, didn’t make it back to New York until August 1862, when Lincoln got him exchanged. In his absence Thomas Francis Meagher organized an Irish Brigade. Meagher had been a leader of the Young Ireland agitation of the 1840s. Exiled to Tasmania, he escaped to New York, where he

set up a law practice and led anti-British agitation among the immigrants. Now Meagher recruited thousands into the brigade's three regiments; Irish women sewed it flags and banners; Daniel Devlin furnished its uniforms free of charge; and the troops departed in late 1861.

When Corcoran returned from Confederate prison to a triumphal welcome in 1862—the kitchen help for miles around flooded to the streets to welcome their hero, noted young Joseph Choate, partner in a Wall Street law firm—he promptly organized yet another four new regiments into an Irish Legion. Corcoran would command its four thousand members—who received an en masse outdoor blessing from Archbishop Hughes—as a brigadier general until his death in 1863.

For many Irish, joining up had political overtones. Patriotic participation, some hoped, would forever silence nativist charges that Hibernian Catholics were unworthy of citizenship. Recruiting posters also emphasized that the war was a blow against England, natural ally of the Confederate “cotton lords.” Many noted, too, that Union army training would serve them well in Ireland's coming war of liberation. For others, volunteering was part lark and part escape from hard times. It was impossible to get work in the panic spring and summer of 1861, and many followed suggestions in the *Herald* to sign up for the soldier's pay of thirteen dollars a month. These companies, extremely rambunctious, constantly tested the limits of military authority.

Billy Wilson's Boys, the Sixth Regiment, were a case in point. Wilson, an expugilist and ex-alderman, recruited his volunteers at a dogfighting and ratbaiting house in White Street. His pugnacious men, armed with slungshots and seven-inch knives, envisioned the war as an adventurous brawl-writ-large. In their camp on Staten Island, they trained by scrapping with other regiments, plundering the neighborhood, and drinking prodigiously.

Equally notorious were the men of the Eleventh Regiment (the Fire Zouaves). Composed largely of volunteer fire laddies, the unit was commanded by Ephraim Elmer Ellsworth, the man who popularized the uniform of the Franco-Algerian Zouaves: red billowing trousers, loose tunics, sashes, and turbans. These b'hoys went boisterously off to war and,

on arriving in Washington, promptly broke into taverns, ordered meals, and charged them to Jeff Davis. They redeemed themselves in Washingtonian eyes, however, when a building next to Willard's Hotel caught fire.

Ellsworth's men, quartered nearby in a wing of the Capitol, leapt out the windows, broke into the engine houses, and reached the spot before the city's firemen were even awakened, saving the whole structure. More to the point, they fought well at Bull Run, though after the rout hundreds melted away and returned to New York, denouncing their officers who had fled the scene of battle. The regiment was reorganized, and though it remained refractory and brawled repeatedly, in the end it returned to the fray.

African-American troops were conspicuously absent from that fray, though not for lack of trying. Back in May, black New Yorkers had started drilling on their own in a privately hired hall. Chief of Police Kennedy warned them that "they must desist from these military exercises, or he could not protect them from popular indignation and assault." In July the community tried again. Three regiments of black soldiers were offered to Governor Morgan for the duration of the war. The black population of the state guaranteed their arms, clothing, equipment, pay, and provisions. The governor declined.

Overall, however, the outpouring of metropolitan manpower and firepower was tremendous. Walt Whitman was ecstatic. In a new poem (*Beat! Beat! Drums!*) that he read aloud at Pfaff's in September, Whitman claimed that the "torrents of men" he'd seen marching off that summer represented "DEMOCRACY" in all its primal energy: "I have witness'd my cities electric; I have lived to behold man burst forth, and warlike America rise."

ENTREPÔT AND WORKSHOP

The South was furious at its former ally. A Richmond Dispatch editorial entitled "Execrable New York" proclaimed it the inferior of "Sodom, to which, on account of its horrible profligacy of morals, it has often been likened," because Sodom, unlike New York, had had at least one principled man "amid an unclean and accursed generation." The *Charleston Courier*—railing at "the treacherous cowardice and hypocrisy of [its] merchants and Mammon-worshippers"—declared that "the interests of Christianity, civilization, humanity, and intelligent self-government, require that New

York, the metropolis of shoulder-hitters, prize-fighters, blackguards and mercantile gamblers should be blotted from the list of cities.”

For a time it looked as if the *Courier* would get its wish. Southern crowds menaced the offices of northern firms until their occupants packed up and returned home. The Confederacy prohibited the payment of debts to northerners. Even merchants who refused to repudiate announced a suspension of remittances until the war’s end. By July trade had virtually ceased.¹

Severed from its southern connection, New York’s manufacturing economy crashed, too. The East River shipyards and ironworks came to a standstill. Boot and shoe production was drastically curtailed. Half the two thousand workers in the carriagemaking trade, heavily dependent on southern slaveocrat orders, were laid off. The dry-goods business was prostrated—the hoop skirt trade had sent 75 percent of its product to southern belles—and by summer one-fourth of the jobbers in Manhattan had gone under. Even the ice industry was crippled by lack of orders from the South.

With thirty thousand idled, droves of workingmen requested commitment to the workhouse. The superintendent of the outdoor poor got ten thousand applications for coal. Hundreds of homeless sought shelter in police stations. In July two thousand German workers demanded municipal public works programs. It looked like 1857 had come round again.

By fall, however, war had resurrected and reoriented the economy. Wheat began surging into the city. In 1860 and 1861 European (and particularly British) crops failed, while at the same time, the American West produced bumper harvests and great quantities of livestock. With the Mississippi closed by war—paddle wheels on sixteen hundred steamboats had stopped turning—westerners shifted from rivers to railways. Freight tonnage and passenger usage expanded rapidly on established East-West lines like the Pennsylvania, the Erie, and the New York Central. Demand spurred the strengthening of old lines—the Hudson River Railroad spanned the Hudson at Albany with a revolutionary two-thousand-foot long iron bridge—and induced construction of new ones. British capital and fifteen thousand British laborers and engineers were dispatched from Europe to lay tracks for the Atlantic and Great Western. It ran from Cincinnati through the newly discovered and already booming oil fields of Pennsylvania, and on to

Salamanca in western New York, where it connected with and revived the half-defunct Erie, cutting Cincinnati-New York travel time to less than a week. Looking ahead to still grander vistas, New Yorkers, including Dix, Dodge, and A. A. Low (now president of the Chamber of Commerce), assumed key roles in the federal government's 1862 incorporation of the Union Pacific, which they planned to run to the eastern border of California. Together with the flood of waterborne traffic—Great Lakes and Erie Canal tonnage was still twice that of the New York Central and Erie combined—the new routing finished off New Orleans as a contender for leading export center. Atlantic seaboard competitors fell even farther behind: while exports of wheat, wheat flour, and corn from New York City mounted from nine million bushels annually to fifty-seven million, Philadelphia limped along with a mere five million, Boston with but two.

The amber waves of grain that rolled into the harbor flowed right out again to European ports. To speed the wheat on its way, merchants at Brooklyn's Atlantic Dock deployed the first floating elevators. These could remove, weigh, bag, and reload grain from canal boats onto steamers at the rate of five thousand bushels per hour. Hundreds

of Irish grain shovelers were fired; the company boasted that thousands more would go. In July 1862 two thousand shovelers, organized by the Grain Workers Protective Association, joined three thousand longshoremen and stevedores in a strike to demand the machines be abandoned. The grain merchants used scabs from ships' crews around the harbor to break the strike, something the grain workers would remember.

The West shipped cattle along with wheat. By the summer of 1862, Illinois alone was forwarding two thousand head a week. The city was overrun with cows being driven through the streets to more than two hundred uptown slaughterhouses. By 1864 over two million beasts were being butchered annually in New York (more than in Chicago) and the air reeked from boiling bones and rendering fat. Lumber came rolling in too, more than enough to sustain Brooklyn's building boom. Sugar poured in, enough to warrant the opening of six new refineries during the war. The Havemeyer family rose to prominence as the sugar business became one of the city's largest industries. Oil gushed in. Within a scant few years of the 1859 discovery of black gold in Titusville, millions of barrels were flowing out of northwestern Pennsylvania to the nation's two hundred new oil

refineries. Twenty-five of these still-small (ten-man) operations were in the metropolitan area, notably in Williamsburg and Greenpoint along the East River and Newtown Creek, where they produced “kerosene,” the cheapest illuminant ever known. By 1863 almost half a million barrels of petroleum product were being exported from New York.

Shipbuilding, like almost every other city industry, was stoked by war contracts. As early as August 1861 the *Tribune* noted that local yards were busy producing a new gunboat fleet for the navy, refitting old steamers and merchantmen for war, and meeting businessmen’s demand for vessels to handle the exploding coastal, lake, and river trade. “Recently so idle and empty, [they] once more resound with the cheery hum of labor and the new music of the adze and anvil.” Soon four thousand men were at work in Brooklyn’s Navy Yard alone.

Skilled machinists were in great demand to develop and repair naval machinery. By 1863 the great ironworks—Neptune, Fulton, Morgan, Novelty, Continental, Allaire, Delamater, and McLeod—were turning out vertical and horizontal engines, boilers, furnaces, plates, and anchors. At the Novelty works twelve hundred men were kept busy refitting the *Roanoke* with a thousand tons of armor and three revolving turrets for fifteen-inch guns, while simultaneously making a beam engine for a Pacific mail steamship and machinery for three side wheel steamers.

The maritime engineering triumph of the war years came at Thomas F. Rowland’s huge Continental Iron Works along the Greenpoint waterfront at Calyer and West streets. In 1861, while most of its fifteen hundred hands were producing gun carriages and mortar beds for the Navy, the company began work on a design by Swedish engineer John Ericsson for an ironclad warship. Ironclads were an old idea. The United States had flirted with them during the Mexican War, and French success with them in the Crimean War (1854-56) had led the English and French navies to pour millions into their construction. The *Monitor*, launched at Greenpoint on January 30, 1862, was also a success: it fought the Confederate’s *Merrimac* to a standoff on March 9 and generated a host of additional government contracts for Continental.

Underwritten by federal dollars and protected by federal tariffs, New York manufacturers of every description expanded rapidly. Cooper, Hewitt turned out gun carriages and gun-barrel iron; Phelps, Dodge, and Company

churned out iron forgings and castings; the Hendricks Brothers Copper Rolling Mills worked at full capacity throughout the war. Conrad Poppenhusen's Enterprise Rubber Works in College Point flourished on orders for hard rubber flasks, cups, and buttons. City carriagemakers produced hundreds of ambulances and baggage wagons for the Quartermaster General's Department. War galvanized Brooklyn's fledgling pharmaceutical industry too. Edward Robinson Squibb, a former navy doctor, manufactured drugs (including ether) for the military, first in rented quarters on Furman Street, then in additional buildings on Columbia and Vine streets in order to handle the bulk orders of bandages, splints, and panniers (baskets of medicines and surgical instruments). Charles Pfizer, who had immigrated in 1848 and established a chemical manufacturing plant in Williamsburg on Bartlett Street, similarly expanded to meet wartime demand.

War orders and the tariff on foreign ready-mades boomed the clothing trades too. A. T. Stewart's army and navy contracts netted him nearly two million dollars annually during the conflict, and Brooks Brothers received its first contract from the New York State Military Board—for twelve thousand uniforms—as early as April 1861. Brooks Brothers also pioneered the use of “shoddy” when, discovering it lacked enough suitable cloth, it resorted to using shredded rags that were rolled, glued, and smoothed into ersatz cloth. When artisan tailors alerted government officials to the fact that the contractor was “fitting out soldiers with suits of clothing that disgraced the State” while paying a “grinding standard of wages,” the firm replaced the inferior goods. However, many of those who snared subsequent contracts were speculators who had influence and connections, but no experience in the business. After taking a hefty cut of the appropriated funds, they subcontracted the work to jobbers who, to extract their own profit, jammed wages down, demanded blistering rates of production from artisans and female outworkers, and scrimped on materials. This became apparent when shoddy uniforms fell to pieces in the rain, leaving soldiers almost naked. The army also marched on shoddy shoes. Even the New York Chamber of Commerce later admitted that local contractors had sold the government great numbers of boots whose soles, made of pine chips pasted over with thin leather, dropped off after a half-hour's hike. Contractors also supplied rotten blankets, tainted pork, glued knapsacks that came apart in rain, and even shoddy horses: stables on 24th

Street—in collusion with inspectors—fobbed off partially blind nags on the cavalry at premium prices.

War boosted the communications industry. New technology allowed newspapers to bring the fighting vividly before the literate public, and as Sabbatarian reservations crumpled, special Sunday editions offered detailed recounting of battles. The press reached the illiterate as well: the dailies, and especially *Harper's Weekly*, *Frank Leslie's Illustrated Newspaper*, and the *New York Illustrated News*, carried Currier and Ives etchings or sketches by artists that graphically portrayed battlefields, soldiers, and hospitals. The soldiers themselves were mass consumers, and it was rumored that during the battle of Antietam newsboys hawked the latest extras to the troops.

The war did deal a severe blow to one sector of the city's economy. New York's merchant marine—badly buffeted in 1857 and 1858—was finished off by Confederate cruisers. After 284 captures by southern privateers (sixty-four by the dreaded *Alabama* alone) and the inevitable hike in insurance rates, most American and overseas traders had transferred to foreign flags. The total value of goods carried in U.S. vessels sank from \$507 million in 1860 to \$185 million in 1864. By war's end three-fourths of the commerce in New York's harbor was carried by foreign lines, and most of the steamship lines that serviced the city were heavily subsidized British and German firms.

Overall, however, the war forged powerful new bonds between metropolitan manufacturing and the national state—neatly symbolized by the Bronx-built Capitol dome set in place in 1863—which wrought a revolution in productivity. The industrial output of New York City almost outpaced that of the entire Confederacy.

GREENBACKS AND GOLDBUGS

By July 1861 the Union was nearly broke. Secretary of the Treasury Salmon P. Chase had two million dollars on hand to meet federal needs he estimated at \$320 million. He turned to the banks. In August, after a week-long conference in Manhattan, a consortium of financiers from New York, Boston, and Philadelphia—headed by Moses Taylor of City Bank and James Gallatin of National Bank—agreed to lend the government \$150 million. Charging a 7.3 percent rate of interest, compared to the 5 to 6

percent they got from railroad companies, the consortium began with a first installment of \$50 million, of which New York's share was \$29.5 million, apportioned among thirty-nine of the city's fifty banks. Secretary Chase took the loan in gold (the government was, by law, not allowed to accept bank deposits). This quickly depleted the banks' reserves, especially given the hoarding of gold that had commenced with the war. By December 30, 1861, the New York banks had ceased making specie payments, and bankruptcy was at hand.

So Congress authorized the treasury to print money. In February 1862 the government began issuing legal tender "greenbacks," and by March 1863 it had authorized \$450 million worth. The arrival of the nation's first uniform currency did not stop state banks from continuing to print a bewildering array of notes, which also served as money, so to regularize the currency, Congress reorganized the entire banking system in February 1863. The law created the new status of "national bank"—chartered directly by the federal government and required to obey certain rules and regulations. Many state-chartered banks, particularly in New York and other eastern cities, were hostile to the new system, as the inducements didn't seem to warrant accepting federal regulation. Finally, in 1865, they were bludgeoned into acquiescence by the imposition of a stiff tax on state bank notes. For all their grumbling, Manhattan bankers soon found the new national system, which quickly came to center in the metropolis, to be highly lucrative.

To raise money to pay the interest on its bonds and back its greenbacks, the Republican administration instituted taxes on manufactured products and on professional and business activities and initiated a 3 percent levy on incomes over eight hundred dollars. When these revenues failed to bring in enough funds, the government decided to borrow from the general public. Secretary Chase appointed Philadelphia financier Jay Cooke as the nation's investment banker. He organized a syndicate of the ablest investment houses in several cities (Livermore, Clews, and Company was the New York choice), and this group in turn hired twenty-five hundred subagents who hawked the treasury's "five-twenties" in almost every town and village. For a time Cooke's bond drive, which brought in a million dollars a day, proved sufficient. During the war's last grueling years, however, expenditures soared to over \$3.73 million a day, and the government was

again forced to rely heavily on New York financial houses to sell bonds and negotiate loans.

The Civil War gave the city's bondholders and bankers—as it had local manufacturers—a tremendous stake in the fortunes of the federal government. By 1863 the Chamber of Commerce added to its list of reasons for putting down the rebellion the “vast pecuniary obligation” the war itself had created, noting Union defeat would put “in jeopardy one thousand millions or more of public debt.” Command of the fiscal sinews of war in turn would give the northern commercial classes, especially the Manhattan bourgeoisie, ever greater influence over affairs of state.

The flood of government greenbacks and the large issue of short-term interestbearing notes made money abundant, facilitated the war boom, and ignited the financial exchanges. The stock market fluctuated wildly with the military situation. When McClellan landed his army on the peninsula, stocks rose; the first reverses brought them down; they rose with the fall of New Orleans; they dropped with defeats on the Chickahominy. Yet through all the gyrations—which afforded fertile field for speculators—the direction of the market was unmistakably up. In the space of two years, the overall value of stocks on the New York market increased by two hundred million dollars.

Merchants, dowagers, and clergymen accordingly flocked to Wall Street. In January 1862 the *Tribune's* financial editor wrote that “the excitement in stock circles today we have never seen equalled in our very long experience of the street. . . . The intense desire to buy almost any kind of securities amounted almost to insanity. . . . The oldest members of the Board cannot remember such a day of rampant speculation.” The bull market was further fueled by margin buying. Stock buyers could put up as little as 10 percent (at times even 3 percent) of the purchase price in cash. Banks were only too willing to lend the rest at up to 10 percent interest. Stockbrokers were delirious: by 1863 they were averaging three thousand dollars a week in commissions.

One beneficiary of the war boom was the New York Stock Exchange, which received a permanent home after flitting for years from stables to attics along Wall, Hanover, William and Beaver streets. In 1863 a group of brokerage firms incorporated a building company, hired architect John Kellum to design a Tuscan palazzo-style structure, bought a site for it two

blocks west from where the Exchange had started back in 1792, purchased iron and stone from the Cornell Works and the East Chester Marble Company, and had the building finished a few months after Appomattox.

THE SHODDY ARISTOCRACY

In March of 1863 William Dodge wrote a friend in England: “Things here at the North are in a great state of prosperity. You can have no idea of it. The large amount expended by the government has given activity to everything and but for the daily news from the War in the papers and the crowds of soldiers you see about the streets you would have no idea of any war. Our streets are crowded, hotels full, the railroads, and manufacturers of all kinds except cotton were never doing so well and business generally is active.”

New York’s upper classes made money in quantities never before seen or even imagined. In 1863 the upper 1 percent of income earners (sixteen hundred families) garnered about 61 percent of the city’s wealth. And where in 1860 there had been a few dozen millionaires in the city, by war’s end there would be several hundred, some of them worth over twenty millions.

In celebration of their expanded or newly minted fortunes, the rich went on a shopping binge. After striking successful deals at the Astor House, speculators decked out in velvet coats, gold chains, breast pins, and rings dined at Delmonico’s on partridge stuffed with truffles. The “shoddy aristocracy” paraded down Fifth Avenue on Sundays or trotted around the new Central Park in their shiny equipages wearing thousand-dollar camel’s hair shawls. Contractor parvenus gloried in liveried servants and imported luxuries. In 1862 the genteel Maria Daly was horrified to hear that “a saddler’s wife went to Tiffany and Young’s . . . and ordered the greatest quantity of pearls and diamonds and plate.”

Among the most prodigious shoppers was Mary Lincoln. When Congress appropriated twenty thousand dollars for her to redecorate the White House, she hastened to New York City’s department stores, overspent her budget, then pleaded with bureaucrats to make up the difference without telling her husband. Throughout the war she went on repeated and increasingly pathological spending sprees in the metropolis.

Mrs. Lincoln was driven by personal demons, but in milder form, her ardent consumerism became commonplace.

The grand symbol of the wartime boom was A. T. Stewart's "New Store." Abandoning his Marble Palace on Broadway and Chambers, Stewart had architect John Kellum design a structure farther uptown on a plot bounded by Broadway and Fourth Avenue, 9th and 10th streets, just across Astor Place from Cooper Union. The New Store was of cast iron (produced at the Hudson shoreline by the Cornell Iron Works). Painted white, the building rose five stories around a great rotunda. Its graceful molded arches in the Venetian manner—Stewart compared them to "puffs of white clouds"—also permitted rows upon rows of windows, and the building featured two thousand panes of French plate glass.

Stewart put no displays in the ground-floor windows, relying instead on views of the shoppers within to draw additional customers. On opening day, November 10, 1862, crowds entering the largest retail store in the world found countless orderly displays, laid out with "military precision," *Harper's Monthly* noted approvingly, and an army of five hundred clerks and cash boys (who ran back and forth between cashier and clerk) waiting to serve them. On the first floor customers could purchase silks, dress goods, men's furnishings, linens, and domestics' clothing. Here the wealthy could buy outfits for balls (like the glittering 1863 reception for officers of the Russian fleet at the Academy of Music) or for the summer season. Though the prices tended to the staggering, the less well heeled could find bargains at the calico and remnant counters.

The upper floors were devoted to production, not consumption. On the fourth, 500 seamstresses and dressmakers labored in well-lit, well-ventilated workrooms considered the finest in the city, though annual wages ranged only from \$100 to \$250. The fifth floor was given over to a linen service that employed another three hundred women. The store thus had nearly a thousand employees, neatly segregated by gender—eight hundred women or girls on the production side, a hundred supers, cashiers, bookkeepers, ushers, porters, clerks, and cash boys on the consumption end—though as the war generated a male labor shortage, women entered the sales force for the first time. In some ways the cast-iron palace, the largest worksite under one roof in the city, resembled a gigantic factory. Reviewers noted the clerks were placed on a strict regimen during their twelve-hour

days and that Stewart treated his “employees as cogs in the complicated machinery of his establishment. . . . The men are numbered and timed.” All the latest technology was deployed: steam engines heated all the floors, pumped water to the laundry, and powered the sewing machines in the carpet-manufacturing department. At night the building was brilliantly illuminated by gaslight chandeliers.

In summer many New Yorkers traveled north to Saratoga on Daniel Drew’s sumptuous new steamboats. There the women arranged fancy dress balls while the men indulged in liquor, races, and gambling at establishments created by John Morrissey, the Democratic politico, boxer, casino operator, and now turfman.

In fall, back in the city, the great hotels were glittering and crammed. Hundreds of contented Republican males packed the Astor House’s smoke-filled, gas-lit Rotunda Bar each evening, to banter and drink tap-beer and eat roasted meat before heading out for evening expeditions. Pleasure seekers might take in the theater, the city’s flourishing bawdy houses, or an opera at the Academy of Music. After 1862, they could dine at Lorenzo Delmonico’s latest and most luxurious restaurant, in the converted Moses Grinnell mansion at Fifth and 14th, one block west of Union Square.

For the ladies, there were days at the milliner’s or department stores. Wartime fashion ran to carriage cloaks of moire or amber velvet, to sable or mink furs, and to gowns of organdy, grenadine, and brocade silks in deep and brilliant magenta, gold, or fuchsia. Hoop skirts blocked traffic, which is why Mme. Demorest’s Imperial “dress-elevator” was immensely popular: its weighted strings allowed women to raise or lower their skirts at will, thus clearing New York’s mud and slush.

Even charitable occasions could be turned into festivals of consumption. In April 1864 the U.S. Sanitary Commission held a Metropolitan Sanitary Fair to raise money for its activities. Organized by the wives of leading businessmen, it was held in two buildings erected at Union Square (with interior decoration by the young architect Richard Morris Hunt). For three weeks, an estimated ten to thirty thousand daily shoppers thronged the stalls, raising \$1,365,000.

The extravagance did provoke some opposition. A *Harper’s* 1864 article called “The Fortunes of War” denounced the “suddenly enriched

contractors, speculators, and stock-jobbers” who were “spending money with a profusion never before witnessed in our country, at no time remarkable for its frugality.” The magazine rebuked those who used gold and silver dust to powder their hair and noted caustically that the price of a dinner at Delmonico’s or Maison Doree could “support a soldier and his family for a good portion of the year.” At a May 1864 Cooper Union meeting called by the Women’s Patriotic Association for Diminishing the Use of Luxuries, various speakers denounced the purchase of foreign superfluities while young men were dying on the Potomac, and all assembled pledged to reject imported luxuries. But the campaign was a flop: many promoted republican simplicity, but few were prepared to practice it.

REFORMERS AT WAR! THE SANITARY COMMISSION

Reformers—environmentalists and moralists alike—saw the great contest as an opportunity to educate the United States into a grander understanding of nationhood. In New York City they had fought to promote the public welfare. Now the war would allow them to apply, on a continental scale, ideas and programs they had developed while fighting metropolitan poverty and squalor.

The object of their reform efforts was the Union Army. Armies, they believed, were like cities: in both, vast numbers of men, mostly undisciplined workers, were packed into small deprived environments, which threatened their health, morals and lives. The organizational instrument they established to reform military life was a commission in many ways analogous to the commissions Republicans had established in the late 1850s to reform New York City.

The genesis of the U.S. Sanitary Commission lay in the response of northern women to the outbreak of war. By 1861 thousands of ladies, exhorted by women’s magazines, had gathered at one another’s homes or in churches to make bandages for the troops. Upper-class ladies worked for the Seventh Regiment at George Templeton Strong’s, and Henry Ward Beecher’s church kept a dozen sewing machines going. In addition, Dr. Elizabeth Blackwell, seeing the need for nurses, began giving two-month training courses in her infirmary, and at Bellevue or New York Hospital, then sending volunteers on to Washington.

Soon, several elite women decided these efforts needed coordination. Dr. Blackwell joined with Mrs. William Cullen Bryant, Mrs. Peter Cooper, and “Ninety-Two of the Most Respected Ladies” in calling for an oversight organization. On April 26 four thousand women gathered at the Cooper Union to form the Women’s Central Association of Relief for the Sick and Wounded of the Army. The twenty-four-year-old Louisa Lee Schuyler, a member of the Rev. Henry Bellows’s fashionable All Souls Unitarian Church on Gramercy Park, became the key organizer.

They soon found that federal administrators paid women little heed, so they turned to Bellows, Strong, and some prominent male physicians for assistance in gaining official approval and establishing a working relationship with military authorities. These men prepared a report for Lincoln that adopted an expert, “scientific” approach. Analyzing data generated by the British and French Commissions of the Crimean War, they observed that during that conflict (1854-56) an estimated 22 percent of British war deaths (30 percent for the French) had stemmed from possibly preventable disease.

In June, Stanton and Lincoln authorized establishment of the Sanitary Commission as a semiofficial agency to take charge of the health and welfare needs of the army. The organizers established a committee of associates, composed mainly of Republican bankers and merchants, to help solicit funds. The initial stake came from life insurance companies; many communities had taken out policies for local volunteers, so the firms stood to benefit from decreases in soldier mortality.

Their next move was to establish the predominance of their male, professional, and highly centralized staff over the volunteer women already organized in benevolent associations in most of the cities and small towns of the north. By 1863 the Sanitary Commission had become the mediator between these women’s groups and the military, circulating information on hospital and army supply requirements to thousands of local Soldiers Aid societies. The commission also investigated troop, camp, and hospital conditions and established an elaborate battlefield relief system, introducing reform methods into the government bureaucracy.

The sanitary commissioners proved extremely effective. They also made a lot of enemies by their insistence that discipline and subordination should be imposed on unruly armies, as on unruly cities. They thought Lincoln’s

pardoning of condemned deserters smacked of just the kind of fuzzy-minded and indiscriminate charity they had battled in New York. Female volunteers, in turn, resented the male commissioners' domination of the one public arena, charity, in which women had established some authority and objected to the commission's use of agents who were paid fifteen hundred to four thousand dollars annually when soldiers were getting \$156. Nor did the commission members' wealth, professionalism, Republicanism, or residence in New York City endear them to the mass of the volunteers.

Many switched their support to another Manhattan operation, the U.S. Christian Commission, founded November 16, 1861, by the YMCA. Its leadership was an interlocking directorate of the American Bible Society, the American Tract Society, and the Sunday school and temperance movements, with its New York Committee chaired by the indefatigable William Dodge. The Christian Commission's concern was the "Spiritual Good of the Soldiers." Its methods too grew out of approaches to the urban poor long since worked out by tract societies and missionaries. Pious and devoted volunteers—1,375 of them—distributed religious literature and medical supplies directly to the wounded men in the hospitals, rather than, like the Sanitary Commission, to doctors for distribution as they saw fit.

CARNAGE AND CLASS

Meanwhile, New York's working classes were experiencing the world's first modern war in all its horror. What had seemed at first a lark or a living became a ghastly death trap. Between April and November 1862—at Shiloh, Seven Days, Second Bull Run, Antietam—tens of thousands were killed or maimed. In December came the disaster at Fredericksburg when the blundering General Ambrose Burnside led the Army of the Potomac in a suicidal charge against Confederate entrenchments. The Fifty-first New York Volunteers were ordered to advance over a narrow plain so well covered, said a southern gunner, that "a chicken could not live in that field when we open on it."

Among the ninety-six hundred Union wounded at Fredericksburg (though luckily not among the 1,284 who died there) was Walt Whitman's brother George. Walt hurried from Brooklyn to Virginia. On arriving, the author of *Beat! Beat! Drums!* had his first direct encounter with war: an immense heap of amputated arms and legs ("cut, bloody, black and blue,

swelled and sickening”). Whitman would stay on for the next three years as a volunteer worker, make six hundred visits to hospitals, comfort soldiers, and record images of a war that resembled nothing so much as the cattle pens of New York City: “a great slaughter-house & the men mutually butchering each other”; a “butchers’ shambles” replete with “groans and screams” and the “odor of blood.”

As city soldiers were shot to pieces—the Irish Brigade and the Garibaldi Guard virtually ceased to exist by 1863—the bright marching songs gave way to mournful ballads. Around the campfires survivors sang sentimental songs of home: “Shall I Never See My Mother,” “It Was My Mother’s Voice,” “Mother, I’ll Come Home Tonight.” The sheet music sales of “Weeping, Sad and Lonely; or, When This Cruel War Is Over” (published in 1863 by Sawyer and Thompson of Brooklyn) reached nearly a million.

Word of the dreadful course of events quickly got back to the northern metropolis a thousand miles or more behind the lines. Newspaper reports and pictures finished off the “picnic” image of the early days of the war as the press routinely printed catalogs of death and disfiguration (“Thomas McGuire, Co. A, leg amp”; “M. Riley, Co. C, groin”; “H. Mcilainy, Co. I, forehead, severe”). Still more direct testimony was furnished by the thousands of hobbling wounded on the city’s streets, the incessant funeral processions, and the many deserters who had fled the wanton waste of life for the anonymity of the big city, rather than return to their small hometowns, where certain arrest awaited them. The city’s hospitals, moreover, were jammed with wounded soldiers, notably Bellevue—whose Dr. Stephen Smith produced the pocket text *A Handbook of Operative Surgery*, which became a standby in Union field hospitals—and the special military hospital set up in Central Park at the former Mount St. Vincent, where nursing duties were given over to the Sisters of Charity.

All these sources made abundantly clear that at the front, pay was not only low but late (and arrears of up to a year were disastrous to those with families dependent on them); that soldiers were gouged by the sutlers who sold them tobacco, ink, stamps; and that nativist bigots ruled some of the camps. Army General Orders required attendance at religious services of the commander’s choice (despite Archbishop Hughes’s plea that soldiers be free to attend or not). The tendency of Republican officers to use their rank to impose their views was particularly objectionable at a time when the

southern press dwelt on the foreign character of the northern armies (calling the Germans Huns and the Irish barbarians) and debated whether to grant such savages prisoner-of-war status or simply to hang them outright when captured.

Word also got back to New York that if officers weren't bigoted, they were incompetent. Whitman was not alone in believing that many of the deaths were unnecessary: he called Burnside's Fredericksburg operations "the most complete piece of mismanagement perhaps ever yet known in the earth's wars." The root of the problem, it seemed clear, was that most of those who raised, and therefore led, the volunteer regiments early in the war were not military professionals (who remained segregated in the regular army) but wealthy businessmen, socially prominent gentlemen, or successful politicians. Their only qualifications were their connections to the state governors who commissioned colonels and brigadiers. Many proved corrupt as well as incompetent, extorting money by making up fraudulent payrolls, forcing their men to answer to fake names, and pocketing their pay.

As word got back, enthusiasm for enlistment fell. The recruiting tent in City Hall Park was shut down for lack of business. And the federal government, faced with similar manpower problems throughout the North, began to explore the possibility of instituting a draft.

The Battle for New York

Working people in the city had their own miseries to contend with as the war ground on. In the boom's first flush, jobs had been plentiful, especially for skilled workers, and wages decent even for manual laborers (a dollar a day versus fortythree cents in the army). People had been able to put a little something away in savings banks. But paper money, scarcity of goods, and incessant profiteering led to rampant inflation. Between 1860 and 1863 currency depreciated by 43 percent while wages rose a mere 12 percent. Beef nearly doubled in price; rents jumped 15 to 20 percent, coal went up more than 30 percent.

Wives and children of the absent volunteers found much of the money the Common Council had appropriated for their care rerouted to supplies and troops. As the relief program sagged, women demonstrated at City Hall and the homes of councilmen; in December 1861, when public relief was halted for a time, some two hundred desperate women gathered in Tompkins Square to insist that "you have got me men into the souldiers, and now you have to kepe us from starving." Community self-help efforts—like a Jones' Wood "festival" that drew sixty thousand who paid twenty-five cents apiece to aid those widowed and orphaned by the Battle of Bull Run—proved at best temporary expedients.

Shelter was a growing problem. During the war construction of housing declined sharply, just as expanding commercial and industrial operations ate into working-class territory in lower Manhattan. Those displaced jammed into uptown districts like the Fourth Ward (at 290,000 people per square mile, now the most densely populated place on earth), or the teeming East Side and West Side factory districts, or shantytowns above 50th Street, where thousands of squatters lived among the rocks and ravines. Working-class quarters grew steadily more wretched. An 1863 AICP report found the housing "dark, contracted, ill constructed, badly ventilated and disgustingly filthy." Eighteen thousand lived in cellar apartments with floors of putrid mud.

In response, working people revived the labor movement and pushed for a greater share of wartime profits. In the fall of 1862 the city's ship joiners and caulkers, coppersmiths, and hat finishers went on strike, launching the "advanced wages movement." Leather workers in the Swamp walked out, as did men at the Manhattan Gas Works near the East River. By the spring of 1863 there were 133 union locals, up from thirty the previous year. Though small, they did well. When custom tailors went out in March, most first-class shops conceded at once (with the fateful exception of Brooks Brothers). Carpenters, pianomakers, and machinists also struck successfully for higher wages. Three thousand mostly Irish longshoremen walked off work, citing the "enormous prices of every article," and won an increase, despite the government's bringing in prisoners from Governors Island to load army transports, protected by troops with fixed bayonets.

Employers and their spokesmen fought back. Horace Greeley, despite his long history of support for working people, insisted that workmen had a right to combine and refuse the wages employers offered but were not entitled to strike. The *U.S. Economist and Dry Goods Reporter* branded work stoppages as "despotic on the business of their employers." Labor was a commodity like any other. Its price should be set by the natural laws of supply and demand.

To boost supply and weaken labor's bargaining ability, employers brought additional workers to the city. Most focused on Europe—during the war Secretary of State Seward's consuls abroad often acted as emigrant agents—but some, like Peter Cooper, urged Lincoln to send up southern blacks. A Tammany mass meeting censured employer efforts "to bring hoards of Blacks from the South, as well as Whites from Europe, to fill the shops, yards and other places of labor and by that means compel us to compete with them for support of our families."

Employers also repeatedly hired strikebreakers to defeat the new unions. African American New Yorkers were used in disputes at the Staten Island ferry, the Custom House, and, most particularly, on the waterfront. In March 1863 laborers at the Erie Railroad's Hudson River docks struck, seeking a share of the company's vaulting prosperity. The railroad hired blacks to move the cotton bales accumulating at Pier 36 at the foot of Duane Street, until a thousand white strikers drove them off.

Increasingly, white workers argued that blacks had no legitimate claim whatever on laboring jobs. In August 1862 two to three thousand people from predominantly Irish South Brooklyn threatened to burn the Watson and Lorillard tobacco factories at the foot of Sedgwick Street unless several hundred black women and children left the plants. When the companies refused, they besieged the buildings and were only prevented from setting fires to “roast the niggers alive” by the arrival of police.

THE POLITICS OF EMANCIPATION

To these growing strains along class and race lines was added the shock of emancipation. In September 1862, when Lee’s invasion of Maryland was turned back at Antietam, Lincoln used the good news to issue a Preliminary Emancipation Proclamation. On January 1, 1863, the Proclamation itself was promulgated, though it freed no slaves, applying as it did only to areas beyond the reach of federal power.

New York City’s blacks and abolitionists were nevertheless ecstatic. At an “Emancipation Jubilee” at Cooper Union, Henry Highland Garnet read the Proclamation aloud to a cheering crowd. Lewis Tappan, the now seventy-five-year-old patriarch of the city’s antislavery movement, gave a moving review of the long history of the struggle in what would prove to be his last public appearance.

Black and white abolitionists were considerably less enthusiastic about Lincoln’s zealous campaign to get African Americans to leave the country voluntarily. An emigrationist minority applauded a late 1862 Lincoln-promoted plan to transport five thousand blacks to lie a Vache, a small island off Haiti, until the effort, run under contract by Leonard Jerome and other prominent New York businessmen, proved a disastrous failure. But most New York blacks flatly rejected the colonization project. The Colored Citizens of Queens County notified Lincoln that America was their native country and they had no intention of leaving it. Emancipation, rather, spurred black demands to join the army and fight for the total liberation of the slaves.

Emancipation also roiled the city’s political waters. Republicans had been of two minds on slavery. Many of those who joined up before the war held fast to their moral and cultural repugnance for the institution and

followed the “radical” lead of Greeley’s *New York Tribune* in opposing it and welcoming Lincoln’s commitment to ending it. For the bulk of the old Whigs who had belatedly clambered aboard the Republican Party and nested in its “conservative” wing, where they took their political cues from Henry Raymond’s editorial page, the war had little to do with slavery. As the *Times* argued: “The issue is between anarchy and order,—between Government and lawlessness,—between the authority of the Constitution and the reckless will of those who seek its destruction.” Still, most conservative Republicans went along with the president on emancipation, with varying degrees of enthusiasm or distaste, accepting it as a necessary wartime measure that would expedite restoration of the Union.

Democrats were more thoroughly divided, much as they had been before the fighting broke out. “War Democrats”—who included prominent businessmen and the bulk of Tammany Hall politicians, among them Tweed—favored fighting on to victory but opposed partisan Republican legislation and the Lincoln administration’s erosion of civil rights. “Peace Democrats,” rooted in Fernando Wood’s Mozart Hall, wanted to restore the Union as it had existed before the war, with slavery intact, though a more extreme wing was prepared to accept peace without reunion. These divisions had already cost their party the mayoralty in 1861, when Tammany’s C. Godfrey Gunther and Mozart’s Wood divided the Democratic vote, allowing Republican George Opdyke—a wealthy dry-goods importer, banker, and broker and a leader in the Union Defense Committee—to capture City Hall with barely more than one-third of the vote. This had led to various overtures looking toward restoration of party unity.

But emancipation appalled the Peace Democrats, who saw it as a fundamental alteration of war aims. They now hoisted a militantly antiwar banner, under which gathered old Democrats unhappy with wartime Republican domination, merchants and financiers disturbed at the increasing power of the national state, and considerable numbers of white working-class people angry at wartime inequities.

Emancipation also alienated the Catholic Church hierarchy. Up till then Archbishop Hughes had been friendly with the administration, especially Seward, his old ally on the education issue. Hughes had even served as Lincoln’s semiofficial envoy to the Vatican and to France (he met with

Napoleon III and Empress Eugenie), where he pleaded the Union cause and urged nonrecognition of the Confederacy. But emancipation alarmed conservative men who had long argued slavery was an evil to be borne, that abolitionism smacked of a revolutionary violation of property rights, and that the antislavery movement was inextricably linked to militant nativist Protestants.

In the fall 1862 elections, after the Preliminary Proclamation, Peace Democrats bid for power. In the city, ex-mayor Wood and his supporters denounced the administration as “fanatical, imbecile, and corrupt” and openly urged resistance to emancipation. At the state level, Peace Democrat Horatio Seymour (allied to New York Central Railroad interests) adopted a similar stance, favoring restoration of the Union by granting all possible concessions to the South. Both resorted to a shrill racism, protesting that emancipation substituted “niggerism for nationality.” In the context of growing unhappiness with the costs of the war, Democrats carried every ward in the city, Wood won a congressional seat, and Seymour captured the governorship.

The peace movement continued to build after the full Proclamation was issued. On February 6, 1863, at Delmonico’s, a group of Democratic and ex-nativist businessmen led by financier August Belmont launched the Society for the Diffusion of Political Knowledge. Other luminaries included the venerable Samuel F. B. Morse (president), Governor Seymour, and corporate attorney Samuel J. Tilden. The organization published antiwar and antiemancipation tracts in which they suggested that freeing the slaves would ruin the South (and indirectly the North) by undermining its ability to compete with slave economies like Brazil or Cuba. Pamphleteers attacked the rising war debt, the government’s military strategy, and the Republican Party’s centralizing project and agitated for a negotiated peace and a revocation of emancipation. Belmont also promoted these ideas in the *New York World*, a newspaper edited by twenty-seven-year-old Manton Marble, which he, Tilden, and other rich Democrats underwrote.

In addition, in his capacity as Democratic Party national chairman, Belmont began grooming the cashiered General George McClellan to challenge Lincoln in 1864. After being fired, McClellan moved to New York City and began working with Chairman Belmont on building a presidential candidacy. He took with him as his aide Lieutenant George

Armstrong Custer, who now received his first introduction to the financial, political, and journalistic elite of the metropolis.

While the Society for the Diffusion of Political Knowledge took the (relatively) high road, the popular press launched a gloves-off campaign that mixed racism, solidarity with labor, attacks on war profiteers, and, increasingly, calls for peace. At various points the Lincoln administration banned “Copperhead” papers from the mails. Republican infringements of civil liberties generated more support for Peace Democrats. The Lincoln administration suspended habeas corpus and arrested or detained hundreds. In New York City political prisoners were housed in Fort Lafayette, just off the Brooklyn shore from Fort Hamilton. When Ohio Democrat Clement L. Vallandigham was indicted for seditious oratory, Fernando Wood chaired a meeting at Cooper Institute in his support.

June 1863 was the high point of antiwar activism in the city. Wood held a massive Peace Convention at Cooper Union on June 3—of which James Gordon Bennett’s *Her-ald* approved, auguring a new respectability—and orators pounded home the ideas that the war was a rich man’s fight, that it was undermining the Constitution, and that it would flood the North with southern blacks.

Few of New York’s wealthy backed Wood’s movement. Nor, despite the Peace Democrats’ intensive efforts at wooing urban workmen, did any laboring organizations or leaders “go Coppery.” Rather the surging peace movement alarmed and galvanized prowar activists. “Two years ago,” one wrote, “you could walk the entire length of Broadway without stepping on a snake,” whereas now “New York swarms with Copperheads” engaged in the “slimy errand” of helping rebellion. Three Sanitary Commission leaders—Strong the lawyer, Olmsted the intellectual, and Bellows the minister—called for a hard-line organization to combat Copperheadism. They were worried that Wood and Belmont’s operations might mislead Europeans into assuming the wealth and culture of the American metropolis were arrayed with the rebellion. Strong wanted to show France and England that the war was “not waged by the rabble of the North, or by politicians, but that the intelligent, cultured, gentlemanly caste sustains it.”

Dismissing Belmont and his crowd as “vulgar parvenus,” Olmsted and friends set out to form a club of “descendants and almsbearers of the old dukes of our land.” Launched on February 24, 1863, the new Union League

Club included pedigreed New Yorkers, leading literati, and sixty-six of the business elite, among them Robert Minturn, the city's top shipping merchant, who became the club's first president. By May it had 350 members, including (in Strong's words) the leading "representatives of capital and commerce." By war's end the Union League Club embraced eight hundred of the city's most wealthy and well established merchants, lawyers, bankers, and professionals. The club leased, redecorated, and strung telegraph lines into an elegant house on Broadway and 17th Street, facing Union Square. It quickly became the place to banquet visiting dignitaries and meet to run the war effort.

The Union League Club quickly took on the Peace Democrats, setting up a Loyal Publication Society. Over the next two years, it distributed, to the army and civilians alike, nine hundred thousand copies of ninety pamphlets (in German and French as well as English). Fierce nationalists, the club members argued that only a strong central state could win the war and establish continental prosperity. In 1863 Olmsted proposed establishing a magazine to spread this gospel, to be called, appropriately enough, the *Nation*. For the moment, however, it relied on *Harper's Weekly*, which George William Curtis took over in 1863 and brought into the Republican camp. Locally, the Union League Club established the Loyal National League, which organized committees in each ward to mobilize mass support and held rallies at Cooper Institute or in Union and Madison squares.

THE DRAFT

In mid-1863, with the city rancorously divided, Confederates invaded the North. On June 27 Lee's Army of Northern Virginia moved up the Shenandoah Valley, crushed the Union garrison at Winchester, and crossed over the Potomac, and by June 29 it was within ten miles of Harrisburg, the capital of Pennsylvania. Thousands of troops poured out of New York City to join General George Meade's army, which, on July 1, engaged Lee at the town of Gettysburg.

The emergency left the city virtually stripped of defenses. General John Wool, commander of the army's Department of the East, reported to Governor Seymour that he had only 550 men in eight forts and almost no military vessels in the harbor. The city was wide open to invasion by

southern ironclads. If Lee eluded Meade he could be in Jersey City, and at New York's throat, in a matter of days.

To make matters worse—far worse—it was at just this moment that the federal government's new draft law was to go into effect. Back in March, reacting to heavy losses, dwindling recruitment, and soaring desertion rates, Congress had passed the National Conscription Act. The legislation authorized government agents to go house-to-house, enrolling all men aged twenty to thirty-five (and all unmarried men thirty-five to forty-five), and then hold a lottery to choose draftees from this pool. The law also created federal provost marshals in each congressional district and gave them unprecedented power to summarily arrest draft evaders, draft resisters, and deserters. Finally, in a crude assertion of class privilege, the law provided that draftees could provide a substitute to fight in their place or pay three hundred dollars—a prohibitive sum for working people—for the government to use as a recruiting bounty. In short order an advertisement, appearing daily in New York City newspapers, announced that “gentlemen will be furnished promptly with substitutes by forwarding their orders to the office of the Merchants, Bankers and General Volunteer Association.”

This was not a popular law in New York. It represented, together with emancipation and the new tariff and banking laws, yet another massive increase in the intrusion of the federal government into the city's communities, workplaces, even households. It did not go unnoted that the three-thousand-dollar shawl A. T. Stewart had imported for Secretary Chase's daughter now represented the price of ten men's lives. The argument advanced by Republican organs like the *Times* and *Harper's*—that businessmen had to stay home and run production—failed to convince many Boweryites.

The enrollment process proceeded peaceably enough in May and June, in part because leading Democrats like Governor Seymour vowed to initiate legal challenges to the act's constitutionality. Seymour also argued, correctly as it turned out, that Republicans had set unfairly high quotas for the heavily Democratic metropolis. Other voices counseled harsher tactics. The editor of the *Catholic Metropolitan Record*, John Mullaly, encouraged armed resistance. Even Seymour, at a mass protest meeting on July 4 at the Academy of Music, used words he would later regret, telling the crowd: “Remember this—that the bloody and treasonable and revolutionary

doctrine of public necessity can be proclaimed by a mob as well as by a government.” On July 4 news of the Union victory at Gettysburg began to trickle in over the telegraph wire, but the general jubilation was tempered by reports of the heavy casualties among local soldiers.

One week later, on Saturday, July 11, the lottery commenced. Seymour had failed even to get it postponed. Anticipating trouble, and still without military resources to back up the police, the authorities chose to begin the process on the city’s periphery, at the Ninth District Headquarters on Third Avenue and 47th Street, an area of vacant lots and isolated buildings. It went reasonably well. While a large but good-tempered crowd watched, the provost marshal read off names drawn from a large barrel. By late afternoon, 1,236 draftees had been selected, at which point the office closed, leaving the remainder of the two-thousand-man quota to be filled two days later.

The next morning, working-class families pored over the names published in the Sunday papers. In bars and taverns around the city, men discussed their response over glasses of whisky, and large numbers of working-class wives and mothers (the *Herald* reported) “mingled their wildest denunciations against the conscription law.” A variety of protest activities were decided upon for the next day, Monday, July 13.

DAY ONE

Between six and seven in the morning, four hours before the lottery was scheduled to begin again, hundreds of workers from the city’s railroads, machine shops, shipyards, and iron foundries, together with building and street laborers working for uptown contractors, began to stream up the West Side along Eighth and Ninth avenues. Beating copper pans as if they were gongs—a tactic familiar from labor protests—they closed shops, factories, and construction sites, moved on to a brief meeting in Central Park, and then marched, with NO DRAFT placards aloft, toward the provost marshal’s office on Third Avenue. There they linked up with downtown committees, which, in similar fashion, had closed Allaire’s, the great novelty works on 14th Street, and a dozen or more foundries and machine shops along the East Side waterfront. At 10:30, with a huge crowd gathered outside, the selection process started up, guarded by sixty hurriedly gathered police.

At this point another group arrived: the Black Joke Engine Company No. 33, in full regalia. The volunteer firemen, enraged at having lost their traditional exemption from military service, had decided over the weekend not only to halt the proceedings but to destroy all evidence that members of their unit had been drafted. They stoned the building, drove off the police, smashed the draft wheel, poured turpentine everywhere, fired the structure, and then drove away the arriving fire companies.

Word of all this reached the provost marshal's general bureau headquarters. A thirty-two man squad of the Invalid Corps (composed of wounded or disabled veterans reassigned to light guard duties) was dispatched uptown on a Third Avenue horsecar through jeering and ever thicker crowds. Finally they were ordered to detrain, form a line across the avenue, and march north toward the burning draft office. When they reached 43rd Street they were met with a fusillade of paving stones. They broke and ran. A similar experience awaited Police Superintendent John Kennedy. On hearing of the attack he hurried most of the way uptown by buggy, then tried to walk the remainder of the way up Lexington through the now huge throngs around the Ninth District Office. After he was identified by a former policeman, the crowd beat Kennedy about the head until he was unrecognizable.

By now the day had grown hot and humid; it made one feel "as if you had washed yourself in molasses and water," one participant recalled. The streets fumed with the usual rotting debris and excrement, the stench worsened by the stifling heat and humidity. Tremendous numbers of people poured out of the tenements. Crowd members began to isolate the area, cutting down telegraph poles that connected local police precincts to the Central Office. They stopped Second and Third Avenue Railroad cars. New Haven commuter trains were stoned, then Irish women crowbarred up the tracks of the Fourth Avenue line above 42nd Street. Rioters pulled down fences surrounding vacant lots to make clubs. The skirmishes spread into the east 40s around Third and Lexington. As small isolated detachments of police reserves were sent into the area they were routed and stomped, their bodies stripped, their faces smashed. Homes suspected of giving refuge to fleeing policemen were burned. Fury at the Metropolitans, banked for years, blazed up viciously.

Targets identifiable as Republican came under attack. A crowd entered the Columbia College grounds on Fifth Avenue at 49th Street, knocked on the door of President Charles King's house demanding to know if a Republican lived there, and were stopped from burning the building down only by the intervention of two Catholic priests. Farther down Fifth, a crowd menaced Republican Mayor Opdyke's house until dissuaded by Democrats. Sumptuous Fifth Avenue mansions were sacked, looted, and burned. George Templeton Strong, watching the stoning of a house on Lexington off 45th rumored (wrongly) to be Horace Greeley's, concluded that "the beastly ruffians were masters of the situation and of the city."

Some of the crowd now hived off downtown toward an armory at 21st Street and Second Avenue, really a rifle factory operated by a son-in-law of Mayor Opdyke, which contained a thousand weapons. The rioters so far had had few guns. The Broadway Squad arrived to defend the armory but soon found themselves surrounded and stoned by thousands of men and women. Strong, who had followed along, depicted a crowd of Irish day laborers, including "low Irish women, stalwart young vixens and withered old hags. . . all cursing the 'bloody draft' and egging on their men to mischief." Finally they stormed and occupied it around four P.M. and began carrying off carbines. When police reinforcements arrived, the crowd torched the building, trapping some rioters inside on the upper floors; of the thirteen who died at the armory, ten perished in the fire.

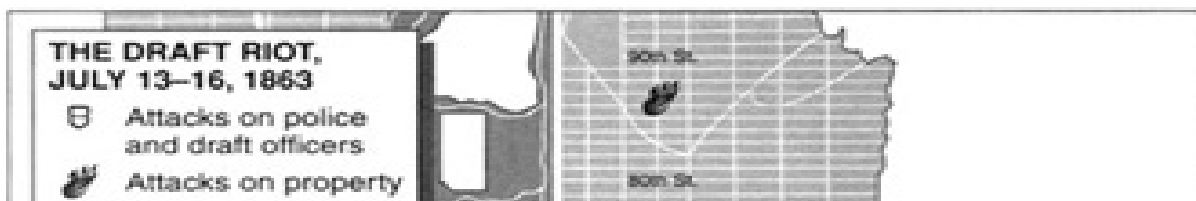

At about the same time, an ugly second front opened up across town, as crowds hitherto focused on rich whites turned their fury on poor blacks. Patrick Merry, an Irish cellar digger, led two to three hundred men and boys down Broadway to West 29th Street where, at five o'clock, they burned the deserted Eighth District provost marshal's office. Then they began attacking homes of African Americans in the west 30s. The race riot had gotten under way.

Bands of Irish longshoremen, with quarrymen, street pavers, teamsters, and cartmen following along, began chasing blacks, screaming, "Kill all niggers!" Blacks were dragged off streetcars and stages around City Hall. The owner of a colored sailors' boardinghouse on Roosevelt Street in the Fourth Ward was robbed and stripped, his building fired. Maria Prince's boardinghouse in Sullivan Street was trashed, as rioters dug up paving stones, smashed the windows, and ransacked it. A crowd tried to attack

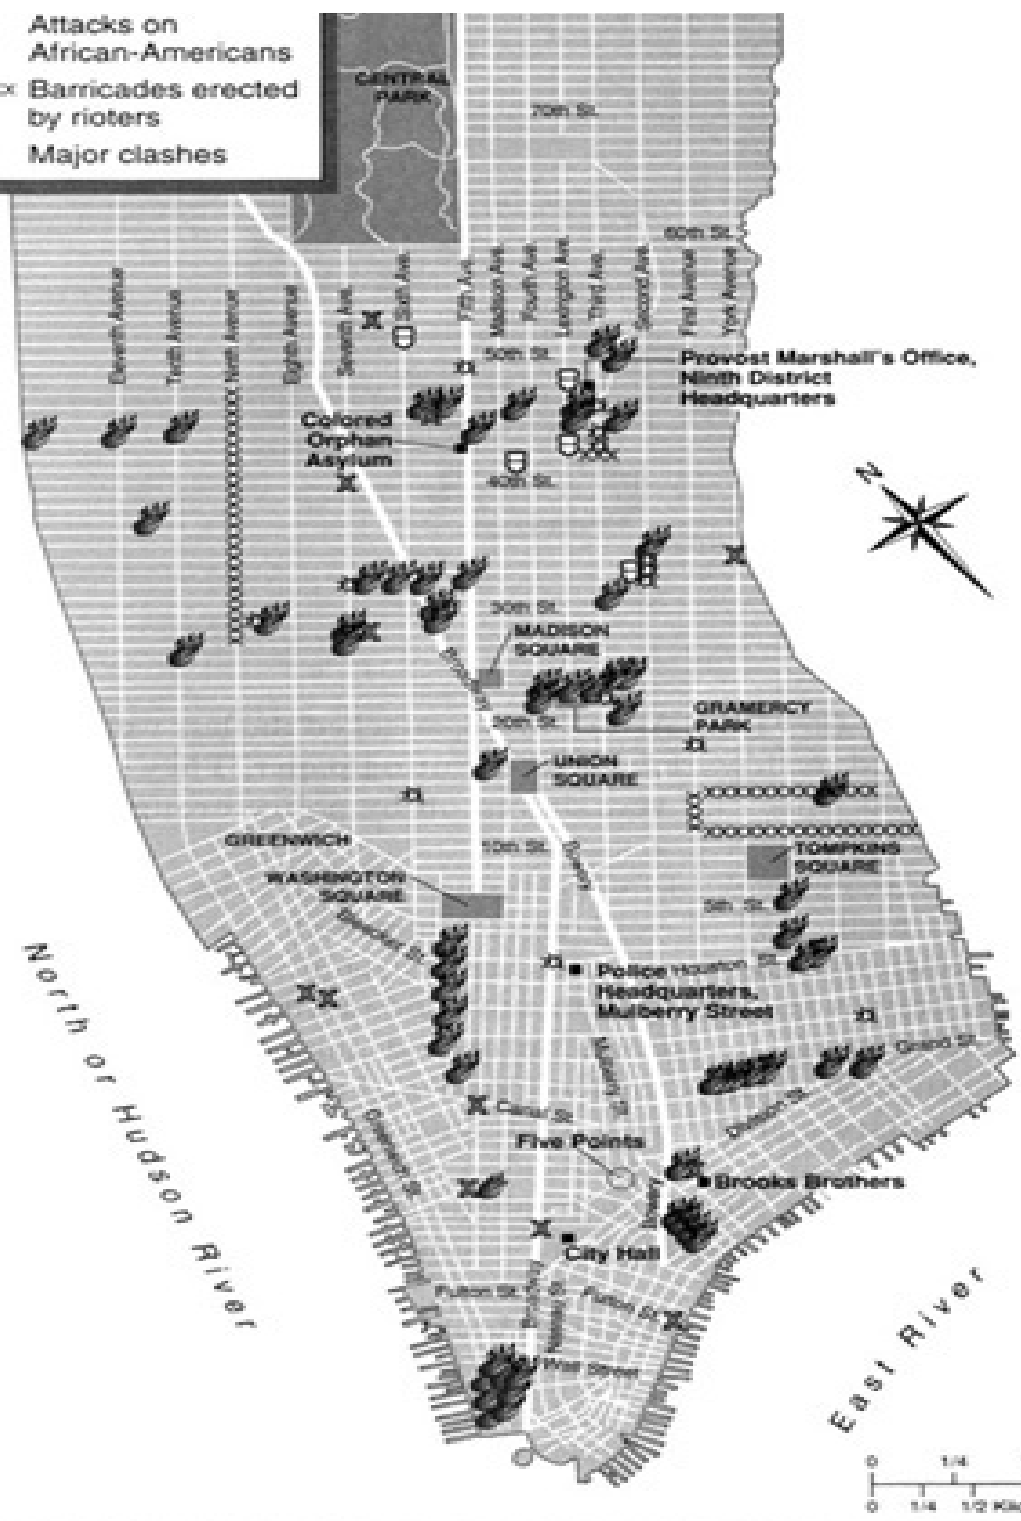

black waiters at Crook's Restaurant in Chatham Street but was repulsed. Uptown, at Fifth Avenue and 43rd, rioters attacked the Colored Orphan Asylum, screaming, "Burn the niggers' nest." The 237 children (most under twelve years old) escaped—young Paddy McCafferty heroically shepherding them to the 20th Precinct house—while the crowd smashed pianos, carried off carpets and iron bedsteads, uprooted the trees, shrubs, and fences, then set the building ablaze. Crowds would attack other moral reform projects, even those not associated with blacks. They stoned the Magdalene Asylum on Fifth at 88th Street and burned down the Five Points Mission.

When night fell, the racial assaults worsened. Some blacks were attacked on the corner of Varick and Charlton streets by a crowd led by an Irish bricklayer. One of the pursued turned, shot the bricklayer with a pistol, and escaped; the maddened crowd grabbed one of the others, lynched him, and then burned the corpse. Gangs attacked and torched waterfront tenements, dance houses, brothels, bars, and boardinghouses that catered to black workingmen. Furniture was burned in sidewalk bonfires. Bands of small boys would mark the victims' houses by stoning windows, then return with older men to finish the job. Racially mixed couples, white women who consorted with blacks—anyone who defied taboos on "amalgamation" was specially targeted. By midweek rioters had virtually emptied the downtown waterfront of blacks.

That same evening crowds moved toward the intellectual heartland of Republicanism, Newspaper Row, across from City Hall Park, where Greeley's *Tribune* and Raymond's *Times* had their headquarters. Raymond had used his influence to get Gatling guns from the army, which he set up in the north windows. Raymond manned one himself; millionaire speculator Leonard Jerome, a leading *Times* shareholder, took another. The crowd, led by a waiter from Astor House, attacked the less well defended *Tribune*, which had barricaded itself with bales of printing paper. They stoned the building, broke in, and started a fire but were driven off by police brought in from the quiet Brooklyn precincts.

Meanwhile, a debate had broken out among the authorities about how to respond to the upheaval. During the day, Mayor Opdyke's approach of dispatching small bands of police to the uptown working-class wards had proven drastically counterproductive; it had enraged the crowds and provoked massive and murderous retaliation. Now Strong and some Union League Club colleagues proposed another strategy. They hurried over to the St. Nicholas Hotel, where General Wool had established his headquarters, and begged him to declare martial law and summon federal troops to

enforce it. Wool refused, though he did order troops moved in from Fort Hamilton to assist the police. Disgusted, Strong and the others telegraphed Lincoln directly, asking for troops, and then went to the home of David Dudley Field in Gramercy Park, where friends gathered with muskets.

At eleven P.M., drenching, cooling rain brought the day to a close.

THE BATTLE FOR NEW YORK CITY

As Tuesday dawned hot and dry, crowds crystallized all over the city, broke into gun shops to arm themselves, and launched firefights against a variety of targets. Far from being random anarchic outbursts, the attacks focused on those in command of the new industrial and political order.

Rioters swept the streets clear of wealthy individuals—readily identifiable by their clothes and bearing. (“There goes a \$300 man!” “Down with the rich men!”) They attacked genteel homes and trashed (more often than stole) the fancy furniture.

They lit into Republican enterprises. Crowds attacked and sacked Brooks Brothers, hated for being hard employers and shoddy contractors, went after German clothing stores along Grand Street, and would have marched on Wall Street had it not been the best-defended area in the entire city. Customs House workers prepared bombs with forty-second fuses. Employees of the Bank Note Company readied tanks of sulfuric acid to spill on attackers. At the Sub-Treasury Building on the corner of Nassau Street, guns and bottles of vitriol were passed out to employees stationed at windows, troops with howitzers were stationed nearby, and a gunboat was anchored at the foot of Wall Street.

The crowds, particularly the women, beat policemen and soldiers, the agents of upper-class and federal power. After Colonel Henry O’Brien of the Eleventh New York Volunteers used a howitzer to clear Second Avenue and killed a woman bystander and a child, the crowds (when they found him the next day) beat his face to a pulp, then stripped, tortured, and shot him in the head and hung his broken body from a lamppost.

Rioters began erecting barricades, cordoning off their waterfront neighborhoods from center-island bourgeois districts. On the East Side, industrial metal trades workers used cut-down telegraph poles, carts, wagons, lumber, boxes, bricks, and rubbish to run a line along First Avenue

(particularly solid from 11th to 14th streets) and along Third Avenue on up to 26th Street—areas with high concentrations of large metal-working establishments. On the West Side, waterfront laborers drew their lines along Ninth Avenue, most solidly from 36th to 42nd streets, from where they could dominate most of the Upper West Side. To hinder the summoning of outside reinforcements, they cut telegraph lines—as Indians did out west—and assaulted ferry slips and railroads.

Rioters also pursued the race war. Brandishing poles and clubs, they hunted blacks on the streets, mauled them along the docks, went after black workers in restaurants and hotels. They attacked black homes and stores around Bleecker and Carmine streets, except where blacks tore down chimneys for bricks to hurl at attackers or, as in Minetta Lane, guarded their homes with guns.

Divisions now appeared in the rioters' ranks. Many original protesters had envisioned at most a one-day antidraft demonstration, and certainly not a general onslaught on private property. Large numbers of them—particularly the Germans, though many Irish Catholics and native

Protestants as well—abandoned violence and even joined with the authorities. Squads of *Turnverein* and *Schutzenverein* patrolled the streets of Kleindeutschland. Volunteer fire companies (including the Black Joke men who had started the riot) turned out to defend their neighborhoods against riot and arson. Crowds, at times led by Irish priests like Father Treanor of Transfiguration, intervened to halt lynch mobs.

While the battle raged on the streets, two sharply opposed factions within the city's upper classes argued over how to respond to the uprising. On one side were those businessmen and Democratic officials who, in effect, treated the riots as an appeal to elites to respect and protect customary working-class rights and privileges. Governor Seymour dispatched gentlemen and clergymen to negotiate face-to-face with the crowds, displaying the confidant paternalism of the old upper class. On Tuesday morning he himself, flanked by Tammany leaders A. Oakey Hall and William Tweed, pledged a large crowd at City Hall (whom he addressed as "My Friends") that he would work for postponement of or relief from the draft, while repudiating violence.

Republican journals, merchants, financiers, and industrialists saw the riot as a fullscale challenge to the political and social order at precisely the moment when—given the Union's doubtful military prospects—such an uprising might actually precipitate European intervention. Their prescription was simple: "Crush the mob!" howled Tuesday's *Times*. Merchants and bankers gathered at Wall Street to demand federal imposition of martial law, "an immediate and terrible" display of federal power.

At noon Mayor Opdyke asked Secretary of War Stanton for troops. Stanton complied that evening, but had the request come even a day earlier it would have put him in a difficult spot. After Gettysburg, Lee's army, wounded and dangerous, had remained in the area, and Union forces had been tied down in blocking a possible move northward. As it happened, Lee escaped south across the Potomac the night of Monday the thirteenth, leaving Stanton free to divert five regiments.

Troops began arriving Wednesday evening, a day of atrocities during which crowds had hanged, drowned, and mutilated black men, looted and burned black homes up and down Sixth Avenue, and attacked Republican mansions and Protestant missions. In Brooklyn hundreds of men, including some disgruntled ex-employees, invaded the Atlantic Docks and burned two of the hated grain elevators, and along the East River north and east of

Fulton Street, blacks were beaten and killed, their houses ransacked and destroyed.

Promptly on arrival, the soldiers from Pennsylvania took up arms against the rioters, aided by volunteer companies set up by merchants and bankers who mobilized their employees. Fighting continued all Wednesday night and throughout the next day. Troops assaulted “infected” districts, using howitzers loaded with grapeshot and canister (primitive fragmentation bombs) to mow down rioters and engaged in fierce building-by-building firefights. Rioters defended their barricaded domains with mad desperation. Faced with tenement snipers and brick hurlers, soldiers broke down doors, bayoneted all who interfered, and drove occupants to the roofs, from which many jumped to certain death below.

By Thursday evening it was all over. The city filled with six thousand troops. Seventh Regiment pickets manned Third Avenue. The Eighth Regiment Artillery Troop trained mountain howitzers on streets around Gramercy Park. The 152nd New York Volunteers set up camp in Stuyvesant Square. By Friday telegraph lines were being repaired, West Side rails relaid. Omnibuses and horsecars ran. Laborers returned to work. It was over.

AFTERMATHS

Contemporaries believed that a thousand people had died, though in the end only a body count of 119 could be verified. To participants, no doubt, it had seemed like another Gettysburg; perhaps the tremendous death tolls on the battlefields made overstatements credible. But even adopting the smaller number, the New York City draft riots had been the largest single incident of civil disorder in the history of the United States.

The response to the riots was relatively mild, certainly not on a par with the bloody reaction to the earlier 1848 uprisings in Paris. There were no mass sentencings, no mass executions of rioters, though some of the Union League crowd thirsted for all-out reprisals. George Templeton Strong declared: “I would like to see war made on Irish scum as in 1688.” Herman Melville, who would move back to New York City from his tranquil Berkshire retreat that fall, conjured up similar images in his poem “The

House Top, a Night Piece, July 1863,” which concluded that “the town is taken by its rats.”

The images haunting Republican minds—of barbaric, subhuman savages tearing down a civilized city—certainly invited retribution, but Republicans were not in charge, War Democrats were. Republicans had asked Lincoln to declare martial law and install General Benjamin F. Butler as military governor (they applauded his rigorous suppression of treason during an 1862 stint running New Orleans). But Lincoln feared alienating conservative Democrats and perhaps provoking the New York City regiments who had loyally done riot duty but might well balk at imposing Republican military rule. Rejecting the advice of Republican hard-liners, the president turned military control of New York over to General John Adams Dix, a Democrat (and financier) of impeccable credentials, appointing him commander of the Department of the East.

This strategy also required, and received, the cooperation of Tammany Hall and its chairman and grand sachem, William Tweed. Tammany, whose patriotic prowar credentials were well established, denounced transgressions against property and lawlessness, while at the same time signaling its willingness, and demonstrating its ability, to protect local rioters from excessive federal vengeance. Tammanyite District Attorney A. Oakley Hall and Recorder John T. Hoffman indicted and prosecuted the rioters vigorously, becoming in the process among the most popular politicians of the era, though the postriot trials they directed through August and September eventually let most offenders off, and of the sixty-seven who were convicted, only a handful got lengthy jail terms.

Meanwhile, Dix ordered a formidable show of force and started up the draft machinery again. Ten thousand federal troops from Meade’s army were brought in, including three batteries of artillery from the Virginia front. Battalions bivouacked in Madison and Washington squares. Squads marched up and down city streets. Republicans were pleased at the display. When the selection process began again on August 19, this time in the Republican stronghold of Greenwich Village, perfect peace reigned in the metropolis.

As well it might have, for the Democrats had completely defanged the draft. Governor Seymour and Samuel J. Tilden had gotten the Lincoln administration to reduce the quota from twenty-six to twelve thousand men.

The Democrat-controlled Common Council appropriated three million dollars to pay bounties and relief to anyone drafted, but Mayor Opdyke vetoed it (even as his own son, conscripted, bought his way out). The Board of Supervisors then created its own Exemption Committee and appropriated two million dollars with which it could buy substitutes for poor men with dependent families and for municipal service workers (police, fire, militia), virtually guaranteeing that few conscripts who did not want to serve would be compelled to do so. On this crucial committee, dispensing life and money, sat William Tweed.

In the riot's aftermath, the mass of the Irish and German working class began to disassociate themselves from Peace Democrats. That fall Seymour was replaced in the governor's mansion by Republican Reuben Fenton, and the following year Wood lost his seat in Congress, though antiwar sympathy remained powerful enough to vote for merchant, pacifist, and dissident Democrat C. Godfrey Gunther into City Hall. Not until 1865 would enough of the electorate rally decisively enough behind Tammany's red, white, and blue banner to elect Tweed's candidate, John Hoffman, to the mayor's office.

Blocked from vengeance, Republicans got back at the rioters more indirectly, at first through their principled support for the rioters' African-American victims. During the riot itself, many Protestant clergymen had courageously given blacks refuge, and merchant families had protected their servants. But blacks needed more organized assistance. Many had fled the city permanently—throughout the summer, one could still see blacks walking north up the Hudson along the railroad tracks—resulting in a 20 percent drop in their numbers in the metropolis, to 9,945 in 1865. But many, an estimated five thousand, were still camped in temporary havens (Blackwell's Island, police stations) or on the outskirts of the city (the hills, woods, and swamps of New Jersey; the barns and outhouses of farmers in eastern Brooklyn or Morrisania; the African-American communities of Weeksville and Carrsville, whose armed residents had taken in hundreds of refugees).

The week after the riots, William Dodge and others established the Merchants' Committee for the Relief of the Colored People Suffering from the Late Riots. At a central receiving depot on East 4th Street, they handed out clothing and money to almost six thousand black laborers,

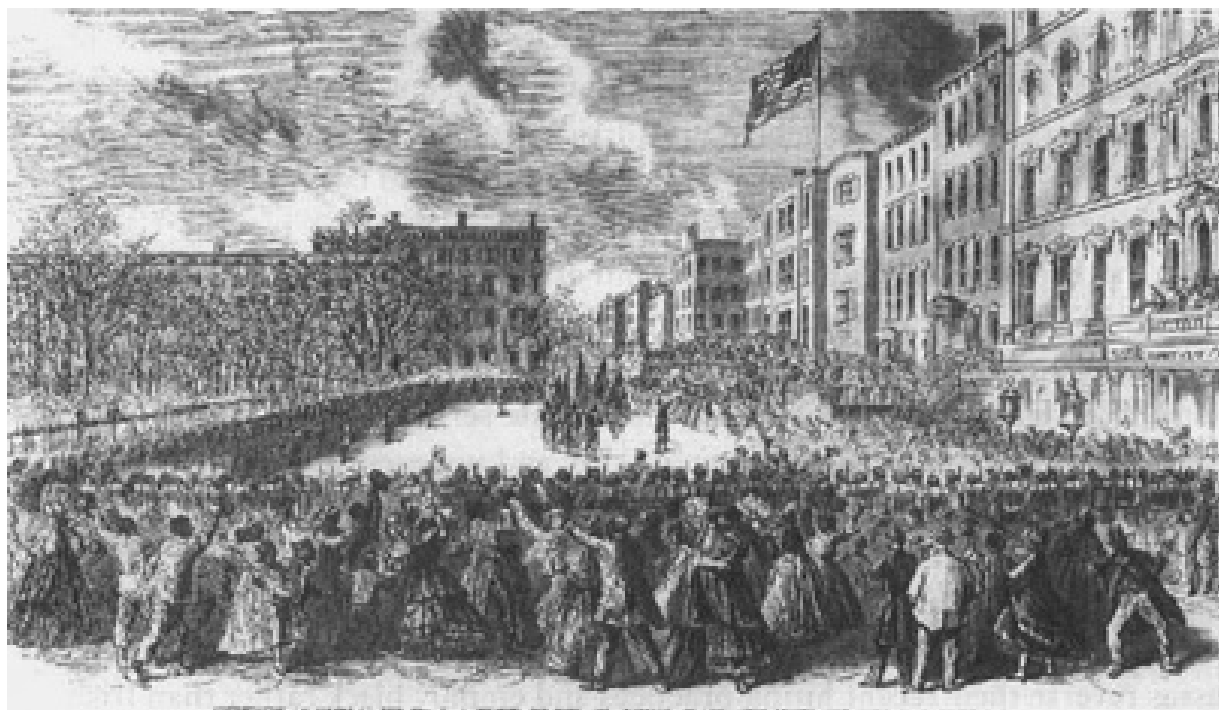

longshoremen, and female servants. Setting aside their usual insistence on discriminating between worthy and undeserving recipients, the Merchants' Committee turned the evaluation procedure over to the Rev. Garnet. The merchants thus demonstrated acceptance of their paternal responsibility to their "loyal" dependents, the churchgoing, respectable black poor, who, unlike the Catholic Irish, shared their language and culture. Indeed some efforts were made to have the upper classes reverse their recent hiring practices and employ black rather than Irish servants.

In a far more satisfying response to rioters, Republicans gave blacks not alms but guns. At one point during the upheaval, when Union League members huddled impotently in their barricaded headquarters, they vowed that if they escaped alive they would send a regiment of black troops to the front, first marching them through the very streets then ruled by the rioters. Now they made good their pledge. By December 19, 1863, they had formed the thousand-man-strong Twentieth Regiment United States Colored Troops, billeted it on Rikers Island, and begun building the Twentysixth.

The Union League Club and the black community's moment of triumph came on March 5, 1864. The Twentieth, clad in Union blue, disembarked at East 36th Street and marched with muskets and fixed bayonets to a gigantic rally in Union Square. There Charles King, the Columbia College president whose house had come close to being incinerated during the riots, addressed the officers and men. He presented them with a flag and a parchment scroll inscribed by the club members' "Mothers, Wives and Sisters" (names including Astor, Beekman, Fish, Jay, and Van Rensselaer). From there the regiment, led by the now recovered Superintendent Kennedy and a force of a hundred Metropolitans, marched down Broadway, past applauding throngs, to the Canal Street dock, where it boarded a steamer bound for New Orleans. The *Times* rejoiced, noting that where "eight months ago the African race in this City were literally hunted down like wild beasts," now they marched in solid platoons "with waving handkerchiefs, with descending flowers, and with the acclamations and plaudits of countless beholders."

Countless other beholders watched too, infuriated but helpless. The *Herald* was livid at the "miscegenation" represented by the "daughters of Fifth Avenue" presenting the black troops their regimental colors. Nor was the point of the black and upperclass alliance lost on the Workingmen's

United Political Association, which asserted: “The very object of arming the negroes is based on the instinctive idea of using them to put down the white laboring classes.” Many upper-class conservatives, like Maria L. Daly, wife of a Democratic judge, were distressed at the move to punish the Irish and support the blacks. She was “very sorry and much outraged at the cruelties inflicted,” Daly wrote, but added: “I hope it will give the Negroes a lesson, for since the war commenced, they have been so insolent as to be unbearable. I cannot endure free blacks. They are immoral with all their piety.”

More pragmatic whites came to accept the idea of black enlistment. When General Thomas F. Meagher gave a banquet for veterans of the Irish Brigade at Irving Hall in January 1864, they hailed a new song written by Charles Graham Halpine. An Irishborn journalist, Halpine, while serving as an officer in the Sixty-ninth, had begun publishing morale-raising minstrel-type pieces for the *Irish American* featuring the fictional hero “Private

Miles O'Reilly of the Forty-seventh New York Volunteers." In his latest ditty, titled "Sambo's Right to Be Kilt," the final stanza went:

Though Sambo's black as the ace of spades,
His finger a thrigger can pull,
And his eye runs sthraight on the barrel-sights
From undher its thatch of wool.
So hear me all, boys darlin',
Don't think I'm tippin' you chaff,
The right to be kilt we'll divide wid him,
And give him the largest half!

These proved to be prescient verses, in that black soldiers would experience ferocious discrimination in the ranks. Until the war's end they got paid less, collected no federal bounties, obtained little help for their families from the government, seldom became officers, were organized in segregated regiments, and were assigned largely to menial labor—though an incredible 37 percent of their total number would die. Nor did the administration hasten to protect black soldiers who surrendered to Confederate forces from being butchered on the spot or sold into slavery. Despite all this, New York's African Americans signed up at a rate twice that the army had forecast, inspired by their antislavery convictions, and for some military service would provide unprecedented opportunities for exercising leadership.

The episode of the black troops was satisfyingly cathartic, but it was clear to upperclass reformers that a longer-term response to the upheavals was necessary. The Association for Improving the Condition of the Poor, now presided over by James Brown of the Brown Brothers banking and trading firm, asserted that the riots proved beyond all doubt the existence of a "dangerous class" in New York City. The "terrible demonstration written in blood" required renewed elite attention to the task of "moral and physical elevation of these ignorant, semi-brutalized masses."

A Citizens Association was founded. Presided over by popular War Democrat Peter Cooper, it included industrialists and merchants of different party backgrounds, from Democrat August Belmont to conservative Republicans Hamilton Fish and William Dodge. The association, picking

up on prewar approaches, called for environmentalist reforms like housing legislation, noting that the rioters had come from overcrowded quarters, but these initiatives would not really begin to take effect until after the war was over.

BACK TO BUSINESS

The draft riots would leave long-term scars, but in the short run their impact was overridden by the war boom, which roared on unabated, offering countless ways of making fabulous amounts of money.

Trading with the enemy—an old New York City staple—again became big business. Congress had legalized trading in cotton with the rebel states, and by late in the war, despite outcries from Union generals, cotton purchased in the Confederacy for twelve to twenty cents a pound in gold was selling in the North for \$1.90 per pound. The Treasury Department licensed factors to do the deals. Thurlow Weed, the powerful Republican politician, could ensure that licenses flowed to traders willing to cut him in. Weed also helped those who shipped bales illegally, and eventually hundreds of thousands of them flowed into New York from captured Confederate towns like Memphis, Vicksburg, and New Orleans.

Land speculation reaped great bounties. The Homestead Act permitted the sale of unsurveyed land at \$1.25 an acre, and syndicates of New York businessmen took up millions of acres. The government also handed out vast tracts of public land to railroad corporations to encourage development; General Dix's Union Pacific did particularly well in this regard.

Stockbrokers engaged in frenzied profit-taking. "Money is pouring into Wall Street from all parts of the country," wrote the *Herald*, a scant two weeks after the draft riots. By 1864 the old system of auction trading could no longer accommodate the flood of business. A breakaway group of brokers established the Long Room on Broad Street, where stocks could be traded continuously and hundreds of transactions could take place simultaneously. In addition, "curb brokers" (also known as "guttersnipes") traded in the streets from after the New York Stock Exchange's five P.M. closing until the sun went down. One businessman opened an Evening

Exchange, providing the only place in the world where securities could be traded twenty-four hours a day.

Stock manipulation reached new heights, best exemplified by the great Harlem Corner, which culminated just after the riots. Commodore Vanderbilt had discovered that the charter of the old Harlem Railroad gave it the right (with the approval of the Common Council) to lay tracks anywhere in the city. Vanderbilt took control of the company and set out to build a line down the full length of Broadway. Secret negotiations brought the aldermen on board: they bought chunks of Harlem stock, approved the franchise, and watched happily as their shares surged from 60 to 116. But then, foolishly, the aldermen decided to doublecross the Commodore. They sold Harlem short—betting that the stock would go down—then rescinded the franchise, and the price plummeted. Before they could take their profits, however, Vanderbilt and his partner, Leonard Jerome, reentered the market and bought up every share of Harlem in sight until they had it all—had “cornered the market.” In August, when Harlem peaked at 179, the bleeding bears were forced to take disastrous losses.

Great profits were made gambling on stocks. “We fellows in Wall Street had the fortunes of war to speculate about and that always makes great doings on a stock exchange,” recalled Daniel Drew fondly: “It’s good fishing in troubled waters.” But far greater fortunes were to be won by gambling on gold.

With government greenbacks unsecured by precious metal, their value plunged and soared depending on the bulletins from the battlefield. In terms of greenbacks, therefore, gold behaved just like a stock. It could be traded. Fortunes could be made (and lost) gambling on its value. Many held such trading in moral disrepute. Currency, after all, was not just a stock, it was the lifeblood of the economy and the sinews of war. But to traders, gold stocks were a source of profit—whether they went up *or* down. When the Union Army won, making the future of greenbacks rosier, their value relative to gold rose (i.e., the price of gold measured in greenbacks fell). This suited bearish investors. Those bullish on gold, on the other hand, prayed for Confederate successes and sang “Dixie” lustily in the Exchange whenever they got one.

Such unpatriotic amorality led the New York Stock Exchange to forbid its members from dealing in gold. This barely halted the trade for an instant.

The dealers began migrating from one basement to another along Wall, William, and Broad—now in an ill-lit den called the Coal Hole, next in Gilpin's News Room, and finally, in the winter of 1864, in their own home, the New York Gold Exchange at the corner of William Street and Exchange Place (the Gold Room, it was popularly called). At the height of the speculative frenzy, the Gold Room was crammed with frantic dealers—a “rat-pit in full blast,” said one observer—while outside speculators lined up in the street, “ankle-deep in slush.”

The key to success in the Gold Room was information. Knowledge of a battle's outcome obtained an hour before one's competitors could be parlayed into a phenomenal fortune. At first, brokers haunted the wire services. Then they built their own: by 1863 private wires brought military results to New York's financial district before they reached Lincoln in the White House. J. P. Morgan installed the first such wire in his office, and as his operator was a friend of Grant's telegrapher, he easily kept abreast of the latest military movements. By 1864 Wall Streeters had spies in the Confederate high command and could learn southern battle plans before colonels in the Army of Virginia did.

As Union fortunes slumped in the summer of 1864, with Grant stalled in Virginia and Sherman stymied in Georgia, gold reached an all-time high of \$280 an ounce. Some began to argue that “Jeff Davis” speculators were even more interested in undermining U.S. currency than in reaping their spectacular profits. Philadelphia's Jay Cooke was convinced that New York City was a “hotbed of Southern sentiment and scheming” and that its moneymen were out to ruin the credit of the government.

“What do you think of those fellows in Wall Street, who are gambling in gold at such a time as this?” Lincoln asked Governor Andrew G. Curtin of Pennsylvania. “They are a set of sharks,” Curtin replied. “For my part,” said Lincoln, banging his clenched fist on the table, “I wish every one of them had his devilish head shot off!” In a crackdown, Secretary Chase dashed up to New York and drove the gold price down—for a time—by selling millions of dollars' worth of specie. Congress tried to outlaw speculative gold contracts altogether, but the act proved utterly unavailing and was swiftly repealed.

Even labor began to benefit from the boom, despite employers having undertaken an anti-Union offensive. The Boss Barbers, Master Coopers,

Master Shipwrights, and Iron Founders aggressively sought to reduce wages, increase hours, and, if possible, destroy the fledgling labor organizations. In 1864 the Pianoforte Manufacturers Association, led by Charles Steinway and D. Decker, spearheaded the fight against piano workers, locking out three thousand workmen.

This initiative had run into stiff labor resistance. Goaded by soaring prices, rising rents, and new taxes, workers organized more unions and launched strikes, drawing in the city's various ethnic communities. Germans were particularly energetic, organizing the cigarmakers, pianomakers, tailors, and varnishers. Irish public works and transport laborers went on strike four months after the draft riots. In October 1864 five thousand machinists walked out of the Novelty, Allaire, and Delameter works (all had important military contracts) and demanded a 25 percent increase. When employers rejected this, two thousand workers turned out and by December had largely succeeded.

In April 1864 employers introduced a bill in the state legislature to outlaw strikes altogether. The newly constituted Workingmen's Union, an umbrella organization led by William Harding, an immigrant English coach painter and president of the Coachmakers Union, rallied in Tompkins Square to protest the antistrike bill. On April 7 mechanics and laborers paraded down Third Avenue with banners, flags, and transparencies, cheered by thousands on the sidewalks. Workers from Williamsburg, Brooklyn, Hoboken, and Jersey City joined them in Tompkins Square, until their numbers had swelled to fifty-thousand. Under this pressure, the initiative was defeated.

The latter years of the war were heady ones for labor. For the first seven months of 1864 not a single trade-wide strike failed. And despite continuing inflation and the dreadful conditions of much of the workforce, steady employment, rising wages, soldiers' bounties, and relief payments to families meant that thousands of New York City's poor had more money than ever before.

THE ELECTION OF 1864

In the summer of 1864, Abraham Lincoln's reelection was very much open to question. The war news was gloomy, the progress of Grant's and

Sherman's armies slow and terribly costly. With Lincoln's private approval, Horace Greeley had engaged in peace discussions with Confederate representatives at Niagara Falls. In New York City several prominent businessmen deserted the prowar coalition to support the Democratic candidate, George McClellan. Then, in September, Sherman occupied Atlanta, and Sheridan began drubbing Jubal Early's forces in the Shenandoah Valley. At a stroke the situation changed. McClellan's early lead was erased, and Lincoln now had an excellent chance of winning. City businessmen rallied to his campaign, which was masterminded by Thurlow Weed from the Astor House.

The impending Lincoln victory meant the war would go on until the South capitulated, and it would be Republicans who would guide the reconstruction of the postwar political order. Some desperate Confederates decided to disrupt the election process by terrorizing northern cities. The idea was to have Confederate sappers team up with disaffected Copperheads to wreak havoc. For New York City the plans were particularly grandiose. Confederate Secret Service men would infiltrate the country from Canada, make their way to the metropolis, and set off fires around town, hopefully triggering another uprising like the draft riots. Copperheads then would seize federal buildings, throw General Dix in a dungeon, raise the Confederate flag over City Hall, and take New York out of the Union and into an alliance with the Richmond government.

When rumors of the plot reached New York City, Governor Seymour poohpoohed them, insisting that New York State could handle any untoward developments. But Stanton and Seward decided to send federal troops to the metropolis to secure the electoral process. As commander they chose General Benjamin E Butler, a fantasy come true for reformers and Republicans. The no-nonsense Butler was just the man to deal with spies, rioters, Tammany bully-boys, and Peace Democrats.

On November 5 regulars from the Army of the Potomac docked in the harbor, the first of a mixed force of five thousand that included reliable New England and New York units. On the seventh the last of the volunteers disembarked in a drizzling rain and stowed their baggage in Brooklyn's Fort Hamilton or at Fort Richmond on Staten Island. Butler set up his headquarters in a twelve-room suite in the brand-new Hoffman House off Madison Square, built on the ruins of stores burned down in the draft riots.

Here he established a sixty-wire telegraph center, connecting him to the War Department in Washington, to every major city in New York State, and to every police station and polling place in New York City.

Unbeknownst to Butler, a band of Confederate agents mingled in the crowd outside the Hoffman House watching the bustling military activities. The rumors, for once, had been true. Led by a pair of ex-cavalrymen from Morgan's Raiders, the sappers had entered the country at Niagara Falls, ridden the rails to New York, checked into various hotels and boardinghouses, obtained Greek Fire (a mixture of phosphorus and bisulfide of carbon that ignited on contact with air) from a sympathetic chemist on Washington Place, and met every few days in public places like the recently opened Central Park.

Butler issued General Order No. i, calling for a peaceful election, and then lay low as the campaign entered its culminating weekend. On Friday night the Republicans paraded, in a chaos of hacks, kettledrums, and wagons festooned with bunting and slogans, from Madison Square to Union Square, converted for the occasion into a temporary coliseum with bandstands (decked with Chinese lanterns) on all four sides. On Saturday night General McClellan (whose home was on East 34th Street) presided over a Democratic parade and rally at Madison Square, three times as large as the Republican effort, culminating in a torchlight parade and fireworks and an address by McClellan from the balcony of the Fifth Avenue Hotel. Monday, the day before the election, the "monied men of the city" rallied for Lincoln, at a gathering in front of the Customs House near Wall Street. According to the *Times*, three-fourths of the capital of the city was represented.

On Tuesday, election day, Butler deployed his troops in low profile, aboard transports, ferryboats, revenue cutters, and tugs anchored along the waterfront. Butler concentrated on key points: Wall Street, the telegraph cable over the North River, the High Bridge, Mackerelville, and the Battery. Backup troops were stationed on Governor's Island, ready "to be landed at once in spite of barricades and opposition." But there was no opposition. The only crowds were those who gathered in Newspaper Row to hear men call down election bulletins from upper-story telegraph rooms. New York, as Butler cabled Washington, was "the quietest city ever seen."

Lincoln carried New York State (by a whisker) and the nation (by a plurality) but lost the metropolis (by a landslide: 73,716 to 36,687, though his percentage was not much lower than in 1860). City Republicans did better in federal elections, sending industrialist William Dodge and Henry Raymond of the *Times* to Congress. Peace Democrats fared poorly: Seymour was ousted from the governorship, and Fernando Wood fell before a Tammany onslaught.

Butler's troops left the Hudson for the James, but Butler himself tarried a bit, to be wined and dined by the rich, the powerful, and the grateful. At a Fifth Avenue Hotel banquet he was given ovations and a pair of silver spurs. Beecher proposed he be a presidential candidate in 1868. He departed in a glow on November 15.

As it turned out, the congratulations were premature. The plot to burn New York had been deferred, not canceled. It had also changed its character. Copperhead supporters of the original project dropped out, disheartened by, among other things, Sherman's sacking of Georgia. As the Confederate cause now seemed irretrievably lost, nothing could be gained by a rising. But the Confederate officers, reading about Sheridan's scorching of the Shenandoah Valley, switched rationales. They would revenge the desolated South by ravaging the North, beginning with gay, rich, and carefree New York City. They would start by incinerating the opulent symbols of the city's wealth, its glittering hotels. With luck, and a good wind, they might burn New York to the ground.

On the night of November 25, the conspirators set their fires in thirteen major hotels, chiefly along Broadway, including the Astor House, the Metropolitan, and the St. Nicholas (the thousand-room palace where Dix's Department of the East was headquartered). For good measure, the Confederates kindled would-be conflagrations in Barnum's Museum, Niblo's Theater, the Winter Garden, and assorted Hudson River docks, lumberyards, stores, and factories, before making good their escape to Canada.

As blazes broke out all along Broadway, terrified crowds poured into the street. Wooden houses were evacuated in a frenzy. Police wagons and fire engines fought their way through dense crowds of people screaming, "Find the rebels! Hang them from a lamppost! Burn them at the stake!"

Despite the panic, the fires were promptly extinguished, though not before causing four hundred thousand dollars' worth of damage. The incident captured world headlines but did not affect the course of the war. New York City detectives tracked the conspirators down in Canada and arrested one, Robert Kennedy, when he reentered the United States trying to return south. Tried as a spy, he was found guilty and hanged in Fort Lafayette in March 1865. His fate was symbolic. That same March the death knell of the Confederacy itself could be heard tolling in New York.

PEACE

On March 6 a procession seven miles long snaked its way through the streets of lower Manhattan—a “National Jubilee” hailing Lincoln’s second inaugural, recent Union victories, and impending Confederate defeats. Marchers included huge numbers of troops, the city’s volunteer fire companies, scores of German, Italian, and Irish community organizations, businesses and banks, insurance and express companies, typographers, pianomakers, steam fitters, tailors—even elephants and camels. Patriotism and commerce mingled: *Harper’s* sniffed that for all too many businesses the “chief object in participating in the festival was the opportunity to advertise their wares.” Some commercials were done with knowing wit, like the sign for McAuliffe’s Irish whiskey: DON T AVOID THE DRAUGHT. In echoes of earlier days, sailors carried model boats, one of a fullrigged ship, another of the *Monitor*. Others proclaimed the future: OIL IS KING NOW, NOT COTTON read one display.

On April 3, businessmen standing on the corner of Pine and William read on the *Commercial Advertiser’s* bulletin board that Richmond and Petersburg had been captured the day before. Broadway became an instant river of cheering, singing men. Flags waved, guns saluted. On April 11 word came that Grant had run Lee to ground at Appomattox, and again the city exploded.

But the night of April 14 wrenched New York into an abrupt change of mood. Lincoln had been shot and died the next morning, Good Friday. Whitman, reading the news in black-bordered papers, crossed to Manhattan and walked up Broadway past shuttered stores hung in black. Toward noon, he recalled, it began to rain: “Black clouds driving overhead. Lincoln’s

death—black, black black—as you look toward the sky—long broad black like great serpents.”

The city prepared for Lincoln’s final visit. The Committee of Arrangements included A. T. Stewart, Moses Grinnell, William Dodge, and William Tweed. The funeral train left Washington on April 21. It stopped at Baltimore, Harrisburg, Philadelphia. From New Jersey the party was ferried to Manhattan. The ships in the harbor were draped in black muslin. At the Desbrosses Street dock the body was placed in a glass hearse drawn by six gray horses. Accompanied by a German society singing a funeral ode, the procession, headed by General Dix and the Seventh Regiment, moved across Canal and down Broadway to a black-draped City Hall, where it was put on a catafalque. Lines formed to pay last respects.

The city shut down for the day. Businesses closed, courts adjourned. At the Nineteenth Street Synagogue, the Rev J. J. Lyons led the Nahan Neshomen, the prayer for the dead, the first time such a ceremony was ever held in the United States for a non Jew. Mourning was not unanimous, however. Strong reported hearing of a dozen cases where “celtic handmaidens” had been summarily discharged for rejoicing at the news. Gramercy Park House similarly dismissed a number of waiters for approving of the assassination.

The next day, April 25, a sixteen-horse funeral car led by eighteen bands paced its way from City Hall up Broadway to 14th Street, across Union Square to Fifth Avenue, and north to the Hudson River Railroad Depot. At the rear walked a small group of “freedmen.” This human postscript represented a last-minute compromise. The Common Council had excluded blacks from participating in the march at all, and they had organized their own ceremonies, featuring Frederick Douglass, at Cooper Institute. But the Union League Club protested. Interceding with Stanton and the local police, they got permission for a token representation to bring up the rear.

At four P.M., the train pulled out of the station for Albany. The Civil War in New York City was over.

Lincoln's funeral cortege turning up Broadway, April 25, 1865. To the right, a huge banner draped across the front of City Hall reads: "The Nation Mourns." It was said that a million people watched the procession. (© Collection of The New-York Historical Society)

Westward, Ho!

With the guns silenced, New York's exporters, importers, shippers, and bankers set out to repair their severed southern connections. Cotton might no longer be king, but as the country's leading export it remained, the *Times* noted, "a magnate of the very first rank." To restore the antebellum status quo as quickly as possible, New York businessmen overwhelmingly supported President Andrew Johnson's policies. They applauded the president's grant of amnesty to most ex-Confederates, accepted a quick return of southern representatives to Congress, and raised no objections when state legislatures passed "Black Codes" imposing virtual peonage on freed slaves.

Less than a year after the fighting ended, though, leniency had reaped few rewards. When New York City's Chamber of Commerce commissioned an envoy, Thomas N. Conway, to canvass the old Confederacy for prospects and to let former rebels know that "money in vast quantities was awaiting a chance of safe and profitable investment," Conway turned in a gloomy assessment. There were, he reported, planters desperate for funds to restart operations, merchants eager to hook up with old trading partners, and would-be southern industrialists who needed northern capital to build railroads, erect textile mills, and exploit mineral resources. But enthusiasm from the few was offset by hatred from the many. There was no way, Conway reported, that New Yorkers "could live and safely conduct business in any section of the South." Nor were serious profits likely. Whites were obsessed with subordinating the newly freed blacks, and looming racial turmoil would make southern labor unproductive and unreliable.

Conway's predictions were quickly confirmed. In May 1866 Memphis whites fired and pillaged hundreds of black homes, churches, and schools, gang-raped black women on the streets, and murdered dozens of black men. In July a massacre in New Orleans left thirty-eight dead and 146 wounded. These events shocked and angered many New York businessmen. So did the decision by "reconstructed" states to send Confederate congressmen, Confederate generals—even the Confederacy's vice-president!—to

represent them in Washington. Presidential reconstruction, it seemed, was letting southerners win back politically what they had lost on the battlefield.

These developments strengthened the radical wing of the Republican Party, which had been arguing for much tougher treatment of the South. Freedmen, radicals argued, should be granted political and civil rights, and former Confederate leaders should be disfranchised. The most militant radicals called for expropriating ex-slaveholders' lands and dividing them up among poor whites and blacks. Radicalism had attracted few New Yorkers outside the Union League Club or the city's African-American community, but the appalling news out of the South enhanced the appeal of harsher measures.

Riding the surge of resentment, Radical Republicans swept to national triumph in the fall 1866 elections, capturing two-thirds majorities in both houses of Congress. In 1867 they imposed military rule on the South. Federal troops oversaw enrollment of voters, this time with blacks included and most Confederate officials excluded. The newly reconstituted state governments ratified the Fourteenth Amendment—a guarantee of equal rights (short of suffrage) for all citizens, to be overseen by the national government—and embarked on social reforms.

Propertied northerners balked at any confiscation of planter lands, however, and by the time the 1868 presidential campaign got under way, New York Republican conservatives believed reconstruction had gone far enough. Democrats believed it had gone too far. Selecting Horatio Seymour, New York's wartime governor, as their presidential standard-bearer, they denounced Republicans for subjecting the South to rule by “a semi-barbarous race of blacks” who longed to “subject the white women to their unbridled lust.” Conservative Republicans, seeking a candidate who would accept the new status quo but foreswear dramatic new departures, turned to Ulysses S. Grant. Indeed the Grant candidacy was born and bred in New York City, launched by such businessmen as A. T. Stewart, Cornelius Vanderbilt, William B. Astor, and Hamilton Fish. The general lost the metropolis, still stubbornly Democratic, but carried the nation.

Under federal protection, southern governments tried hard to attract northern investment. They extended munificent aid to railroad corporations, exempted new industries from taxes, leased convict labor to entrepreneurs, repealed usury laws, and proved as susceptible as their northern and federal

counterparts to being bribed by businessmen. One Georgia legislator got a “loan” of thirty thousand dollars from Harper and Brothers in exchange for a promise to have the new state school system adopt its textbooks.

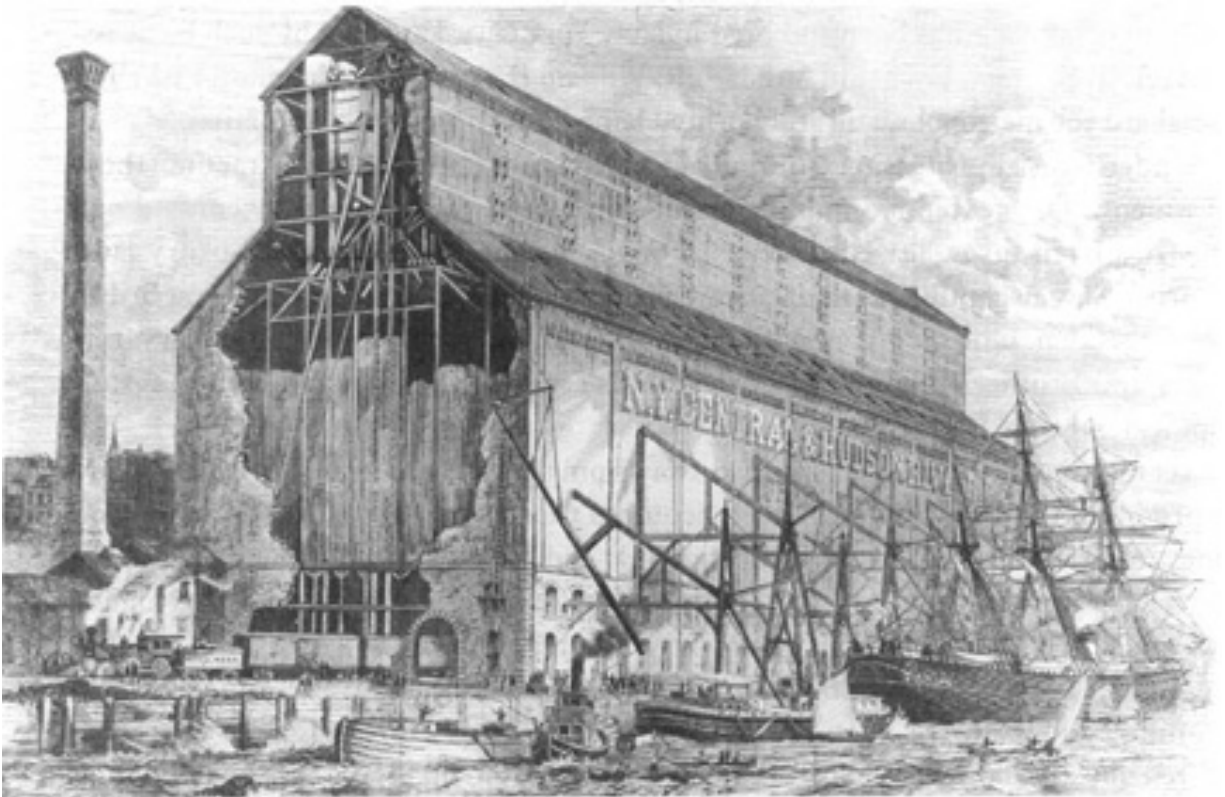

Yet most New York capitalists shied away from the South. They financed some cotton production (some merchants even acquired their own plantations) and put some money into railroads, the Texas cattle industry, and Florida’s nascent tourist business. Merchants restored the flow of cotton bales through the Hudson River seaport and on to Europe, driving exports from a puny six million pounds in 1865 to over three hundred million pounds by 1873. But with disfranchised, infuriated whites organizing the paramilitary Ku Klux Klan and launching insurrectionary forays against the reconstructed governments, the South seemed “the last region on earth”—as George Templeton Strong formulated dominant opinion—in which “a Northern or European capitalist [would] invest a dollar.”

WALL STREET AND THE WEST

As their hopes for the former Confederacy withered, New York businessmen grew ever more enthusiastic about the West, eyeing the enormous opportunities opened up by the thrust of railroads across the Mississippi toward California. Before the Civil War only a scant six thousand miles of track had been laid. By 1869 the engineers and work gangs of the Union Pacific and Central Pacific had driven their converging lines toward a golden-spiked conjuncture, and competitors were proliferating rapidly. By 1873 twenty-four thousand miles of track had been laid; by 1877, seventy-nine thousand miles. Railway expansion not only created a truly national marketplace but spurred a cascading industrial development. The demand for rails and railroad bridges galvanized iron manufacturing, summoned the steel industry into being, and touched off mining booms from Pittsburgh to Colorado. These industrial and extractive operations, in turn, attracted vast numbers of immigrant workers, accelerated urban development, and fostered commercial agriculture.

New Yorkers would be deeply involved in the industrialization of the West. The metropolis would finance, promote, and publicize the region’s feverish development, funnel its products to Europe, distribute imported commodities to its populace, serve as portal for the millions rushing westward, and consume vast quantities of its agricultural and industrial

products. Soon four of the country's seven great arteries to the interior (the Erie Canal and the Central, Pennsylvania, and Erie railroads) would be pouring western goods into New York's harbor—grain, meat, lumber, coal, and iron, both for local consumption and for transshipment to Europe and a growing Latin American market. In return New York merchants would ship westward burgeoning quantities of northeastern industrial products—shoes from Lynn, rifles from Springfield, clothing from Manhattan itself—and the most essential item of all: money.

The torrent of western wheat that descended on the city after the Civil War would prompt the New York Central Railroad to erect this enormous grain elevator on the Hudson River at Sixty-First Street in 1870.. (© Collection of The New-York Historical Society)

Dime novels depicted western settlement as the result of ambitious efforts by innumerable individuals—family farmers and cantankerous cowboys—but pioneering the continent also demanded a far more organized mobilization of resources. Mining, lumbering, steelmaking,

railroad building, cattle ranching, and “bonanza” farming were enormously expensive, requiring investment capital on a colossal scale.

Government provided much of the funding (and, of course, the requisite military muscle). No fears of socialism or debilitating dependency hindered entrepreneurs from seeking handouts. Washington and local states gave subsidies, credits, and over a hundred million acres of land to mining companies and railroads, free of charge. The legislative largesse was intended to foster economic development, consolidate the national territory, and, less high-mindedly, to line the pockets of officeholders, as evidenced by the spectacular scandals of the Grant administration.

It also provided a huge windfall for the New York bourgeoisie, who had invested so heavily in such enterprises. Industrialists turned to Manhattan to tap into eastern and European capital pools. Paced by the rapid growth of trading in railroad stocks, Wall Street’s money markets expanded rapidly. By 1868 over three billion dollars’ worth of securities were sold at the New York Stock Exchange, an even larger volume at the Open Board, and still more at the curb. Additional trading at the Gold Exchange, Produce Exchange, and Petroleum Exchange swelled New York’s capital markets until they outranked all their American competitors combined.

Industrialists turned less often now than they had before the war to the city’s merchants, more often to its financiers. Brokerage houses proliferated in downtown Manhattan, especially after the invention of the stock “ticker,” patented in 1867, allowed them to access price information from exchange floors. The crucial financing institutions, however, were the great banking firms, especially those with solid European connections, and the most critical technology was the Atlantic cable, which, restored to life in 1866, made instantaneous communication with overseas investors possible.

Once again foreigners began pouring vast sums into the American economy—the setbacks of 1857, like those of 1837, now merely a hazy memory. In 1853 fifty-two million dollars’ worth of U.S. railroad stocks and bonds had been held outside the country. By 1869 the figure had jumped to \$243 million and was accelerating rapidly. Altogether, in that year, Europeans held over \$1.46 billion of American securities.

Tremendous power accrued to firms that could raise and funnel funds from Europe into the U.S. economy. Some were old, established operations,

like the House of Belmont, with its ties to the House of Rothschild, but new ones emerged as well, the most outstanding being the father-son team of Junius Spencer Morgan and John Pierpont Morgan.

The elder Morgan ran the largest and wealthiest American bank in London. A highly respected firm, it had long specialized in underwriting the sale of British iron to American railroads. But Junius aspired to the loftier plateau of investment banking, where Barings and Rothschilds dwelled. Morgan had developed close ties with leading railroad entrepreneurs (and iron consumers) like Commodore Vanderbilt. When galloping American iron production and steep American tariffs drastically curtailed this trade, Junius shifted easily into underwriting railroad issues.

Like any other European-based concern, J. S. Morgan and Company needed reliable information about the great American West. Junius turned to his son, Pierpont, whom he had long been grooming for the business. After being schooled in Switzerland and Gottingen, Pierpont had started work in a conservative Wall Street firm during the panic year of 1857. Brilliant but rash, the burly young man with the handlebar mustache and intense gaze alarmed his employers, and when they refused to make him a partner Morgan formed his own firm in 1861.

Pierpont composed lengthy letters to his father on America's political and financial condition (and reported in person to London each spring), but he also found time to participate in the speculative scramble of the war years. (When drafted, he'd purchased a substitute, whom he jocularly referred to as "the other Pierpont Morgan.") He became a regular denizen of the Gold Room, cleared \$160,000 on a market-rigging scam, and financed some speculators who purchased five thousand obsolete rifles from a government armory in New York and resold them to government troops in Missouri at six times the price. Junius, dismayed, orchestrated an alliance with a sober banker thirty years Pierpont's senior, and Dabney, Morgan, and Company became his New York agent.

As his father moved into railroad financing, Pierpont set out to investigate the frontier first hand. Boarding a train in July 1869—a scant few weeks after the first transcontinental line had gone into operation—he and his new wife, Fanny (daughter of the successful lawyer Charles Tracy), headed for the Far West. After a twelve-day stopover in Chicago, during which he met with officials of the major railroads, he pressed on through

Nebraska in one of George Pullman's recently invented luxury sleeping cars. From his window he spotted Pawnee warriors, wagon trains, and U.S. Cavalry scouts. Then the train notched through the Rockies at South Pass and descended into California, where Morgan spent an additional month, as the guest of prominent Western businessmen, deepening his firsthand knowledge of the emerging American rail system.

In 1871, when Dabney retired, Junius arranged for a new Pierpont partner: Anthony Drexel, a leading Philadelphia banker, who was well aware that the center of financial activities lay in New York City. Two years later, the firm of Drexel, Morgan, and Company moved to a brand-new six-story marbled building on the corner of Wall and Broad streets (the land alone had cost a record-breaking \$349 per square foot). The new company, in alliance with Morgan Senior, was perfectly positioned to market railroad and government bonds to English clients and swiftly became one of the leading houses on Wall Street.

England was not the only source of investment capital flowing into New York City. Germany too shipped vast quantities to Wall Street, and this afforded an opening for several German Jewish concerns that had made the transition from commerce to banking. The most influential was the firm of J. and W. Seligman. Joseph Seligman and his brothers, having done well in California commerce, had moved into banking by trading their West Coast bullion on the New York gold market in the 1850s. They quit just in time to keep their fortune from being wiped out by the 1857 panic and bought a clothing factory just in time to take advantage of wartime government contracts. When, to their dismay, they were paid with Union bonds instead of specie, they learned how to convert the paper into hard cash by selling the securities to wealthy contacts in Frankfurt and Amsterdam.

The Seligmans' expertise caught the eye of the secretary of the treasury, who enlisted their aid in marketing tens of millions of new government notes abroad. It proved much easier to raise money among Germany's numerous Union sympathizers than in the City of London, whose cotton connections left it cool to the North. When the war was over, the brothers established an international banking house, frankly modeled on the Rothschilds'. Various Seligman brothers were dispatched to Paris, Frankfurt, London, San Francisco, and New Orleans, and in 1869 the House

of Seligman became the first German Jewish bank to enter the railway security business.

Close on their heels came another firm that had emerged out of wartime profitmaking. Abraham Kuhn, a German Jewish immigrant, had founded a prosperous drygoods business in Cincinnati. He was joined, after 1848, by a distant relative, Solomon Loeb, son of a Worms wine dealer. During the war they made a fortune providing uniforms and blankets to the Union Army. After Appomattox, they took their capital of half a million dollars to New York City and opened Kuhn, Loeb, a private banking establishment in Nassau Street. Kuhn soon retired to Germany, but the mother country supplied a more than ample replacement when Jacob Schiff, scion of an ancient Frankfurt family of scholars and bankers, joined the firm in 1875.

In the 1870s investment banking firms like Drexel, Morgan, the Houses of Belmont and Seligman, and Kuhn, Loeb constituted New York's financial elite, partly because they channeled such huge amounts of capital into western industrialization, but also because they were known as ethical operators. Not that they weren't ruthless businessmen, but they did tend to adhere to a gentlemanly code that emphasized discretion, honest agency, and restraint in competition with one another. These standards worked to their advantage and the city's: by garnering the trust of distant investors they sustained New York's reputation as a reliable haven for foreign capital.

THE SCARLET WOMAN OF WALL STREET

Not all New York financiers were honorable men. Ever since the days of Hamilton and Duer, the market had inevitably been a magnet for those who hoped to profit by manipulating the market itself. Prudential investment and speculative rascality were the Castor and Pollux of Wall Street.

The Panic of 1857 wiped out most of the older generation of traders, and the Civil War brought to prominence a breed of brash gamblers, men who played big-stakes games with cutthroat earnestness. In the postwar years, these travelers down Wall Street's dark side were fortified by an atmosphere of feverish growth, a virtual absence of regulation, and a political system in New York City that facilitated skullduggery.

John Duer's most notorious incarnations in this era were the improbable trio of Daniel Drew, Jim Fisk, and Jay Gould. Drew, now in his seventies,

was one of the few survivors from prewar days, having been a leading Wall Street figure since 1838, when he'd given up driving cattle and turned to manipulating stock. Jim Fisk—tall, florid, and fat—was a vulgarian even by the lights of a gaudy age. With his pomaded and waved light brown hair, his loud suits, his frilled shirtfront garnished with huge diamonds, and his theatrical style, he looked like the huckster he had in fact once been. During the war Fisk wangled contracts to sell dry goods to the government and smuggled cotton through the Union lines. At war's end he came to New York, bet and blew a fortune speculating on Wall Street, and started anew as a broker handling work for Daniel Drew. He soon demonstrated that behind the genial Falstaffian buffoonery lay a speculative freebooter of the first order.

Jay Gould was not a man who, by his appearance, would shock polite New York (indeed he married into it and set up a model family life on Fifth Avenue). Small, thin, intense, and abstemious, Gould was an enigma, not a peacock, but in his own way quite as amoral as his friend and colleague Fisk. Gould grew up poor and sickly in upstate New York, first visiting New York City in 1853 when he came down to exhibit his grandfather's better mousetrap at the Crystal Palace. He entered the leather business, moved to New York to deal in the Swamp, then shifted into the stock market as a "guttersnipe," teaching himself the tricks of an increasingly nasty trade. Learning how to control big enterprises with small holdings, Gould became a consummate litigant and a master of the arts of deception and bribery. He would soon become the most hated man in America.

Cornelius Vanderbilt was no Alexander Hamilton—he had zero qualms about speculative wheeling and dealing—but since he'd shifted from river to rails, by gaining control of the Harlem during the Civil War, he had been a model entrepreneur. Devoting himself to improving the old line's management and equipment, by 1866 he had turned the Harlem into a going concern, but one whose future profitability, he realized, was imperiled by competition from the Hudson line. Vanderbilt, accordingly, bought control of the Hudson by purchasing its shares on the open market, in partnership with Leonard Jerome and John M. Tobin. Then he coordinated the former rivals' schedules and rates.

Now it became apparent that the success of his combined operation, which ran to Albany, was at the mercy of yet another road, the New York

Central, which controlled the traffic with Buffalo, the junction point with midwestern commerce. Vanderbilt decided to take over the Central too. Buying a minority holding on the open market, he proceeded to convince key Central stockholders—notably John Jacob Astor Jr.—that only by linking up with his roads and letting him manage the conjoint operation would the Central be able to stand up to *its* competitors for the western trade. By 1867 he had become president and was operating the Hudson and Central as an effective New York-to-Buffalo unit.

The roads flourished and paid high dividends. Vanderbilt accordingly issued a vast amount of new stock, nearly doubling the capitalization, arguing that the additional certificates were justified by anticipated earnings. Others had “watered” stock this way, but only to make quick speculative profits; Vanderbilt plowed much of the proceeds back into improvements.

In his new position as commander of the consolidated Central lines, Vanderbilt confronted yet another competitor, the old Erie Rail Road. It too ran from New York City to the Great Lakes. The Erie, moreover, was controlled by his old steamboat rival Daniel Drew, beneath whose pious and austere Methodist exterior beat the heart of a shark. Drew had repeatedly jerked the road’s stock price up or down, as suited his market gambit of the moment, and had launched periodic rate wars to win freight traffic away from the Central.

In 1867 Vanderbilt set out to capture Erie and oust Drew. Drew, seconded by new board members Fisk and Gould, prepared to repel the hostile takeover. The Commodore began by secretly buying up Erie stock, through dummy agents. To block Drew and company from issuing more stock, which would make his buyout harder, Vanderbilt prevailed upon Justice George G. Barnard of the Supreme Court, a Tammany man renowned for his favors to wealthy petitioners, to enjoin Erie from increasing its capitalization. But Drew, Fisk, and Gould evaded the ban and secretly threw millions of dollars of new Erie stock on the market, in effect churning out certificates as fast as Vanderbilt’s unsuspecting brokers could buy them. “If this printing-press don’t break down,” chortled Fisk, “I’ll be damned if I don’t give the old hog all he wants of Erie.”

Vanderbilt soon discovered the ruse but grimly kept buying, driving the price ever higher. Meanwhile, he got Judge Barnard to authorize the arrest

of the Erie's directors for contempt of court. Drew, Fisk, and Gould, one jump ahead of the law, gathered together the company records, baled up over seven million dollars' worth of greenbacks, and literally decamped with the corporation, fleeing by ferry through the fog to Jersey City. There they set up headquarters at Taylor's Hotel (promptly dubbed "Fort Taylor"), hired policemen and roughs to protect them from Vanderbilt vengeance, and settled in for a lengthy stay.

The Erie directors now opened up a second front. Their agents in Albany introduced a bill into the state legislature that would, in effect, retroactively legalize all their questionable stock issuances. The proposed bill also shrewdly forbade Vanderbilt from merging the Central and the Erie, on the grounds that it would create a monopoly that would leave the poor and working class vulnerable to price-gouging. While the Erie's newfound concern for the poor probably changed few votes, legislators did pay close attention to New York City's merchants, who also feared, and vigorously protested, a Vanderbilt-dominated future.

Winning Chamber of Commerce support gave the triumvirate high hopes for success, but, taking no chances, Gould traveled to Albany, reportedly with a trunk full of thousand-dollar bills, set up shop in the Delavan House, and began buying votes. The Commodore swiftly dispatched counterbribery agents, among them William Tweed, who installed themselves on another floor of the same hostelry. Legislators shuttled back and forth in search of the highest bidder. With the Erie's treasury close at hand, Gould's was the more bottomless wallet, and Vanderbilt's troops deserted him, even Tweed—who was rewarded for his treachery with lavish supplies of Erie stock, netting him \$650,000 in all. The desired legislation passed.

Vanderbilt didn't give up. He met secretly with Drew, who—miserable in New Jersey and ready as ever to sell out his partners—whined his way back into the Commodore's good graces and initiated a deal. In return for Vanderbilt's withdrawing his lawsuits and allowing the exiles to come home, Erie would buy back a hefty chunk of his recently purchased stock, even though it would add millions to the company's debt and leave it virtually bankrupt.

Drew left the road to Gould and Fisk—and two new board appointees, Tweed and his henchman Sweeney—and the duo settled into control of Erie. At Fisk's urging, they purchased for their headquarters the floundering

Pike's Opera House (at Eighth Avenue and 23rd Street). The top floors became offices; the bottom part—now festooned with frescoes and gilded balustrades—became the Grand Opera House, a theater in which Fisk, wearing his impresario hat, staged extravaganzas. The flamboyance disturbed Gould, who preferred anonymity, but Fisk was in his element. He installed his mistress Josie in a nearby house, and she presided over regular champagne and poker soirees for Boss Tweed, Judge Barnard, and others in what people now called the “Erie Ring.”

Gould proceeded to wring a fortune from the supposedly squeezed-dry railroad by spreading false rumors that sent Erie's stock quote dancing in the direction he desired. In the course of one audacious scam Gould fleeced his quondam partner Drew so thoroughly that he was forever washed up as a major Wall Street figure. Gould's gambits, however, deeply disturbed *the* Erie's English bondholders, and they asked August Belmont to organize his ouster from the presidency. Gould, in a brilliant maneuver, had the ever complaisant Judge Barnard throw the road into receivership and appoint him its caretaker.

At this point the Erie buccaneers came up against a worthier opponent. Determined to take over a small but strategically located upstate New York railroad, Gould and Fisk began buying its stock on the market. The desperate directors turned for help to Pierpont Morgan. The ensuing contest was a bruiser, the highlight of which was a shootout for control of a railway station in Binghamton. Fisk recruited a small army of eight hundred gang members from the Five Points; Morgan countered with recruits from the Bowery; and in the ensuing free-for-all, at least eight men were shot before the state militia intervened. Morgan's forces triumphed, and Fisk returned to New York, famously remarking that “nothing is lost save honor.”

Morgan solidified his clients' position by arranging for a friendly merger with a larger company, then sought and obtained a seat on the board of directors of the consolidated company. It was Morgan's first such position, and it marked the beginning of a portentous new relationship between financiers and industrialists.

Gould's railroad predations had seriously annoyed conservative bankers like Morgan, but his next venture, an audacious foray into high finance, horrified and enraged them. In 1869 Jay Gould set out to corner the nation's gold supply. Given the centralization of finances in lower Manhattan, this

was not an impossible dream. The supply of gold in the city was less than twenty million dollars' worth, and it could all be purchased on credit. Once he had it in his hands, Gould could drive the price sky high. City merchants who needed the metal for their international dealings, and bearish speculators who had foolishly promised to sell gold at a lower figure, would be at his mercy.

The treasury could easily break such a corner by selling some of its vast holdings in the market, instantly driving the price down. Gould, to prevent the newly installed Grant administration from intervening against him, convinced the president that a corner was in the national (and Republican Party's) interest. If the price of gold went up, American farmers could more easily sell their wheat abroad; railroads would profit from the increased grain shipments; and farmers and railroads were key Republican constituencies. Q.E.D.

Grant agreed, and with the president on board, Gould and Fisk began buying gold. As their army of brokers drove the price steadily higher, howls of outrage reached the White House. Sensing impending doom, Gould began secretly *selling* gold, even while encouraging Fisk to keep buying and bulling its price. Bears, facing utter disaster, pleaded with the government to sell gold. On September 24, 1869, soon to be remembered as Black Friday, crowds of businessmen and merchants facing ruin jammed New Street. As Fisk bought and Gould secretly sold, gold inched up, accompanied by shrieks from the bears, to 145, 150, 155. Then, at noon, with brokers crumpling, transactions flying, and the crowd outside so enraged the militia was ordered into readiness, the government dumped gold on the market, sending the price plummeting. Slipping away from the chaos, Gould and Fisk holed up in their heavily defended Opera House headquarters while the reverberations rocked the city.

Scores of smaller dealers failed, one broker shot himself to death, and the market collapsed, threatening a full-scale panic. "Over the pallid faces of some men stole a deadly hue," wrote the *Herald*, "and almost transfixed to the earth, they gazed on vacancy. Others rushed like wildfire through the streets, hatless and caring little about stumbling against their fellows." One man who kept his head was Jim Fisk, who escaped ruin by the simple expedient of repudiating all his contracts and hiding behind Tammany-supplied judges.

Gould kept his head too but lost what was left of his reputation. The collapse of the Gold Corner didn't precipitate a full-scale depression, but hundreds of businesses failed, and thousands of workers were laid off. They would remember Jay Gould, and the emerging national labor movement would be indelibly affected by this encounter with finance capitalism run amuck. Nor was the press pleased with the turmoil. The *Times* led a journalistic assault that fastened to Gould forever the character of a sinister and poisonous predator. New York City's reputation suffered as well. Wartime gambling in the Gold Room had cast the metropolis in a baleful light; Gould's escapade further blackened its image.

But the men most alienated by the mess Gould had made of the financial markets were the elite directors of conservative banking houses, particularly J. P. Morgan. Gould's machinations distressed Pierpont both as a matter of business aesthetics and personal interest—his own firm of Dabney, Morgan, and Company was bruised by Black Friday—and in years to come he would dedicate himself to imposing his particular brand of order on the national economy.

THE WEST AND WALL STREET

From the West's perspective, the differences between Wall Streeters were less compelling than their similarities, given that most bankers and merchants were determined to restore "hard money." During the Civil War, the government had churned out greenbacks—paper money not exchangeable for gold—in such massive quantities that the postbellum era inherited an inflated currency. This distressed the banking community, which had never liked greenbacks, finding them all too vulnerable to politicians with printing presses. Merchants hated them, for though legal tender in America they were non grata in Europe and ensnared international traders in endless difficulties.

Seeking a quick return to the gold standard, New York City's bankers and merchants hailed a Johnson administration plan to make greenbacks "as good as gold" by withdrawing them from circulation and literally burning them up. Eventually, with scarcity, their value would swell to market equivalence with precious metal, and gold and paper could once again be made interconvertible.

Western farmers and businessmen loathed the idea. With their capital-starved region in the midst of a gigantic expansion, there was not enough currency in circulation as it was. They protested a policy that would drive them into deeper dependency on Wall Street. Entrepreneurs in the iron and steel industry—who had done quite well under wartime inflation—denounced this plot by “money lenders” to throttle “productive capital.” Eastern manufacturers agreed. They organized the American Industrial League (1867), installed Peter Cooper as its first president, and complained that contraction would choke the economy into depression.

Western fury at Wall Street was intensified by the perceived inequities of the banking system. Congress had authorized nationally chartered institutions to issue banknotes that could circulate as money but allocated this credit-creating right on a regional basis, giving by far the bulk of it to New York and New England. By 1866 the per capita circulation of banknotes in New York was \$33.30; in the Midwest, \$6.36; in Arkansas, fourteen cents. This too forced West and South to turn east to finance their own expansion.

The new national financial system had further exacerbated regional inequalities by creating a three-tiered pyramid of banks. At the bottom were “Country Banks,” required for safety’s sake to keep a portion of their capital in a bank located in one of seventeen “Reserve Cities.” These institutions, in turn, were mandated to keep half of *their* required reserves at a bank in the “Central Reserve City”—i.e., Manhattan. This generated additional outcries against “the money power” that was being “centralized in New York.”

Westerners were even more unhappy with the government’s solution to the bond problem. During the war, Washington had been forced to offer high rates of interest, payable in gold, to those who purchased bonds. By 1869 there were over \$1.6 billion of these in circulation. The government now announced that it would pay off the principal in gold too, even though most bonds had been purchased with greenbacks worth fifty to sixty cents at best. This would give bondholders a tremendous windfall profit (akin to that received by New York speculators in the aftermath of the Revolutionary War). Westerners denounced the plan, noting that the great bulk of notes were held by wealthy individuals and financial institutions. One protest pamphlet depicted a sybaritic “Mr. Bond” sitting in his parlor,

smoking imported Havanas, downing French champagne, and gloating over tax-free bonds that brought in 11 percent a year, while out west, a disabled union veteran groaned under the high taxes imposed to pay off the corpulent Mr. Bond.

In 1867 Western animosity crystallized around a “soft money” proposal to pay off the bonds in greenbacks, the same depreciated currency with which they had been purchased. “Hard money” forces—centered in New York City—went wild. Academic economists weighed in with treatises about the immutable laws of classical economics. Ministers like Henry Ward Beecher preached sermons on the sanctity of specie and the wickedness of paper money. (Beecher’s text: “Thou shalt not steal.”)

The money issue became central to the 1868 presidential campaign. The Democratic Party held its national convention in New York, the first in the city’s history. A bruising battle pitted a strong western contingent backing paper, against eastern Democrats led by national chairman August Belmont, Samuel J. Tilden, and Horatio Seymour (all intimately tied to Wall Street financial circles), who insisted on government’s moral obligation to redeem in gold. In the end, Seymour got the nomination, only to lose to Grant and the Republicans, who had more decisively declared themselves for hard and moral money. Their word proved to be their bond. On taking office, Republicans immediately passed the Public Credit Act (in March 1869), which pledged to redeem bonds in coin and to make greenbacks as good as gold, as soon as possible.

To raise the massive supply of specie required for a return to the gold standard, the government planned to sell \$1.4 billion worth of federal bonds, the largest securities transaction of the decade. For help, the government turned to a syndicate dominated by New York’s international bankers, including the Seligman Brothers (who had close ties to Grant and strong connections abroad), August Belmont and Company (acting on behalf of the English Rothschilds), and Drexel, Morgan (representing Junius Spencer Morgan of London). Syndicate members succeeded brilliantly, accruing hefty profits in the process, and on January 2, 1879, the country went back on the gold standard, a Wall Street triumph bitterly resented in the West.

Reconstructing New York

Southern planters and western greenbackers were far from being the sole concerns of the city's propertied classes in the immediate aftermath of the Civil War. Memories of the terrible draft riots remained raw. The lower three-fifths of New York's population seemed still in thrall to poverty, ignorance, alcohol, Romanism, and the Democratic Party, which some Republicans now believed tainted with treason as well as venality.

The Union League Club's Committee on Municipal Reform, established in October 1865, caught the prevailing mood among groups like the Citizens Association and Chamber of Commerce when it wondered: "Is there not a member of this Club who had not had fleeting moments of longing for a temporary dictator who would sweep these bad men from our municipal halls and cleanse this Augean stable of its accumulated corruption?" Some Republicans were indeed convinced that setting the city to rights would require methods as vigorous as those employed in reconstructing Georgia or Mississippi, and they yearned for the dispatch of federal troops to New York.

But most preferred to resume the strategy, launched just before the war, of using the state legislature to override and supplant local government, thus bypassing politicians and encrusted special interests. Handing power to state commissions staffed with professionals, moreover, would allow reformers to assess and redress civic wrongs by using "scientific" studies of municipal problems.

Drs. Griscom and Sanger had pioneered the idea of scientific surveys and statistical analyses of municipal problems back in the forties and fifties. The wartime success of agencies like the Sanitary Commission had greatly strengthened reformers' confidence that the fruits of social intelligence could be brought to bear upon previously intractable urban ills. Now, in the postwar era, "social science" (argued E. L. Godkin in the *Nation*) could be fully brought to bear on "the arrangement and management" of city life. The new optimism was caught by William Cullen Bryant in an *Evening Post* editorial. "Thoughtful men," Bryant said, no longer believed that urban

growth was beyond “the control of scientific thought.” Instead they were focusing their attention on “the important problem of how to plan and how to build a city so as best to accommodate business and promote health.”

Many businessmen were prepared to support such initiatives. Even laissez-faire stalwarts who, before the war, had balked at any legislative infringement on property or profits experienced a change of heart after the draft riots. The Citizens Association, formed in that upheaval’s aftermath and heavily stocked with civic leaders, would now push hard for substantial government intervention in an all-too-free marketplace.

FIRE

One of the city’s most serious problems was its ongoing flammability. Reformers blamed the volunteer firefighters, whom they now set out to replace with a professional fire department. The volunteers were newly vulnerable to assault, as their prewar reputation for rowdiness had been reinforced by the behavior of some in their ranks during the draft riots. After Appomattox, moreover, their brawling had reached intolerable new heights. In one August 1865 shootout at a fire scene, two men were killed and eighty wounded, while the building they had come to rescue burned to char and cinders. For the insurance companies, which had to cover such losses, and for the local merchants, who were forced to pay premiums higher than anywhere else in the United States or Europe, the volunteer system was inexcusably inefficient. Republican reformers were also well aware that the companies were prime recruiting resources for the Democratic Party.

Republican legislators accordingly introduced a bill to replace the forty thousand volunteers with a thousand-man professional fire department, to be equipped with the horse-drawn, steam-powered pumpers that brawny volunteers had long resisted. In hearings on the bill, the insurance industry presented the damning evidence they had systematically collected that demonstrated exactly how costly the old amateur order was to the city and its property owners. Other urban centers, the insurance companies noted, had established professional departments, and the statistics made clear how much more effective Baltimore and Cincinnati’s systems were. Twenty-three banks, 109 insurance companies, and thirteen thousand citizens filed petitions on the measure’s behalf. Businessmen complained that having

worker-volunteers down tools and race off whenever the fire bells rang was “incompatible with any steady pursuits of industry.” The police commissioner testified about rowdiness. Moral reformers charged that volunteers, who were allowed to bed down in the firehouses at public expense, had been bedding down with prostitutes, converting stations to de facto whorehouses.

The existing Board of Fire Commissioners offered feeble rebuttals but was ill equipped to controvert such charges. Sputtering was no match for statistics. The bill passed, weathered an immediate lawsuit challenging its constitutionality, and went briskly into effect. The new fire commissioners, moving swiftly to establish discipline, replaced competition between companies with a centralized command. The old system of summoning assistance by ringing the City Hall bell was replaced by an extensive network of fireboxes (by 1873 there were 548 boxes on Manhattan, connected by 612 miles of telegraph wire). Within a few years, annual losses from fire, and the amount of settlements paid out by insurance companies, had both dropped sharply, to widespread relief and applause.

HEALTH

Reformers also succeeded in establishing a Metropolitan Board of Health. Dr. John H. Griscom, who first called for creating a sanitary police back in the 1840s, had kept hammering at the issue throughout the 1850s and had been joined by other activist physicians like Joseph M. Smith, president (from 1854) of the New York Academy of Medicine. The doctors helped organize a New York Sanitary Association in 1859, which brought physicians together with civic-minded businessmen like Peter Cooper to agitate for change. The Association for Improving the Condition of the Poor signed on to the crusade, spurred like other reformers by the draft riots. “The mobs that held sway in our city,” the Citizens Association agreed, had been generated in “overcrowded neglected quarters.”

In 1864 the Citizens Association submitted a proposal for action to the state legislature. It went nowhere. The most vigorous resistance came, ironically, from the city inspector’s office (Griscom’s old department), which had oversight of sanitation. Inspectors opposed further transfer of municipal authority to Albany, partly on home-rule principle, primarily to hold on to their hefty level of funding (some of which they apparently

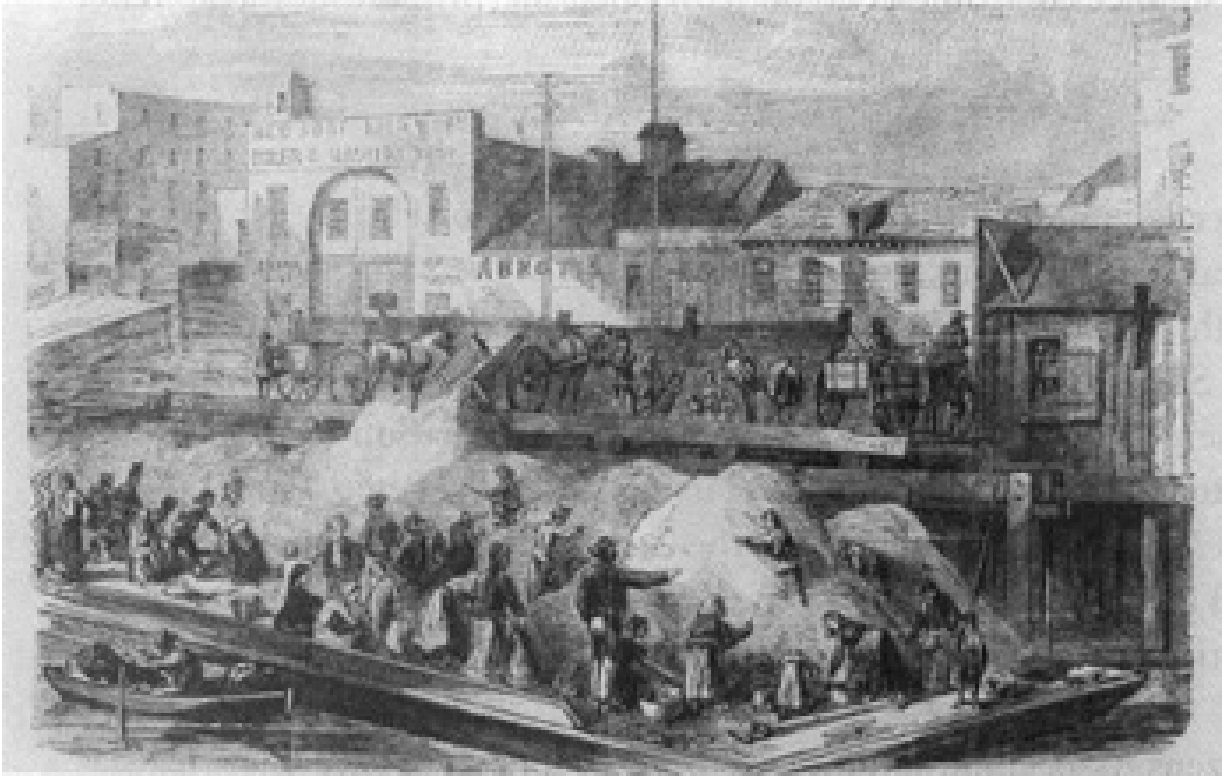

diverted into the pockets of legislators who voted against reform). Antireformers also claimed that charges of unsanitary conditions were vastly overblown.

Griscom blasted his old department, noting that since he'd left twenty years earlier, its expenses had shot up, and so had the city's mortality rate. In terms of public health, Griscom charged, New York had regressed to London's position two centuries earlier. To counter opponents with solid statistics, militant physicians organized a Council of Hygiene and Public Health and initiated a block-by-block, tenement-to-tenement survey of Manhattan. Dividing the city into twenty-nine districts, the council assigned each a doctor, who visited every building and put to every family a written schedule of questions. Artists went along, sketched conditions, and prepared illustrations. The mammoth study (it ran to seventeen volumes) was then condensed to a five-hundred-page *Sanitary Report*, published in June 1865.

The report startled even those hardened by two decades of such surveys. The examiners had discovered that smallpox—a preventable disease—was rampant in the city; they turned up fifteen hundred cases in their first few days investigating. The Council of Hygiene called on the city to replace its voluntary (and disorganized) vaccination efforts with a compulsory program. But smallpox was only a small part of the story. Where Philadelphia's death rate per thousand was twenty and London's was twenty-two, New York City's stood at thirty-three. This meant that thirteen thousand people were dying each year from diseases and conditions that were probably avoidable. And for each death there were twenty-eight cases of disease: in some tenements, 50 to 70 percent of the residents were sick at any given moment. This added up to a vast amount of preventable illness and—a fact the council underscored for the business community—a corresponding loss of work hours.

By 1865 the Citizens Association had distributed two million sanitarian tracts in every part of town, sponsored many public meetings, and once again introduced a health bill in the legislature. Incorporating provisions of England's public health laws, it urged that a nonpolitical board of experts be given extraordinary powers to clean up unsanitary conditions. Union League Club members testified on the bill's behalf. Once again it was blocked by municipal bureaucrats and politicians and by those who resisted

giving government agencies substantial power over property rights. The legislature did, however, authorize New York City's Croton Aqueduct Department to devise a plan for the systematic sewerage of all Manhattan, free from interference by the Common Council.

Scavengers on the Beach Street dumping barge, *Harper's Weekly*, September 29, 1866. Here, the paper said, men, women, and children dug through “the refuse of respectable folk” to find anything that could be used or sold to junk dealers. (Library of Congress)

At just this point, cholera tugged at the legislators' sleeves. In August of 1865 newspapers announced that the disease had reached Europe and was heading west. In November a steamship arrived with sixty cases aboard. A cold winter retarded its movement, but alarmed state lawmakers realized that in spring the plague might well scythe through New York's tenement population and then, as in the past, press on to devastate Syracuse, Rochester, and Buffalo. In February 1866, therefore, Albany created a Metropolitan Board of Health and gave it extraordinary powers to fight the scourge. The new board could order any person deemed a health threat

removed from home to hospital. It could order property owners to rectify unhealthy conditions. Such orders could be enforced by the police or the board's own officers.

When spring came the board sent an army of agents marching through town, making house-to-house inspections and cleaning and disinfecting privies, cellars, and yards. It commissioned new street-cleaning contracts and oversaw the removal of vast amounts of filth from the city's streets (160,000 tons of manure from vacant lots alone). It got the city's butchers to clean up slaughterhouses and agree to their eventual removal north of 40th Street. The water supply was improved. New standards were imposed on the milk industry.

The mobilization helped keep New York's death toll under five hundred—one-tenth the fatalities of 1849, despite a one-third increase in population since then—while Cincinnati lost twelve hundred, St. Louis thirty-five hundred. New York had erected a milestone in the history of public health, but it was clear to reformers that securing their victory would require systematic attention to the city's built environment as well.

HOUSING

The war had exacerbated the city's housing crisis. New construction had limped badly while immigrants continued to pour in (over 150,000 in 1863 alone). With peace, demobilized veterans swarmed back home, and steamers disgorged ever greater numbers of newcomers. The 1865 report of the Council of Hygiene and Public Health demonstrated just how crowded the tenement districts were. Out of New York's seven-hundred-thousand-plus residents, 495,592 individuals were tenanted in 15,309 multifamily dwellings, an average of roughly seven families per building. Many of these five-or six-story tenements had each floor carved into eighteen rooms, organized like compartments on a train, hence the expression "railroad flats." Only two of these tiny rooms got direct sunlight (if the facade faced south), and interior cubbyholes were without ventilation, unless an extravagant builder included air shafts. Thousands more tenants were crammed into the back buildings landlords continued to insert behind tenements, often jammed up against their rear wall. In the Fourth Ward, the population density reached 290,000 per square mile.

Things got rapidly worse. In 1867 the legislature authorized another investigation. Again, statistics were amassed. Fifty-two percent of Manhattan's tenements were "in a condition detrimental to the health and dangerous to the lives of the occupants." Their deficiencies included insufficient ventilation, absence of light, lack of fire escapes, and terrible drainage. (When the tide came in, a basement in a filled-in swampland area could fill to a depth of twelve inches, high enough "to keep the children of the occupants in bed until ebb-tide.")

With rotten conditions came rising rents, which jumped 50 to 100 percent within a year after Appomattox, feeding a profit stream that flowed upward to the great propertied families from whom many slumlords leased their lands. Priced out of even tenement housing, the very poorest drifted to uptown shantytowns or, like Jacob Riis, a young and unemployed Danish immigrant, slept in doorways.

In March 1865 Germans near Tompkins Square held a mass meeting and called on the legislature to regulate rents; a year later they renewed their demands. The Council of Hygiene and Public Health called for strict public regulation of tenements. Radical Republicans supported imposition of minimum standards. The conservative Republican *Times* and Democratic *World* agreed, with the latter's editor, stunned by the investigations, declaring that "of all the diabolical, horrid, atrocious, fiendish, and even hellish systems of money-making ever invented by the mind of man, the tenement-house system of this city, is the most horrible."

In 1866 Albany enlarged New York's Department of Buildings, giving it a full-time staff, and established standards for municipal construction, creating the nation's first comprehensive building code. In 1867 the legislature passed the Tenement House Law, New York's first regulation of working-class housing. Modeled in key respects on London's 1848 Lodging-House Act, the act limited the number of persons permitted to reside in a given amount of space. It required that every room in new buildings have ventilation and that transoms be installed in older ones. It decreed the installation of fire escapes and the provision of one water closet for every twenty residents (one per hundred then being the norm). It outlawed domestic animals (except dogs and cats). It forbade renting out cellar apartments less than seven feet high. And it made landlords liable to a

daily fine for every uncorrected violation cited by the new Metropolitan Board of Health, which was given enforcement responsibility.

Clearing Out a "Dive," *Harper's Weekly*, July 12, 1873.
Basement dwellers often clashed with the Board of Health's Sanitary Inspectors, who were empowered to throw them out and dispose of their possessions. (Library of Congress)

Most landlords, builders, and real estate companies soon discovered, however, that the Tenement House Law was loosely worded and loophole-ridden. A fire escape "or some other means of egress" was required—a wooden ladder might do. Cesspools were forbidden—except where unavoidable. Ventilation for a dark inner room could be provided by a window to an outer one. "Tenements" were legally defined as buildings with more than three families, though many of the worst ones contained only that number.

Despite these obvious concessions to real estate interests, the law was a remarkable stride forward. Reformers had made private housing a matter of public concern and authorized government intervention to protect tenant

health and welfare. The Metropolitan Board of Health pursued its duties vigorously, suing scores of city landlords for code violations in over three thousand units in 1868 alone, and in succeeding years managed to cut the cellar-dweller population in half. Slowly, dilapidated wooden housing gave way to new brick tenements constructed under the reformed building codes.

CITY BUILDING

“Generally the public works that have heretofore been carried out on this island have been conceived on too narrow and limited a scale,” said Andrew Haswell Green in 1865, “We need not go off the Island,” he amplified a year later, “to see lamentable results of the want of largeness of ideas in the attempts that have been made to provide for the growing wants of a great people,” If “the planning of a city” were to be “done with any degree of foresight,” Green insisted in 1867, it was imperative to transfer authority to “some body with comprehensive powers.” The body he had in mind was his own Central Park Commission, and the powers he had in mind were Haussmannesque—nothing less than authority to plan and oversee the expansion of all city services into northern Manhattan, and even Westchester.

Suggestions from Andrew Haswell Green commanded respect among New York’s landed wealthy, for he had long since proven his devotion to their larger interests. Since 1844 the former wholesale clerk had been a partner in Samuel Tilden’s law firm, where he worked closely with the eminent corporate attorney then urging consolidation on the railroad industry. Green himself offered investment advice and management services to owners of New York’s great estates. He won their trust with his expertise, his pious Protestantism (a legacy of his Massachusetts upbringing), his extreme frugality (bordering on miserliness), and his pugnacious conviction that government should rest with the propertied, not the politicians. He himself had entered politics as an anti-Wood Democrat, been appointed by state Republicans to the Central Park Commission in 1857, and served ever since with distinction.

Though he shared many of the values of the reformers, professionals, and journalists then debating the proper “arrangement and management” of cities in periodicals like *the Journal of Social Science*, Green approached city building as a businessman rather than an intellectual. Well aware that

property owners balked at infringements of their prerogatives, Green argued that comprehensive and orderly development would enhance the value of their property.

This approach resonated among members of the organized real estate “industry” that was now emerging in New York City. Businessmen concerned with property and its purveyance formed trade journals, like the *Real Estate Record and Builders’ Guide* (1868), and established landowners’ associations in various parts of town. Their goal was to systematize New York’s haphazard approach to urban development and to discipline the city’s chaotic real estate market, in the interest of enhancing profitability.

Such men cast envious eyes at contemporary Paris. “Despotic governments are generally bad governments,” the *Guide* averred, “but when one hears of the marvels Napoleon has accomplished in Paris. . . , it makes us wish that he, or some one like him, could be made Emperor of New York for about ten years.” Would-be developers at the *Guide* were particularly enamored of the French capital’s stunning public improvements and stated baldly that “we want a Haus[s]mann who will do for New York what that great reconstructor did for Paris.”

Uptown boosters attracted to this vision founded the West Side Association (WSA) in 1866 to promote extensive improvements in the area north and west of Central Park—the Badlands of Manhattan. Craggy slopes, running streams, and malarial pools marked the bleak and rocky land. It was barely accessible to downtown civilization: a single horsecar trudged along Eighth Avenue up to 84th Street, where it gave up, turned around, and trudged back. Intrepid travelers heading farther north could take a stagecoach up the Bloomingdale Road (now Broadway), but there wasn’t much to see in these parts. The hamlets of Harsenville, Manhattanville, and Carmansville. Some miniature farms. Some squatter shacks occupied by poor immigrants, refugees from Central Park, and assorted outlaws. Some asylums, hospitals, institutional homes, country churches.

In the collective mind’s eye of the WSA, however, the inhospitable terrain looked very different. The elevated plateau afforded magnificent views of the Hudson to the west and the splendid new Central Park to the east, and river breezes provided a salubrious climate. If the rugged topography were tamed—drained, roads and sewers put through, gas and

water lines installed, scenic parks and tree-lined promenades created, centers of culture and learning sprinkled here and there—it might one day replace lower Fifth Avenue as New York’s luxury *quartier*.

West Ninety-fourth Street, looking west across West End Avenue toward Riverside Drive, c. 1889. Although real estate promoters began to target the Upper West Side soon after the Civil War, development was slow. (© Museum of the City of New York)

To hasten such a glorious future into existence, WSA boosters, ably led by lawyer-developer William Martin, petitioned the state legislature to give Andrew Haswell Green and the Central Park Commission (CPC) authority to transform the upper western wilds into a residential gentry preserve. Albany Republicans had already shown their willingness to expand the CPC’s powers: In 1864 it had been asked to extend the park’s pleasure drives above its northern boundary by turning Seventh Avenue into a shaded carriage way; in 1865 legislators charged it with fixing up upper Sixth Avenue and making over the old Bloomingdale Road into a tree-lined, Parisian-style “Boulevard.”

In 1866, with Martin and the WSA applying the pressure, Albany gave the go-ahead for the CPC to develop a street and property plan for all

territory above 155th Street (ungridded in the 1811 blueprint). In succeeding months and years, the legislature steadily expanded the CPC's mandate to include platting streets, designing new works of parkways and promenades (including a grand Riverside Boulevard along the top of the bluff, and a racing lane for elite horseowners), arranging for parks (Morningside and Riverside), laying out suburban districts, improving up-island riverfronts, dredging a shipping canal at Spuyten Duyvil, and arranging for bridge and road connections across the Harlem River. Not only did the CPC now dominate the citybuilding process for all of Manhattan Island north of 59th Street and west of Central Park, but Green also took charge of forming a general street plan for the adjacent regions of the Bronx—still part of Westchester County.

Green now called for the annexation of western Westchester; “unity of plan for improvements on both sides of the river is essential,” he said. This was soon arranged. In 1873 voters were asked to authorize the incorporation of the area, including Kingsbridge, West Farms, and Morrisania, into New York City. Then-Mayor Havemeyer opposed the plan, which he attributed to “speculators on both sides of the Harlem River.” Where would it all end, he asked: “Once entered on the mainland, where can we stop?” He was voted down, however, as Westchesterites opted overwhelmingly for access to the city's police, fire, water, sewage, and street-building services, while Manhattanites agreed with one newspaper editor who declared it “the manifest destiny of this great commercial emporium to spread in ever-widening circles over adjacent counties.” And many voiced hopes of moving the “laboring classes” to “neat and comfortable cottages,” accessible via “cheap workmen's trains.” With the formal acquisition in 1874 of what would long be known as the “Annexed District,” New York entered on the first phase of its imperial expansion.

With the Central Park Commission established as the nation's first de facto planning agency, the Prospect Park Commission emerged as a close runner-up. In Brooklyn, Andrew Haswell Green's counterpart was James Samuel Thomas Stranahan. An upstate New Yorker who settled in Brooklyn in 1844, Stranahan had made a fortune as a railroad contractor, become a principal investor in the Atlantic Docks and the Union Ferry, and served as a trustee of the Brooklyn Academy of Music and the Long Island Historical Society.

In 1859 the *Eagle* had argued that if Brooklyn were “no longer to be a suburb of New York” it needed to develop “extensive and well cultivated Public Parks.” Mayor Powell agreed the following year, noting that “to attract a large population, it is indispensable that something else should be provided than interminable rows of brick houses along long lines of dusty streets, for these alone can never constitute a great city.” Stranahan, public-minded capitalist, took up the challenge. He gathered other prominent citizens into a South Brooklyn Association and argued strongly for a mammoth three-hundred-acre park, one grand enough to entice Manhattan taxpayers to Brooklyn. The group proposed to locate it on Prospect Hill, an elevated area already a favorite with “pic-nic parties” and easily accessible via Flatbush Avenue, Kings County’s major thoroughfare.

In 1860 the state legislature, following its Central Park procedure, created a Board of Commissioners (headed by Stranahan), which in January 1865, again following in Manhattan’s footsteps, invited Calvert Vaux to prepare a plan of development. Vaux, soon accompanied by Olmsted, produced a design the commissioners believed would “hold out strong inducements to the affluent to remain in our city” rather than be drawn away by the “seductive influences of the New York park.” In May 1866 the two, now the landscape architects and superintendents of the park, began directing the labor of hundreds of stonecarvers, masons, earth movers, and tree planters. Work proceeded rapidly during the late 1860s. Portions were opened in 1867 and 1868, and the work was essentially completed by the early 1870s, when even George Templeton Strong was forced to admit that Prospect Park was “a most lovely pleasure” and that in trees and views it “beats Central Park ten to one.” The Brooklyn populace was equally pleased: in 1873 the park received 6,700,000 visits.

Stranahan, now known as the Haussmann of Brooklyn, followed Green’s lead by extruding his commission’s power beyond the park’s boundaries, moving steadily from park design to urban planning. In 1868 Olmsted and Vaux proposed creating a “parkway neighborhood” surrounding Prospect Park that would offer “more wealthy and influential citizens” the rural satisfactions of air, space, and abundant vegetation. The commission was given extraordinary powers to open and improve streets, take property, and restrict land use. Though most of the costly project never came to fruition, it did eventually leave one major legacy: two grand “park-ways” radiating out

from Prospect Park, for which Olmsted and Vaux cited Louis Napoleon's Avenue de l'Impératrice as precursor. To the east, stretching to the city's frontier, ran Eastern Parkway—a treelined dual carriageway quite like Manhattan's Boulevard—and the equally magnificent Ocean Parkway, which ran south to the sea.

In 1870 the legislature embarked on its last and most ambitious venture into urban reconstruction by appointing a Staten Island Improvement Commission to transform the malaria-plagued and hard-to-reach territory into New York's premier suburb. A "committee of experts," including Olmsted (an old Staten Island hand) and architect Henry Hobson Richardson, offered a fourteen-point, multimillion-dollar scheme to drain lowlands, improve ferry service, and build a comprehensive network of roads and parks, as well as suburban domestic neighborhoods, for the "class of people . . . able and willing to pay an advanced price for land and for improvements." The island's far-flung villages, however, proved unwilling to underwrite the experts' approach, and though piecemeal improvements were undertaken, the grand plan was never implemented.

WHITE MEN SHALL RULE AMERICA!

New York radicals' boldest intervention in civic affairs involved political rather than physical reconstruction. In tandem with Republican initiatives in the South and other states, New York's radicals pressed for giving the black population the right to vote. African Americans, in their churches, newspapers, and state conventions, had been demanding the suffrage as a fair return for their war service, and many radicals agreed a debt was due. The elimination of the existing \$250 property qualification, moreover, might add eleven thousand blacks to the rolls, virtually all of whom would vote Republican. This was a bloc of considerable consequence, given that Republican Governor Reuben Fenton had won by only eight thousand votes in 1864 and that Democratic presidential candidate Horatio Seymour would carry the state by just nine thousand votes in 1868. The bulk of these potential Republicans, moreover, lived in the Democratic strongholds of New York City and Brooklyn.

Radicals first raised the issue at the state constitutional convention in 1867. Democrats, spearheaded by Henry C. Murphy of Brooklyn, resisted furiously. Playing a "scientific" race card, Murphy trotted out a

“craniological” analysis that purported to prove the existence of superior and inferior breeds of man. Giving blacks the vote, Murphy argued, would lead to social equality, race mixing, and the collapse of civilization. Republicans countered that granting political rights would lessen the likelihood of amalgamation—which they too rejected—by granting blacks dignity. “There is no danger,” one radical argued, “of the intermingling of the race by a man who respects his own blood.”

Democrats pressed their racist campaign during the November 1867 elections. Banners at Tammany campaign rallies read NO SUFFRAGE NOR NEGRO EQUALITY! WHITE MAN’S GOVERNMENT FOR WHITE MEN! WHITE MEN SHALL RULE AMERICA! Riding the backlash, Democrats handily captured the state assembly and missed retaking the state senate by a mere two votes. When a proposed state constitutional amendment authorizing black suffrage was finally submitted to the electorate, in November 1869, the *Daily Eagle* asked the white man in the street: “Are you willing to declare by your vote that you are exactly and precisely the equivalent of a negro, neither more nor less?” The answer was a resounding no. New York repulsed black voting by 70.4 percent.

THE END OF RADICAL RECONSTRUCTION IN NEW YORK

The same 1869 election that defeated black suffrage gave Tweed Democrats control of both the Assembly and the Senate, completing their conquest of the state (Tweed’s protege, New York Mayor John Hoffman, had captured the governorship in 1868). Tammany’s forces, marshaled by Grand Sachem Tweed, a state senator since 1867, now proposed a new city charter that would restore home rule to the metropolis by abolishing all the new state commissions and transferring their functions to ten departments controlled by the city (and Tweed). After thirteen years, power over the police force would be returned to the municipality, along with dominion over its own health, fire prevention, education, public works, charities, buildings, and docks. The proposed charter further strengthened City Hall, making all department heads mayoral appointees, and further hedged the Common Council, requiring it to muster a three-fourths vote on all bills involving expenditures. The charter also allowed the city virtually unlimited borrowing power for specified improvements.

Reformers were surprised but delighted. Tweed had proposed a simplified, centralized, fiscally responsible, and potentially effective city government. Peter Cooper of the Citizens Association strongly urged passage. So did the Union League Club, Horace Greeley, and a long list of prominent businessmen headed by banker James Brown and rentier John Jacob Astor. Even the Republican minority supported it, either reassured by promises that a strong voter registration law would be enacted or won over by hard cash—some six hundred thousand dollars' worth, Tweed later admitted. Governor Hoffman signed the charter into law in April 1870. In May Democrats easily won charter-mandated special elections for the Common Council, sweeping all fifteen aldermanic slots (one going to a budding politico named George W. Plunkitt).

Despite their acquiescence on the charter, Republicans, like their Klan-beleaguered southern counterparts, were not prepared to accept Tammany's electoral triumph without protest. Since 1868 Republicans had been compiling statistical evidence of Tammany wrongdoing. They leveled charges of straight-out fraud (some wards had more voters than residents), and they accused Tammany of mass-producing new citizens. Tammany Judge McCunn naturalized 2,109 petitioners in one day, a rate of three per minute—with “as much celerity,” the *Tribune* observed caustically, “as is displayed in converting swine into pork at a Cincinnati packing house.”

Republicans appealed to Washington, where their party still reigned. A sympathetic Republican Congress investigated in 1869 and agreed that “crimes against the elective franchise” had been committed. The “crimes” were only metaphorical, however, because Tammany practices contravened no existing law. Congress closed this loophole in 1870 with two pieces of legislation. An Enforcement Act—aimed at crushing both Ku Klux Klan resistance to southern Reconstruction governments and Tammany-style practices in northern cities—imposed penalties for obstructing or intimidating voters and authorized federal marshals or troops to supervise elections. A second law, the Naturalization Act, extended the waiting period between naturalization and voting by six months and established machinery to supervise voter registration.

New York Republicans used the new legislation to full effect in 1870. Federally appointed officials scrutinized registration proceedings and clapped some Democrats in jail even before election day. On October 25

President Grant ordered several regiments to the city's harbor forts and dispatched two warships to the East and Hudson rivers.

Democrats portrayed themselves as martyred defenders of civil rights and home rule. At a torchlight parade, Tweed told fifty thousand partisans to scrupulously obey the law on November 8. Tammany more or less followed orders—the courts created only two thousand new citizens, compared to the sixty thousand they'd turned out two years earlier—and Republicans had to admit it was a fair election. Which made the results—a total Democratic sweep—all the more galling.

The new charter had established a powerful municipal government, but that power belonged to Tweed. The trio of Tweed and his comrades Mayor A. Oakey Hall and Comptroller Richard Connolly constituted the new Board of Supervisors that controlled city finances, and Mayor Hall swiftly appointed his colleagues to high offices as well. Tweed himself presided over the Department of Public Works, a consolidation of the former Street Department and Croton Aqueduct Board. And one of Tweed's closest advisers, Peter Sweeny, took charge of the powerful Central Park Commission, now folded into a Department of Public Parks.

With control over parks, public health, and tenement regulation now removed from their hands, the elite stewards, who in their own minds stood for professional expertise, moral refinement, and the public welfare, worried that their regulatory state would be dismantled. In some cases, they were right. The new Metropolitan Board of Health became a haven for hacks and rapidly waned in effectiveness, and the Tenement House Law, easily evaded by bribing compliant inspectors, went largely unenforced.

Yet Tammanyites didn't scuttle all their predecessor's initiatives. In particular, they made the city-building project their own, though turning it to their own purposes. The reformers had seen their primary constituency (in the words of one association) as the bourgeoisie in general—"the class who have the largest pecuniary stake in the good order of the city and who also command its moral forces." The politicians were certainly prepared to extend municipal benefits to businessmen who were willing (or forced) to pay for them, but they also sought power and profit by dispensing patronage to working-class clients and siphoning off benefits for themselves.

Democrats backed public works projects far more grandiose than anything the Republican planners had promoted, to maximize the jobs they could hand out and the money they could pull in. Embracing a far more comprehensive and centralized approach to wielding municipal power than the laissez-faire Democratic Party had been accustomed to, Tammany politicians together with their bourgeois allies set out to reshape the urban landscape once again.

53

City Building

William Martin of the West Side Association was delighted with Tweed's rise to power, convinced that under a Democratic regime "the great public works on this Island would be vigorously pushed forward." Yet in his part of town, the pace of progress remained languorous at best. Olmsted was not asked to submit a plan for Riverside Park until 1875, and work began only in 1877. Masses of laborers did begin transforming the old Bloomingdale Road into the grand new Boulevard, laying out two fifty-foot-wide carriageways, broad sidewalks, and a thirty-foot-wide planted median, but that project alone wasn't enough to transform the drowsing countryside. In 1876 a *Herald* reporter found its lower extremities lined with saloons and shanties and its upper reaches, around looth Street, used mainly by the occasional cowherd leading his charges to pasture.

There were many reasons for the sluggish pace of West Side development, but the most critical was the Tweed men's fixation on the opposite side of Central Park, a function in part of their heavy real estate investments in the area. The property owners who formed the East Side Association in 1868 had several things going for them. What their territory lacked in grandeur, it made up for in lower construction costs. The terrain from 59th to noth, between Fifth and Third avenues, was relatively easy to grade, dig up, and build upon, and the Harlem Plains (north of 110th) were more accessible still.

Tendrils of civilization, moreover, had already climbed higher up Manhattan's East Side than its West. The New York and Harlem Rail Road up Fourth Avenue had opened up the area in the 1830s. In the 1850s horsecars came to Third Avenue, and by the 1860s it was lined with detached frame buildings, shops, and occasional groups of row houses. Horsecars ran along Second Avenue too, all the way up to 122nd, providing access to Harlem's modest cottages. By Tweed's time, with newcomers spilling westward along 125th Street, Harlem seemed ripe for full-scale development.

The East Siders' battle plan was straightforward: settle working-class families in brownstones and tenements along the arterial avenues, salt the transverse streets with row houses for the middle class, and entice the wealthy to Fifth Avenue mansions fronting the new Central Park. Hopefully the obstacles and nuisances littering the territory—shantytowns and slaughterhouses, breweries and quarries, stockyards and garbage dumps—would be forced over to the industrializing East River waterfront.

Tweed proved a perfect partner. As commissioner of the Department of Public Works, he authorized miles of sewer, water, and gas pipelines, appointed first-rate professionals to oversee the enterprise, and told them to build the best. Tammany sent civil engineer Alfred Craven to study European waste disposal systems, then sanctioned the use of technologically innovative vitrified tubing. Tweed appointed Edward H. Tracy chief engineer (he'd worked on the Croton Aqueduct under Jervis), and Tracy laid out the new underground network as a coordinated, unified system, in sharp contrast to the downtown jumble.

Next came roads. By 1873 over a thousand men in the pay of the Department of Public Works were laying out miles of hundred-foot-wide macadamized avenues (made using successive layers of stone broken into pieces of nearly uniform size) and substantial streets, at least fifty feet wide, with the key crosstown connectors (at 57th, 79th, and 86th) twice that size. The city also fostered development by leasing or giving away land to hospitals, schools, and museums—Mount Sinai, a Sisters of Mercy foundling hospital, the Normal (later Hunter) College—and encouraged Harlem's improvement by laying out Mount Morris Park at 120th and Lenox.

Contracting firms, employing great numbers of skilled construction workers, followed behind the public works crews and began erecting speculative housing. Much of it—aimed at middle class and better-off Irish and German workers—consisted of three-story brick row houses with brownstone fronts, equipped with gas, Croton water, and indoor toilets. Even the four-story tenements lining Third, Second, and First avenues were several notches up from those blanketing the Lower East Side, though shady, marginal operators perpetrated some inferior work. Municipal expansion allowed the Democratic Party to establish solid relationships

with uptown contractors, brickmasons, stonemasons and plasterers, many of them Irish-American.

New housing blotted out the old. At Dutch Hill—the shantytown on 42nd Street at the East River—the city broke up the hundreds of one-room shacks, cobbled together out of old timbers and tin roofing, that had housed over a thousand full-time residents. Old mansions tumbled. The Astors' former estate at the foot of East 88th was torn down, as was the 1763 Beekman country home on East 51st Street. Workingmen digging the cellar for a building at Lexington and 104th Street uncovered a graveyard for British soldiers.

The construction boom sent land prices spiraling, and rumors of transit development sparked further hikes. Investors, convinced current values would be doubled or tripled in months, paid outrageous asking prices. Turnover was brisk, profits were taken quickly, and among the biggest profit-takers was William Tweed. He and his cronies bought heavily in uptown lands, especially in Yorkville and Harlem, and their properties became prime beneficiaries of—and spurs to—their many projects. In 1869, for example, Tweed and some friends bought the entire block bounded by Fourth, Madison, 68th, and 69th, had the city lay water pipes, and watched happily as their investment soared. Some bonanza hunters didn't wait for actual construction. In 1869 Terence Farley, a contractor and well-connected Tweed alderman, acquired a corner lot at Madison and 68th; the city announced the impending arrival of sewers and water mains; and within two weeks of his purchase, Farley sold out for a substantial profit. Tweed had West Side investments too, but his East Side ventures were three times as big, which likely accounts for some of the delay in launching West Side public works. There were others who argued that progress on mapping, coordinating, integrating, and upgrading the maze of disintegrating sewer pipes in lower Manhattan was unduly delayed by the pressure of real estate promoters pushing uptown expansion.

But Tweed's speculative exploits were matched by solid accomplishment. In the mid-1870s the *Real Estate Record and Builders' Guide* rhapsodized that “from One Hundred and Tenth street to Harlem river, from St. Nicholas avenue to the East river, the Boulevards and cross-streets are laid out and improved in the highest style of Tammany Art—opened, regulated, curbed, guttered and sewered, gas and water mains laid,

with miles and miles of Telford-McAdam pavement, streets and avenues brilliantly lighted by fancy lamp-posts.” Tammany had made the region “one of the most desirable and picturesque localities for residence.”

Tweed had done his job well but expensively, with padded contracts inflating real construction costs. Some of the money came from city-levied property taxes, authorized by Tweed’s charter, whose collection was overseen by the Tweed-dominated Board of Apportionment. Most, however, was borrowed by selling interest-bearing bonds on the open market. In 1867 New York had already owed thirty million dollars—for Croton, for Central Park, and for Civil War draft-related expenditures—but the debt tripled by 1871, to nearly ninety million dollars, with two-thirds of the increase coming between 1869 and 1871.

Much of this capital flowed from wealthy private investors—old-monied merchants and Civil War profiteers—who with stock market waters roiled by the likes of Jay Gould sought the more sheltered investment harbor of municipal bonds. City bankers were pleased to underwrite the public works program, which generated fat commissions and a hefty 7 percent rate of interest (payable, as was the principal, in gold). Trust companies and savings banks blossomed after the war, many boasting Tammany-affiliated officers, and these repositories for the spectacular fortunes accumulated during the boom bought up fifty million dollars’ worth of city and county bonds by 1871. The international capital markets were another novel source. The Houses of Belmont and Seligman were skilled at financing railroads. Now they marketed New York City, selling its bonds in London, Frankfurt, and Paris.

RAPID TRANSIT

The one piece of infrastructure upper Manhattan still sorely lacked was a transportation system that could speed uptown residents to downtown jobs. On the East Side, the old New York and Harlem line, now part of the Vanderbilt empire, was a limited and unpopular resource. Property owners along Fourth Avenue had long been dismayed by the steam locomotives chugging up and down their thoroughfare, spewing smoke and cinders, and though Vanderbilt did open stations at 86th and noth streets, rail access wasn’t nearly sufficient. Nor was the old horsecar system. By 1872 Third Avenue cars built to carry twenty-two riders bulged with sixty or more

during rush hour, and it could take an hour and a half to get to Wall Street. West Siders wailed that without fast transportation their area (as one promoter put it) would remain a “howling wilderness of vacant lots and rocks and morasses” from “which only death and the tax-gatherer will extract any harvest.” Here Tweed’s ambitions were the most vaulting. He planned to build a colossal, elevated Viaduct Railroad that would run along tracks mounted on massive masonry arches, forty feet high. Starting at a grand terminal he envisioned across from City Hall, two tramways would drive northward, plowing through the middle of blocks rather than along the avenues. One would proceed up the East Side paralleling Third Avenue to Harlem, the other up the West Side alongside Sixth Avenue to Spuyten Duyvil, thus encircling Manhattan Island. The cost was projected to be millions of dollars per mile.

In 1871 the Democratic legislature and Democratic Governor Hoffman authorized Tweed to charter the New York Railway Company and provided that after an initial subscription by private capitalists, the city treasury would contribute five million dollars to start construction. The company, moreover, was to be exempted from all taxes and assessments, could build anywhere it chose, and could condemn and raze anything in its path. With such extensive powers in hand, Tweed attracted the wealthiest capitalists in the city to the line’s board of directors—including A. T. Stewart, August Belmont, Abram Hewitt, Joseph Seligman, and J. J. Astor—as well as prominent press barons James Gordon Bennett Jr., Horace Greeley, and Oswald Ottendorfer.

Not surprisingly, Tweed reacted crankily to competition from Alfred Ely Beach, editor-publisher of the *Scientific American*, who in 1868 had slipped a bill through the legislature permitting him to install an underground system of pneumatic tubes using compressed air. Beach claimed they would blow letters and parcels between Wall Street and a planned new post office at City Hall, but in fact he intended blowing *people* to and fro. From the basement of Devlin’s clothing store at Murray Street, Beach had workers dig a nine-foot-wide tunnel twenty feet below Broadway, smuggling out the dirt after dark, that ran one block north, to Warren Street. Next, to ensure the popular acclaim that would overwhelm resistance from corrupt politicians, Beach installed a gas-lit entryway, a platform with frescoed walls, settees, and a grand piano, and a luxuriously upholstered twenty-two-

person car. In February 1870 a huge rotary blower began propelling passengers smoothly back and forth—a public relations triumph that drew four hundred thousand riders that year, at twenty-five cents each. Nevertheless, the combination of Tweed's opposition, protests from powerful Broadway landlords who feared for their buildings' foundations, technical difficulties, and reluctance of private investors to undertake the enterprise led to its demise.

Charles T. Harvey had better luck. Back in 1867 he had received legislative permission to erect an experimental single-track elevated line on a half-mile stretch of Greenwich Street (just north from Battery Place). By June 1868 Harvey's scheme was precariously operational, with cables attached to stationary engines shuttling a car back and forth. Harvey was ruined in Jay Gould's Black Friday, but three years later, after several corporate reorganizations and abandonment of the pulley system, steam locomotives of the New York Elevated Railway Company began regular service along the single elevated track that ran up Greenwich and along Ninth Avenue to the 30th Street station of the Hudson River Railroad. For all its flaws—the engines belched sparks and inundated pedestrians below with ashes—the elevated railroad had proven its practicability. The future seemed rosy to uptown Manhattan's promoters, with the disturbing exception of the competitive behemoth rising across the East River.

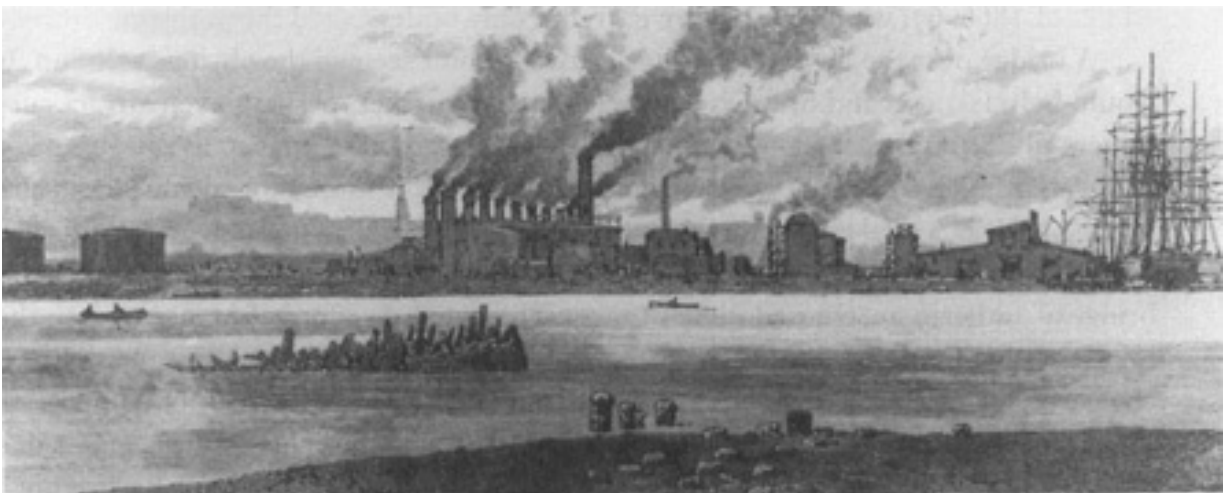

BOSES, BOOSTERS, AND BRIDGEMAKERS

Brooklyn was booming. Most new development still closely hugged the waterfront, especially industries with large land requirements; Havemeyer and Elder's mammoth sugar refineries; Appleton's printing and bookbinding establishment near the Navy Yard, manned by six hundred workers; Williamsburg breweries, far larger now than before the war; Mayor Martin Kalbfleisch's Bushwick Chemical Works; the score of refineries in Greenpoint along Newtown Creek, like Charles Pratt's, which processed oil shipped east by rail and floated to their front doors. Around these giants hundreds of smaller concerns clustered: in 1865 Brooklyn had five hundred factories; by 1870, a thousand; by 1880, over five thousand.

Residential districts near the waterfront also did well. The Brooklyn Heights and Cobble Hill complex expanded farther into South Brooklyn (today's Carroll Gardens) in these prosperous years. But interior territories

near the new Prospect Park languished. Back in the 1850s Edwin C. Litchfield had assembled a seven-acre stretch of land that sloped downward from the crest of Prospect Hill. Construction of Prospect Park in the 1860s gave him hope that he could lure wealthy families into buying large plots and constructing grand urban town houses along its borders, villas like his own Alexander Jackson Davis-designed Grace Hall. Unfortunately, buyers showed insufficient interest in paying the kind of prices Litchfield had in mind, so, with the patience of the long-term developer, he settled down to wait. (He would in fact die, in 1884, before prices reached a satisfactory level.)

Other developers, encountering similar resistance from the well-to-do, tried to attract people of more moderate means. They tried to pull buyers from downtown Brooklyn or Williamsburg, both of which were rapidly changing into immigrant industrial or commercial districts, and to attract middle-class Manhattanites, who were being priced out of New York by escalating rents and land prices. Developers of Windsor Terrace had some success enticing buyers to streets stretching from Prospect Park's southwestern border down to Green-Wood Cemetery. But Kensington's developers did less well, while those who purchased large tracts south of the park around Ocean Avenue did downright poorly. Similar difficulties plagued Charles S. Brown, who bought land way to the east of the park, a place he immodestly christened Brownsville. Brown hadn't really imagined his domain becoming a middle-class suburb, what with the unpleasant smells wafting up from the marshes and bone-boiling plants of Jamaica Bay, but even working-class customers proved scarce.

Oil Refineries on Newtown Creek, from *Harper's Weekly*, August 6, 1881. (© Collection of The New-York Historical Society)

Brooklyn's bosses and boosters, like those promoting uptown Manhattan, believed that poor transportation was the source of their city's problems, and they set about rectifying the situation.

Boss Tweed's Brooklyn counterpart was Boss Hugh McLaughlin, master of the Kings County Democratic Party. McLaughlin, whose parents had come from Ireland early in the century, had worked, variously, as whip boy in a ropewalk, waterfront gang leader, fishmonger, and master foreman in the Navy Yard before becoming a full-time professional politician. McLaughlin looked a bit like Tweed—he was almost as tall and fat—and he too concentrated on facilitating public improvements, then profiting from insider information about the direction of the path of progress. Real estate deals would make him a millionaire, but, unlike Tweed, he would avoid ostentation and continue to dress “like a Canarsie clam baker.”

McLaughlin's chief colleague was William C. Kingsley, Brooklyn's most prosperous contractor. Kingsley made a fortune paving streets and installing sewers, then branched out into dealing in lumber and granite. He bought real estate, forged close ties to the Fulton Street banks and insurance companies, became publisher of the *Brooklyn Eagle*, and emerged as a major power in the city.

McLaughlin, Kingsley, and other boosters like J. S. T. Stranahan had been delighted with the Prospect Park Commission's work. Kingsley's companies did a great deal of the park's construction business, and Boss McLaughlin managed to buy up land where Vaux and Olmsted intended to place their grand plaza at the park's Flatbush Avenue entrance. But when the park failed to galvanize Brooklyn's interior development they refocused their attention on the transport problem.

Viewed by night from one of Brooklyn's lofty lookouts, the harbor sparkled romantically with the gaily colored lights of ferries plying their way back and forth from Atlantic Street to South Street, from Wall to Montague, from Fulton to Fulton. And Whitman's masterpiece “Crossing Brooklyn Ferry” was an exuberant hymn to its daytime glories. But practical men saw the system as a bottleneck, not a marvel, and the icy

winter of 1866-67, which crippled river traffic, only underscored the problem.

A bridge over the East River at its narrowest point seemed the obvious solution. It would help farmers and brewers get their wares to market, perhaps even attract customers to Fulton Street shops, and, above all, allow Manhattanites to live in Brooklyn and work in New York. But would-be bridgebuilders confronted formidable obstacles. The East River, a tidal estuary prone to surging currents, was dauntingly wide, and conventional bridges would block the flow of maritime commerce. Only a suspension bridge of hitherto unachieved dimension—high enough to afford clearance to even the tallest sailing ships, and long enough to overleap the treacherous currents—had a chance of succeeding, and only John Augustus Roebling had a chance of building it.

In his native Germany, Roebling had studied architecture, hydraulics, and bridge construction—and philosophy, with Hegel, who thought Roebling one of his brightest pupils. In 1831 he had migrated to the United States, joined a farming colony, worked as a canal engineer, and developed a wire cable, which he used in building iron bridges that allowed America's proliferating rail lines to surmount its abundant rivers. At Niagara Falls locomotives shuttled serenely across the great gorge on Roebling's breathtaking International Suspension Bridge. Contacted by promoters of the East River crossing, Roebling laid out a magisterial plan. He would build the longest suspension bridge in the world, eighty feet in width (as spacious as Broadway, he liked to point out) with plenty of room for cable cars. The span would be supported by steel cables strung over two massive masonry towers—which if built would be the largest structures ever built on the North American continent—and the cables would be rooted to onshore seven-story stone anchorages.

If technical obstacles seemed bridgeable, political currents remained treacherous. In 1867, when William Kingsley broached the idea of chartering the New York Bridge Company, he turned to State Senator Henry Cruse Murphy, point man in Albany for Brooklyn's Democrats. Son of a Brooklyn judge, Murphy had had a distinguished legal and diplomatic career, helped found the *Brooklyn Eagle* back in 1841, served as Brooklyn's mayor and congressman, and taken part in the city's economic evolution,

most recently as a developer of Coney Island (another potential bridge beneficiary).

Murphy designed a charter for the Bridge Company that would fix its capital stock at five million dollars and authorize the City of Brooklyn to subscribe three millions' worth and the City of New York one-and-a-half million, with the rest to be taken up by private shareholders. Brooklyn authorities, he knew, would do their part. The key problem lay in Manhattan, where the phalanx of promoters and politicians booming the upper island worried a bridge would siphon off potential home buyers. In addition, New York warehouse owners feared loss of business, and its taxpayers fretted at the enormous costs involved. But only one voice counted in the end, and it belonged to William M. Tweed. To find out if New York aldermen would accept a half-price deal, Murphy paid Tweed a visit. Tweed allowed as how the aldermen would probably come around if encouraged by sixty thousand dollars or so. Murphy authorized the expenditure—according to Tweed, though Murphy denied the story—and Kingsley provided the cash, carried over from Brooklyn in a carpetbag.

To recompense Tweed, hardly interested in such paltry rewards, Kingsley bought up and gave over roughly half the outstanding private stock to the Boss and two Tammany colleagues. The stock was incredibly valuable because under Murphy's charter, only private stockholders had voting rights. The cities, which would put up 90 percent of the capital, were to be, in the truest sense, dummy partners. For Tweed, this opened up magnificent vistas—jobs for constituents, kickbacks from contractors—a treasure chest that would more than offset any potential damage to his uptown investments.

This tawdry but obligatory business behind them, the Bridge Company (Henry Murphy, president; William Kingsley, chief contractor) set to work. Roebling, named chief engineer in 1867, gathered a crack crew and had just about completed preliminary planning when, on June 28, 1869, an accident crushed the tip of his foot, which led to lockjaw, seizures, a coma, and death on July 22. The company passed the engineer's mantle to his son, Washington, who had worked on bridges for the Union Army and, at his father's request, visited Europe in 1867 to study the use of pneumatic caissons.

Young Roebling's first task was to design and oversee the construction of just such caissons—essentially huge, watertight, submersible boxes that could shelter work crews while they dug down in search of bedrock on which to erect the giant towers. In May 1870 the first caisson was floated four miles down the East River from the Webb and Bell yards to just beside the Fulton ferry slip. Now, invisible to onshore watchers, the mostly Irish, German, and Italian laborers set to work under limelights—calcium lamps normally used for stage lighting or nighttime political rallies—boring their way down through traprock and basalt, at fewer than six inches a week. To speed the process, workers using long steel drills hammered holes in the obdurate rock, tamped them full of blasting powder, and set them off. Working around the clock (three eight-hour shifts every day except Sunday), the rate of descent accelerated to twelve to eighteen inches a week, and the bottom was soon reached.

In May 1871, while the Brooklyn tower rose ponderously out of the water, the process began again on the deeper, more difficult New York side. Now to the grueling work and foul odors were added incidents of a strange and painful disease. Laborers found blood spurting from their noses and mouths and fell prey to terrible cramps, which so contorted their bodies that the ailment was named “the bends.” As the shaft sank deeper, workers began to die (young Al Smith, who lived near the construction site, listened to neighborhood talk of their horrible deaths). The company hired a doctor to investigate and while he never quite identified the cause—nitrogen bubbles trapped in the blood—he more or less stumbled on the solution, a slower transition from compressed to normal atmosphere. He urged a five-to-six-minute exit procedure (twenty minutes would have worked), but with the company in a hurry to finish and workers in a hurry to get out, they settled on a two-to-three-minute transit—so men kept dying.

On May 8, galvanized by the terrifying conditions, the caisson men struck for an increase in pay: three dollars for their four-hour stints. The Bridge Company agreed to \$2.75, which the men angrily turned down, but when Kingsley announced he would fire them all, the strike collapsed. Roebling, aware laborers were at their limits, gave orders on May 18 to halt further digging, chancing that the level already reached, though not bedrock, would provide a sturdy enough base. Now the final stages commenced—though without Roebling. His health crushed by the ordeal, he spent the next several years in European spas and in Trenton, New Jersey, trying in vain to recover, but all the while directing the ongoing work via letters to his on-site assistants.

In June 1875 the Brooklyn tower was finished. Little over a year later the last stone was set in place on its New York counterpart. As crowds watched on both shores—it was the “best attended circus in the world,” said the *Tribune*—the first cables were strung over the tops of the immense towers, taller even than the spire of Trinity Church. Finally, on Friday, August 25, Master Mechanic E. F. Farrington, an agile sixty-year-old, donned a linen

suit and a new straw hat and climbed into a little seat attached by pulley to the wire rope. Then, as tens of thousands cheered, cannons roared, church bells clanged, and tugs shrilled their whistles, Farrington was hauled aloft to the flag-bedecked top of the Brooklyn tower, sailed serenely across the river (lifting his hat from time to time), and then brought safely down, twenty-two minutes after his departure, on the tumultuous Manhattan shore. The bridge's span would take years more to complete, and the 1876 mini-Festival of Connection would be dwarfed by the official one in 1883, but it was as plain as the sparkling August day that a momentous conjuncture had been wrought.

CONSTRUCTING QUEENS

The great postwar boom roused even slumbering Queens. Here, however, no formidable state commission would undertake large-scale planning, nor would an alliance of powerful politicians and private investors direct large-scale development. It was, rather, an ill-judged action of Brooklyn's that proved to be the crucial agent of change.

Since 1832 the Long Island Rail Road (LIRR) to Jamaica and points beyond had run east along Atlantic Street (later Avenue) from Brooklyn's South Ferry. Objections to the smoky and dangerous steam engines and to the cargoes of manure they hauled had forced the line (in 1844) to submerge its first two thousand feet of tracks in a tunnel under Atlantic. In 1859, however, responding to years of continuing complaint from area merchants and homeowners, the state legislature banned steam locomotives from Brooklyn altogether.

In 1861, accordingly, the tunnel was sealed up (and eventually forgotten, only to be rediscovered in 1980). The LIRR moved its operations to Queens. For its new depot, the company chose Hunter's Point, an easy ferry crossing from Manhattan's 34th Street and already, since the 1850s, western terminus of a railroad from Flushing. From Hunter's Point, the company ran a line directly to Jamaica, where it linked up with the main road on to Greenport. By the early 1870s rival rail lines connected the Hunter's Point hub with Rockaway and Whitestone, and a turnpike (now Jackson Avenue and Northern Boulevard) had been pushed through to Flushing.

Long Island's commuter and commercial traffic quickly reoriented itself along the new rail and road arteries. Many of Brooklyn's warehouses, stores, hotels, and banks closed or relocated. Kings' loss proved Queens' gain. Soon Hunter's Point resembled a western boomtown. Entrepreneurs built hotels, saloons, boardinghouses, kerosene refineries, and coal and lumber yards. A massive depot with engine houses and machine shops went up. Housing, churches, and schools arrived.

Like many western towns, Hunter's Point developed a grandiose vision of its future. In 1869 it launched a drive to incorporate itself as Long Island City, an entity with imperial ambitions. Leading businessmen lobbied Albany. So did the pastor of St. Mary's Church, whose Catholic congregation included the town's Irish factory and railroad workers. In 1870 the state legislature decreed a shotgun wedding between industrial Hunter's Point, aristocratic Ravenswood, and affluent Astoria. In 1872 the county seat was transferred from Mineola to the new Long Island City, and by 1876 a grand new courthouse had been completed at Thomson and Jackson avenues.

It soon became apparent, however, that ambition had outrun reality. Vast marshes separated the new city's component regions. These marshes, once drained by tidal flows, were now fouled with factory and slaughterhouse effluvia and had become breeders of endemic malaria. Some heroic (and lucrative) draining and filling was undertaken, but the task was beyond the fledgling city's means. Though the Long Island Rail Road tried to knit together a transportation infrastructure by acquiring its competitors, it failed. Long Island City, moreover, was as politically fragmented as it was spatially divided, riven by endless contention between wealthy families to the north and immigrant workers to the south.

Lacking a nucleus around which to crystallize, Queens, as in the past, would be developed by discrete local initiatives—chiefly, in this era, company towns launched by big-city industrialists, and residential suburbs founded by speculators. The preeminent postwar company town was developed by William Steinway. After the Civil War, Steinway and Sons' success at marketing its upright pianos outgrew the production capacities of its 52nd Street factory in Manhattan. Steinway was also concerned to shelter his workforce from "the machinations of the anarchists and

socialists, who,” he said, “were continually breeding discontent among our workmen and inciting them to strike.”

In 1870 Steinway began buying up farms and estates in northeastern Astoria overlooking Bowery Bay. He acquired four hundred acres of the most lightly taxed land in the city, including woodland, salt meadows, and open fields in virtually primeval condition, plus half a mile of waterfront property. At water’s edge he constructed a pianoforte production complex, which included an iron and brass foundry, a steam sawmill, boiler and engine houses, and a large building for making iron frames. On the waterfront, an enclosed dock and basin could hold millions of square feet of lumber—the logs floated in and kept moist while awaiting processing—and receive barge deliveries of foundry sand and pig iron.

Steinway set up summer quarters in the old Pike mansion overlooking the bay (the family wintered at Gramercy Park). His German laborers camped out in Long Island City hotels or commuted from Yorkville via the 92nd Street ferry (soon known as the Piano Ferry), where they were picked up by stage and brought to the factory. In 1873 Steinway began building a town—grading, leveling, and macadamizing the roads at his expense. Private money also built the waterworks, installed the sewer system, constructed a railroad spur, and installed a telegraph line connecting the new facilities with the Fourth Avenue factory and the 14th Street showrooms. Finally, Steinway’s Astoria Homestead Company erected frame houses for sale to workingmen and more substantial homes for “well-to-do refined people.”

Steinway’s efforts were matched by Florian Grosjean. After outgrowing his Manhattan factory, which churned out tin cooking utensils, Grosjean settled on Woodhaven Village (bounded by today’s 95th and 97th avenues, Woodhaven Boulevard, and 85th Street, in what is now Ozone Park). Here Grosjean built a new factory, over a hundred workers’ cottages (half he sold, half he rented), a hotel, shops, churches, a market, and a school. By 1873 Woodhaven—which was accessible by rail (along Atlantic Avenue) and wagon (along the Jamaica highroad)—had become a going concern.

Corona, on the other hand, was a residential development, not a factory town. In 1867 music publisher Benjamin W. Hitchcock had successfully launched the village of Woodside. Now the peripatetic developer moved east (along today’s Roosevelt Avenue) to West Flushing, home since the

1850s of the Fashion racetrack. Hitchcock bought twelve hundred lots, christened the area Corona, prevailed on the Flushing Rail Road to open a station at National Avenue, and, after a brisk sales campaign in 1870, sold off hundreds of lots (P. T. Barnum bought two).

Next, in 1871, Hitchcock organized the New York Suburban Building Society, offering loans to the land buyers (repayable in easy ten-dollar monthly installments) to help them build on their plots. (Adding a western touch, he called this the “homestead system.”) So many “homesteaders” erected homes that professional builders and masons from nearby Flushing flocked in, and Hitchcock had to install a sawmill to keep up with demand. The paraphernalia of social life followed: a firehouse, stores, saloons, meeting halls. A Catholic church went up on the former racetrack’s property in 1872, and a Sunday school was opened by the president of the Bank of New York, who owned a mansion nearby. In 1873 the well-established village, having met the requirement of six hundred people within one mile, was crowned with a post office. In 1875 the restless Hitchcock floated farther east to begin yet another project.

HIGH FINANCE

In the wide-open spaces of Queens, Brooklyn, and uptown Manhattan, planned developmental initiatives were the norm. Lower Manhattan, by contrast, evolved out of countless calculations and decisions by an astounding number of participants, none of whom was capable of exercising a decisive influence. Businesses jockeyed for position, with the real estate market serving as the principal sorting mechanism; the soaring costs of land, assessments, and rents reserved the most valuable space for the most prosperous users. Through a ceaseless process of tearing down and building up, the once compact business district was rapidly reconstructed and broken down into discrete clusters devoted to particular functions: finance, communication, shipping, retailing, and commercial entertainment.

The financial district grew both laterally (it now stretched to City Hall) and perpendicularly (beginning its ascent toward the sky). Hundreds of private banks and trust companies were founded in the late 1860s and early 1870s, and they spawned scores of new headquarters buildings, like Drexel, Morgan’s at Wall and Broad. Brokerage firms multiplied like bees and

settled into rented office space; their agents hived together at the New York Stock Exchange, John Kellum's Tuscan palazzo.

Galvanized by the wartime risks of military service, the life insurance business had surged as well. The assets of New York companies (who controlled some 85 percent of the national market) multiplied eleven times during the postwar decade, rising to nearly a quarter of a billion dollars. Growth led to a spate of headquarters construction by the likes of Equitable, Mutual, and New York Life.

The burgeoning office district was not, however, primarily built and tenanted by the corporations directing western development—railroads, mines, oil—but by the host of businesses and professionals that sprang up to serve their needs. Corporate law firms multiplied (by 1870 there were two and a half times the number of lawyers as in the mid-1850s boom). Express firms expanded their outreach. American Express, which had concentrated on transport of goods, currency, and securities in New York State, now offered services nationwide and moved into the former Taylor's building—the 1850s “restaurant of the age” had closed in 1866—on Broadway and Franklin. Lewis Tappan's old Mercantile Agency, wholly owned since 1859 by R. G. Dun, soon had twenty-eight branch offices in the nation's major commercial centers and over ten thousand reporters or investigators handling the five thousand requests for information that poured in each day. The tremendous demand for credit information on ever more distant clients kept the rival Bradstreet Agency booming as well.

Railroad and telegraph revolutions transformed the marketing of commodities too. Old-style cotton factors, who had extended credit to planters, were replaced by jobbers, who bought cotton directly at southern railheads and resold it to British or New England textile mills. In 1870 the New York Cotton Exchange was established, allowing these brokers to collectively standardize grades of cotton, inspect samples, and begin a market in futures, to reduce risk. In 1873 the Butter and Cheese Exchange opened on Greenwich Street, near the railroad terminals where dairy shipments arrived; here too buyers and sellers met to examine products, negotiate prices, and get information on future crop prospects. The New York Produce Exchange similarly let merchants examine samples from individual lots of grain, and in 1874 it established trading pits for such transactions.

All these businesses, and swarms of others, needed two things: proximity to one another—as profitability depended on access to information, markets, and capital resources—and space, for their burgeoning staffs of administrative and clerical workers (Equitable Life, in addition to top management, administrators, and agents, had two hundred clerks processing policies). The only way to achieve both proximity and space, given downtown’s circumscribed terrain and sky-high land prices, was by thinking big and building tall. Before the war, five-stories was the rule, and commercial life was carried on primarily at ground level—in streets and showrooms, at sales counters, on exchange floors. After the war, office buildings went vertical, climbing to unprecedented heights—six stories, seven, eight. “Our business men are building up to the clouds,” one newsman exclaimed.

The elevator made this possible. Lift technology had improved since the vertical screw used at the Fifth Avenue Hotel. Now the “steam and drum” method was available. Steel wire cables were run over a drum at the top of the shaft, which was then revolved to raise or lower the cab. An alternative model hauled the cage up and down the shaft by looping its wire cable over a pulley, then attaching a wrought-iron bucket almost as weighty as the cage. When filled with water from a tank, the bucket descended by gravity, pulling the cage up. At the bottom, an operator emptied the bucket, shifting the weight balance in favor of the cage, which then descended and pulled the bucket back up.

Elevators made upper floors profitable, bringing in the rents required to offset the rising cost of land. Directors of Equitable Life were skeptical of consulting-engineer George Post’s plans to make their proposed seven-and-a-half-story headquarters at Broadway and Cedar into New York’s first office structure with steam passenger elevators. They were reassured somewhat when the young man rented an upper-floor suite of offices at twice the market value to demonstrate his confidence. Two months after it opened in 1870, Equitable easily leased out the fifty upper story rooms to financial and legal firms, and four months later Post sold his lease for a profit of six thousand dollars. Multitudes came to ride the iron-framed building’s elevators to see the panoramic view afforded by this first example of what in time would be called a skyscraper.

Tall buildings raised stylistic problems, and possibilities too. Many owners played it safe, commissioning structures modeled on the commercial palazzos of the 1850s. A more adventurous solution was to make the building “modern” by topping it with a mansard (or “French”) roof. This transformed “Italianate” into “Second Empire,” drawing on the cachet of Napoleon III’s France and the elegance of Haussmann’s Paris. Continental Life introduced the mansard roof to the business district at 100-102 Broadway; New York Life Insurance Company followed suit; and Mutual, to stay in vogue, was forced to call John Kellum back to add two mansarded stories.

COMMUNICATION GIANTS

The Second Empire solution was also adopted by the federal government for its new post office, which went up in City Hall Park in 1875. The tremendous increase in business correspondence, the emergence of the railroad mail car, and Congress’s approval of free urban delivery in 1863 had channeled staggering amounts of mail into the metropolitan area. Some six million letters were delivered locally in fiscal year 1867-68 alone, despite complaints that it was easier to get mail to Boston than to Gramercy Park. The post office was still headquartered in the dark, overcrowded, seventeenth-century Middle Dutch Church on Nassau Street, where it had

moved in 1845. So when Alfred B. Mullet was asked to build a new central post office he thought big and raised a colossal Second Empire structure in City Hall Park; widely hated for overshadowing City Hall itself, it was contemptuously nicknamed “the Whale.”

Society)

A more revolutionary architectural development lay two blocks south, at Broadway and Dey, where, in 1872, the cornerstone was laid for what was about to become the nation's tallest office building and home to the nation's first continental-scale enterprise: Western Union. The company had done well in the war, receiving massive government subsidies and fourteen thousand miles of government-built lines, and in 1866 had merged with its leading rivals, using massive quantities of Cornelius Vanderbilt's money, and relocated to New York City. Its virtual monopoly on national telegraphic communications gave Manhattan the technological wherewithal to monitor capital and commodity movements on a national scale and also helped triple the volume of messages between Manhattan and Europe by

1875. New York's lock on the new information order was further secured with a December 1865 compact between Western Union and the Associated Press, in which each agreed not to patronize one another's competitors or accept clients who did.

When Western Union commissioned construction of a nerve center to coordinate its over 12,600 offices—and to reflect its wealth and glory—it turned to Equitable's George Post. The architect-engineer had several novel problems to solve, stemming from the building's projected height, a hitherto unimaginable ten stories—notably the question of how to design surfaces lifted far beyond any street watcher's ability to grasp them. Post opted for a tripartite organization that would become standard for tall towers. A massive base—required by masonry construction, which needed thicker walls to support additional higher stories—supported a shaft section, boldly striped with red pressed brick and granite. Atop this was perched a showpiece capital—a Renaissance palace—and a clock tower, which featured a ball, synchronized with the Naval Observatory in Washington, that fell precisely at noon, allowing mariners in the harbor to set their chronometers and ground-level businessmen to adjust their watches.

When completed in 1875, the Western Union building stood at 230 feet, featured one of the first hydraulic-gravity elevators, and had its own wells beneath the cellar, from which water could be pumped to the roof by steam pumps in case of fire. The office, which housed one hundred telegraph operators in the vast open reaches of the eighth floor, was open 24 hours a day and brilliantly illuminated through the night. New York had become a city at least part of which never slept.

The great newspapers too began to climb skyward. Most still congregated just east of City Hall Park amid a thicket of magazines, news agencies, job printers, type foundries, lithographers, engravers, bookbinders, stationers, and publishing houses. The day's copy (much of it taken from the telegraph wires) was assembled at night, and the giant basement steam presses rumbled until the predawn hours. Newsboys, some of whom slept on nearby streets, picked up the still-warm sheets and began their sunrise deliveries. The newspapers, already voracious consumers of space, with their extensive staff and bulky presses, were also expanding rapidly. This dictated larger headquarters, for purposes of practicality and for competitive display.

James Gordon Bennett's *Herald* hunched the process. When Barnum's American Museum burned down in July of 1865—a spectacular blaze, which left a dead whale in the street for two days—Bennett decided to erect a showpiece building on its Broadway and Ann Street site. He selected architect John Kellum, who by 1867 had turned out another of the mansarded Second Empire structures that were now the rage.

Perhaps Bennett's project, together with Oswald Ottendorfer's construction of new quarters for his *Staats Zeitung* at the corner of Chatham and Tryon, inspired Greeley to outdo them all and trump even Western Union. He commissioned Richard Morris Hunt—the first American architect trained at the Ecole des Beaux-Arts in Paris—to raise an *eleven-story* mansarded building, the Tribune Tower, on the corner of Nassau and Spruce. Like Post, Hunt divided his granite and brick structure into an imposing base, a repetitious shaft, and a dramatic summit: a clock-campanile that, when completed in 1875, soared to 260 feet, now within nine yards of Trinity's crown.

RAIL COMPLEX

Some of Louis Napoleon and Baron Haussmann's most dramatic interventions in the Parisian cityscape had been designed to integrate the French capital into the national rail network. Cornelius Vanderbilt, whose consolidated lines now connected the western heartland to the heart of Manhattan, similarly realized that to maximize his system's efficiency, he (and his son William) would have to complement their rail building with city building.

Vanderbilt's primary effort lay far uptown, where he decided to build a passenger terminal that would service both the Central and Hudson road (which ran down Tenth Avenue) and the Harlem and New Haven lines (which ran down Fourth Avenue to the shed at 26th Street). Ridership on the three roads had doubled in the 1860s, a function of increased suburban commuting and an increase in long-haul travelers, enticed by new luxuries such as through-ticketing, sleepers, diners, and parlor cars.

Neither existing terminal seemed suitable. Tenth was too far west, and 26th too far south, given that the city still required that any train running below 42nd Street be hauled by horsepower, not steam power. So

Vanderbilt settled on Fourth Avenue and 42nd Street as a suitably central location. To make the East Side venue accessible to his West Side line, he had tracks laid along the north bank of the Harlem River from Spuyten Duyvil to Mott Haven. This allowed Hudson trains coming south from Albany to enter the city via the Harlem's Fourth Avenue route.

Construction of Grand Central Depot began in 1869. It took two years and three million dollars to finish, a sum raised partly by selling off the old station at 26th Street, which was soon converted into the first Madison Square Garden. When the depot opened in 1871, the five-acre complex included a brick and granite neo-Renaissance station, twelve parallel tracks, and an immense iron vaulted shed, the largest enclosed space on the North American continent and a close runner-up to London's St. Pancras as the biggest train station in the world.

After Grand Central Depot opened, a hundred trains rattled to and fro each day, creating such a din that Columbia College, near the tracks at 49th Street, couldn't conduct classes. Under mounting pressure, Vanderbilt agreed to sink the tracks—if the city came up with half the six-million-dollar price tag. The municipality grumbled but paid, and by 1876 the tracks dropped below ground at 56th, not to emerge again until 96th. With his usual keen eye for developmental possibilities, Vanderbilt began buying up land cheaply along the still-unappealing Fourth Avenue—the future Park Avenue.

Way downtown, meanwhile, Vanderbilt was building a new freight terminal for the Central and Hudson. He purchased the once exclusive suburb of St. John's Park from Trinity Church and its co-owners for a million dollars. In its place he erected a massive three-story granite structure, topped with a 150-foot bronze pediment memorializing his achievements on land and sea, featuring a giant statue of himself. ("As a work of art," grumbled George Templeton Strong after the 1868 opening, "it is bestial.")

The new terminal revolutionized the Lower West Side. An enormous complex of grain depots, stockyards, and stables arose along the waterfront. Here, also, midwestern cattle, sheep, and hogs—fifteen thousand head each week—were dispatched in efficient new assembly-line abattoirs and dressed for transshipment to European markets.

The transport complex acted as like an enormous magnet, pulling wholesalers and related businesses west from old haunts near the East River seaport. Access to the national rail grid had already transformed commercial relations between New York and the interior. Before the war, rural shopkeepers had made semiannual pilgrimages to Manhattan to purchase imported consumer goods for the coming season at Pearl Street auction houses. With the spread of rail and telegraph links, the city went to the countryside instead. Wholesale merchants—jobbers—bought goods en masse from manufacturers; unlike the old commission merchants, jobbers actually took title to the commodities, pleasing manufacturers, who no longer had to await a final sale for payment. Then merchants like A. T. Stewart and H. B. Claflin established nationwide sales networks of “drummers.” In the late forties such men had drummed up business from country merchants lodged at Broadway hotels. Now they swarmed west and south, displaying samples, reporting back on changing demand. Rural stores and urban shops then wired in orders to jobbers, who dispatched shipments immediately to the buyer’s doorstep, no longer constrained by the seasons. The same rail-and-wire system would make it feasible for rival jobbers to emerge in the midwestern cities themselves, and soon Chicago, Cincinnati, and St. Louis would be major dissemination centers in their own right.

Many mercantile establishments fled the venerable East Side slips. South Street would remain the port’s ground zero, but wholesalers, express companies, packing-box firms, and dry-goods commission merchants set up shop on the West Side near the freight depot. Economical and efficient cast-iron warehouses, equipped with the newest in freight elevators and “modelled after the sumptuous palaces of Italy,” went up due west of City Hall and then north to Canal, and on into today’s SoHo. These new warehouses—over two hundred went up in the Fifth Ward alone in the postwar decade—quickly filled with midwestern farm staples, New England manufactured products, and luxury goods from Europe and East Asia.

Other wholesalers followed the dry-goods giants. The city’s hardware district had migrated from upper Pearl to Chambers by 1877, and the iron shops from lower Broadway to Washington and West. Only the leather-goods traders remained in their ancient territory: the Swamp (bounded by Beekman, Gold, Frankfort, and the East River). Workshops too tagged

along. Processing and consumer-finishing manufactories flourished, finishing goods that moved in and out of the warehouses. Extra loft space was turned over to pieceworkers making boxes, notions, artificial flowers, or cigars.

LADIES' MILE

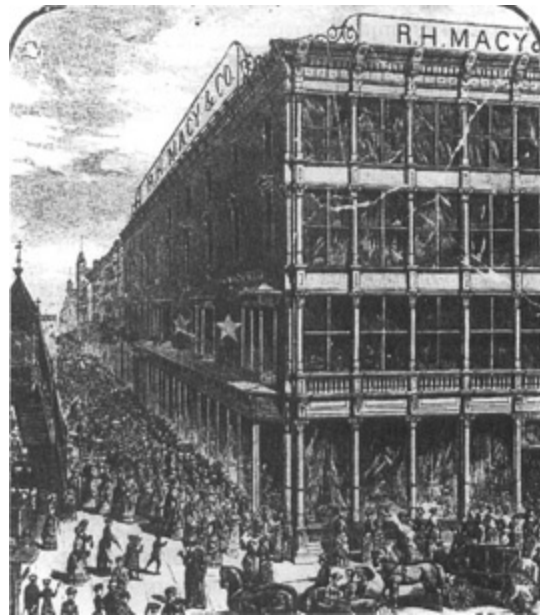

The spread of warehouses and factories bumped fashionable retailers from Broadway below Houston northward toward Union Square. A. T. Stewart had pioneered this transition during the war, when he shifted operations from his Chambers Street Marble Palace to his New Store at Broadway and 9th Street. Now competitors overleaped him, spilling into Union Square itself and pressing on toward Madison Square.

Some department stores opted for Broadway. Arnold Constable remoored itself just north of Union Square, on Broadway at 19th Street in 1868, and Lord and Taylor soon resettled a block farther uptown, in an ornate cast-iron five-story structure, replete with steam elevators fined out with divans and plush carpets.

Others preferred Sixth Avenue, well serviced by horsecars. At 14th and Sixth, Rowland Macy expanded his original shop by taking over adjacent stores and adding departments rapidly. Macy, a close friend of P. T. Barnum, used his talent for publicity to draw clientele, producing thematic exhibits and fashioning elaborate Christmas extravaganzas that featured a store Santa and illuminated window displays, introduced in 1874. His competitors used architecture as publicity, erecting gigantic palaces of consumption. Majestic cast-iron frigates lined Sixth by the 1870s, including Hugh O'Neill's Byzantine-style building, domed and painted yellow and burnt umber, along with Altaian's, Best, and Stern Brothers, the latter a two-hundred-foot-wide, seven-story monster on 23rd Street.

In the wake of these frigates sailed the sloops and schooners of retailing. Many moved into the basements and parlor floors of Union Square mansions and brownstones, none more than twenty years old, but vacated now by wealthy families fleeing north to Gramercy Park and Murray Hill. Silversmiths, dry-goods stores, confectionery shops, F. A. O. Schwarz, and W. and J. Sloane were among the newcomers. Tiffany's purchased the Church of the Puritans, demolished it, and in 1870 had Kellum put up a

cast-iron palace that boasted a storage vault where the affluent could leave their plate and jewels during the summer Saratoga season.

The cast-iron arcades and glass show windows attracted armies of shoppers, mainly women. Broadway and Sixth were choked with female-filled victorias, landaus, broughams, and coupes during afternoon hours, and the sidewalks thronged with elegantly attired women, promenading and perusing the windows. So emphatically female an area was eventually dubbed the Ladies' Mile. The women were served by armies of salesclerks, mainly male (though increasing numbers were female), whose lot was a difficult one, as authoritarian management banned talking and imposed six-day weeks and lengthy hours. During Christmas, when Macy's stayed open till eleven, male clerks would often not bother going home but curl up in their bluish-gray uniforms and sleep on the counters.

RIALTO

As department stores relocated to the Union-Madison Square area, another flock of northwardly migrating institutions, the city's theaters, were touching down in the same terrain. Theaters and emporiums coexisted

amicably, in part because each increasingly resembled the other. Stores had a new dramatic flair, and theaters, induced by new opportunities out west, adopted the latest marketing techniques.

Railroads wrought a revolution in the New York stage. For over a century, the basic unit of theatrical business had been the stock company. A Broadway or Bowery manager—often a prominent actor—would buy a theater, equip it with sets and costumes, and engage a resident company to perform plays in repertory. Such companies did survive in the postwar world. Lester Wallack's theater, on Broadway and 13th Street, was considered by many the finest stock company in town, and it offered a steady diet of British Restoration comedies and the occasional romantic melodrama. Edwin Booth, who had retired temporarily after his brother John Wilkes assassinated Lincoln, returned to the New York stage in 1866 to thunderous ovations. He used his profits to open Booth's Theater on Sixth Avenue and 23rd Street, a technologically sophisticated and magnificently florid Second Empire temple to Shakespeare. Another prewar giant fared less well: the younger generation wrote off Edwin Forrest as a "ranter," and he gave his final New York performance in 1871.

Stock companies themselves were on the way out, along with the minstrel outfits. The future lay with the "combination" system. A star or manager would pull together an ensemble for a single play. It would showcase in New York, then take to the road on the new rail networks and tour the country. When the run was over, the company disbanded, and the promoter reinvested his profits (if any) in another New York production. The city had become a manufacturer of dramatic commodities.

This transformation of the entertainment industry affected the theater district's location and structure. Before the war, playhouses had been beaded along Broadway and the Bowery, with the Academy of Music on 14th Street at the apex. Now entrepreneurs—drawn by the crowds of shoppers in Ladies' Mile—opened playhouses between Union and Madison squares, along Broadway and Sixth Avenue, with the idea of renting them out for the length of a booked run.

The new combination system also required a complex array of support services. Since the tools of the theatrical trade—costumes, props, scenery—were no longer owned by each house, they had to be rented for each particular performance. Specialized businesses met the need, beginning

with the Eaves Costume Company, formed by a former actor, which furnished wigs and beards, boots and shoes, tights and swords.

Actors too had to be assembled on a show-by-show basis. At first this was done in an impromptu way, with deals cut on benches in Union Square (known to some as the “slave market”) or in nearby restaurants. Then professional talent brokers emerged, theatrical agents who mediated between actors and impresarios. They too set up offices around the square (the first being the Simmonds and Wall Dramatic Agency in 1875). To stay near the action, hundreds of young actors settled into theatrical boardinghouses nearby.

Actors aiming for the big time, and stars who kept their image brightly burnished, both turned to stage photographers like Napoleon Sarony, who opened his famous Union Square studio in 1871. Here actors posed in costume, with arresting props, before painted backgrounds, while the “father of artistic photography” worked his flamboyant magic, deepening New York’s capacity to manufacture “celebrities.”

Publicity was crucial to theaters, and the increased competition spawned a flourishing poster and playbill business. This in turn boosted the theatrical printing industry, which also turned out tickets, which were hawked by scalpers who wandered the Rialto crying, “I have seats in the front!” Printers ran off new trade newspapers, which covered the drama industry, playscripts, in great demand out in the country, and sheet music, for sale to middle-class families with parlor pianos, likely purchased at Steinway’s Union Square showroom.

Trade papers, scripts, and music alike were also sold at the bookstores that clustered in the Rialto. Agosto Brentano, a Sicilian immigrant, had for years run a newspaper stand in front of the New York Hotel. In 1860, gambling his earnings, he bought in bulk an issue of the *London Times* recounting the Heenan-Sayer fight. With the windfall profits he garnered selling these to sporting men, Brentano opened a larger stand in Union Square. After amassing capital selling foreign and domestic papers, he branched into books and playscripts, opening Brentano’s Literary Emporium in 1876. It became a popular rendezvous for the theatrical elite, as did specialty shops like Gustave Schirmer’s and Samuel French and Son; another favorite haunt was the Lambs Club (1874), which met in restaurants around Union Square.

Rialto restaurants also drew evening crowds of theatergoers and men-about-town. Many local oyster and chop houses—like Shakespeare Inn and Browne’s Greenroom—were opened by actors. Italian restaurants catered to Italian singers from the Academy of Music. As ever, the preeminent establishment was the ever prescient Delmonico’s at Fifth Avenue and 14th Street, where it hosted champagne and canvasback dinner parties—*pre* and *après* the theater—for wealthy patrons of Wallack’s and the Academy of Music. In 1876, sensing another impending shift in the center of theatrical gravity, Delmonico’s closed its 14th Street operation and moved to sumptuous quarters at 26th Street.

DOWNTOWN DOWNSIDES

Lower Manhattan had emerged as a well-oiled business machine, whose discrete parts related synergistically. Capital, legal expertise, trade information, wholesale goods had easy access to one another. Commodities flowed smoothly from train station to warehouse to workshop to emporium or harbor. But while the marketplace had in many respects reordered the cityscape to meet the needs of the new economic order in a rational way, vexing irrationalities remained.

Nowhere were these more manifest than in the streets. As property values rose, and buildings rose with them, more people and goods were accommodated in the commercial quarters. As a result, traffic levels—chaotic enough before the war—now approached the point of paralysis. Costly paralysis, the *Real Estate Record and Builders’ Guide* noted, as it forced merchants “to pay as much for the removal of a load from Courtlandt to Canal street as is required to bring it from Chicago to New York.” When to gridlock were added spectacular accumulations of garbage—filth that sometimes reached knee level—the judgment of the *Evening Post* that “New York is the most inconveniently arranged commercial city in the world” was uncomfortably close to the mark.

Some of the disarray was a consequence of success: the terrific increase in flow of bulky agricultural goods, fuel, and manufactured products. Much of the muck followed, from the still-unavoidable reliance on horses—forty thousand of them, who each working day generated some four hundred tons of manure, twenty thousand gallons of urine, and almost two hundred carcasses—exacerbated by municipal incompetence and corruption in

garbage removal. Some difficulties stemmed from cramming a nineteenth-century economy into a seventeenth-century matrix of narrow and crooked former cowpaths. Others were the fault of the grid's blithe disregard of Manhattan's topography, or actual exacerbation of its shortcomings, as in emphasizing north-south arteries over east-west river-to-river connections. (Only Fulton Street spanned the lower island, and it perforce slammed head on into the torrent of eighteen thousand vehicles that daily made their way up and down Broadway, to say nothing of the flood of pedestrian shoppers.)

Some of the problems reflected limits of the era's technology. The city did replace cobblestones in Broadway, Wall, and West streets, among other key arteries, but replacements were not necessarily improvements. With asphalt still decades away, Department of Public Works officials relied on the "Belgian" method of setting granite blocks in sand. The slabs were durable (if horrifically noisy), but as they shifted in their foundations they produced a jarring, undulating ride; "carriages," reported one French visitor, "appear to rise and fall as if on a troubled sea."

Much of the difficulty lay in the inability to bring concerted public power to bear on the issue. Many of the city's business leaders, public officials, and journalists—thoroughly disgusted with the effects of the preceding generation's laissez-faire policies—clamored for a sustained and systematic approach to coordinating essential improvements in the built environment. "NO PIECEMEAL IMPROVEMENT WANTED," blared the *Guide* in 1870: "What is wanted is one, general, comprehensive plan for . . . the thoroughfares of the whole city." But the resistance of property holders to any constraints on short-term profitability, and the tremendous number of interested and competing parties, few if any of whom were willing to subordinate their interests to some larger vision, raised insurmountable obstacles to reform.

The docks provided a particularly egregious case in point. Thrown up in slipshod manner during the prewar boom, then neglected and abused, by the mid-1860s fewer than 10 percent were in good or fair repair. Docks periodically collapsed from the weight of merchandise piled high on rotting timbers or were swept away by the current. Wharves were too short and narrow for the era's larger vessels and increased volume. They lacked such modern improvements as the steam-powered hoists commonplace at

seaports in Europe, along the eastern seaboard, and across the East River. Unsheltered and unsecured, they were subject to weather, fire, and theft.

Ship captains could wait a week to land cargoes; without paying bribes, they could wait forever. Municipal piers adhered to the strategy of underpricing rivals by keeping rents and wharfage costs low, but this failed to generate enough income to maintain, much less upgrade, them. Regulation was inconsistent or absent and occasionally perverse: the Albany legislature, to boost the toll-earning capacity of the state's waterway system, reserved the lower East River for its canal boat fleet, which clogged the piers around Coenties Slip, hindering deliveries of western grain.

Shipping continued to slip away to Brooklyn's modernized facilities. Following the huge financial success of the Atlantic Docks, extensive waterfront improvements flowered after the war. The vast Erie Basin complex at Red Hook sped barged-in grain to Liverpool steamers using steam-driven elevators. Public works complemented private metamorphoses, transforming Wallabout Bay marshlands into the Kent Basin municipal docks. From Main Street to Red Hook Point, three thousand vessels (not counting canal boats) tied up each year, disgorging molasses, sugar, coffee, hides, and wool into the burgeoning warehouse districts and grain into elevators capable of storing fifteen million bushels.

Frustrated Manhattan merchants cried out for port improvements. For a city that had "a whole country tributary to its power, a whole nation concerned in its welfare," said the Citizens Association, it was astonishing how little New York had done "to improve the commercial advantages which nature affords." The group sponsored a meeting of indignant merchants in 1867, which proposed formation of a state Harbor Commission to unite the Manhattan and Brooklyn waterfronts. Other merchants, shipowners, and marine insurers formed a New York Pier and Warehouse Company to build and lease a complex of stone quays, iron piers, and dockside stores with steam hoists and railheads.

The rise of Tweed's Democracy scuttled these plans—the machine was not willing to forego the patronage possibilities inherent in waterfront development—but Tammany proposed an even more ambitious agenda of publicly sponsored and planned development.¹ Tweed's 1870 charter created a strong, centralized, municipal Department of Docks, which sent engineers to London and Liverpool to study current approaches and

commissioned General George C. McClellan to design a master plan. McClellan proposed a waterfront revamping similar to Tweed's projected Viaduct Railway in grandeur and potential cost. It called for ringing the riverside, from the Upper West Side round to Corlear's Hook, with a massive masonry bulkhead, a grand waterfront highway, and a uniform system of piers, with all private wharves to be absorbed by the city.

Some land acquisitions began in 1872, but the project soon slowed to a crawl. Owners of waterfront property, including some of the wealthiest men in New York City, fought the project. Transport magnates like Vanderbilt lobbied hard to be given control of dock improvements, but rivals and concerned merchants blocked that initiative too. Other merchants agitated for complete deregulation rather than municipalization. In the end, the multitudinous shipowners, wharf owners, insurance firms, canal interests, rail lines, ferry companies, real estate promoters, wholesalers, and assorted corporations and individuals were utterly unable to agree on a collective solution. The very diversity of competing forces led to stalemate.

And worse. Land values stagnated along the East River waterfront, reflecting the rapid decline of the East Side shipyards and the rise of superior portside facilities in Brooklyn and New Jersey. Low-cost land attracted space-hungry industrial users—breweries, stables, refineries, grain and construction mills, coalyards—which further devalued the area, leading to disinvestment and accelerating squalor. The result was a downtown landscape that, for all its efficiencies and its lucrative centers of finance, communication, wholesaling, and retailing, coexisted with an inefficient public sphere and decaying, overcrowded communities.

Haut Monde and Demimonde

In May 1871 the *New York Times* observed that elaborate preparations for the ball honoring Grand Duke Alexis of Russia had “kept all the aristocracy and respectability of this good city in a fever of expectation for weeks.” Now, as instructed by the Reception Committee (which included John Jacob Astor, William Henry Vanderbilt, August Belmont, and John Pierpont Morgan), workmen at the Academy of Music were hoisting into position the evening’s decorative centerpiece: two huge banners, one portraying Czar Alexander abolishing serfdom, the other Abraham Lincoln holding up the Emancipation Proclamation. Elite New Yorkers would thus proclaim their commitment to human liberty, while at the same time asserting their parity with the aristocratic classes of Europe.

Since the Revolution, Manhattan’s elite had been torn between a lifestyle that befit their sober republican principles and one that displayed their increasing wealth and confidence. In the affluent fifties they had tilted toward public preening; now, in the gilded sixties and seventies, they lurched toward outright ostentation. The adoption of ducal levels of display was driven by tremendous self-assurance—engendered by their victory in war, mastery of the peacetime economy, and unprecedented accumulation of wealth. (After 1873, moreover, their riches would no longer be subject to federal exactions, thanks to successful lobbying and legal challenges by the Anti-Income Tax Association of New York, led by Astor, Belmont, Morgan, and others among the grand duke’s welcoming party.)

The New York haute bourgeoisie’s postwar passion for gilded display also reflected recent shifts in power, wealth, and cultural authority within its ranks. The frenzied industrialization and financial speculation unleashed by combat and reconstruction had weakened those in the elite whose prewar preeminence had come from trade. Sea-based merchants remained numerically superior among their peers—in 1870 38 percent of those whose combined personal and real property was assessed at more than fifteen thousand dollars dealt in commerce or retail trade—but land-and-rail-based industrialists (16 percent) and financiers (6 percent) were often richer, stronger, and more central to the city’s changing economy.

These factions mixed and mingled in their social and business dealings, to be sure, and in some respects an ever more homogenized bourgeois culture was emerging. But important stylistic distinctions remained—with old-monied merchants tending toward the understated, and new monied industrialists and financiers favoring the flamboyant. Given the latter groups' new resources and the intensely competitive nature of Manhattan's elite socializing, customary constraints fell rapidly away. Upper-class rituals came to resemble those of European—and especially French—aristocrats, far more than they did those of antebellum American republicans. Nowhere was the penchant for princely display more evident than among those metropolitan millionaires who pursued their city's long-standing love affair with fine horses with heightened fervor, even as they presided over an industrialization of transportation that would terminate the equestrian age.

HOT TO TROT

After a hard morning fighting Gould, Fisk, and Drew in the Erie War, Cornelius Vanderbilt would harness up his team, drive north of Central Park to Harlem Lane (later St. Nicholas Avenue), and spend the afternoon happily racing heats against other whooping and screaming brokers and lawyers—to the cheers of sightseers on porches of inns along the route. Vanderbilt might well find Robert Bonner of the *Ledger* awaiting him with his new champion trotter, Dexter (for whom he had paid an incredible thirty-three thousand dollars). Certainly his partner Leonard Jerome would be there, a horse fancier of such intensity that he housed his team in a black walnut-paneled stable complete with wall-to-wall carpeting—lodgings that rivaled Napoleon III's Mews in Paris, where Jerome had attended races with French dandies. August Belmont, when not selling railroad or municipal bonds, would be behind his sulky, urging on his prize horses. The actor Lester Wallack and even the Rev. Henry Ward Beecher were known for their fast teams. Indeed so famous an institution was Harlem Lane that when General Grant first visited New York after the war he immediately asked to be taken uptown to see the spectacle.

Fast Trotters on Harlem Lane N.Y., by Currier & Ives, 1870.
(© Museum of the City of New York)

A more sedate type of horse-mania was the carriage promenade through Central Park. In the late afternoon the aristocracy climbed aboard their coaches and entered the park at Fifth Avenue and 59th Street; by four P.M. the miles of drives were alive with carriages, so many that “a stranger would think that the whole of New York was out on a grand trotting spree to see which had the fastest pair of horses or the gayest and most costly equipage.”

This mode of elite socializing—an elaboration of the Broadway promenade of the 1850s—embraced both sexes. While plenty of men were delighted to demonstrate that they could afford to curtail their working day, women were more available for these fashionable parades, especially as Central Park was a thoroughly controlled environment, insulated from the indignities of urban street life. By the 1870s even young unmarried women could drive through the park—with a friend, with a suitor, even alone, albeit not without raising an eyebrow or two. As May King Van Rensselaer later recalled, “When I drove the first pony phaeton ever seen on Fifth Avenue, members of the Union Club, as I passed, shook their heads and feared the young Miss King was rather ‘fast.’”

Vehicles varied by class clique. The old patriciate of Jays, Livingstons, and Stuyvesants favored stately black broughams, or perhaps a landau, hauled by huge fat horses. The smart set, who relied more on wealth than pedigree to establish their position, adopted the barouches favored by the Empress Eugénie. The avant-garde, taking their cues from Leonard Jerome and August Belmont, piloted coaches with two pairs of fine horses, a feat requiring some skill at four-in-hand driving. Not to be outdone by anyone, Jim Fisk, the King of Flash, would roll out from his stables just behind the Erie's Opera House headquarters, driving six-in-hand—three pairs of white and black horses—with a coach adorned in front by two black postilions in white livery, and in the rear by two white footmen in black livery.

Jerome and others also organized the more formal Coaching Club, which sponsored semiannual parades organized according to strict protocols. Drivers dressed in bottle-green cutaways with brass buttons and tall white hats and were accompanied by ladies under frilly parasols. When all was ready members would roll four-in-hand up Fifth Avenue, past crowds of gawking onlookers, many clutching *The Tally-ho*, a pamphlet that identified the heraldic colors of each participant. Gossip columnists reported on the doings for those who couldn't afford the trip uptown.

The pleasures of coaching, with its opportunities for social primping, and of trotting, with its hard-driving manly competitions, merged neatly in thoroughbred racing. Before the war, as sectional relations curdled, southern horse breeders had refused to send their steeds to northern competitions, and the sport had declined. Now southerners were back at Saratoga, and New York turfmen returned to building up racing stables.

What they lacked, however, was a proper setting, Long Island's Union Course and Fashion Park having been taken over by the hoi polloi. Leonard Jerome, a familiar of Parisian courses, set out to fill the need. In 1865 he and wealthy horse fanciers August Belmont and William Travers formed the American Jockey Club (AJC). Jerome then purchased a 230-acre Bathgate estate in Fordham and laid out a track, an eighthousand-seat grandstand, and a clubhouse patterned after elaborate European models. With his brother, Lawrence, Jerome had a wide avenue cut from Macomb's Dam to the track (today at the bottom of Jerome Park Reservoir). Local authorities named it Murphy Avenue, after a local alderman, but Lawrence's infuriated wife ordered bronze plates bearing the words JEROME AVENUE and

had them riveted in place—a fait accompli in which the authorities acquiesced.

Jerome Park opened on September 25, 1866. Everyone was there: old money and new, swells and politicians, Vanderbilt and Fisk, Tweed and Morrissey, sportsmen from around the country, all in white hats and gloves. Grant was guest of honor. Ladies attended too—“ladies of fashion, ladies domestic, ladies professionally literary, ladies of birth and culture” (in the words of a *Harper’s* reporter). They felt protected in Jerome’s elegant clubhouse, despite the presence of people who arrived via the Harlem Rail Road, and their participation rendered racing both fashionable and respectable.

Too fashionable, some thought. Complaints emerged about the AJC’s “aristocratic” policies. Opponents sniped at its governing clique of fifty life members, calling it the “House of Lords,” and objected to having the main section of the grandstand restricted to members only. The AJC dealt with such adverse press by inducting publishers (Henry Raymond, Man ton Marble, and James Gordon Bennett Jr.) into the ruling group and permitting nonmembers to enter the club section if introduced by a member. But mainly they hung tough: “Racing is for the rich,” Belmont said bluntly.

Racing was also faster than ever. The AJC abandoned four-mile heats in favor of the British system of “dashing” over short distances, an “urban” approach that emphasized speed. In 1867 the Belmont Stakes was inaugurated, named for the AJC’s first president, and the size of prize monies mounted steadily. Soon New York’s purses, largest in the nation, were drawing entrants from around the country, and the metropolis had reemerged as the capital of American thoroughbred racing.

Nonequestrian clubs blossomed too, as bourgeois men refurbished old sanctuaries and created new ones—venues one observer classified as “anti-matrimonial and antidomestic” havens. Merchants and lawyers of impeccable pedigree indulged in the sedentary pleasures of conversation and dining at the Union Club, now resituated at Fifth Avenue and 21st Street. Its ten-year waiting list so grated on blueblood potential applicants that Alexander Hamilton, John J. Astor, and Philip Schuyler formed the Knickerbocker Club in 1871, and gentlemen of the Democratic persuasion turned to August Belmont’s Manhattan Club (1865) in the old Benkard residence on Fifth Avenue.

Many of the newly monied flocked to the New York Yacht Club—though the group drew the line at accepting Jay Gould—and their ever bigger boats, including schooners of over two hundred tons, encouraged millionaire members Jerome, Bennett, and Pierre Lorillard to launch racing on a transatlantic scale. Other vigorous Knickerbockers (including some young Roosevelts and DePeysters) were inspired by the London Athletic Club to open a New York version in 1868, and soon the New York Athletic Club was sponsoring track and field meets. Sporting men also turned to the New York Racquet Club or got caught up in the velocipede (early bicycle) craze of 1868 and formed associations dedicated to its development.

When such wholesome diversions palled, gentlemen could gamble at any of a dozen new luxury casinos, equal to Europe's finest. Here one could dine in splendor—the sumptuous meals and choice wines were free—and then repair to the glass-domed, velvet-carpeted, rosewood-furnished gaming rooms for high-stakes faro and roulette (Belmont reputedly lost sixty thousand dollars in one night). Old-fashioned Knickerbockers considered even the grandest of these establishments, John Morrissey's on 24th Street near the Fifth Avenue Hotel, to be somewhat indecent. They had not forgotten Morrissey's brawler origins or Tammany ties. But the frisson of such connections appealed to sporting men like Vanderbilt, Jerome, and Belmont, who had no hesitations about racing Morrissey's team up at Harlem Lane or playing at his tables.

New York clubmen seeking new ways to shatter old constraints on conspicuous consumption adopted recreational hunting, that favorite pastime of European aristocrats. The ever energetic Bennett Junior, assisted by his good friend General Phil Sheridan, organized one such expedition in 1871. The party whose sleeping car chugged out of the newly completed Grand Central Depot in mid-September included such members of the “fastest society set” as Leonard Jerome, John G. Hecksher, Carrol Livingston, and J. Schuyler Crosby. Awaiting them at Fort McPherson, Nebraska, was a supply train of sixteen wagons to carry tents and provisions (including ice for the wine), three hundred Fifth Cavalry troopers to ward off Indians, and a guide, gorgeously resplendent in a white buckskin suit and crimson shirt, by the name of William Frederick Cody—better known, since the 1869 New York publication of Ned Buntline's dime novel about him, as Buffalo Bill. The “dudes” proceeded to “rough it” in

style, shooting up behemoths, dining under prairie sunsets on filet of buffalo aux champignons, and leaving behind campsites littered with Mumm's champagne bottles. Buffalo Bill made such a hit with the New Yorkers that they invited him to the metropolis, where for six weeks he was trotted around town from party to party. Hostesses lionized him, papers reported his every word, and Cody became the smash hit of the social season, the quintessence of western equestrian chic.

LES GIRLS

The unbuttoned, not to say raucous, sexual hedonism of upper-class males—in marked contrast to the growing prudishness of the merely well-to-do—was yet another way that the haute bourgeoisie pleurably demarcated itself in the Gilded Age. New peaks of public promiscuity were attained at masked balls (also known as French balls), which began just after the war when the Cercle Français de l'Harmonie started hosting wild parties at the Academy of Music, New York's sanctum sanctorum of high culture. Nouveau riche Wall Street brokers in fancy dress rubbed elbows and much else with the city's assembled demimondaines, attired in costumes that exposed much, if not all, of their persons. As the champagne flowed, modesty was abandoned and the parties escalated to Mardi Gras levels. In the words of an amazed *World* reporter attending one such event, women were caught up and tossed in the air, then fallen on by a "crew of half-drunken ruffians, and mauled, and pulled, and exhibited in the worst possible aspects, amid the jeers and laughter of the other drunken wretches upon the floor." There was, he recounted, "not a whisper of shame in the crowd," nor did such press strictures halt the carryings-on. Indeed they expanded, as clubmen and courtesans flocked to the frolics—in 1876 over four thousand attended one event—and they would grow even larger in succeeding decades.

Public theaters too became sites of sexual display, the likes of which had not been seen since "living tableaux" had been suppressed before the war. In 1866 Niblo's Garden booked *The Black Crook*, a balletic musical spectacle. The unprecedented display of female flesh by lightly clad "coryphees" packed the house, night after night, until nearly five hundred performances had shattered all box office records in New York City—and the sale of men's opera glasses had reached an all-time high.

Two years later the Lydia Thompson Burlesque Company arrived at Wood's Museum (Broadway and 30th Street), four British blondes who sang, danced, winked, leered, and satirized conventional manners with raucous impertinence. These prototypical “showgirls”—voluptuous departures from the ethereal feminine ideal—were soon followed by dancers of the opera bouffe companies, fresh from the boulevards of Paris. Offenbachian events climbed steadily in popularity, capped, during the 1874 winter season, by the triumphant arrival of the cancan. Crowds came to see dancers expose their colorful garters and ruffled drawers.

With the showgirl came the man-about-town, as wealthy, famous, and often married men vied with one another for the attentions of dancers or singers. The richest—the Belmonts and Jeromes—openly “sponsored” singers, showering them with flowers and jewelry, investing their money for them, and driving them around town, while their wives looked the other way or, as in Jerome's case, were packed off to Paris. Jim Fisk, whose wife languished in Boston, did things in his usual spectacular way. Apart from his many liaisons, culminating in a soon-to-be-fatal affair with Josie Mansfield, Fisk set up entire companies in his Grand Opera House, becoming the city's first “angel.” Soon the playboy-showgirl nexus was as prevalent in Manhattan as it was in Paris.

“Paris in New York,” from Van Every, *Sins of New York*. “The shameless antics and contortions indulged in by the lively damsels of la Belle France, at the Cercle de l’Orpheon masquerade ball at the Academy of Music—free champagne and Offenbachian music puts life and mettle in feminine heels.” (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

Churchmen fulminated against “French indecencies” and attempted to suppress the “leg shows,” but they flourished, ironically, in response to the successful prewar crackdown on immorality in conventional theaters, with “disreputable” women expelled from audiences now popping up onstage.¹ An equally unintended consequence of suppressing “third tier” prostitution was the birth of the concert saloon, forerunner of the New York nightclub. These boozy and licentious variety halls thrived on the patronage of civil War soldiers on furlough, prompting moralists to persuade the city to require in 1862 that all theatrical and musical performing spaces be licensed and that the sale of liquor and employment of “waitresses” be banned wherever a curtain separated performers from customers. Entrepreneurs of leisure promptly dove through this loophole by inaugurating nightspots that featured a raised platform in the rear, a piano, and an open dance floor surrounded by tables and chairs. In larger establishments, balconies overlooked the floor and “stage” and were ringed with private rooms.

By 1872 there were roughly eighty of these concert saloons in New York City, many of them with names—Cremorne, Strand, and Buckingham Palace—that evoked the London scene. They featured traditional entertainment turns drawn from French vaudeville, Italian opera, and German beer gardens—and a novel form of audience participation, encouraged by the legally mandated absence of curtains. Patrons sang along with the chorus, singers sat at tables between acts or danced with customers, and “waiter-girls” with low bodices, short skirts, and high tasseled red boots took orders for drinks at the tables. They often sold sex as well, and waiter-girls, many of whom had been camp followers during the war, might accompany a guest to one of the upstairs rooms or arrange an assignation in a nearby brothel.

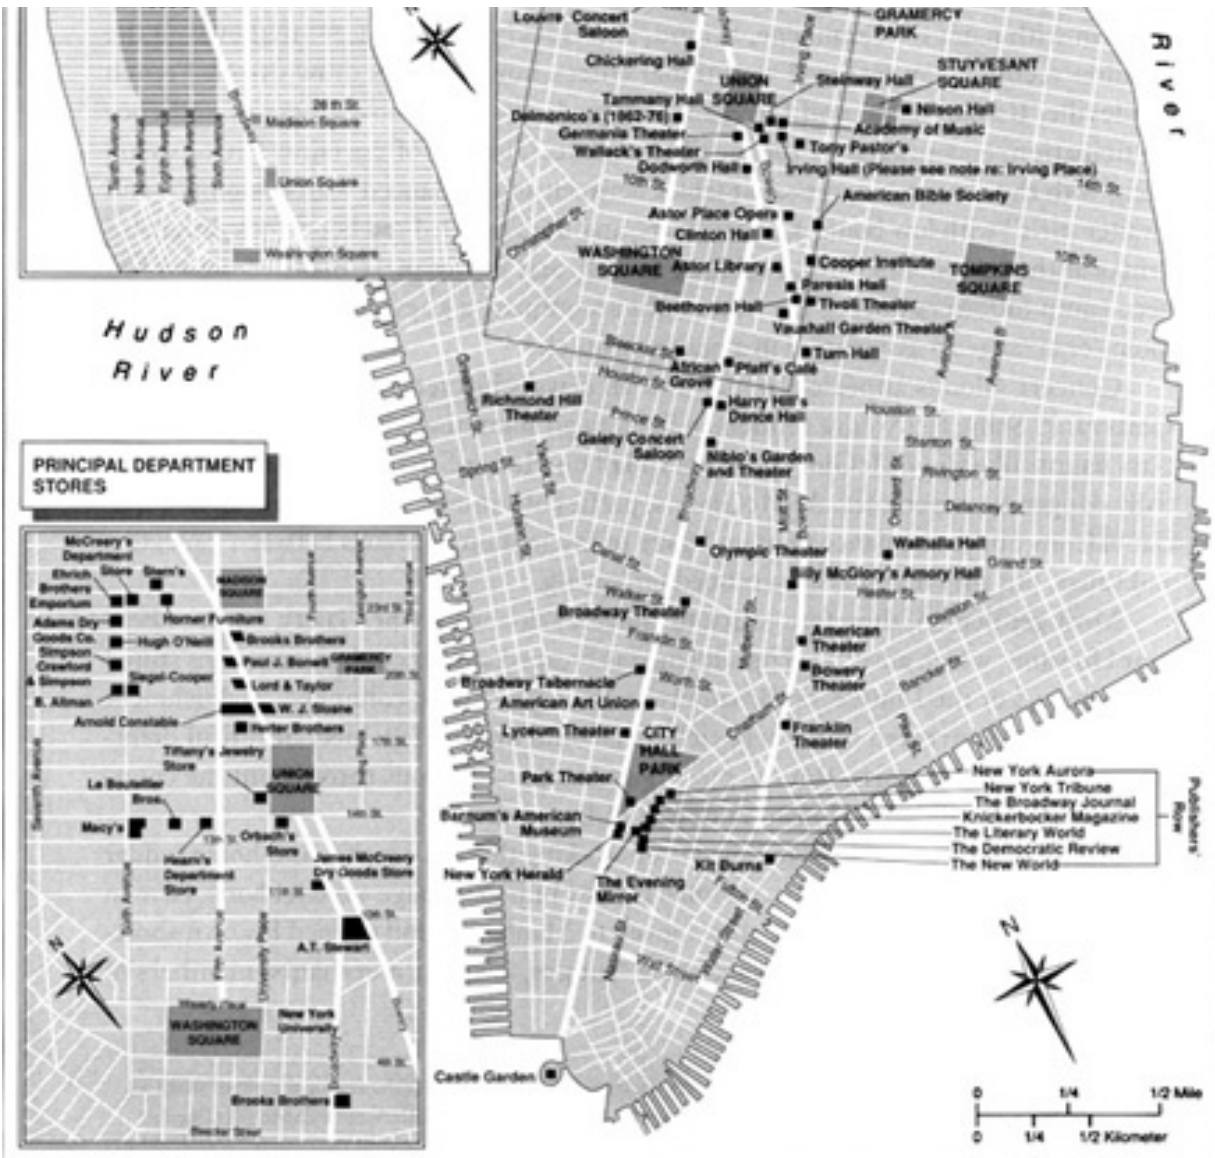

Concert saloons appealed to males of all classes but tended to be segregated by social rank. Some fast young gentlemen liked to go

slumming, dropping in at workingclass haunts like Billy McGlory's Armory Hall on Hester Street, a thrilling but potentially dangerous experience. At McGlory's, parties of uptown visitors could sit in a special balcony above the dance floor and gaze in fascination at brawls between gangsters and thugs, but they might also be robbed on leaving.

Most gentlemen, therefore, stuck to concert saloons like the Gaiety, on Broadway near Houston, which advertised its audience as "respectable, though by no means stilted in manners," or the Louvre, on Broadway and 23rd, a marble-columned establishment with an ornate mirrored bar, where rich men could more safely meet beautiful demimondaines or waiter-girls. But the most popular spot—famous throughout the country—was Harry Hill's, on Houston just east of Broadway.

Hill, born in Epsom, England, had been working there as a jockey and horse trainer when in 1850 a visiting American turfman invited him to manage a model horse farm in Astoria. Hill did so for two years, then moved to Manhattan and opened his own sporting house. After the war Hill's place drew "judges, lawyers, merchants, members of Congress and the State Legislature, doctors and other professional men" who liked to mingle with pugilists, politicians, and the racetrack crowd and to dance and drink with fast women (not all of them professionals). Harry's prominent patrons were reassured by the proprietor's tight surveillance—a prominent sign warned that "no one violating decency, will be permitted to remain in the room"—and his provision of a private room in which to sober up, lest they be waylaid by thugs outdoors.

It was getting ever harder to “violate decency,” however, as the continuing relaxation of standards helped expand the commercial sex industry rapidly. After the Civil War, brothels traipsed north along with the department stores and theaters, pursuing their upwardly mobile clientele and fleeing a SoHo now overrun with factories and warehouses. Scores of warehouses remained behind on Crosby, Howard, and Grand to service the arriving working class, but others overleaped the Rialto to the area above Madison Square, where a raft of new hotel construction was in progress. By the early 1870s the Fifth Avenue Hotel, which had once been a venturesome frontier outpost, found competitors springing up north of it along Broadway and Fifth Avenue. Visiting congressmen, military officers, coal mine

operators, and railroad magnates could take their pick among the Hoffman House on 24th Street, the Brunswick (favorite of the horsey set) on 26th, the Victoria at 27th, the Gilsey House at 29th, the Grand at 31st, and—just opposite Vanderbilt’s Grand Central Depot on 42nd Street—the Grand Union Hotel.

Anywhere that hotels went, the whores were sure to follow. On West 25th Street, the so-called Seven Sisters opened seven adjacent brothels in a residential brownstone neighborhood. The Sisters sent engraved invitations to sojourners whose arrival was announced in the press. Guests, often attired in formal evening clothes, were received by girls as well versed in society etiquette as in the tricks of their trade; some were accomplished pianists or singers. Josie Woods, proprietor of an exquisite brothel, donned elegant dresses, wore magnificent diamonds, went to Saratoga in the summers, rode in the Central Park carriage promenades, and kept open house on New Year’s Day to receive her aristocratic neighbors (and clients).

The police accommodated the spread of prostitution, for a price. By 1876 the system of payoffs was so notorious that when police captain Alexander S. “Clubber” Williams was transferred to the 29th Precinct, he almost drooled with delight: “I’ve been having chuck steak ever since I’ve been on the force,” said Clubber, “and now I’m going to have a bit of tenderloin.” His bon mot, then most applicable to the mid-20s between Sixth and Seventh, would come to characterize the entire area between Fifth and Eighth avenues from 23rd to 57th streets—known for the next two generations as the Tenderloin or, alternatively, as Satan’s Circus.

ON THE AVENUE

The new fascination with aristocratic French taste, architecture, and costume also pervaded the sumptuous residences and lavish private entertainments of Manhattan’s haute bourgeoisie, whose precincts were once again in motion. The commercial invasion of Union Square, and the transformation of elegant row houses on Fifth Avenue’s side streets into boardinghouses for the merely middle class, squeezed the rich northward. Soon even Madison Square began to give way on its western edge to shops, clubhouses, and boardinghouses willing to pay tremendous rents, though the square’s eastern side remained lined with fancy residences. Murray Hill remained a secure haven for the moment, and the fashionable quarter

between 23rd and 34th quickly filled with well-appointed town houses. Increasingly, however, the rich migrated to the area between Sixth and Third, from the 30s through the 50s, particularly along the vertical axes of Madison, Park, and above all Fifth Avenue.

The latest luxury area's upper boundary was staked out in 1869 by an unlikely pioneer, Mrs. Mary Mason Jones. This seventy-year-old dowager of impeccable pedigree—Edith Wharton, her niece, would use her as the model for Mrs. Manson Mingot in *The House of Mirth*—abandoned her venerable Waverly Place establishment and moved to the northeast corner of Fifth Avenue and 57th Street. The locale, despite its proximity to the new Central Park, was still undeveloped and filled with shantytowns, slaughterhouses, charitable institutions, the unfinished Catholic cathedral, and, at Fifth and 52nd, the home of abortionist Mme. Restell, now known as the “wickedest woman in New York.” Nevertheless, Mrs. Jones's mansion, and the new Grand Army Plaza the Tweed regime thoughtfully provided in 1870, were soon surrounded by fine homes of fashionable Fifth Avenoodles (as the irreverent called them).

Fine homes, as before the war, meant three-or four-story Italianate structures (at \$75,000 to \$150,000 each), only now they had to be topped with a mansard (or “French”) roof. As one commentator noted in 1868, “no man who wants a fashionable house, will be without it,” and some now hopelessly passé Federal, Greek, and Gothic houses were accordingly recapped.

A few pathbreakers built urban chateaux. Leonard Jerome's flamboyant six-story mansion at 32 East 26th Street included a six-hundred-seat theater (for performances by his protégées), a breakfast room seating seventy, and a white and gold ballroom with fountains that spouted champagne and eau de cologne. A. T. Stewart's white marble Parisian *hôtel*, when finished in 1869, was the largest dwelling in New York City and featured a seventy-five-foot-long art gallery for his superb collection. Most wealthy Manhattanites still preferred comfortingly monolithic streetscapes to individualistic architectural statements, though their plain brownstone fronts masked increasingly extravagant interiors. Gilt-covered walls, marble, mirrors, frescoes, bric-a-brac, cabinets of porcelain curiosities, and ponderous furniture upholstered with opulent fabrics became standard issue along the avenue.

The social events held in these mansions grew ever more elaborate and competitive. The season just after the war featured six hundred balls, for which seven million dollars was laid out for dresses and jewelry. The ultimate arbiters of fashion were still European monarchs, though less Victoria now (since her beloved Albert died in 1861, she had taken to mourning clothes) than the Empress Eugénie. Her every move was monitored and interpreted by Mme. Demorest, the reigning monarch of New York fashion, in her *Demorest's Illustrated Monthly Magazine* and *Mme. Demorest's Mirror of Fashions* (as well as in, after 1867, the new *Harper's Bazaar*). Madame's correspondents reported instantly on every new Worth gown the empress wore to a Tuileries ball, and in New York the imperial styles were reproduced, exhibited in semiannual shows, and sold as finished garments or as patterns for seamstresses to follow. (Mme. Demorest's 14th Street workshops generated tons of these multicolored tissue-paper patterns and distributed them throughout the country via three hundred agents and by catalog mailings). The more daring fashions of the Parisian demimondaines received similar treatment, though modulated appropriately for American women (in Mme. Demorest's words, stripped of "coarseness or exaggerations" so as not "to vitiate and deprave the public taste"). In fashion, as in finance, New York remained Europe's gateway to the American continent.

Fashion dictated the demise of the crinoline and the birth of the bustle. Dresses (both day and evening) gradually flattened in front while gathering at the back, assisted by the bustle, a half-cage or puff filled with horsehair or stiffened gauze and net. (This was not a new invention, having been favored in the eighteenth century, when it was known more forthrightly as a "false bum.") Dresses cascaded down over this precipice to flow out (by the mid-1870s) into a trailing train. This appendage proved something of a safety hazard as, in an age of open fireplaces, it tended to catch fire while the wearer was dancing. Ladies' advice books urged fireproofing trams with a mixture of whitening and starch.

While it was acceptable to flaunt wealth by having diamonds sown into one's dress, moralists did raise alarms at the way 1870s fashions—and their underlying corsets, bustles, and breast-heavers—created a voluptuous display of propped-up bosoms. In 1868 Harriet Beecher Stowe launched a violent attack on "*outré* unnatural fashion," claiming that despite all

Demorest's modifications, trends were being set by "the most dissipated foreign circles"—those immoral Parisian demimondaines who "live[d] only for the senses," lacked "family ties," and adorned themselves "to attract men and hide the ravages of dissipation." Such admonitions got nowhere. Indeed, very rich women began buying some of the forty gowns they would need each Season directly from Worth in Paris, at twenty-five hundred dollars a dress.

Dresses like these were too good to waste on small private parties, and social events increasingly switched to more public spaces. In the early 1870s Archibald Grade King gave a debutante ball for his daughter at Delmonico's; Belmont threw one there in 1875 for his daughter that was reportedly "more splendid than the famous one given the previous year in London by the Prince of Wales." The only thing better than outdoing European aristocrats was marrying them. The first "dollar princesses" appeared as cash-poor Eurocrats lined up to wed Manhattan's daughters: among the first was Leonard Jerome's Jennie, who, after lengthy negotiations over her dowry, was married off to Lord Randolph Churchill in 1874.

Substantial wardrobes were de rigueur as well for appearances at theater and concert hall. Wealthy New Yorkers mingled with other classes in the Union Square Rialto. They would take in an opera there at the Academy of Music, which in addition to offering luscious music—the hall hosted the American premieres of *Aida* (1873), *Lohengrin* (1874), *Die Walküre* (1877), and *Carmen* (1878)—provided a place for debutante daughters to meet eligible gentlemen during the intervals. Boxes at the Academy were as eagerly sought after as seats on the Stock Exchange.

Stalls at Wallack's, the nation's leading playhouse, were in equal demand, and first nights in particular brought out the aristocracy of wealth in full plumage. Concerts similarly drew the wealthy to Union Square. At Irving Hall, designed (in 1860) for "miscellaneous entertainments of a high character," one could hear both the Philharmonic Society—the old German co-op—and Theodore Thomas's new orchestra. Thomas had been brought to America in 1845, at the age of ten, by his German parents. During the Civil War the young man, with the aid of wealthy backers, founded and trained his own orchestra, paying the musicians a regular salary rather than sharing box office takings as the Philharmonic's members did. This stable

income allowed Thomas's artists to rehearse and play together on a full-time basis, and the well-drilled performers soon surpassed their part-time competitors. The new group also felt freer to go beyond the Philharmonic's more old-fashioned (but crowd-pleasing) repertoire: it was the Thomas Orchestra that introduced Schubert's *Unfinished Symphony* to America in 1867.

Both orchestras soon deserted Irving Hall in favor of the new Steinway Hall (1866), an exceptionally comfortable three-thousand-seat theater the piano manufacturer opened at the rear of his showroom on 14th Street. It also became the favorite stage for touring opera singers (Christine Nilsson made her American concert debut there in 1870), instrumentalists (such as Anton Rubinstein, the legendary Russian pianist), and lecturers (Dickens, on his 1867 visit, read selections from *Christmas Sketches*, *Pickwick Papers*, and *Nicholas Nickkby*).

MCCALLISTER AMONG THE PATRIARCHS

The trouble with the torrent of competitive postwar socializing was that it dissolved society into a welter of competing epicenters, none of which seemed to hold. Its innermost precincts—swollen but manageable in the 1850s—were now (as May King Van Rensselaer recalled) “assailed from every side by persons who sought to climb boldly over the walls of social exclusiveness.” Arriviste hostesses, backed by their husbands' cash, threw ever more lavish and unorthodox affairs. Mrs. Paran Stevens (her husband a real estate tycoon) held parties on Sunday nights! Scandalized matrons ostracized her, but gentlemen flocked to her parlor. Mrs. William Colford Schermerhorn, a still more disturbing renegade, drew guests to her Madison Square drawing room with musicales.

Men were equally combative. Jerome, Belmont, and wealthy clubman William R. Travers each engaged Lorenzo Delmonico to offer the most perfect dinner, at any cost. His Silver, Gold, and Diamond affairs were so equally magnificent that Jerome, to win the race, gave each lady in attendance a gold bracelet. Still worse was the way a social unknown like millionaire importer Edward Luckemeyer could barge his way into society with a *coup de table*. Luckemeyer simply gave Charles Delmonico free rein (and ten thousand dollars), and *voilà*. Seventy-two distinguished guests turned out to boggle at the gigantic oval dining table, of virtually ballroom

size, landscaped with flowers, with a thirty-foot lake at its center, upon which paddled four swans from the new Prospect Park.

In the 1870s only one family had the financial and social resources to bring some order to this chaos: the Astors. John Jacob had passed on his land and liquid assets to William Backhouse Astor, who during his lifetime had doubled his inheritance by assiduous extraction of rents from his acres and tenements. When he died in the mid-1870s, he in turn bequeathed roughly forty million dollars to his two heirs, John Jacob III and William. John Jacob (elder of the two) received two-thirds of the estate, but neither he nor his wife was willing to take on the role of social dictator. Nor was William—a playboy who spent his days at the track, or pursuing women, or yachting in distant waters. It was his frustrated and furious wife, Caroline, possessed of wealth and status too (she was a Schermerhorn), who set out to impose her authority on New York society.

As her chamberlain she chose Ward McCallister, a man who became known as the “Autocrat of Drawing Rooms” but was really more a steward of the elite, on the order of Isaac Brown. McCallister’s own pedigree was most unaristocratic; the son of a Savannah attorney, he had moved to New York in the 1840s and worked as a bookkeeper. Society-struck, and desperate to break into the inner circles, McCallister found he lacked the economic wherewithal or social cachet to sustain a position among the smart set. Resolved to correct both deficiencies, he went to California, made a modest fortune, and married an heiress. Then he traveled extensively in Europe, memorizing the manners of the great courts and studying heraldry, genealogy, and cookery.

After the war, McCallister came to Caroline’s attention through his elaborate Newport parties and his revival, in the winter of 1866-67, of cotillion suppers—an old New York tradition dating back to the colonial-era Dancing Assembly. The metropolitan patriciate was delighted at the idea of a secure space in which its daughters could meet eligible men. In the winter of 1872-73, McCallister, with Caroline Astor as special adviser, executed his masterstroke, the creation of the Patriarchs. He selected a group of twenty-five men, headed by the Astor brothers, that included both Old Knickerbockers and newly monied—a group that collectively commanded unrivaled respect. Each Patriarch was invested with the right and responsibility of inviting four ladies and five gentlemen to periodic

Patriarch's Balls. Fastidious exclusion soon made these affairs the city's cultural pinnacle, the goal of every social climber. They were also—along with balls given by the Assembly, the old guard, and the Cercle de l'Harmonie—attended by representatives of the press. Reporters wrote up the parties for the society pages, and artists sketched the scenes for *Harper's Weekly*, *Frank Leslie's*, or *Ballou's Pictorial*, making it a matter of public record as to who was in, and who was out. The city's facilities for creating celebrities were now applied to the social elite.

Grand public spectacles were complemented by more private weekly dinner parties at Mrs. Astor's Fifth Avenue and 34th Street mansion. These elaborate rituals further helped to discipline the chaos of social life, especially as practiced by playboys like her husband. They began and ended at precise times. Exact gastronomic rules were enforced. Topics tolerated in other mansions were banished; food, wine, horses, yachts, cotillions, and marriages were the only acceptable subjects.

“STILL DESTITUTE OF SUCH AN INSTITUTION”

Though art was not on Mrs. Astor's list of approved topics, for many in the elite world the amassing of great collections had long been an important tactic in the struggle for social preeminence. But the galleries established before the war by mercantile men had been chiefly for private consumption. Now industrial and financial elites decided to marry their pursuit of personal collections with a new emphasis on creating museums in which to display their treasures publicly. By providing the city with cultural institutions more lavish than any the old elites had created—merging connoisseurship with civic stewardship—they would exalt their own status while enhancing the city's reputation.

The Hudson River painters remained popular in the city—Asher Durand still sold well—but chroniclers of the Catskills were now surpassed by those who captured the glories of the great West. In 1859 Albert Bierstadt had explored the Rockies. After his return he moved to New York City and took a room in the Richard Morris Hunt-designed Tenth Street Studio Building—the first structure in the United States or Europe designed as a place for artists to live, work, and exhibit. Bierstadt's heroic canvasses, like *A Storm in the Rocky Mountains* (1866), generated a host of private

commissions (at from five to thirty-five thousand dollars each) from fashionable men of means.

Bierstadt's work could be seen at the National Academy of Design, now in a new and highly praised Venetian Gothic building at Fourth Avenue and 23rd Street, but that building, indeed all current artistic showplaces, seemed insufficient to wealthy New Yorkers determined to match the best that Europe could offer. John Jay, descendant of the governor and chief justice, convinced the Union League Club that the city needed a permanent public art gallery. The club's Art Committee, headed by George Palmer Putnam, included Samuel P. Avery, the respected art dealer then helping William Vanderbilt and other millionaires form their private collections. The committee convoked a public meeting in late 1869, out of which in January 1870 came the Metropolitan Museum of Art—a title no other city would have assumed. Its trustees and officers commingled prominent businessmen and lawyers with leading artists like poet-editor Bryant, architect Hunt, and landscaper Olmsted.

The Metropolitan's new president, John Taylor Johnston, set out to obtain for the institution a "more or less complete collection of objects illustrative of the History of Art from the earliest beginnings to the present time." He made some early headway by buying up the private collections of Europeans made desperate for funds by the outbreak of the Franco-Prussian War (rather as Tiffany had done with jewels). He exhibited these prizes in rented quarters on the Rialto—the former Douglas Cruger mansion at 128 West 14th Street—preserving its elite status by remaining closed on evenings and Sundays, the only times most working people could attend.

The influential trustees next set their sights on a permanent home. As so often, they found in Tweed a helpful associate. Tweed prevailed on the state legislature to assign the museum a portion of Central Park, in the low 80s off Fifth Avenue—far from the downtown rabble and close to other new cultural institutions. Among these was the Lenox Library (1875), at Fifth Avenue and 71st Street, which Richard Morris Hunt had designed for the scholarly book collector and millionaire rentier James Lenox. Up till then Lenox had piled his volumes in a carelessly kept-up town house that appalled his wealthy neighbors. Now he made his eighty-five thousand books accessible (providing a half-million-dollar endowment to care for them), though only to scholars. Ground was broken in 1874 for the

Metropolitan Museum—an institution built on municipal land, supported with public funds, but controlled by private trustees—and it would move into its new quarters in 1880.

Across Central Park, a group of prominent men set out to build an American Museum of Natural History, modeled on European institutions and inspired by the Museum of Comparative Zoology that Louis Agassiz had created at Harvard in 1860. Albert Bickmore, an Agassiz student, proposed to wealthy amateur members of the Lyceum of Natural Sciences that they purchase two large private natural history collections then up for sale and use them as the core of a new establishment. Theodore Roosevelt Sr., a leading glass importer and amateur naturalist, agreed to help; he got J. P. Morgan and corporate attorney Joseph Choate involved, and the enterprise was launched.

The founders were prominent men—A. T. Stewart, James Brown, and William Dodge, in addition to Roosevelt, Morgan, and Choate—though not yet of the highest rank in New York society, not quite on a par with Rhinelanders, Livingstons, or Stuyvesants. Creating a natural history museum would strengthen their social position while underscoring their commitment to newly prized scientific values. It would also, as they stressed in their fund-raising appeals, rectify the disgraceful situation that “nearly all the capitals of Europe and more important cities in our own land” had natural history museums, “while New York, notwithstanding its metropolitan position, is still destitute of such an institution.” Again, public assistance proved crucial. Samuel Tilden was dispatched to broach the idea to Tweed, who quickly secured a charter in 1869. The operation established temporary quarters in the Central Park Arsenal and opened to the public in 1871.

The trustees encouraged other-than-wealthy visitors, but with little success, so they too pressed the city for land on which to build an attractive permanent home. After they presented Tweed with a petition signed by men who collectively owned over half the taxable real estate in New York City, the museum was given the use of Manhattan Square, a rocky patch on the wild West Side covered with rocks and stagnant pools. Convinced (correctly) that the municipality would pick up the bill, the trustees forged ahead, got Calvert Vaux and Jacob Wrey Mould to design a huge structure, and pressed on with its construction. By 1874 the enterprise was far enough

along for President Grant to come up from Washington and preside over laying the cornerstone. In haute culture, as well as in more frivolous enterprises, the haute bourgeoisie was making its mark on Manhattan.

The Professional-Managerial Class

In 1868 James Dabney McCabe's *The Secrets of the Great City: A Work Descriptive of the Virtues and Vices, the Mysteries, Miseries, and Crimes of New York City* proposed that "the middle class, which is so numerous in other cities, hardly exists at all here." New York, said McCabe, had only two classes—"the poor and the rich."

Such a perception was understandable, given the glaring visibility of the city's social extremities, but wrong. Somewhere between a quarter and a third of the population were middle class, an amorphous strata encompassing a wide range of conditions and occupations. Its upper ranks were composed of professionals and managers: doctors, lawyers, editors, professors, architects, landscape architects, civil servants, librarians, reporters, engineers, advertising executives, corporate administrators, lesser merchants, nurses, dentists, retailers, ministers, entrepreneurs, department store buyers, realtors, and artists. At its less affluent end lay growing numbers of shopkeepers, schoolteachers, clerks, and salespeople.

Its boundaries were fuzzy. At the top, the Gilded Age middle class bled imperceptibly into the haute bourgeoisie, with the border peopled by independently wealthy professionals descended from mercantile and landholding families. At bottom, the line between clerks and the more prosperous members of the skilled working class could be hard to discern, especially as clerical workers might well earn less than shipwrights or masons. Generally, however, a lower-middle-class New Yorker would probably take home two thousand dollars a year while a mechanic would be happy to make half that. It is only when looking at the *mentalité* of this new middle class—its values and ideologies, rooted in changing patterns of work and culture—that its contours come more sharply into focus.

NOBLE PROFESSIONS

The professionals and managers who set the tone and tenor of middle-class life believed that mind was mightier than muscle. As organizers and officers in the Civil War, they had mobilized manpower and deployed resources,

initiatives crucial to the military effort. Such experiences gave them the psychic wherewithal to challenge the traditional republican conviction that all value flowed from artisanal or agricultural labor—that he who worked with head, not hand, was probably a social leech.

The increasing complexity of postwar technical and organizational projects further demonstrated the growing centrality—and enhanced the valuation—of skilled intellectual labor. The Brooklyn Bridge had continued to rise even as its engineer-designer lay sick abed, and Washington Roebling himself had drawn the appropriate conclusion: “When it comes to planning, one mind can in a few hours think out enough work to keep a thousand men employed for years.” Grasping the underlying concepts behind everyday empirical experience elevated professionals above the once vaunted “amateur” (the dismissive word “amateurish” dates from this period) and made them indispensable to the “running” (another contemporary neologism) of modern civilization.

New York City, in particular, spawned many such specialists, and their growing numbers generated a reassuring sense of collective authority. Upper-echelon professionals, moreover, were independent agents, with far greater control over the nature and conditions of their labor than was usual in the now heavily proletarianized city; this too strengthened class confidence.

In the seventies confidence was reinforced by organization. Before the war many professions had been on the defensive, their efforts to set standards and control access to their ranks traduced as aristocratic. Now, newly nerved, they strengthened existing professional bodies and created new ones. Lawyers, doctors, engineers, and architects came together to restrict membership to candidates they designated as qualified and who pledged allegiance to a common code of conduct.

Lawyers multiplied rapidly in the postwar era, though firms remained relatively small. Bidwell and Strong, which represented Steinway and Sons, Wells Fargo, and Western Union Telegraph, consisted of six attorneys and four assistants in 1878. Lawyers served many functions in the new order: defending railroads in court, serving as board directors, working as lobbyists (bridging the worlds of business and government), representing speculators and empire builders, managing real estate interests, advising social and cultural organizations, and handling trusts, estates, and,

especially in New York City, the complicated affairs of the new nationally oriented corporations.

Involvement in corporate warfare, however, brought the Bar into serious disrepute. Drew, Fisk, and Gould hired a team of forty-plus attorneys to run legal interference for them in the Erie War, while an opposing regiment of lawyers handled Vanderbilt's machinations. The Bench too had been tarnished by its abetting of financial and political skullduggery: in 1867 the distinguished attorney James T. Brady accused Tweed crony Judge Barnard of corruption, to his face in open court.

Many lawyers, notably George Templeton Strong of Bidwell and Strong, blamed not corporate capitalism but the 1846 state constitution, which had abolished the old distinctions between attorneys, solicitors, and counselors, placed all lawyers on the same nominal footing, and adopted simplified and unexacting licensing procedures. It had also made judgeships elective rather than appointive positions. The result, Strong believed, had been a "progressive debasement of the Bar & Bench." The swollen legal fraternity was no longer "learned & dignified" but rather ranked "next below that of patent-medicine mongering." Strong believed reform required replacing apprenticeship with a law school education. He devoted himself accordingly to expanding Columbia College's School of Law, and by the 1880s it was one of the two largest in the United States.

Other reform-minded lawyers—Samuel Tilden and William Evarts chief among them—decided that only a new and exclusive group restricted to "the more worthy of the profession" could remedy the situation, given their inability to control access to the field itself. If New York City were to remain the commercial and monetary capital of the United States, Tilden warned, "it must establish an elevated character for its Bar, and a reputation throughout the country for its purity in the administration of justice." To police their own ranks, define the boundaries of acceptable conduct, aid attorneys in standing up to judges (and the political machines that elected them), and make the law a "noble profession" and not merely a "trade with the rest," they and others created the Association of the Bar of the City of New York (1870). Rigorous admission procedures and hefty fees allowed the "worthy" to exclude the "uncouth in manners and habits, ignorant even of the English language, jostling and crowding and vulgarizing the profession." A year after its formation, the self-selected and

overwhelmingly Anglo-Saxon Protestant founders had admitted only 450 out of New York's approximately four thousand lawyers to their ranks. Grievance and screening committees were established to exercise some control over the behavior of attorneys and judges. The association's pioneering effort at self-regulation was swiftly and widely copied throughout the country, and Manhattanites proved instrumental in forming the American Bar Association in 1878.

The New York chapter of the American Institute of Architects, under the presidency (after 1869) of Richard Morris Hunt, similarly sought to winnow out those it considered unprofessional and to impose order and standards on practitioners. It recruited only trained architects—often from well-to-do families able to pay for their education—while rejecting older craftsmen who had worked their way up from the ranks of carpenters and masons. The group thus denied membership to John Kellum, perhaps the most employed architect of the day, on the ground that he was merely an unskilled draftsman. Indeed Kellum's very popularity counted against him: the new men found him too “commercial,” too willing to defer to the wishes of his prosperous clients, too reluctant to improve his employers' tastes by bringing to bear the authority of his professional credentials.

In the 1870s “regular” doctors made another effort to impose their methods and approaches on the practice of medicine. The New York Medico-Legal Society prepared a bill in 1872 authorizing the County Medical Society to license all physicians, thus allowing the American Medical Association's allopathic physicians to define their homeopathic rivals as quacks, effectively putting them out of business. The bill passed, but, heeding widespread opposition, Governor Hoffman vetoed it, arguing that only the marketplace should regulate medical practice. A compromise measure passed in 1874, but physicians remained dissatisfied. In the meantime their public-oriented colleagues organized separately: Dr. Edward H. Janes, the city's sanitary inspector from 1866 until his death in 1893, helped found the American Public Health Association in 1872.

New Yorkers and Brooklynites were particularly prominent in the movement to professionalize civil engineering, as so many leading practitioners were graduates of the area's many public works projects. Faced with a flood of self-proclaimed engineers in the late 1860s, promoters pushed to create a “proper association, admission to which

should only be possible to accomplished and competent men.” In 1867 they established the American Society of Qvil Engineers (ASCE). J. P. Kirkwood and Julius Adams, the engineers of Brooklyn’s sewer system, served as the ASCE’s first president and vicepresident, respectively, and Alfred W. Craven, John B. Jarvis, and other Croton veterans became prominent members. Indeed seven of the first eight presidents were either permanent employees of New York City or did consulting work for it. The organization established its permanent home in Manhattan, holding meetings and social functions in offices at the Chamber of Commerce Building, and started regular publication of a professional journal in 1872.

The ASCE thrived, boasting 212 members by 1871. Participation was restricted to men who had been actively employed for five or more years in a supervisory capacity, though less experience was acceptable for those who had completed a college course of study. Before the war New York’s engineers had trained on the job or in apprenticeships; mastery of the fundamentals of math, physics, and mechanics had been deemed unnecessary to solving most technical problems. In 1864, however, Thomas Egleston founded Columbia’s School of Mines, which, despite its name, pioneered broad-based scientific education for engineers as well as geologists, and in 1869 the school began offering four-year courses in civil engineering. Mechanical engineers too, most of whom had emerged from machine shops, set about distinguishing themselves from mere “mechanics,” by forming in New York City the American Society of Mechanical Engineers (1880).

One of the greatest obstacles to even organized engineers’ winning professional autonomy was their continuing subordination to the political authorities who controlled public works, but here too there were breakthroughs. In 1860, when Mayor Wood fired Alfred W. Craven, chief engineer of the Croton Aqueduct, Craven fought back vigorously, arguing that he had the technical know-how required to run the city’s water and sewer systems, and the mayor did not. Craven won his point both legally (he was reinstated) and in the court of public opinion, where the mayor was denounced for putting politics above efficiency.

Professionalization spread among corporate managers too, particularly in the expanding railroad industry. Managers of competing companies, striving to rationalize a hodgepodge system, came together to standardize

operating procedures and equipment, then continued to meet regularly. A growing sense of professional kinship transcending corporate loyalties gave rise to groups like the American Society of Rail Road Superintendents and the National Association of General Passenger and Ticket Agents.

At the other end of the middle-class spectrum, which consisted of employees rather than professionals and managers, postwar developments in the municipal economy swelled the ranks of clerical and sales forces. Insurance companies, banks, mercantile and stock exchanges, post offices and express agencies, credit rating firms, shipping and railroad companies, newspapers, large-scale manufacturers, and wholesaler jobbers—all these required sizable numbers of bookkeepers, cashiers, accountants, and clerks to staff them. The burgeoning of department stores, fashion and piano showrooms, and elegant retail outlets similarly required growing numbers of stockroom employees and salesmen—and, gradually, saleswomen: in 1869 A. T Stewart's began to employ "American ladies of refinement and culture" to stand behind the counters.

Such workers seldom organized on the model of the professional organizations; most didn't organize at all. What bound them together, rather, were common experiences and shared values. Most worked in "clean" environments—the giant new downtown office buildings—rather than grubby factories, grimy warehouses, or messy construction sites, and most of them dressed accordingly. Junius Browne, watching the morning ferry passengers disembark in 1869, noted that the first contingent—"mechanics with their flannel and check shirts"—was followed by platoons of salesmen, accountants, and clerks after seven A.M., at which time "the shirts of the passengers begin to whiten and raiment to improve." Many of these white-collared workers believed, as an 1868 commentator in *Galaxy* put it, that "manual labor is disreputable" even though it often paid better than head work (masons earned twice what clerks did). To further distinguish themselves from mechanics and laborers, the lower middle classes adopted appropriate modes of personal conduct—taking their cultural cues from professionals and managers when deciding how and where to live their lives.

HOME SWEET APARTMENT

Manhattan's middle classes had their own territorial enclaves, spatially distinct from both Hell's Kitchen and Fifth Avenue. They settled in the West Village, in Chelsea, along cross streets in the rectangle bordered by 14th, 59th, Eighth, and Second, and on the Upper East Side and Harlem. Their travels to and from work downtown helped swell the annual ridership on New York's thirteen streetcar lines to 150 million by 1873, up fourfold since 1860, despite crammed conditions on the commuting cars (it "would not be decent to carry live hogs thus," huffed Horace Greeley). Shopping soon followed them northward, and dry-goods stores spread up Third, Sixth, and Eighth avenues, making them the commercial thoroughfares of middle-class neighborhoods.

When they could afford to, middling New Yorkers purchased their own homes. In the postwar years, however, clericals and even professionals found this increasingly difficult to do. Soaring land prices put single-family twenty-five-foot-wide row houses out of reach. Middle-class salaried employees making two thousand dollars a year could seldom afford a ten- to eighty-thousand-dollar town house, and for a skilled mechanic making an annual thousand dollars it was quite impossible.

Many abandoned private ownership altogether and became boarders. As commerce marched into Union Square, the rich decamped northward, and their elegant town houses along lower Fifth and Madison avenues were subdivided and converted into respectable boardinghouses for doctors, lawyers, professors, and smaller merchants. Rooms here might cost from twelve to fifteen dollars a week in 1869. Hotels were another option, and those willing to settle for modest accommodations had a wide choice. By 1869 the construction boom had boosted the total number of metropolitan hotels to between seven and eight hundred, many of which offered rooms for residents as well as for transients. Boardinghouses on side streets offered even cheaper accommodations, which salaried clerks could afford. As Dickens observed on his 1867-68 visit, there were "300 boarding houses in West 14th Street, exactly alike, with 300 young men, exactly alike, sleeping in 300 hall bedrooms, exactly alike, with 300 dress suits, exactly alike, lying on so many chairs, exactly alike, beside the bed."

But the growing middle class did not *like* such housing. *Respectable* people lived in a "home" of their own, not jumbled up with strangers. Multifamily dwellings smacked of tenement life. Boardinghouses, with

their centrally cooked and commonly eaten meals, threatened family integrity; wives might mingle promiscuously with others while husbands were off at work. Enforced intimacy mocked middle-class values of family privacy and the sanctity of the home.

The first “apartment houses” were built to solve this spatial and cultural conundrum. New Yorkers had been hearing about so-called French Flats, the grand buildings lining Haussmann’s new boulevards, and most of what they heard was negative. French Flats were too public; they came with a nosy concierge; they lacked most features of a proper Anglo-Saxon home. Some magazine writers did note their advantages: everything was on one floor, eliminating the need to squeeze up and down a brownstone’s narrow stairway; they were more spacious and easier to clean; the nosy concierge looked after things when owners summered out of town. Still, prevailing opinion was opposed. “Gentlemen,” as one of the breed irately put it, “will never consent to live on mere shelves under a common roof!”

It took the combined prestige and power of the city’s most francophiliac architect and a gentleman of unimpeachable social standing to pierce the armor of conventional opinion. Rutherford Stuyvesant was as patrician as you could get in New York. His father, Lewis Rutherford, was merely a distinguished astronomer. But his mother was a direct descendant of Petrus Stuyvesant and had transmitted the family fortune to Rutherford (on the condition that he spurn patrilineality and adopt his mother’s last name). Stuyvesant had admired apartment houses in Paris, and in 1869 he hired Richard Morris Hunt, whom he had met in France, to create one for him on a fourrow-house-wide stretch of 18th Street between Irving Place and Third Avenue. Each of the first four floors had four separate apartments, and the fifth was reserved for artists’ studios. To the astonishment of many, the apartments, overseen by a French-style concierge, were rented immediately, by young couples of impeccable “old Knickerbocker” credentials.

Hunt next constructed a far grander apartment house for Paran Stevens (whose wife’s parties were then scandalizing more staid society matrons). The striking marbletrimmed, mansard-capped, eight-story building, when completed in 1872, occupied the entire south side of 27th Street between Fifth Avenue and Broadway and was one of the largest buildings in the city. Stevens House had eighteen suites, each with parlor, dining room, kitchen, butler’s pantry, bedrooms, dressing rooms, and bathroom—along with

steam elevators that rose to an attic where servants' quarters were available. Stevens had overreached, and his luxury operation was soon converted into a more modest apartment hotel, but the Second Empire edifice remained a New York cultural and technological landmark.

Now socially certified, the French Flat began to catch on. By the mid-1870s, with a dozen or so up or in the planning stages, especially around the lower border of Central Park, the New York City Buildings Department adopted "French Flat" as an official category. The term, like "apartment house," implied a larger and better-quality edifice than "tenement," and to underscore the class status of their residents, the new buildings took toney names like Osborne, Knickerbocker, Berkeley, and Saratoga.

The as yet limited number of apartment houses could shelter only a relative handful, however, and many middle-class home and status seekers, in pursuit of an immediate solution, decided to cross the East River. The wealthiest professionals took up quarters in Brooklyn Heights or Cobble Hill, mingling with old New England merchants and new-monied businessmen. Others settled in Fort Greene (particularly around Washington Park, where contractor William Kingsley built his home in 1867) or in Clinton Hill (where oil magnate Charles Pratt erected a mansion in 1875). Less costly accommodations could be found in Boerum Hill or in row houses with deep front gardens along the streets around Carroll Park, an area developed after 1869. The least-well-paid members of the middle class could turn to the lower Park Slope area, between Third and Sixth avenues, though it was unattractively interlaced with the light industrial establishments spreading outward from the Gowanus Canal.

Those willing to travel farther could settle in growing Bedford. Speculators and builders advertised the area as the "Garden of Brooklyn," perfect for the "refined and select" middle class. Single-family Gothic-style frame houses with gas, hot and cold water, indoor plumbing, and, in some cases, gardens, grape arbors, and apple trees, could be had in South Bedford for between five and ten thousand dollars. These new homes were deliberately situated away from the LIRR stops on Atlantic Avenue and the horsecar line on Fulton Street, even though 50 percent of Bedfordites commuted all the way into Manhattan, a two-and-a-half-mile journey that took about an hour and cost thirteen cents. Catching a ride to the city entailed a long walk, but it seemed worth it to preserve, for the moment, the

area's bucolic character. To the north, by contrast, row houses and tenements clustered around the Flushing and Myrtle Avenue lines of the Brooklyn City Rail Road. Their cars transported native-born lower-middle-class clerical workers to Manhattan or to Brooklyn's City Hall and Fulton Street commercial districts.

Some professionals were drawn to the Queens suburban frontier, to places like the new railroad community of Richmond Hill, named for a London suburb. New York attorney Albon Platt Man built it in 1869 along the wooded hills of the terminal moraine and ensured its class character by barring such "nuisances" as factories, warehouses, and tenements. But in the 1860s and 1870s, Kings seemed preferable to Queens, as residents could visit local analogues of New York City's cultural institutions (Brooklyn Academy of Music, Brooklyn Club, Mercantile Library, Long Island Historical Society) and were close to Prospect Park, Green-Wood Cemetery, and more distant rural diversions. A Brooklyn Heights resident could leave his Manhattan office at three o'clock, return on the Wall Street ferry, dine at four, then take a leisurely drive to the outskirts of town. Residents and realtors began to boast that Brooklyn was a middleclass paradise, free from urban ills and evils, a complacency that required ignoring the tenements of detested "micks" on the flats south of the Navy Yard.

Brooklyn was indeed something of a paradise for the African-American middleclass. Though the vast majority of black Brooklynites consisted of manual laborers, the city was also home to a small elite of professionals (doctors, lawyers, journalists, ministers, and teachers) and businesspeople (dressmakers, undertakers, carpenters, barbers, tailors). Some were affluent enough to invest in real estate during the 1870s, via the Excelsior Land Association of Brooklyn, and some owned substantial middle-class dwellings, complete with pianos, libraries, and pictures of Lincoln, John Brown, and AME Bishop Richard Allen.

The presence of this African-American elite was felt most strongly in Brooklyn's black churches, which moved away from religious enthusiasm toward a more urbane and intellectual Christianity. Their trained and educated ministers focused heavily on promoting learning, literacy, and culture. Concord Baptist, Bridge Street African Wesleyan Methodist Episcopal (AWME), and Siloam Presbyterian took the lead in providing libraries, classes, lectures, and concerts of classical music. The black

Brooklyn community also developed autonomous institutions, like the Howard Colored Orphan Asylum (1866), the African Civilization Society, which began publishing the newspaper *Freedman's Torchlight* the same year, and the Zion Home for Colored Aged (1869).

THE CULTIVATED LIFE

In the 1870s Harriet Beecher Stowe wrote novels about New York life—like *We and Our Neighbors; or, the Record of an Unfashionable Street* (1875), which featured heroines like Eva, “a child of wealth and fashion” whose father had gone bankrupt. Eva married a journalist, moved to an unfashionable street, made do with only one servant, and moderated her expectations to middle-class levels-. Referring to the posh Elmores she said: “We must keep in sight of them. All I ask is to be *decent*. I never expect to run into the extremes those Elmores do.”

Middling New Yorkers adhered to values that, like their jobs and residencies, set them off from vulgar lower classes and dissipated upper ones. “Decent” was an imprecise term, more or less interchangeable with “genteel,” “cultured,” “refined,” “civilized,” “respectable,” and “cultivated,” but all the near-synonyms suggested an earned status. “Cultivation” implied self-development, a purposeful pursuit of “higher things.” It prized intellect and sensibilities tutored in arts, letters, and manners. It was an identity rooted in education rather than in labor or wealth.

Not that the middle class had anything against wealth as such: prosperity was an indispensable precondition for gentility. Indeed it was the growing purchasing power of the postwar middle class that allowed ever greater numbers of New Yorkers to acquire the trappings of gentility: to live in tasteful homes in good neighborhoods, wear respectable clothes, attend refined schools, cultivate the arts and graces. Only “mere” or “vulgar” wealth was objectionable, wasted as it was on display rather than development, squandered in private hedonism rather than promotion of the public good.

Wherever they settled, therefore, middle-class New Yorkers decorated their quarters with objects that betokened their cultivation. Art galleries á la A. T. Stewart were out of the question, but mass-produced artwork was

readily available. In his studio at 212 Fifth Avenue, John Rogers fashioned sculptural tableaux in clay, then churned out reproductions in plaster and bronze, which sold throughout the city and, via advertising and railroad delivery, across the continent. Rogers used industrial methods to evoke preindustrial life—*The Village Post-Office, Coming to the Parson*—along with more topical, even political themes, which balanced realism and sentimentality. Contemporary critics noted that his was not a “high art” but lauded the “Rogers groups” for their “elevated meaning” and “true feeling,” which were “alike satisfying to head and heart.” Metropolitan middle-class parlors were embellished as well with Currier and Ives chromolithographs that limned the triumphal expansion of Christian American civilization out west and hailed the triumph of a middle-class order in New York City.

As cultural possessions piled up in the parlor, along with machine-made upholstery, drapery, and carpeting and heavily carved furniture, they demanded an increasing level of maintenance. The haute bourgeoisie solved this problem with platoons of servants, but most of the middle class could at best afford but one. This required the housewife to take a professional approach to increasing the efficiency of such domestic labor as she had available. Advice books had been telling wives to manage households scientifically since the 1840s, but now the audience for such counsel had grown large enough to support an ongoing journalistic advocacy. Thus Eunice Beecher wrote a regular domestic advice column for the *Christian Union* in the 1870s, in which she aimed to help a woman “conduct her household as a business, prepare herself for it as a man prepared for his life work.”

When they turned from work to play, more and more middle-class New Yorkers could afford to take in the same operatic and theatrical performances at the Rialto as did the haute bourgeoisie. But they also enjoyed more modest pastimes, like group singing in their parlors or reading aloud from genteel magazines like *Harper's Weekly* and *Scribner's*. Lectures were popular too: the uplifting or scientific ones at Chickering Hall (Fifth Avenue and 18th Street) and the effusions of humorists like Artemus Ward at Dodworth Hall (just north of Grace Church).

The new Central Park attracted many middling Manhattanites. When flags flew on omnibuses and horsecars, or one heard that “the ball is up in the Park,” it meant that the pond at 59th Street was frozen over and one

could go skating (at night the area was illuminated by calcium lights). Park officials enforced respectable behavior, and regulations said that “any person observing any act of indecorum may signalize a park-keeper by holding aloft or waving a handkerchief.” Middle-class New Yorkers couldn’t afford private carriages, but they could rent one from a livery stable for a dollar or two an hour, at least for special occasions. Families of clerks, prosperous shopkeepers, young professionals, and independent artisans (especially Germans) also went for walks, strolled through the Ramble, and took their children to the nascent zoo at the Arsenal. On summer Saturday afternoons, when most of “the mechanic and laboring classes” were still at work, Dodworth’s band concerts attracted crowds of forty-five thousand or more to the Mall. These assemblages, the papers noted, were composed of the “orderly, wellconducted and respectable,” the kinds of people (said the *Tribune*) “whose tastes are above grog shops and lager bier gardens but whose pockets are not equal to Newport or Saratoga.”

Those who could afford the bicycles produced by several city manufacturers—which retailed for a stiff fifty dollars to three times that—could take classes in biking at the new Velocinasium. Here, the *Scientific American* observed in 1869, “on any weekday evening may be seen upward of a hundred and fifty gentlemen—doctors, bankers, merchants, and representatives from almost every profession—engaged in this training school preparatory to making their appearance upon the public streets and fashionable promenades.”

Shopkeepers, clerks, and skilled craftsmen (especially butchers) dominated the city’s baseball fields, hailing the sport as a healthful outdoor exercise. Amateur outfits continued to flourish, and by 1867, with the return of veterans who had played in the army, there were over one hundred clubs in Brooklyn and Manhattan, many formed by companies and colleges. But baseball had begun its own professionalization process during the war, when William H. Cammeyer opened the Union Grounds in Brooklyn’s Eastern District, providing a rent-free playing field to three clubs but charging a tencent admission fee to watch the games. His success inspired a competitor in the Capitoline Grounds (once part of the old Lefferts farm). Now the clubs that drew the biggest crowds demanded a share of the gate; to attract greater attendance they sought more proficient players; athletes, in

turn, demanded pay to play and proved willing to engage in “revolving”—jumping from one team to another that paid better.

By the late 1860s baseball had become a business, an urban entertainment commodity with Brooklyn and New York City at its center. The metropolitan area was a major market for recruitment: when a Cincinnati Red Stocking triumph in 1869 ended the local area’s domination of baseball, most of the Reds proved to be New Yorkers.

The huge crowds that came to contests were predominantly drawn from the city’s middling ranks. In part this was simply because the fees (twenty-five to fifty cents) and costs of travel to out-of-city fields effectively barred unskilled laborers. It was also due to baseball’s peculiarly white-collar charms, its appeal to middle-class sensibilities. An extremely orderly game, full of reassuring rules and penalties for infractions, baseball grew ever more “scientific” in nature as it professionalized. This was reflected on the field, in growing levels of specialization, training, and discipline and in the invention of new techniques: Dicky Pearce, the Atlantics’ star shortstop, became the first to employ the bunt as an offensive weapon. Even fandom required new levels of cerebration. Henry Chadwick, editor of the *Chronicle*, invented box scores and began calculating batting averages. Spectators could now peruse the reports, tables, and statistics in the sporting press and follow players and teams in a methodical fashion. The commentary of sports journalists in turn expanded the available information pool—the *New York National Police Gazette*, a major source, was widely available in hotels, barbershops, and saloons—and helped educate habitués in the finer points of observation.

The respectable middle class knew the kinds of entertainment it didn’t like, as well: the sordid goings-on in Kit Burns’s rat pit. The American Society for the Prevention of

“City Enormities—Every Brute Can Beat His Beast!” from *Frank Leslie’s Illustrated Newspaper*, October 28, 1865. This depiction of cartmen abusing a horse is said to have prompted the formation of the ASPCA, which used it for many years to rally support among the urban middle classes. (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

Cruelty to Animals (ASPCA)—a strictly New York City concern despite its expansive name—had been founded in 1866 by Henry Bergh, son of wealthy shipbuilder Christian Bergh. Addressing a crowded Clinton Hall meeting of the American Geographical and Statistical Society, Bergh had denounced the cruelties practiced upon urban animals, particularly by the brutish (and Irish) lower classes, and urged New Yorkers to follow

England's example in tackling the problem organizationally and legislatively. The backing of wealthy bourgeois gentlemen (Astor, Fish, Belmont) and leading ministers (the Unitarian "Pope" Henry Bellows) won the ASPCA a charter and gained passage of restrictive laws, but the rank-and-file supporters of the organization were mainly middle class.

The ASPCA took out after lower-class blood sports, deploring both their cruelty and their waste of working-class time. It repeatedly raided Kit Burns's establishment, forcing sportsmen to shift to pits in Brooklyn, Williamsburg, and Hoboken, and in subsequent decades largely succeeded in driving animal sports from the city. Except, that is, for the upper-class pastime of fox-hunting.

In addition to denouncing particular forms of working-class play, many professionals scorned the communal culture of the immigrant streets. Frederick Law Olmsted objected to "young men in knots of perhaps half a dozen in lounging attitudes," who rudely obstructed sidewalks or descended into a "brilliantly lighted basement, where they find others of their sort, see, hear, smell, drink, and eat all manner of vile things." Proper neighborliness did not consist in sitting about on doorsteps or curbstones while children "dodge[d] about at play," but rather in sitting at the "tea-table with neighbors and wives and mothers and children, and all things clean and wholesome, softening and refining."

RAGS TO 'SPECTABILITY RELIGION

More than ever, middle-class families hewed to distinctively middle-class creeds and denominations, clustering in neighborhood Methodist, Baptist, Congregational, Presbyterian, and Episcopalian churches and having little to do with Catholicism unless they were Irish or German. Middling New Yorkers harkened particularly to the teachings of three theologians whose messages resonated with special force within their social stratum: the Rev. Henry Ward Beecher, the Rev. Dwight L. Moody, and the Rev. Horatio Alger Jr.

In the postwar years Henry Ward Beecher was at the top of his form. His exuberant oratorical performances pulled crowds of Manhattanites across the river on Sunday mornings (on "Beecher boats") to drink in his Plymouth Church sermons alongside Brooklyn brokers, small businessmen,

professionals, clerks, bookkeepers, and skilled laborers. The “Hercules of American Protestantism” made twenty thousand dollars a year—equal to the president’s salary—supplemented with income from writing articles for the secular and religious press, penning a bestselling novel, and giving lectures.

Part of Beecher’s attraction lay in his long-standing ability to successfully negotiate tensions in middle-class ideologies, as in his continuing reassurances to privileged audiences that social inequalities generated by the free market system were divinely sanctioned and morally justifiable. Now, in the postwar age of Darwin, Beecher demonstrated a capacity to reconcile religion with reason—coequal polestars for his middle-class followers. Confronted with hard evidence from geologists, paleontologists, and biologists that challenged traditional biblical teachings, Beecher responded by accepting the new findings, formally embracing Darwin in 1882, though implicitly he had done so much earlier. Beecher argued that Science and Religion were not really in conflict, as evolution was God’s work. God was imminent in Nature, and His Laws might be grasped by the rational mind, but His Divine Essence was Love, and that could only be captured by contemplation of Nature’s beauty. God could therefore be best discerned, Beecher suggested, by the refined and the sensitive, attributes that (like knowledge and education) could be cultivated. It was possible, accordingly, for people to “ripen” by their own efforts to a “nobler plane,” attaining a level at which they were naturally attracted to love and goodness and cleaved to proper behavior as a matter of course, not coercion.

Organizing the process of elevating masses of middling men and women to such an exalted status was central to the work of Dwight L. Moody, the era’s most influential evangelical preacher, and in 1875 Moody decided to undertake a jumbo-scale revival in Beecher’s Brooklyn, one that would dwarf the efforts of prewar predecessors like Charles Grandison Finney. As a young man, Moody had moved from Massachusetts to Chicago, become a successful shoe salesman and usurious moneylender, and worked for the Chicago YMCA. After a conversion experience, he became an itinerant revival preacher in the midwest, then rocketed to fame after a successful 1873-75 tour of England, Scotland, and Ireland, along with Ira D. Sankey,

his musical director, who led congregants in old hymns and taught them new ones.

On his return, Moody launched the revival in Brooklyn. Demonstrating a mastery at organizing urban camp meetings, the evangelist converted a huge skating rink to a six-thousand-seat auditorium, advertised extensively with posters and newspapers, and accommodated reporters on the platform who in turn related the services at great length. The following year, 1876, he worked out of New York City's mammoth Hippodrome, the remodeled Harlem Railroad Depot at 26th and Madison whose adaptation cost a substantial ten thousand dollars, plus a fifteen-hundred-dollar weekly rental.

Moody's ministry was financed by the very wealthy (William E. Dodge, Cornelius Vanderbilt II, J. P. Morgan). As one journalist observed, a Moody revival was "a vast business enterprise, organized and conducted by businessmen, who have put money into it on business principals for the purpose of saving men." They applauded his views, which, though short on doctrine, suggested that urban suffering was due to city folk having drifted away from God and could best be addressed by seeking personal salvation through Jesus and avoiding sins such as drunkenness, Sabbath-breaking, and theatergoing or other "worldly amusements."

Moody's meetings were themselves fabulous middle-class entertainments. Immense crowds, often ten thousand or more, jammed and overflowed his arenas, aided by the streetcar companies, which built special tracks to their doors. The hymnbook and photograph vendors, the common singing, the mixing with pious strangers: these afforded a social outlet sorely needed by those required to abjure wicked commercial pleasures.

Such guilt-free get-togethers were particularly attractive to recently arrived, country-bred, evangelically oriented young men who had perhaps secured an office job but whose status and social networks still seemed fragile and insecure. One such newcomer was Horatio Alger, a recently secularized man of the cloth. Born in 1832 in Revere, Massachusetts, Alger went to Harvard, tried unsuccessfully to make a living as a professional writer for the Boston weeklies, then finally, and somewhat reluctantly, entered Cambridge Theological School to prepare himself for the ministry. Alger spent the war years preaching. On the side, he wrote patriotic verse and a juvenile novel, *Frank's Campaign*, "to show how boys can be of most effectual service in assisting to put down the Rebellion." In 1864 he settled

down as a Unitarian pastor in Brewster, Massachusetts, but his ministry ended abruptly two years later, after an investigation by church authorities determined that the pastor had been engaging in “unnatural crimes” with young boys in the parish. Alger, admitting he had been “imprudent,” left town on the next train.

Moving to New York, Alger rented a room in a cheap hotel on St. Mark’s Place and set about making a career as a writer, though at first his articles and novels garnered good reviews but disappointing sales. In the meantime he had begun to study the habits of New York’s “street Arabs” and to aid the work of the Newsboys’ Lodging House. A project inaugurated by Charles Loring Brace’s Children’s Aid Society, it provided dormitory space at Fulton and Nassau where newsboys and bootblacks could lodge for a nickel a night. Alger’s experiences provided him with material that, once fictionalized, proved the making of him as a writer.

In 1867 the Boston editor of a children’s magazine, *Student and Schoolmate*, began bringing out monthly installments of Alger’s *Ragged Dick; or, Street Life in New York*. Dick, the bootblack hero, is ragged indeed, but a youth of enterprise and ambition. By chance (and luck plays as much a part as pluck in Alger’s novels) Dick is hired by a wealthy merchant to guide his rural nephew, Frank, around the city. Dick initiates the country lad into the ways and wiles of the city. He takes Frank (and the reader) on an extensive tour of Manhattan, alerting Frank to urban perils: “A feller has to look sharp in this city, or he’ll lose his eye-teeth before he knows it.” At the same time, Frank introduces Dick to refined speech and dress and awakens his latent desire to rise in the world. Dick announces his intention to “try to grow up ’spectable.” To ready himself for a job “in an office or counting room,” he takes up lodgings, opens a savings account, and gets some new clothes. At this point, his past looms up in the person of Micky Maguire, an Irish Five Points tough, who accuses Dick of “putting on airs” and picks a fight. When Maguire (a boy of “impetuous” Irish nature) strikes out “wildly,” Dick (a model of “quiet strength and coolness”) fells the bully with “adroit” and “measured” blows. From here on Dick never looks back, and in the end he gets a Pearl Street countingroom job (at ten dollars a week), becomes Richard Hunter, Esq., and moves to “a nicer quarter of the city.”

Dick's trajectory is not from rags to riches but from rags to 'spectability. Alger's sermons, like those of Beecher and Moody, honored not robber-baron rapacity but middle-class diligence. He counseled ambitious young boys to make themselves useful and acceptable to potential employers—to prepare themselves, as it were, for the dispensation of economic grace. Alger's secularized vision of salvation demanded ongoing subordination, not manly independence, as illustrated by the once scrappy Dick's now humble response to his job offer: "I'll try to serve you so faithfully, sir, that you won't repent having taken me into your service." His was a creed for clerks.

THE POLITICS OF DECENCY

The question of how to apply science to society—particularly the affairs of New York City—posed a conundrum for the middle class in general, and its intellectuals in particular. On the one hand, there was continuing enthusiasm in the postwar years for "scientific governance": action by experts, armed with up-to-date statistical information, to improve urban conditions. On the other hand, "social Darwinism" won many advocates; this credo, as expounded by Herbert Spencer, the English philosopher, and William Graham Sumner, the Yale sociologist, suggested that evolution's natural workings should not be interfered with by misguided state-based activists, even in the name of science, compassion, or justice. In the 1860s and 1870s New York's college-educated professionals veered back and forth between purposive social action and a revitalized laissez-faire, but people of both persuasions agreed the government of New York City was in the wrong hands.

Disgruntled observers believed the public sector responded all too readily to particularistic political and economic interests. Politicians pandered to the urban proletariat, dispensing largesse to alien immigrant voters, and self-serving businessmen barged their way into the legislative process, buying what favors they needed. Both streams of corruption commingled in the ample person of Boss Tweed—crony of Jay Gould, patron of the Irish, enemy of good government. There were, to be sure, sanitary engineers, landscape architects, educators, and physicians sprinkled throughout city government who had carved out positions of some independence—witness Croton engineer Craven—but trained intellectuals

were generally shunted aside or forced to make dishonorable compromises with ignorant politicians.

What New York needed, argued the American Social Science Association (1865), was a neutral corps of experts, along the lines of the English civil service, in which Oxford and Cambridge graduates found respected positions administering the realm. To achieve it, the association called for civil service reform—taking public jobs away from party spoilsmen and giving them to qualified professionals—and a campaign got underway in which George William Curtis, political editor of *Harper's Weekly*, assumed the leading role.

Social Darwinists like E. L. Godkin also supported civil service reform. Godkin, a middle-class Protestant born in Northern Ireland, had emigrated to New York in 1856, having received a rigorous training in classical political economy at Queens College, Belfast. He began a career as free-lance journalist and, in 1865, accepted editorship of the *Nation*, which Olmsted had urged the Union League Club to establish. Godkin used his magazine pulpit to warn cultivated middle-class readers about looming threats to laissez-faire. Manufacturers wanted tariffs, which would disrupt the free flow of trade between nations. Greenbackers sought to block restoration of the gold standard, the only rational form of specie. The labor movement wanted to tamper with the “eternal laws of political economy” by imposing an eight-hour day, as preposterous an idea as legislating against the attraction of gravity. For Godkin, the most “scientific” government was the one that governed least, and bureaucrats of the proper persuasion would be far superior to Tammany hacks. In this Godkin had the fervent backing of bourgeois taxpayers who believed that politicians were spending extravagant sums of city money—their money—on public projects.

With both hands-off and hands-on advocates concurring that government should be turned over to (in Godkin's words) “thoughtful, educated, high-minded men,” representatives of both perspectives inched their way toward the conclusion that universal suffrage was the major stumbling block to professionalizing government.

One strategy for curtailing the influence of the urban masses was advanced by Simon Sterne, a New York lawyer and University of Heidelberg graduate who promoted the English idea of “cumulative

voting,” a nostrum calculated to restore the influence of the educated minority. Others proposed giving extra weight to the ballots of college graduates or establishing literacy tests to screen out the uncultivated. Godkin suggested giving propertied taxpayers power to veto city expenditures adopted by “the representatives of mere numbers” or treating the city as a corporation and letting only those who held stock in it vote.

Though suffrage restriction remained a minority prescription, it won some sympathy in the most surprising quarters. In *Democratic Vistas* (1871) Walt Whitman denounced the terrible deficiencies of America’s democratic society in the age of Grant and Tweed. Looking his times “searchingly in the face,” Whitman found himself unable to “gloss over the appalling dangers of universal suffrage”—the “half-brained nominees,” the “savage, wolfish parties,” the governments “saturated in corruption, bribery, falsehood, maladministration.” Most distressing of all was the fate of his beloved cities, New York and Brooklyn. Certainly there was still much to admire: the “oceanic amplitude and rush,” the “hurrying, feverish, electric crowds,” the “costly and lofty new buildings.” But these aesthetic delights could not outweigh the “demonism of greed,” the “robbery and scoundrelism,” and the ascension of “a mob of fashionably dressed speculators and vulgarians” whose antics were matched only by the “plentiful meanness and vulgarity” of the masses below. The city had betrayed the promise of its artisanal republican youth, and Whitman could summon up only a nebulous hope for its moral renaissance.

“WOMEN: THEIR RIGHTS AND NOTHING LESS”

The booming metropolitan economy opened up opportunities for middle-class women to make their mark in professional and managerial positions—particularly those geared toward serving other women. Jane Cunningham Croly was a regular news columnist who published collections of her pieces under the pen name “Jennie June.” Dr. Clemence Lozier was a highly regarded obstetrician who had established the New York Medical College and Hospital for Women in 1863, from which Dr. Susan Smith, daughter of a Weeksville pork merchant, graduated in 1870 to become New York’s first female African-American doctor, and later founder of a Women’s Hospital and Dispensary in Brooklyn. Dr. Mary Putnam Jacobi, daughter of George Palmer Putnam, studied medicine in Paris, taught at the Women’s Medical

College, and in 1872 would found the Women's Medical Association of New York City. Ellen Louise Demorest's *Mirror of Fashions* by now had sixty thousand readers, some as far away as mining settlements in Colorado and isolated farms in the Midwest. Sarah Payson Willis (Fanny Fern), now nearly sixty, was still the greatest circulation draw at Robert Bonner's *Ledger*, and Margaret Getchell, general manager of Macy's, was responsible for many of the firm's innovations.

Despite these individual successes, which built on the prewar legislative victories that allowed wives to keep their own earnings, middle-class females in general found themselves repeatedly thwarted in efforts to crack male monopolization of professional positions. When three women applied to Columbia Law School, one trustee responded, "No woman shall degrade herself by practicing law, in New York especially, if I can save her."

One such snub precipitated a collective reaction. On the occasion of Charles Dickens's second visit to the metropolis, the New York Press Club decided to pay him homage with a fancy Delmonico's dinner. Women, including journalist Croly, were barred. Croly, along with Willis, proposed forming a woman's club, in counterpoint to the male havens lining Fifth Avenue, in which women could support one another's initiatives and careers. Several of the best-known professional women had already begun meeting periodically at Sunday evening receptions held in the oak-paneled library of Alice and Phoebe Cary, two poet sisters. The core group quickly incorporated Sorosis—the first such organization in the country—and by April 1868 its members were meeting regularly in a second-floor room at Delmonico's. The idea of a woman's club triggered widespread derision, but the lampooning soon died down, in part because many members' husbands were powerful men. By 1870 Sorosis included thirty-eight writers, six editors, twelve poets, six musicians, two artists, ten lecturers, four professors, nine teachers, two physicians, and one historian.

Many in the group were feminists and freethinkers, including Jacobi, Matilda Joslyn Gage, and Paulina Wright Davis, and in 1869 Sorosis leaders helped organize a Woman's Parliament in New York City. The body established committees to deal with education, household reform, health reform, and newspaper work for women, among others. It lasted only a year but was resurrected, in 1873, as the Association for the Advancement of Women, again at the initiative of Sorosis. The association sponsored the

first Woman's Congress, to which it invited all who "have conquered an honorable place in any of the professions or leading reforms of the day." Over four hundred women from eighteen states came to New York, all from upper- or middle-class backgrounds, and they concentrated on problems specific to professional women, like having "two careers." They applauded the ongoing expansion opportunities in women's education—that same year the Normal College of the City of New York (1869), the teachers' training institution presided over by Thomas Hunter, moved into a neo-

Anatomy Lesson at the New York College for Women, 1870,

Collection of The New-York Historical Society)

Gothic building at 68th and Lexington—but delegates also demanded the opportunity to be educated for all professions and businesses.

Professional women in New York City also provided a powerful constituency for the broader feminist movement now revitalized by Susan B. Anthony and Elizabeth Cady Stanton. Both had been based in New York since Henry Stanton won appointment as deputy collector of the Custom

House in 1862. The Stantons had settled into a brownstone on West 45th Street, a block from the Colored Orphan Asylum, and Anthony boarded with them. Like many other women, the duo had subordinated feminist concerns for the duration of the war—even when the state legislature took advantage of the temporary abeyance of feminist pressure to gut several provisions of the Married Women’s Property Act. After Appomattox and the Thirteenth Amendment’s abolition of slavery, they decided to press on for the emancipation of women, and in particular the right to vote.

In 1866 Stanton became the first woman to run for Congress—having noted that though females were disfranchised, nothing in the Constitution forbade them from holding office. A symbolic breakthrough, her campaign in New York City’s Eighth District was an electoral flop, garnering but two score votes.

In 1867 Stanton and Anthony organized a lobbying and petition campaign to pressure the state constitutional convention—then considering black male suffrage—into extending the privilege to women too. Granted a hearing by Horace Greeley’s Committee on Suffrage, they parried a barrage of jibes and objections, including Greeley’s jocular query whether the women—given that “bullet and ballot go together”—were “ready to fight.” “We are ready to fight, sir, just as you fought in the late war,” Stanton snapped back, “by sending our substitutes.” In the end the convention refused to grant female suffrage, an innovation “so openly at war with a distribution of duties and functions between the sexes.”

The campaign for women's suffrage drew this satirical response from Currier & Ives, known variously as *The Age of Brass* or *The Triumph of Women's Rights*. (© Museum of the City of New York)

The women fared no better at the federal level. When former abolitionists set out to guarantee the vote for black males by passing the Fifteenth Amendment to the Constitution, Stanton and Anthony supported them but insisted that suffrage for women be included in the demand. Rebuffed by hitherto staunch supporters like Wendell Phillips, who announced that "this hour belongs to the negro," Stanton and Anthony countered that Phillips's definition of "negro" left out half the African-American race and that by smuggling the word "male" into the Constitution, the proposed new amendment was actually taking a step backward. Their protests proved unavailing, and many abolitionist women (mostly in Boston) supported Phillips's argument that burdening black suffrage with women's rights would sink it.

Balked by Republicans, Stanton and Anthony turned to Democrats, in the process embracing racist justifications for their cause. Arguing that white men should accept women as allies against the supposed perils of black supremacy, they joined forces with the flamboyant millionaire George

Francis Train and campaigned for enfranchising Beauty, Virtue, and Intelligence to counter freedmen's Muscle, Color, and Ignorance. Many of their colleagues felt shamed by this appeal, but Stanton and Anthony argued that the Republican Party was a sinking ship, and "rats—that is female rats ought to know enough to leave." Yet when they appealed for support at the national Democratic Party convention in 1868, Stanton was literally laughed out of Tammany Hall.

Renewing their search for allies, Stanton and Anthony discovered their true constituency: middle-class women like themselves, particularly those living in New York City. Using funds provided by their rich ally George Francis Train, they launched a feminist journal, the *Revolution*, from offices in the Woman's Bureau, a large town house near Gramercy Park established by Elizabeth B. Phelps as a meeting center for New York women. With Anthony managing and Stanton editing, they brought out the first issue in January 1868, its masthead proclaiming, "Men Their Rights and Nothing More—Women Their Rights and Nothing Less." Train, a militant Fenian, departed soon after for Ireland, leaving Stanton and Anthony the sole directors of the paper.

The *Revolution*, promising that "not only the ballot, but bread and babies will be discussed," embraced a whole panoply of gender-related issues. The editors resurrected the radical feminist heritage by publishing the work of Frances Wright and Mary Wollstonecraft. They boldly tackled the divorce issue, which Stanton had first raised, to great consternation, at the Tenth Woman's Rights Convention in 1860, and again urged that marriage be treated not as a sacred pact but as a civil contract, easily dissolvable in the event of desertion, drunkenness, insanity, cruelty, adultery, and even simple incompatibility.

Setting the divorce issue in a still larger framework, the editors argued that women needed to become independent so they could marry and remain married out of choice, not economic necessity. This in turn required equal rights under law, the vote, coeducation in schools and colleges, and fundamental changes in society's attitudes about men, women, and the nature of their relationships. To this end, the editors took up subjects usually considered anathema in respectable publications, including sex education, infanticide, rape, wife beating, and prostitution. In 1867 the duo had protested when the Metropolitan Board of Health, picking up on Dr.

Sanger's antebellum proposal, recommended fighting venereal disease (which had spread dramatically during the war years) by legalizing and registering prostitutes and requiring they be regularly inspected. Questioning why men who visited the prostitutes were to be immune from such public surveillance, they denounced the proposal as an insult to women, got the bill killed, and in 1871 beat back another attempt to pass what Anthony called a "Social Evil Bill."

The *Revolution's* editors also mobilized for action around the suffrage issue. At an 1869 meeting in the Woman's Bureau, they and their supporters formed the National Woman's Suffrage Association—an avowedly feminist-first body whose officers were all women—to press for passage of a Sixteenth Amendment to guarantee female access to the ballot. It was supplemented the following year by the New York City Woman Suffrage Association (1870), formed by Dr. Clemence Lozier and Charlotte Wilbour, president of Sorosis, beginning what would be a decades-long struggle to win the franchise locally.

The *Revolution's* militant policies won significant support from New York City's professional women. Many in Sorosis were quite prepared to take up daring subjects: club members discussed abortion and prostitution, and Dr. Mary Putnam Jacobi lectured about the need to abolish female ignorance concerning sexual physiology. Dr. Anna Densmore, vice-president of the New York City Woman's Club, gave scientific lectures for women on physiology and in 1868 got Board of Education approval to train female public school teachers to pass on such information to their students.

Other women were alarmed or repelled by material they considered far too controversial. In addition, former antislavery activists denounced Stanton and Anthony's continuing resort to race (and class) bigotry. When the Fifteenth Amendment passed Congress in February 1869, making no provision for women, Stanton denounced it as an "open, deliberate insult to American womanhood to be cast down under the iron-heeled peasantry of the Old World and these slaves of the New."

At the same moment they were being challenged by relatively conservative women, Stanton and Anthony found themselves confronting Victoria Woodhull, a feminist who was in some respects more radical—and certainly more flamboyant—than they were. Born poor in the frontier hamlet of Homer, Ohio, Woodhull had spent her youth roaming the

Midwest with a traveling family medicine show—telling fortunes, communing with spirits, practicing faith healing and animal magnetism. With her sister Tennie C. (or Tennessee) Claflin she came to New York after the war and struck up an alliance with Cornelius Vanderbilt (Tennessee's physical ministrations warmed the old man's bones while Victoria's seances consoled him over the loss of his wife). Vanderbilt's remarriage suspended more intimate relations, but the grateful millionaire set them up on Wall Street. Woodhull, Claflin, and Co., the first woman's brokerage firm in the all-male New York financial world, was a great success, its rise in no way impeded by the sisters' well-known association with the Commodore, and the women made a small fortune.

They did not, however, rest on these professional laurels, but instead entered the world of radical politics. In 1870 they started their own newspaper, *Woodhull and Claflin's Weekly*, which took up the deeply scandalous (and deeply misunderstood) issue of Free Love. Widely seen as a commitment to unbridled lechery, it was, in fact, a feminist challenge to men's sexual prerogatives under prevailing gender rules. Free Lovers attacked the double standard and insisted men be held to the same high levels of moral purity that were required of women. In some respects, Woodhull's position was not far removed from that of those who had challenged the convention of marriage ("We are all free lovers at heart," Stanton said). The *Revolution*, quite as often as *Woodhull and Claflin's Weekly*, carried demands for a woman's "control over her own person, independent of the desires of her husband."

If some of Woodhull's ideas weren't shocking, her manners certainly were. Woodhull was a feminist for the age of flash, as shrewd about publicity as Barnum, as brash in personal style as Jim Fisk. Her personal appearance violated gender proprieties: short hair, skirts that reached only her shoe tops, jackets of mannish cut, bright-colored neckties. Worse still, Woodhull argued that people might have more than one "natural mate," which raised the theoretical possibility of extramarital pursuits (in Victoria's case, apparently, not merely theoretical), and she took a positive view of sexual pleasure, even when not aimed at procreation, and indeed agitated openly for legalized prostitution and birth control. Mainstream feminists did not approve of contraceptive devices (though many used them) for fear their widespread adoption would increase male promiscuity. They were wary of

abortion (though many had them) because they were associated with frivolous society women, demimondaines, and the poor and because they too could be used by men to escape the consequences of their cavortings.

Given her notoriety, when Woodhull plunged into the suffrage movement, many in the American Woman Suffrage Association and even some in the National Woman's Suffrage Association (including Stanton) were dismayed. But Woodhull quickly earned some kudos. She presented a memorial to the House of Representatives arguing that the Fourteenth Amendment's extension of suffrage to blacks provided ample constitutional grounds for granting it to women, and she proposed that women take direct action at polling places and assert their right to vote. Woodhull's speech and battle plan met with tremendous acclaim and catapulted her to a leadership position in the suffrage movement. Objections by those scandalized by association with such a forward woman were brusquely dismissed by Stanton: "We have had women enough sacrificed to this sentimental, hypocritical prating about purity," she said scathingly. "If Victoria Woodhull must be crucified, let men drive the spikes and plait the crown of thorns."

In 1872 Stanton went so far as to back Woodhull's proposal to use the May meeting of the National Woman's Suffrage Association in Steinway Hall to launch a third political party, of which Woodhull would be the presidential candidate. The new People's Party platform, as leading feminists envisioned it, would merge their crusade for the enfranchisement of women with the movement that, for the past several years, had been pressing for the emancipation of labor.

Eight Hours for What We Will

Postwar prosperity revitalized the labor movement. German tradesmen (nearly a quarter of the city's working population) were particularly energetic. Their individual unions—woodworkers, machinists, tailors, cigarmakers, waiters, silverplaters, and bookbinders—confederated in an umbrella organization, the Arbeiter Union. English-speaking workers, led by printers and building tradesmen, formed their own citywide central, the Workingmen's Union. Irish organizations flourished too, both the Longshoremen's Union and the Laborers United Benevolent Society, which, with its myriad divisions (brown-stone cutters and blue-stone cutters, marble cutters and marble-polishers, hod carriers and derrickmen, sawyers and quarrymen), was the largest labor organization in the city. Seventy thousand were involved in this union resurgence. A larger proportion of the metropolitan working population enrolled in trade unions between 1865 and 1873 than during any other period of the nineteenth century.

City unions launched 249 trade-wide strikes between 1863 and 1873, some of them, like the 1868 bricklayers' walkout, involving several thousand workers. Some trades were particularly militant and persistent: Steinway's pianomakers struck in 1863, 1864, twice in 1865, and again in 1869. From 1866 on the Association for Improving the Condition of the Poor published yearly reports on "Labor Movements and Strikes."

Many contests were for higher wages, as workers fought to keep ahead of rising costs. They also sought a fair share of the period's tremendous profits, most of which accrued to the owners of capital, who flagrantly displayed their riches for all to see. Capitalists groused at these demands. A. A. Low told the Chamber of Commerce that the only real danger to "the prosperity of our port and our city" was "the combinations of men who seek continually to advance the prices of labor beyond what employers can afford to pay." But pay they did. Rolling in money, employers could easily afford to purchase labor peace. Wages in the strategically critical construction trades nearly doubled in the 1860s.

THE EIGHT-HOUR DAY

Another labor objective—one that inspired much stiffer resistance from employers—was to cut the working day from ten to fourteen hours down to eight. In May 1865 the Workingmen's Union launched the eight-hour campaign with a monster picnic in Jones' Wood attended by fifty thousand. In December a packed mass meeting of over fifty unions at Cooper Institute turned thousands away. The following April an immense rally jammed Union Square.

Speakers at these events—men like Brooklynite William Harding, president of the coachmakers—argued that an eight-hour day would ease the crushing workload that made laborers slaves to their jobs. “Labor-saving” machines should start saving labor, rather than just increasing profits. Eight hours for work and eight for sleep would leave eight more in which to develop their human capacities, to be with their families, to get some fun out of life. The working class should get to enjoy the pleasures of the city. There was, Harding reminded his audiences, a fine picture gallery in the Cooper Institute, but not one in twenty workingmen had time to see it. A band gave concerts in Central Park, but artisans hadn't time to hear it. “Should it not,” he asked, “play for the mechanics in this republic as well as for the millionaire?” Shorter hours would make it feasible for workers to live farther away from their jobs and escape the tenement districts. Shorter hours would cut unemployment, by requiring more workers to maintain existing production levels. Shorter hours would ward off depressions, by boosting wages and increasing purchasing power.

Moving beyond speechmaking, the Workingmen's Union petitioned New York State to pass an eight-hour law. In April 1866 shipyard workers at the Greenpoint yards launched a strike for the eight-hour day. It was broken, but the sounds of labor's growing militancy were heard up in Albany. State legislators disagreed on how to respond. The ruling Radical Republicans had demonstrated, in the cases of the fire department and the Board of Health, that they were prepared to use government to redress social ills. They liked the eight-hour issue's potential to attract Democratic workmen to their party. They appreciated the argument that laborers would use the extra time to improve their character as citizens and workers.

But Radicals worried about intervening in capital-labor relations. The idea went beyond guaranteeing the equality of individuals and smacked of “class legislation,” which might open the door to more extreme proposals. Some lawmakers were convinced that workers would use their leisure time to drink themselves into a stupor. Others argued that hours legislation violated both the “natural law” of supply and demand and the “liberty” of the worker. “This is a free country,” said one Republican, “and everybody ought to be allowed to work just as long as he pleases.”

They settled on a spurious compromise, embodied in the Eight Hour Law of April 1867. The legislation set eight hours as the legal length of a working day but allowed longer workdays if arranged by “mutual consent.” If a laborer worked “overtime,” moreover, he or she was not entitled to extra compensation. Nor did the state create an administrative agency to monitor compliance. Employers ignored the law.

Unions decided to enforce it on their own. At the beginning of the 1868 construction season, over two thousand bricklayers struck for a 20 percent reduction of hours (from ten to eight), to be partly offset by a 10 percent cut in wages (from \$5.00 to \$4.50). Boss masons fought back furiously, supported by investors and clients like Vanderbilt who would brook no impediment to the breakneck and profitable pace of construction. They organized an employers’ association, advertised in other cities for replacement workers, and sued the journeymen under state conspiracy laws.

Other workers, realizing a crucial test of strength was at hand, rallied to the builders’ support. When bricklayers at the new Arnold Constable site insisted on a shorter workday, plasterers and painters walked off as well. Traveling committees went to Brooklyn, Jersey City, and Philadelphia, dissuaded scabs from coming, and got union locals there to provide money and roughly a thousand jobs for their beleaguered New York comrades. The Workingmen’s Union organized a mammoth street procession, headed by two thousand bricklayers, and held a militant rally at Cooper Institute. By 1869 a majority of builders were working eight hours. So were federal employees at the Navy Yard, thanks to the Radical Republican Congress and the Grant administration.

The gains proved difficult to sustain, however, thanks in part to Jay Gould. In the slump that followed the unraveling of his gold corner in September 1869, many employers successfully forced hours back up to ten,

so the unions turned again to politics. In the fall of 1869, claiming that “both of the existing parties are corrupt, serving capital instead of labor,” the Workingmen’s Union, the Arbeiter Union, and the Irish unions combined to run independent labor candidates. Their electoral initiative was defeated, as were others in 1870 and 1871, so they had to rely on workplace battles to wring concessions on wages and hours from employers.

MARXISTS, FEMINISTS, AND THE MONEY POWER

Many unionists believed labor’s ills were exacerbated by the financial system. New York workers watched the shenanigans on the Stock Exchange, probed the impact of the new banking system, and called for a change in monetary policy. Before the war labor had fought for hard money against the depreciated paper notes issued by banks. Now, with bondholders clamoring for a return to the gold standard, unions backed paper currency. What linked labor’s old “hard” and new “soft” money programs was the insistence that control over currency should be taken from banks and given to government.

The soft money policy was adopted by the new National Labor Union, established in 1866, when officers of nine national unions—all residents of the metropolitan area—met in New York City. The union aimed to coordinate labor activity on a continental scale, support the eight-hour day, and fight the “Money Power.” When Republicans (and Wall Street Democrats) triumphantly passed the Public Credit Act guaranteeing a return to specie payments, many workingmen decried a bondholder victory engineered (they were darkly convinced) by “the Rothschilds and their agents here.”

Another set of participants in the postwar labor movement, the German socialists, supported both the eight-hour day and currency reform but argued that such piecemeal single-issue strategies were doomed from the start, that only a broad-based attack on the entire capitalist order could succeed. The sole survivor of the prewar movement, Friedrich Sorge’s Communist Club, affiliated itself with Karl Marx’s International Workingmen’s Association (IWA) and in the late 1860s received reinforcements when radical brewers, metalworkers, and printers arrived from Germany. Radical intellectuals arrived as well—followers of Ferdinand Lassalle—who proposed organizing cooperatives, a shopworn

approach to which they gave a new twist. Co-ops, Lassalleans argued, could compete with capitalist firms if they got financing from the state, so workers should use the ballot to attain political power.

In 1868 New York's Marxists and Lassalleans joined forces and plunged into politics. Their platform called for the eight-hour day, currency reform, a progressive income tax, and equal rights for men and women. They got nowhere electorally. But digging in for the long haul, they reconstituted themselves as Section 1 of the IWA, with Sorge as secretary. The IWA, headquartered at Broome and Forsythe (near Fanny Wright's 1829 Hall of Science), had strong links to the German trade unions, and it became the backbone of a renewed socialist movement in New York City. Like other German-American vereins, the socialists created an array of neighborhood clubs, chiefly organized by socialist women, who arranged bake fests, musical performances, "hen parties," excursions, and events at the socialist-owned Germania Hall in the Bowery.

Their very success at rooting themselves in Kleindeutschland concerned the ever practical Marx, who sent word from London that the nascent American socialist movement had better expand beyond "foreigners residing in the U.S." Sorge protested this characterization, calling his members "adopted citizens," but others admitted that "we Germans do not mingle with Americans in public." In July 1871, accordingly, two "American sections" were admitted to the International.

The leaders of Sections 9 and 12 were indigenous (and mostly elderly) New York land reformers and labor activists. Some had been engaged in radical politics since the era of the Loco Focos. They included John Commerford, the chairmaker who had presided over the National Trades Union in 1835, Lewis Masquerier, who had helped George Henry Evans found the National Reform Association in 1844, and Stephen Pearl Andrews, the now sixty-year-old abolitionist, anarchist, mystic, Free Lover, and leader of a circle that included Victoria Woodhull and Tennessee Claflin.

These survivors of the successful crusade against slavery were determined to create a fully egalitarian society. Andrews and his comrades were radical democrats, convinced that extending citizenship rights to blacks and women was the best way to right society's wrongs. They also supported a vast range of other reforms—universal religion, universal

language, universal world government—some with distinctly crankish aspects. They ardently opposed monopolies, landlords, politicians, and clerics but were also, as Marxists noted with alarm, hostile to class-based movements and sought the “Scientific Reconciliation of Labor and Capital.” Yet it was clear to the Germans that, all in all, the American sections’ democratic egalitarianism and experience with direct action made them a potentially potent addition. For the moment, the IWA flourished—by the end of 1871 there were thirty-three sections, with five thousand members—and it received the endorsement of the English-speaking New York Workingmen’s Assembly led by the sympathetic William J. Jessup.

Working women, on the other hand, though they would have liked to join the resurgent labor movement, continued to be unwelcome. So some responded positively when, as before the war, they received offers of help from middle-class women—this time not religious reformers but suffrage leaders. Stanton and Anthony turned to workers in their search for allies. The *Revolution* embraced the eight-hour day and greenbackism, agreed that the working class was the source of all wealth, accepted that the rich had stolen their wealth from those who created it, and declared that strikes were legitimate tools of working people.

As part of their new concern for the condition of working women in New York City, feminists investigated the situation of seamstresses at A. T. Stewart’s department store, and in 1868, Anthony and Stanton established the Workingwoman’s Association, initially composed chiefly of female typographers who worked in The *Revolution*’s shop. Publishers confronting strikes by the all-male National Typographical Union had made a practice of training women as compositors, employing them as scabs, then firing (or demoting) them once the men were brought to terms. This had created a pool of semiskilled, semitrained women floating around the industry, whom Anthony through the typographers offered to help organize. The female printers decided to take her up on it, though nervous about being tagged “strong-minded” women of a Bloomer persuasion.

Though Stanton and Anthony hoped the Workingwoman’s Association would in the long run establish unions in every industry employing women and forge a crossclass alliance behind women’s suffrage, in the short term the group provided Anthony with the credentials she needed to join the National Labor Union, whose members she wished to lobby on behalf of

women's rights. The NLU accepted her as a delegate to the New York City convention in 1868, in part because it too was looking for allies. But as soon as Anthony raised feminist issues, it became clear this would be a difficult coalition to cement. The NLU's base of skilled white craft workers saw working women as competitors. They also believed women were "created" to be "the presiding deity of the home circle," as one NLU leader argued, there to "console us in our declining years."

What shattered the alliance was a labor conflict that pointed up the gap between middle-class feminists and working-class unionists. The National Typographical Union, impressed with the new militancy of female printers, moved to placate and incorporate them. They were accepted as an NTU local, and when male printers struck the *World*, the women refused to replace them. But now Anthony stepped forward as a

The Upstairs Sewing Room at A.T. Stewart's store on Broadway at Tenth Street, *Frank Leslie's Illustrated Newspaper*, April 24, 1875. While middle- and upper-class women thronged the emporiums of Ladies' Mile below, regiments of working-class seamstresses toiled under the

watchful eyes of male supervisors. (© Collection of The New-York Historical Society)

strikebreaker. She offered the Workingwoman's Association as a place where publishers could train women to be scabs, arguing (as did employers) that it was only seeking new opportunities for females. Printers at the national convention in 1869 demanded Anthony's ouster, and got it.

The Workingwoman's Association did not last much longer, but its existence marked an important development. In the past, the conventional linkages between upper- and lower-class women—charitable enterprises launched by ladies—had been one-sided and condescending. The Workingwoman's Association, though riddled with mutual misunderstandings, suggested the possibility of a more coequal coalition.

WALKING TO WORK

Even with improved wages, the bulk of the working class—still unable to afford public transportation—had to live near their jobs. For most this meant Manhattan's rim, the tenement-lined streets leading back from the docks into a mixed terrain of heavy industry and light manufacture. The twenty-five thousand ironworkers walked to great foundries rooted on the East and Hudson river shorelines, near their rail and sea lifelines. Clothing sweatshops sprouted in the Lower East Side wards to be near their cheap labor supplies (some women outworkers rarely left their tenements at all). Bohemian cigarmakers too worked at home now that cigar molds made it possible to do so.

The proximity of community to industry cast a pall over daily life. Admixed with foundries and factories were reeking gasworks, putrid slaughterhouses, malodorous railyards, rotting wharves, and stinking manure piles, which gave the working-class quarters their distinctively fetid quality. In the Lower (predominantly Irish and German) East and West Side wards, the stench was compounded by Tweed's inaction. The race to develop the uptown wards left scant energy or public capital available to rescue the downtown districts, many built on filled-in swampland. Poorly designed sewage pipes were left to spew their putrefying contents into cobblestoned streets, where they mingled With animal wastes, and where at night homeless children slept in abandoned carts and wagons. Cholera and

other diseases devastated such streets. In 1866 the death rate reached 195 per thousand in the worst blocks. Even the cantankerous George Templeton Strong muttered, "It is shameful that men, women and children should be permitted to live in such holes."

Those who could, moved. Conditions were far better in the newer tenements of Yorkville or Harlem, if one had the cash for a horsecar commute downtown or found a job in the factories, stoneyards, or gas tanks moving north along the East River. But sleazy conditions crept uptown too, as speculators threw up rookeries on the damp and low-lying streets leading from First Avenue down to the waterfront. The area's many vacant lots were used as garbage dumps, through which poor women and children scavenged, and stables from near and far dropped their loads at colossal manure heaps. Conditions on the far West Side were no better. The immigrant residential areas abutting the railyards, factories, and the stinking Manhattan Gas Works at 18th and Tenth were so bad that their upper reaches, around the west 30s and 40s, became known as Hell's Kitchen (the name borrowed from an old Corlear's Hook dive or perhaps a local gang).

Other workers fled Manhattan for Brooklyn. Conditions were marginally better in the factory-warehouse districts along the Red Hook waterfront and around the Gowanus Canal, and considerably so in the growing downtowns of Brooklyn proper, Williamsburg, and Greenpoint and in the upper stretches (around Myrtle Avenue) of Bushwick and Bedford. Other laborers settled on the new urban frontiers: the bluecollar, oil-worker town of Hunter's Point (soon Long Island City), the company town of Steinway, or industrial villages like College Point, Woodhaven, and Mott Haven in the Bronx. In 1869 the German Cabinetmakers Association of New York cooperatively purchased five East Astoria farms, covering ninety-one acres; in 1870 they opened a hotel and a shooting gallery that within two years had blossomed into Scheutzen Park, a seven-acre grove complete with woodland, shooting galleries, and dancing pavilions.

Working women had special problems finding housing. Those who entered service were provided for, of course, though the "new conveniences" seldom reached the topfloor servants' quarters, whose inhabitants still washed weekly in a tub in *the* kitchen. Clothing workers continued to pool their low wages and rent a garret or tenement room. But the ranks of single laboring women had grown greatly in the backwash of

civil war, a function of mass widowhood, economic dislocation, and a dearth of marriageable men. And many boardinghouses—the chief mainstay of single men—refused to accept single women.

Middle-class reformers made some efforts on their behalf. The Female Christian Home and Ladies Christian Association (later the YWCA) founded a Young Woman's Home to promote the "temporal moral and religious welfare of women, particularly of young women dependent on their own exertions for support." The Five Points House of Industry, aided by the state, remodeled the old six-story tenement on Elizabeth Street, built in 1855 by the AICP as a "Workmen's Home," and renamed it the Home for Working Women. It provided its five hundred boarders and employees with six dormitories, a large dining room, parlors with donated pianos and organs, a sewing room, and a library with daily papers, but it required character references to enter and attendance at prayers to stay.

These initiatives served as models for A. T. Stewart, who wanted to repay his debt to the women who had made his fortune (and perhaps encourage his current employees to remain unmarried longer, and help expand his fortune farther). Stewart built a magnificent hotel for working women of good character on Fourth and 32nd. Its sumptuous apartments, for a thousand women, put it on a par with the city's top hotels, and Stewart planned to rent them at an affordable \$2.50 a week for room and board. But Stewart died in 1876, and his executors upped the charges to seven dollars—knocking out seamstresses and dry-goods clerks but accommodating teachers, bookkeepers, and governesses. When it still continued to lose money, it was shut down altogether after a scant two months of philanthropic life and reopened as a luxury hotel.

COLORED QUARTERS

Relations between working-class blacks and whites did not improve in the decade after the draft riots, and labor's new solidarity did not extend across racial lines. When Susan B. Anthony asked why unions didn't lower their barriers to women, a baffled printer replied: "You might as well ask why we don't send for the colored men or the Chinese to learn the trade." White contractors and work gangs collaborated in keeping black workers from the docks, pits, and quarries and in terrorizing those who did get hired, even though the costs of such racial exclusion kept mounting. An 1866 strike by

Greenpoint shipyard workers had been successful—until black caulkers were brought in from Portsmouth, Virginia, to replace them, which further poisoned relations.

In 1869 blacks demanded an “equal right to labor with all other classes of our fellow citizens,” calling the exclusion policy “strong evidence of the power which the spirit of slavery and caste still holds over the mind of our white fellow citizens.” The sole positive response came from Section 1 of the IWA, the only white citywide labor group that actively promoted the organization of black workers—one reason the National Colored Labor Convention sent a delegate to the 1870 Paris Congress of the First International.

Excluded from the mechanical trades—a machinist with Admiral Farragut found he couldn’t get a job in the city—blacks remained sequestered in the laboring and service sectors as longshoremen, laundresses, sailors, waiters, barbers, cooks, servants, coachmen, or porters or in a handful of skilled crafts jobs. Excluded from the unions, laborers, longshoremen, and artisans gathered in the New York African Society for Mutual Relief, founded in 1808 and still going strong, while black caterers, coachmen, barbers, and seamen formed their own organizations.

Despite the generally dismal circumstances, the city’s shrunken black community began to regenerate itself. At war’s end there were but 14,804 African-Americans in New York and Brooklyn combined, five thousand fewer than in 1840, and they constituted a scant 1.4 percent of the total population. The populace grew 26.7 percent between 1865 and 1870 and jumped by another 53.6 percent over the next decade, partly through natural increase and partly via the flow of immigrant freedmen who began to trickle north, primarily from Virginia.

Internal migration was more dramatic. In the 1860s and 1870s, though some blacks still lived in Greenwich Village, like “sardines in a box in rickety-old houses,” many more had migrated to enclaves in Hell’s Kitchen. These were among the meanest areas in the city but were within walking distance of such longshore and service jobs as remained open to them. Churches relocated accordingly. St. Mark’s Methodist Episcopal and Bethel African Methodist Episcopal moved uptown. New congregations opened as well, like Mount Olivet Baptist, which appealed particularly to southern newcomers. Philanthropists followed too. The Quakers’ New York Colored

Mission settled on West 30th Street to seek the “religious, moral and social elevation of the Colored People”; it offered Sunday school, Bible classes, aid for the sick and underfed, and a nursery school to get children out of apartments “while laundry work was carried on.”

Brooklyn had been attracting blacks since the draft riots, though here too numbers remained small. In 1870, out of a total Brooklyn population of approximately 420,000, roughly fifty-six hundred were African Americans, and they were scattered across widely separated communities. The Fort Greene Park area, south and east of the Navy Yard, and the stretch along Atlantic Avenue to the western border of Bedford both witnessed black development in these years. The black enclave at Weeksville-Carrville still hosted 650 in 1875, though much of the area was destroyed when Eastern Parkway and other streets were cut through the area, and it soon lost its African-American character.

HAVING FUN

New York’s working people divided along racial and ethnic lines at play as well as at work and in their residential quarters, in part because so many leisure-time activities were themselves structured around existing communal institutions: fraternal orders, benevolent societies, political and social clubs, militias and rifle clubs, unions, churches, and family groups.

After the war Kleindeutschland’s Germans enhanced the already considerable number of spaces devoted to community pastimes, adding Walhalla Hall, Beethoven Hall, and a new Turn Halle, among many others. Here German confectioners, upholsterers, barbers, horseshoers, morocco dressers, and goldworkers could hold their fall and winter balls.

German (and Irish) associations also traipsed en masse to pleasure spots around the metropolitan area. At first, the favorite Manhattan venue was Jones’ Wood, where the Schermerhorn and Jones families had leased their grounds to entrepreneurs who established a commercial picnic ground and hotel there. The proprietors then rented out the space to ethnic, social, athletic, and religious groups, who arranged their own excursions or festivals. Germans arrived in great numbers—by steamboat or the Second and Third Avenue street railways—to dance to German music, watch gymnastic exhibitions, and drink lager beer. The Scottish Caledonian

Society held track and field games at Jones' Wood, and Irish church groups and temperance societies held annual excursions and fund-raising picnics.

Improved transport made trips farther afield practical too. The Journeymen Plumbers traveled (along with Wallach's Brass Band) by steamboat and barge up the Hudson to hold their annual picnics at Dudley's Grove. Nearby rural Queens County was even more popular. Every Sunday four to five thousand would cross to Hunter's Point on the 34th Street ferry and fan out to various country retreats for picnics. On one fine afternoon in 1872 so many Germans flocked to Schuetzen Park to hear the Prussian Guard Band play that over a thousand were turned away. Steamers ferried massive crowds directly to weekend resorts like Witzel's twenty-seven-acre establishment at College Point for eels, clams, and beer and to Coney Island, whose west end was an increasingly popular destination.

Working people avoided the new Central Park at first—aside from special occasions like July 4—as Olmsted's rules forbidding German singing society picnics or Irish church suppers made it clear that visitors were welcome only on bourgeois terms. Things changed when Tweed's charter transferred power from state to city. The Tweed regime did not, as the *New York Times* was convinced it would, turn the park over to rowdies, peddlers, and prostitutes. Tammany politicians actually improved the park—while lining their pockets and those of well-connected contractors. It also loosened park rules, expanded permissible activities, and added new attractions like boat rentals, Sunday pony rides (though religious groups blocked Sunday concerts), and a children's carousel, turned by a blind mule in the basement. Above all the Democrats renovated the Arsenal Zoo in 1870. By 1873 park attendance had jumped 43 percent, and the zoo, a free attraction, was the destination of roughly one of every four visitors (especially after circus owners like P. T. Barnum began quartering animals there). Working-class visitation continued to soar in the late 1870s, as the Sixth Avenue El cut twenty minutes off travel time from downtown and more working people had moved within walking distance. Sundays in the park were now dominated by working-class visitors, especially Germans.

Alongside these communal activities the city's expanding commercial culture attracted people on a more individual basis. On Saturday evening, their week's wages in hand, working people still headed for the Bowery. From its lower reaches in the Five Points up to its northern end where it

spilled into the Union Square Rialto area, the Bowery was aflame with gas-lit clusters of white, red, blue, and green glass globes. The street itself was filled with entertainers: four- or five-piece German bands playing waltzes and schottisches, organ grinders with gaudily attired monkeys, black quartets singing spirituals, street vendors hawking hot corn and fresh oysters (the latter served raw, with pepper sauce, for a penny apiece). Illuminated signs—a good half now in German—pinpointed the tremendous variety of indoor attractions, including the *Lagerbier* saloons, the *Weinstuben* (“Grosses Concert, Eintritt Frei”), and huge establishments like the Atlantic Garden where German families sang songs of the fatherland or listened to orchestras perform Strauss, Wagner, and Beethoven.

Popular theaters—including the old Bowery, still going strong—offered melodramas like *The Three Fast Men, or New York by Daylight and Gaslight* and dramatized stories from the *New York Weekly* like *Bertha, the Sewing Machine Girl*. Many featured elaborate special effects and mechanisms, such as trains, fires, and live animals. Some houses specialized in Irish dramas in which virtuous peasant girls and high-minded patriots joined forces to confound designing English dukes. As in prior generations, actors engaged in colloquies with the peanut-and sausage-munching audiences (families held mini-picnics in the second tier). Marching down front after a particularly patriotic speech, they would demand, “Isn’t that so, boys?” and receive an earsplitting affirmation. Other houses presented musical extravaganzas, burlesque, and French opéra bouffe.

Bowery dime museums presented mechanical contrivances, flea circuses, and wax figures: one such establishment had a fake Dante’s Inferno peopled by the likes of Tweed, Gould, and Henry Ward Beecher. A panorama building housed a Gettysburg cyclorama where audiences stood while unfolding canvases depicted the clash of armies (accompanied by narration from a uniformed veteran). Lent’s New York Circus at 14th Street (just across from the elite’s Academy of Music) boasted equestrian rings—larger than Astley’s in London or the Cirque Napoleon in Paris—where one could see horseback riders, high-wire artists, clowns, and animal acts.

“Variety” shows refused to specialize in any one popular entertainment form but mixed them all. Starting in 1865 Tony Pastor, a former clown and

veteran concert saloon entertainer, ran one out of an old Bowery theater. Tony Pastor's was known as a bar-free family house, a place to take one's maiden aunt. It mixed blackface minstrelsy, clog dances, magicians, acrobats, tableaux vivants, sing-alongs with Tony, and plays presenting idealized pictures of life on the Lower East Side (like *The Little Fraud*, in which Ned Harrigan and Tony Hart made their first appearance in September of 1872).

Tammany Hall merged politics and entertainment, already stylistically similar, in its new headquarters (1868) just off Union Square at 141 East 14th Street. The Tammany Society kept only one room for itself, renting the rest to entertainment impresarios: Dan Bryant's Minstrels, a German theater company, classical concerts and opera. The basement—in the French mode—offered the Café Ausant, where one could see tableaux vivant, gymnastic exhibitions, pantomimes, and Punch and Judy shows. There was also a bar, a bazaar, a Ladies' Cafe, and an oyster saloon. All this—with the exception of Bryant's—was open from seven till midnight for a combination price of fifty cents.

All-male audiences could enjoy raunchier entertainments. After 1874 Robinson Hall presented the cancan—"funny, frenchy, spicy and sparkling"—which was such a hit the theater changed its name to Parisian Varieties. This inspired the Columbia Café to open in 1875 with "the Latest Parisian Novelties," including risqué pieces like *Cleopatra's Amours* and *Fifty Nice Girls in Naughty Sketches*. The competition soon generated full-fledged girly shows—"spicy French Sensations" such as *Beautiful Minnet Dances from the Jardin Mabille, Paris* and *The Sultan's Harem, or Secrets of the Seraglio*.

Raunchier still—and far more participatory—were the concert halls at the Bowery's lower end, in the Five Points, or along the waterfront. Many were gas-lit basement dives—like Sailor's Welcome Home or the Jolly Tar—which cajoled sailors through their red-curtained doors down to rooms where pianos rolled and drinks were brought to bare tables by waiter-girls. Other desires could usually be accommodated on the premises—in gambling rooms, cockpits, boxing rings, or ersatz seraglios complete with women in Turkish costumes.

Finally, there were the real workshops of commercial sex, brothels geared to male laborers. The female laborers here worked in unappealing

conditions. The madams, entrepreneurs of sex, charged their girls—the appropriate term, as many of the whores were between ten and fifteen—weekly board and took half their income. Given their vested interest in productivity, the madams insisted on a high-volume, high-turnover strategy. On Saturday and Sunday nights lines formed outside the most successful houses. One Stakhanovite of sex serviced fifty-eight men in three hours. The more routine (but still strenuous) rate averaged between from seventy to a hundred encounters a week, at one to two dollars for ten to fifteen minutes in the sack.

OLD SLEUTH AND BUFFALO BILL

Sensational fiction was another working-class pleasure—quite different from the genteel fiction served up in *Harper's* or *Scribner's*—which New York publishers specialized in generating. The front counters of corner groceries sold story papers like Beadle and Adams's *Saturday Journal* and George Munro's *Fireside Companion*. Aimed at the

Inside John Allen's Dance House on Water Street, *Frank Leslie's Illustrated Newspaper*, August 8, 1868. Allen provided small rooms in the rear of the house for prostitution, each of which he equipped with a Bible. In 1868, he began allowing prominent evangelists to hold prayer meetings in his establishment, which soon lost its clientele and was converted into a revival hall. (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

entire family, they offered eight pages of illustrated adventure stories and domestic romances, usually three or four serialized episodes per issue. The installments were then collated and reprinted as pamphlet novels selling for a nickel or ten cents and packaged in "libraries."

The form was pioneered by Erastus Beadle, a small New York City publisher of ten-cent song and etiquette books, who in 1860 began bringing out a weekly series of pamphlet novelettes known as Beadle's Dime Novels. During the Civil War these handy, pocket-sized (four by six inches, a hundred pages) "yellow-backs" became enormously popular with young soldiers. Beadle published four million by 1865. Competitors sprang up immediately. George Munro, a clerk in the Beadle enterprise, started his own operation in 1863, and by the 1870s his firm had become one of the largest mass-fiction publishers in the country.

Dime novel entrepreneurs employed journalists, teachers, and clerks to hack out formulaic literary commodities. The intended audience was composed of skilled craftsmen, factory workers, and laborers, at times sorted out ethnically, as with the Ten Cent Irish Novels and George Munro's Die Deutsche Library, though none addressed blacks. Many serials spoke to young female domestic servants, but the overwhelming targets were young men and boys.

The papers and booklets, heavily advertised, were distributed nationally by the monopolistic American News Company (formed in 1864) along the new trunk railway lines. But their premier audience, and often premier subject, lay in the city itself, especially in the case of crime thrillers. In this poe-initiated genre, a professional villain, often of "foreign" blood, was tracked down and jailed, murdered, or banished back to his "foreign" clime by a stern and paternal detective. The most famous, Old Sleuth, first

appeared in the 1872 “Old Sleuth, the Detective; or, the Bay Ridge Mystery,” in George Munro’s *New York Fireside Companion*. The New York private eye (his card read “Sleuth, Detective”) was a spectacular success. Crime dimes—like Alger’s books—helped demystify the city. They showed, as the plot rolled along, how to secure a cheap room, open a bank account, go shopping, and avoid con men. They also provided a vicarious peek at upper-class exotica such as masked balls and Fifth Avenue mansions.

Western adventures, another wildly popular genre, were also churned out en masse in the metropolis. The West had long been promoted by city-based land reformers as a rural Utopia of small republican farm communities. The dime novel West—peopled by savages, scouts, desperadoes, and dance hall madams—was a more individualistic place, where white men could make a new start, a world of gambling, gold, and guns where—unlike the city—masters of property and capital were not in control. Out west unfettered heroes like “Ralph Rockwood, the Reckless Ranger” or “Deadwood Dick” and even “Calamity Jane” triumphed over greedy villains—often bankers. The most triumphant of all was Buffalo Bill.

In 1869 the publishers of the *New York Weekly* signed Astor Place riot veteran Edward Z. C. Judson—better known as Ned Buntline—to write a series of sensational westerns. On a trip to interview Frank North, a well-known frontier scout, Buntline ran across William S. Cody, whom he considered a more promising candidate, gave him a more crowd-pleasing cognomen, and began writing. In December *Buffalo Bill, the King of Border Men* appeared in New York, the first of 550 dime novels about Cody to follow.

By the time Cody came to New York City (in 1872) as Bennett Junior’s guest, Buntline had turned out three sequels and produced a play. When Cody took in the performance at Niblo’s Gardens—and received an ovation—he realized the commercial possibilities of becoming the author of his own melodramas, rather than a star in someone else’s. Jettisoning Buntline, whose bombastic style had become a liability, he took on as a press agent Major John M. Burke, one of the earliest geniuses of publicity.

For the 1873-74 season, Cody joined forces with Wild Bill Hickok—another metropolitan media star, who had shot to fame after publication of an article in *Harper’s Monthly*—persuading him to come to New York and

play himself. Cody sent precise instructions: “You will land in New York at the 42nd St. depot. To avoid getting lost in the big city, take a cab at the depot and you will be driven to the hotel in a few minutes. Pay the cabman two dollars. These New York cabmen are regular holdup men, and your driver may want to charge you more, but do not pay more than two dollars under any circumstances.” The cabbie charged him five, and Hickok refused stoutly. When the cabbie announced he would “take the rest out of your hide,” the long-haired Hickok flattened him with a roundhouse swing. Despite this impressive entrance, Hickok couldn’t make the jump to performer for the metropolitan masses. He found “making a show of yourself” ridiculous and embarrassing and finally headed back west. Cody, however, was making a fortune with his growing repertory of western dramas, ground out by Bowery hacks on a piecework basis, and the Buffalo Bill Combination launched an eleven-season run.

UNDERWORLD

Like their detective hero Old Sleuth, dime novel aficionados found plenty of criminality close to home. The laboring quarters were the primary stomping grounds for the city’s gangs—though “gangsters” was increasingly the more appropriate term—and host to a newly professionalized criminal fraternity that grew up on the underside of working-class life.

The old Bowery Boys and Dead Rabbits, for all the mayhem they inflicted (mainly on each other), had not been really *criminal organizations*. They were, rather, part of the rowdy republican universe; the same skilled craftsmen and laboring men often turned up as volunteer firemen or militia units serving semicivic functions.

Now, however, following the lead of antebellum river pirates, many gangs preyed professionally on citizens and businesses. They broke into houses in daylight, beat and robbed strangers by night, levied tribute on merchants and factory owners, stole from warehouses and railroad yards. The piers remained a favorite thieving ground, with their piles of unprotected goods heaped up for easy plunder. An estimated million dollars’ worth of merchandise was stolen annually in the late 1860s by river thieves like the Hell’s Kitchen Gang headquartered around Eighth Avenue and 34th.

Some of the post-Appomattox crime wave was the doing of battle-hardened veterans, familiars of pain and death, but the period also saw a rapid growth of juvenile and teenage gangs (now called “hoodlums,” a word newly arrived from San Francisco). New legions erupted from the slum streets: the Baxter Street Dudes; the Nineteenth Street Gang (on Tenth Avenue); the Fourth Avenue Tunnel Gang (denizens of the 34th to 42nd Street horsecar conduit, led by young Richard Croker). Some were willing to contract out their violent services if the price was right: the Whyos, early pioneers of mayhem for money, would blacken eyes, break jaws, shoot legs off, or “do the big job” all according to an established scale of prices.

Crude criminality was countered by crude policing. Before patrolman Alexander S. Williams graduated so gleefully to the Tenderloin, the huge former ship’s carpenter had worked the Houston Street and Broadway area. On his first day out he selected two of the toughest local hoods, knocked them cold with his club, and hurled them through the window of their favorite saloon. Reportedly averaging a fight a day for the next four years, Clubber Williams (as he soon became known) was promoted in 1871 to captain in the Gas House district, home to the Gas House Gang. Williams formed a strong-arm squad that proceeded to club local gangsters senseless, with or without provocation. “There is more law in the end of a policeman’s nightstick,” Clubber reflected, “than in a decision of the Supreme Court.”

Street gangs were arguably less significant in New York’s outlaw annals than a much smaller confraternity of criminals who dwelt in the working-class world but modeled themselves on the professional classes above them. Eschewing brute force, these more resourceful outlaws prized planning and analysis, and they scanned the contemporary landscape for entrepreneurial opportunities. Happily for them, almost every new enterprise developed by legitimate businessmen could also be considered a novel source of profit by their netherworld counterparts. As the postwar economy grew more specialized and sophisticated, so did those who preyed upon it.

With the tremendous expansion in the circulation of easily negotiable paper—greenbacks and federal bonds—and concomitant increase in everyday impersonal commercial transactions, a crew of sophisticated counterfeiters, forgers, and white-collar con artists sprang into being. The City Bank forked over seventy-five thousand dollars in exchange for a check purportedly signed by Cornelius Vanderbilt. Liquid assets had to be

shuttled about the financial districts, so gangs waylaid messengers carrying money or securities between banks or, on a grander scale usually associated with the Wild West, hijacked rail shipments: the Tenth Avenue Gang boarded an express train of the Hudson River Rail Road at Spuyten Duyvil and got away with an iron box stuffed with greenbacks and government bonds.

As an ever-growing number of banks filled up with deposits, safecrackers and bank robbers made New York City their national headquarters. Some people called the robbery of Rufus Lord's Exchange Place office in 1867, in which a three-man team made off with cash and securities worth over a million dollars, the first "truly professional" crime. But that isolated coup was as nothing compared to the body of work sustained over years by George Leonidas Leslie (or Western George, as he was known) and his colleagues. This Ohio immigrant lived a remarkable double life. At one moment he was an independently wealthy man-about-town, known for his impeccable manners, his tailoring, his love of books, and his membership in several excellent clubs. At other moments he headed a highly sophisticated gang of bank robbers whose careful preparations—obtaining architect's plans of the building under scrutiny, or constructing special burglars' tools—helped pull off perhaps a hundred jobs like the robbery, in 1869, of the Ocean National Bank at Greenwich and Fulton, which netted them over threequarters of a million dollars. Beginning in 1875, Western George spent three years preparing for his master heist, a knockover of the Manhattan Savings Institution on Bleecker and Broadway, arrangements that included purchasing a duplicate of the Manhattan's vault in order to ferret out its weak spots. In the end his team of specialists made off with nearly three million dollars, though it turned out that not all the bonds were negotiable.

Not all the opportunities afforded by the city were on this munificent scale, but there was as much work available for the minnows of crime as for the whales. Crowded streetcars became traveling meccas for the hordes of pickpockets (and, on occasion, the hijacking of an entire vehicle). Packed department stores turned into stamping grounds for light-fingered ladies. Commercial sex offered great opportunities for panel game entrepreneurs, some of whom, like Shang Draper, were highly organized: he had thirty salaried women working out of his saloon on Sixth Avenue between 29th

and 30th streets enticing drunks to a house with sliding panels behind which confederates waited to relieve preoccupied marks of their possessions. Even old-fashioned muggers got up-to-date by purchasing knockout drops—chloral hydrate or morphine—from one of Diamond Charley's traveling salesmen; a teaspoon's worth in the victim's beer saved time and muscle.

Professionals avoided violence as much as possible; of the forty-eight murders in 1868, almost all were committed by "youthful ruffians." The best ones avoided drink and drugs, kept themselves in shape, and exchanged tips and tricks only with one another. Slowly a professional community emerged among the perhaps twenty-five hundred full-time criminals. Certain concert saloons became well-known hangouts, like Paddy Quinn's Island No. 10, on Catherine Street just off the Bowery, or Bill Varley's joint, in the basement of a Bowery hardware store.

This community had a distinctive hierarchy of criminal careers, ranked by skill and daring. Robbery, the premier form, had its own subspecialties: bank robbers ranked from bank-sneaks of the first class at the top down through damper-sneaks, safe-blowers, safe-bursters, and, the lowest grade, safe-breakers. Somewhere near the bottom in the community's estimation dwelt the ghouls—grave robbers like the ones who snatched A. T. Stewart's remains shortly after they were buried in St. Mark's, and demanded a ransom of twenty thousand dollars from his widow, which the hard-nosed lady took a good two years to pay. The Vanderbilts took Stewart's postmortem dilemma very much to heart and had Richard Morris Hunt design them an impregnable mausoleum on Staten Island.

Fencing too got professionalized in this period. Pawnbrokers and junk dealers still operated, but the smart thieves and prominent pickpockets like William Burke (better known for his later western exploits as Billy the Kid) patronized sophisticated operators like Rosenburg, who fronted as a respectable jeweler on the lower Bowery, or Traveling Mike, who frequented the Thieves Exchange (near Broadway and Houston).

The state-of-the-art practitioner, however, the queen of fences, was unquestionably Fredericka "Marm" Mandelbaum. This 250-pound, black-bonneted matron got her start after the war running teams of young pickpockets, supplying them bail if arrested and fencing their harvest from a clapboarded wing behind her haberdashery store at Clinton Street on the corner of Rivington. In time Marm concentrated on financing and directing

operations of gangs of bank and store burglars, though, being a proto-feminist in her own way, she always found time to help female pickpockets, blackmailers, and con women get their careers off the ground. She particularly enjoyed throwing fancy dinner parties, á la Mrs. Astor, for members of the criminal fraternity.

One reason Marm Mandelbaum could dine in relative repose, despite the perils of her profession, was that she had the law firm of Howe and Hummel on an annual retainer of five thousand dollars. Big Bill Howe and Little Abe Hummel were as odd a pair, in their way, as Fisk and Gould were in theirs, and equally at the top of their field—the newly specialized profession of criminal law. Howe, like Fisk, was given to gaudy attire and clusters of diamonds and was also a master showman. In the courtroom his inspired rhetoric or ready tears worked wonders for his clients, famous and shady alike. The Gould-like Hummel—small, tidy, and precise—sporting not gems but a death's head watch charm and was master of the more subtle legal maneuvers.

Behind the lawyers were policemen and politicians. The Gilded Age witnessed an elaboration of the linkages between crime and politics established before the war. Politicos turned to gangsters for an election-day supply of muscle power and repeaters. Bill Varley's joint was not only the resort of well-known burglars, it was also election headquarters for the energetic campaigns of electoral fraud waged during 1868 and 1870. Bribery and corruption of law enforcement officers became as commonplace as it was in the mainstream business world. The newly professionalized underworld nexus of criminals, fences, lawyers, police, and politicians would grow and deepen in coming generations, but the fundamental structure had been put in place.

The New York Commune?

Since the war, New York's elite had been spellbound by Paris, glittering capital of Napoleon III's Second Empire. Shedding centuries of anglophilia, they had passionately pursued all things French, from apartment houses to mansard roofs, from boulevards to ball gowns, from the cancan to the *Crédit Mobilier*. Now, in the summer of 1870, they were riveted by the rise and fall of the Paris Commune.

Bismarck's rising empire had declared war on France, crushed Napoleon's troops, and captured the emperor himself. (In *Kleindeutschland* enthusiasm for Prussian victories reached delirious levels.) Napoleon and Eugenie's empire reeled, then toppled. The mass of Parisians demanded a republic that would fight on. They got a provisional government, led by haut bourgeois republicans, that only reluctantly prosecuted the war. The Prussians laid siege to Paris and, over the ensuing bitter winter, starved and froze it into submission. In January 1871 the provisional government agreed to an armistice and gave way to a new government, chosen by rural Frenchmen, dominated by landed gentry and royalists and headed by Adolphe Thiers, who accepted a humiliating surrender. But when Thiers's troops tried to disarm the Parisian national guard, they failed, and he and his government fled the city.

Power passed to the Commune of Paris. Its officials were primarily professionals; its chief supporters craftsmen, laborers, and poor women, who were particularly active in street demonstrations. Within days Thiers's army launched a second siege of Paris. In May, after bombarding the city's fortifications, his troops entered the city and attacked the barricades the people of Paris had erected around their quarters and *arrondissements*. In the next gruesome week of street fighting, Thiers's forces made free use of incendiary shells, and the Communards burned great swatches of the city to slow the advancing troops. At the climax, vengeful troops slaughtered thousands of Parisians out of hand, and maddened and despairing Communards shot those they had held as hostages—including the archbishop of Paris—and torched hated public buildings. The victors, urged on by a frightened and frenzied bourgeois press, launched a "Communard

hunt,” assembling new-made corpses in great piles at which wealthy women gleefully poked with parasols. “Trials” found thirteen thousand guilty and meted out sentences of death, imprisonment, forced labor, and deportation. Final body count: seventy hostages, 877 soldiers, and over twenty-five thousand Parisians.

New York radicals supported the Parisians. The American sections of the International expressed sympathy for the fight against the Thiers government, and Victoria Woodhull led a dramatic march in memory of the Commune. Exiles who escaped the carnage were welcomed and organized into a French section of the IWA. German socialists too supported the Commune, at the cost of much of their popularity in pro-Bismarck Kleindeutschland. The labor movement’s *Workingman’s Advocate* printed Marx’s blistering defense of the Commune, *The Civil War in France*.

Wealthy New Yorkers, however, were horrified by the red flags, the socialist speeches, the carnage of Bloody Week. Many hailed the violent suppression; George Templeton Strong professed delight that the “foot of the bourgeoisie is on the neck of the dreaded and hated Rouges at last,” rendering them powerless, “if anything short of extermination” could do so.

Equally horrifying was the thought that such scenes might be reenacted in New York. Godkin’s *Nation* saw the socialist specter “gaining among the working-classes all over the world” and declared one had to be “wilfully blind” to “imagine that America is going to escape the convulsion.” Charles Loring Brace insisted that “there are just the same explosive social elements beneath the surface of New York as of Paris,” and the *Times* concurred. The “terrible *proletaire* class” had already shown its revolutionary head during the draft riots, the *Times* recalled, when for a few days in 1863, “New York seemed like Paris, under the Reds in 1870.” Now matters were arguably worse, as there were “communist leaders and ‘philosophers’ and reformers” in New York, ready to stir up the “seething, ignorant, passionate, half-criminal class” who “hate and envy the rich.” Should “some such opportunity occur as was present in Paris,” we should soon see “a sudden storm of communistic revolutions even in New York such as would astonish all who do not know these classes.”

ORANGE AND GREEN

In early July 1871 a group of Protestant Irish-Americans—the Loyal Order of Orange—requested police permission to march through the city streets to celebrate the Battle of the Boyne. Irish Catholic organizations protested that the parade would be an insult to their community and pointed to the Orangemen's behavior the previous July 12, when they had marched up Eighth Avenue to Elm Park on 92nd Street. As they went they had taunted residents of Hell's Kitchen, Irish Catholic laborers laying pipelines in 59th Street, and others who were broadening the boulevard farther uptown. They'd spewed epithets and sung insulting tunes, such as "Croppies, Lie Down," whose refrain ended: "Our foot on the neck of the Croppy we'll keep." A crowd of enraged workmen followed along and attacked the Elm Park picnickers with stones and clubs. Shots were exchanged, and eight people were killed.

Such disgraceful scenes, the Catholics argued, must not be repeated. The Orangemen sought "race ascendancy," argued Patrick Ford, Galway-born editor of the recently established *Irish World*. They hoped, in league with the nativist "Anglo-American element," to make the United States a thoroughly "Saxon" nation. But the United States, Ford argued, articulating what would emerge as a major strand of metropolitan thought and feeling, was in fact a multicultural construction—"a *political*, not a *natural*, nation." "This people are not one," Ford insisted. "In blood, in religion, in traditions, in social and domestic habits, they are many." It was wrong, therefore, to ask non-English residents to "ignore their own identity and origin" and "become *Yankees* first, before they can be regarded as Americans."

City authorities agreed, noting that the use of abusive language or gesture in public streets was a misdemeanor and that courts had declared no organization had the right to provoke violence by inflaming the passions of other groups. On July 10, with Tweed's backing, Police Superintendent James J. Kelso forbade the parade. Irish organizations and Archbishop John McCloskey (who had succeeded John Hughes on his death in 1864) applauded the decision.

Now Protestants protested. The next day, indignant Wall Street businessmen lined up outside the Produce Exchange to sign a petition denouncing the edict. Leading newspapers raged at the cowardly surrender to a Catholic mob and demanded an instant reversal. Protestant New

Yorkers viewed the parade issue through the prism of events in France. Thus the *Herald* argued that Irish Catholic outcries against Orangemen manifested “the same spirit which prompted the Paris Commune.”

Protestants also feared that Catholic political power menaced republican liberties, an old worry recently revived by Pope Pius IX’s Syllabus of Errors (1864), eighty in all, that condemned such tendencies of the bourgeois era as naturalism, rationalism, separation of church and state, liberty of conscience, and (error number eighty) the notion that “the Roman Pontiff can and ought to reconcile himself and come to terms with progress, liberalism and modern civilization.” The *Times* suggested that Catholics intended to set up a state church and drive Protestants “to take shelter in holes and corners,” and Thomas Nast, cartoonist for *Harper’s*, fashioned images of mitred crocodiles slithering up on the beaches of America.

“The American River Ganges: The Priests and the Children,”
by Thomas Nast, *Harper’s Weekly*, September 30, 1871.
(General Research. The New York Public Library. Astor,
Lenox and Tilden Foundations)

These anxieties had been boosted by Tammanyite Mayor Abraham Oakey Hall, who had taken to reviewing the St. Patrick's Day parade in full Irish regalia, showing up at balls in bottle-green flytail coats and emerald silk shirts, and jocularly claiming his initials really stood for "Ancient Order of Hibernians." Tweed and company had, moreover, authorized state and city aid to parochial schools and Catholic private charities: the Church got nearly \$1,500,000 from public sources between 1869 and 1871. To the *Tribune* it seemed quite apparent that the Irish, "under the leadership of Mr. William M. Tweed, had taken possession of this City and State." Superintendent Kelso's order banning the Orange Parade seemed brutal confirmation of this.

Protestants also fought the banning order because it gave comfort to Irish nationalists, Fenians chief among them. After the war, the Fenians had come up from underground, declared themselves a sovereign government-in-exile, and hoisted their harp-and-sunburst flag over the old Moffat mansion (opposite Union Square), now their capitol. A faction led by William R. Roberts, a wealthy New York dry-goods merchant, pushed to capture British Canada and hold it hostage for Irish independence. This would hopefully embroil the United States in an Anglo-American war, during which Ireland could break for freedom.

This program roused tremendous enthusiasm among New York's working-class Irish. In March 1866 over a hundred thousand turned out for a Fenian rally in Jones' Woods—despite the opposition of Archbishop McCloskey. The savings of domestics and longshoremen (not, for the most part, the more conservative Irish middle classes) helped purchase a cache of arms from the U.S. government. But money, enthusiasm, and some tacit support from American officials still fuming at England's Confederate leanings were no substitute for military competence, and the Fenian invasion forces were easily routed by Canadian militiamen.

This invasion fiasco stimulated the growth of the Clan na Gael (founded 1867), a far more disciplined and secretive organization. Because Irish nationalists retained broad popular support, they were vigorously wooed by Tammany politicians, and Grant Republicans gave them federal jobs in New York City. But leading Irish exiles aligned themselves with the International, which strongly supported Irish independence. Ford of the *Irish World* linked the nationalist cause to radical enthusiasms by

denouncing the “money interest” as “a huge boa constrictor” that “has wound itself about the nation, crushing its bones and sucking the life blood from its heart.”

This combination of concerns about Commune-style radicalism, Irish Catholicism’s growing power in the city, and the emergence of left-leaning Irish nationalism generated intense elite pressure on Tammany to reverse its stand and let the Orangemen parade. Tweed, already feeling the heat from some initial exposés of Tammany corruption, decided he had no choice but to acquiesce. Governor Hoffman came down from Albany on the eleventh and, after conferring with Tweed and Hall, rescinded Kelso’s decision. He also ordered regiments of National Guardsmen and cavalry to guard the marchers the following day.

SLAUGHTER ON EIGHTH AVENUE

July 12 dawned bright and hot. Five thousand troops reported to their armories at seven A.M. Some were old hands at this kind of thing—notably the elite Seventh Regiment. At the other extreme was the new-minted Ninth Regiment, a Jim Fisk creation. The master of Erie had bankrolled the troop but put far more energy into its scarlet-coated hundred-piece band than into imparting military discipline. Most Guardsmen were Protestant employees of the city’s financial and business firms (the Irish Sixty-ninth would be kept in its armory all day). Most shared their employers’ fear or hatred of the tenement house denizens whose paths they would cross that day. In addition to the military, fifteen hundred policemen gathered at headquarters in Mulberry Street.

Catholic forces readied themselves as well. For a week there had been vigorous debates in nationalist circles about how to respond should a parade go forward. Ancient Order of Hibernians lodges around New York and Brooklyn had called for violent resistance. Some had undergone street drills in preparation. Fenian leaders were in unusual agreement with the Catholic hierarchy that violence would only make the Irish appear incapable of self-government, but neither priests nor moderate nationalists had much influence that morning.

From all over the city groups of people made their way toward Lamartine Hall, on the northwest corner of Eighth Avenue and 29th Street,

where the Orangemen were forming up their tiny contingent. The Green forces came from scattered worksites: longshoremen from East River docks, laborers from the Jackson and Badgers Foundry on 14th Street, plasterers, Boulevard workers, quarrymen at Mount Morris, Central Park laborers, men doing repairs on the Third Avenue Railroad or digging sewers in Fourth Avenue or manning the Harlem Gas Works. They came from a morning mass meeting at Hibernian Hall—Ancient Order of Hibernians headquarters, at Prince and Mulberry—where there had already been a violent clash with the Eighty-fourth Regiment and the police (except for two “cops” who had refused to fight fellow Irishmen and been promptly fired and jailed). And, of course, they came from the working-class quarters, from Mackerelville (around 13th Street between First Avenue and Avenue A), from Yorkville, from Brooklyn, and—in greatest numbers—from Hell’s Kitchen.

By 1:30 crowds lined both sides of Eighth Avenue, from 21st to 33rd, and jammed the cross streets. Most were laborers, wearing the long black coats and dirty white shirts of their calling. Many neighborhood women mingled in the crowd, and others took up positions at windows and on roofs (reminding one reporter of “the Paris *pétroleuse*”).

Now the troops and police arrived and took up their positions, to jeers and hisses. At two o’clock, the Orange women and children were sent off, and the men donned their regalia (often with pistols under their coats) and formed up in 29th Street. The men of the Eighty-fourth Regiment, to make clear their unabashed sympathy with the marchers, placed their caps on their bayonets and cheered. The Orangemen were now surrounded by regimental units—the Seventh in front, Sixth and Ninth in rear, Twenty-second and Eighty-fourth to the sides. After some preliminary street clearing by mounted and club-wielding police, a cannon was fired, the band played “The Star-Spangled Banner,” the Orangemen unfurled their purple silk banner of the Prince Glorious on horseback, and the parade set off.

Almost immediately, to howls of “Give them hell, the infernal Englishmen!” a shower of stones, bricks, bottles, and old shoes was unleashed. Some militiamen fired musket shots, pistols were fired from the crowd, police charged and clubbed the bystanders, and the parade moved ahead. A block further on came more stones and sniper fire; Seventh Regiment soldiers responded, on command, with sporadic shots. Eighth

Avenue ahead of the line of march grew choked with crowds. The procession

“The Orange Riot of July 12th,” from Frank Leslie’s Illustrated Newspaper, July 29, 1871. This view shows the soldiers firing into protesters massed on the east side of Eighth Avenue near 24th Street. (Courtesy of American Social History Project. Graduate School and University Center. City University of New York)

halted. One woman broke through the troops and tore the regalia off an Orangeman before being pushed back at bayonet point, shrieking and raging. The police smashed into the crowd ahead, bashing heads open. Stones and crockery rained down from rooftops and windows. More gunshots rang out. Two Eighty-fourth Guardsmen were hit. The troops, without orders and without warning, began blasting volleys at pointblank range into the throngs along the sidewalk at 24th Street. Other regiments began firing indiscriminately into the screaming and terrified crowds. Mounted police followed up with charges.

The parade re-formed ranks. The band struck up a festive Orange tune, banners were lifted aloft, and the assemblage ground on. The police had to batter their way into 23rd Street, where immense numbers had regrouped at Booth's Theater, but the parade successfully negotiated the left turn and headed east, its rear protected from angry crowds, until it reached Fifth Avenue, where, for a moment, it entered a different world: at the Fifth Avenue Hotel, two to three thousand well-dressed people cheered lustily. Further ovations greeted them as they made their way south along Fifth Avenue. Then marchers and troops and police entered Rialto territory at 14th Street. Once again they had to wade through hissing and jeering crowds (except for Protestant oases like the American Bible Society building, from which girls merrily waved orange ribbons). Wearily they made their way across town toward Cooper Union, where finally, at four o'clock, they shed their regalia and quietly dispersed.

Back at Eighth Avenue it was quiet too, apart from the groans of the injured and dying and the lamentations of priests and women. A shaken *Herald* correspondent found the steps of a basement barbershop "were smeared and slippery with human blood and brains while the landing beneath was covered two inches deep with clotted gore, pieces of brain, and the half digested contents of a human stomach and intestines." The walls of a butter store, he observed, were "speckled with bullet marks and splashed with blood," and the sidewalk in front was "thickly coated with a red mud."

Over sixty civilians were killed outright or later died from wounds. Over one hundred were wounded (and another hundred arrested). Most were Irish laborers, but there were many German and American casualties. Twenty-odd policemen were injured by stones, clubs, and rocks, and four were shot, none fatally. Three Guardsmen were killed (possibly by wild firing from other troops) and twenty-two injured. One Orangeman was wounded.

The next day twenty thousand Irish mourners converged on Bellevue's morgue, adjacent to the outpatient dispensary for the poor, to pay respects. Massive funeral processions, composed of somber delegations from the Society of the Immaculate Conception, St. Patrick's Mutual Alliance, and the Ancient Order of Hibernians in white mourning scarves, traveled by the Greenpoint ferry to Brooklyn's Calvary Cemetery. There were other, angrier responses to what Ford's *Irish World* called the "Slaughter on Eighth Avenue." The Brooklyn Irish hanged Governor Hoffman in effigy in a

parade down Hamilton Avenue, and barroom poets composed ballads like “The Great Orange Massacre.” There were, however, prominent nationalists—Fenians and Irish Brigade Association leaders from the ranks of business and the professional classes—who distanced themselves from the whole affair, a sign of divisions to come.

The day after the riot, fashionable men and women rode along Eighth Avenue in comfortable carriages, matching up street corners or buildings with descriptions in the morning papers. But the forces of order, while triumphant, were also in a fury. One banker declared that the riot eclipsed “the worst religious outrage of the Commune.” A *Times* editor found it final proof that the “Dangerous Classes” cared nothing for “our liberty or civilization” other than to “come forth in the darkness and in times of disturbance, to plunder and prey on the good things which surround them.” Police Commissioner (and banker) Henry Smith only regretted “that there were not a larger number killed.” As he explained to the *Tribune*, “in any large city such a lesson was needed every few years. Had one thousand of the rioters been killed, it would have had the effect of completely cowing the remainder.”

Democratic authorities got no points for having ordered out the troops. Their “criminal weakness and vacillation,” the *Tribune* charged, had encouraged the mob in the first place. One of the reasons many in the upper and middle classes had grudgingly acquiesced in Tammany’s hold on power was its presumed ability to maintain political stability. That saving grace was gone: Tweed could not keep the Irish in line. The time had come, said Congregational minister Merrill Richardson from the pulpit of his fashionable Madison Avenue church, to take back New York City, for if “the higher classes will *not* govern, the lower classes *will*.”

TWEED TOPPLED

Six months earlier, Tweed had seemed impregnable, despite assaults by the *New York Times* and the vitriolic *Harper’s Weekly* cartoons of Thomas Nast, which portrayed Tweed as a leering hulk of corruption and Tammany’s inner circle as a conspiratorial Ring. The campaign, long on invective, was short on facts, and the *Times* insisted the city’s books be examined. Just before the election, Mayor Hall established a blue ribbon panel of six businessmen with unimpeachable reputations—including rentier John Jacob

Astor, banker Moses Taylor, and Marshall O. Roberts of the West Side Association—and gave them access to municipal accounts. On election eve, the panel issued its findings. The books had been “faithfully kept,” avowed these leading beneficiaries of Tweed’s policies, and the debt levels were manageable. Tweed and his men swept to victory.

Accordingly, 1871 had looked to be a very good year. On New Year’s Day, A. Oakey Hall was again sworn in as mayor, and John T. Hoffman took office as governor. With luck, by 1872, Hoffman would be president, Hall would move up to governor, and Tweed would become a United States senator. The annual Americus Club Ball, held in early January at Indian Harbor, Connecticut (near Tweed’s summer place at Greenwich), was a jubilant affair. As late as May, Tweed was still riding high. On May 31 he arranged a spectacular wedding, at Trinity Chapel, for his daughter Mary Amelia. At the Delmonico’s-catered reception that followed at Tweed’s Fifth Avenue (and 43rd Street) mansion, guests brought a vast outpouring of dazzling gifts (including forty sets of sterling silver). Tammany’s growth-oriented coalition, like the Gilded Age boom itself, was in fine fettle.

Within weeks, however, the visceral response to the Commune and the Orange Riot had rallied support for the war the *Times* and *Harper’s* were waging against Tweedite corruption. On July 22, ten days after the Boyne Day battle, the *Times* began publishing solid evidence of Ring rascality, turned over to the paper by an aggrieved insider. Day after day, publisher George Jones reproduced whole pages from the cooked account books of James Watson, who until his recent death in a sleighing accident up in Harlem Lane had been the Ring’s trusted bookkeeper. The series culminated in a special fourpage supplement, on July 29, that quickly sold out its run of two hundred thousand copies. Under screaming headlines—“Gigantic Frauds of the Ring Exposed”—the paper detailed Watson’s system of kickbacks. Contractors on public projects padded their bills and slipped the overcharge back under the table. The surcharge to the city usually ranged from 10 to 85 percent, though on occasions it soared to truly empyrean heights of corruption. One member of a Tweed-affiliated club was paid \$23,553.51 for furnishing thirty-six awnings, boosting the per-awning price from the market rate of \$12.50 to a Ring rate of \$654.26. Construction of the county courthouse allowed for an orgy of such creative accounting, and

the building wound up costing four times as much as the Houses of Parliament and twice the price of Alaska.

The *Times* stories brought to a head a growing international crisis of confidence in New York City's ability to pay its debts. Earlier in the year, rumors of mismanagement had so undermined trust that only the unimpeachable credentials of the city's underwriters were keeping New York's securities afloat. Now overseas bankers refused to extend further credit. The Berlin stock exchange struck the city's bonds from its official list.

This jolted New York's financial and mercantile community into action. Mammoth interest payments on outstanding debt were due in weeks, and in a few months twenty-five million dollars' worth of short-term notes would come due for payment. If the city's credit collapsed, noted Henry Clews, a leading private banker, every bank in New York might go down with it. It was time, Qews said, to oust "this brazen band of plunderers, root and branch."

On a Monday evening in early September, after the elite had returned from their summer vacations, a great reform meeting was held at Cooper Union. In attendance, besides Republicans, nativists, civil service reformers, and frightened financiers, were powerful upper-class Democrats, like corporate lawyer Samuel J. Tilden, who had been forced to take a back seat to Tweed; Germans, led by *Staats-Zeitung* editor Oswald Ottendorfer, who had felt pushed aside by the Irish; and those small property owners, merchants, and manufacturers who feared Tammany corruption would hike taxes and pauperize them.

The meeting quickly agreed that the "wisest and best citizens" should take control of the city government—as intellectuals and reform groups had been arguing since the draft riots. Extremists, Godkin of the *Nation* among them, talked cholericly of forming a Vigilance Committee to lynch Tweed. Cooler heads established instead an Executive Committee of Citizens and Taxpayers for Financial Reform of the City, popularly known as the Committee of Seventy. Chaired by sugar refiner William Havemeyer, and packed with Bar Association lawyers, it decided to bring Tweed down by choking off the city's funds. Setting up offices in the Brown Brothers building—making the banking house de facto center of city government—the committee spearheaded a concerted refusal by a thousand property

owners to pay municipal taxes until the books of the city were audited. On September 7 they went before Judge Barnard, who now deserted his former comrades and gave them an injunction that barred Comptroller Connolly from issuing new bonds or spending any money. As Tweed later noted, this “destroyed all our power to raise money from the banks or elsewhere and left us trapped.” Crowds of workmen now gathered at City Hall demanding their pay—a crisis relieved only temporarily by Tweed’s handing out fifty thousand dollars from his own pocket. Organized labor turned against him too, even those in the construction trades who had benefited mightily from his programs. On Wednesday, September 13, eight thousand workmen marched in the rain to City Hall to denounce Tammany rule.

Five days later, Comptroller Connolly jumped ship. At Committee of Seventy insistence, he appointed Tilden associate Andrew Haswell Green as acting comptroller. Escorted by a hollow square of mounted policemen, Green took possession of the office, giving investigators access to Ring financial records and further isolating Tweed. (Barnard allowed the city to borrow from the banks again, but only departments not under Tweed’s control.) At the end of October Green and Tilden traced money from city contractors directly to Tweed’s bank account, and the following day Tweed was arrested, though immediately released on a million dollars bail.

Tweed appealed to the ballot box and held rallies on the Lower East Side, to no avail. In the November 1871 elections—with the polls closely guarded—Tweed retained his state senate seat (and he would remain a Robin Hood hero, “poverty’s best screen,” to his local constituents), but most of his associates were defeated by wide margins. Ring members large and small slipped out of the city for foreign climes. Tweed stood his ground. Indicted in December, he was arrested, forced to resign his powerful public works position, and voted out as grand sachem of Tammany.

His personal world unraveled too. In January 1872 his old comrade Jim Fisk was fatally shot, while walking up the marble staircase of the Grand Central Hotel, by Edward S. Stokes, the spendthrift son of a prominent New York family, who had taken up with Fisk’s mistress Josie Mansfield. As he lay dying, Tweed (out on bail) was at his side. Another bedside mourner was Jay Gould, who had his own problems, stemming directly from Tweed’s fall. The Erie president’s powerful enemies had been circling, but

he had successfully fended them off with the aid of Tweed's judges. Now Tweed was forced to resign from the Erie board of directors, Judge Barnard was impeached and convicted (at the insistence of the Bar Association), and Gould's position became untenable. He too was forced to resign.

Though his power was shattered, Tweed continually wriggled out of reach of his prosecutors. His trial in January 1873 ended with a hung—some said bribed—jury. In November 1873 he fared less well and was sentenced to a twelve-year term. But after a year in jail, the decision was reversed, and in January 1875 he was released. His enemies immediately slapped him with a civil suit to recover six million of his ill-gotten gains. Unable to come up with the three-million-dollar bail, he was reincarcerated and languished in Ludlow Street Jail. The monotony was broken, however, by repeated home furloughs. In the course of one of these, he escaped and made his way to Florida, then to Cuba, then (disguised as a seaman) attempted to flee to Spain. Arrested by Spanish authorities, Tweed was delivered to an American warship for return to New York. Back again in the Ludlow Street Jail, and now desperate, he agreed to testify (in return for his freedom) about the workings of the Ring. After he did so at great length, however, vengeful authorities (including now-governor Tilden) refused to release him. His spirit broken, he died in prison, of a combination of diseases, on April 12, 1878.

To consolidate their takeover of municipal power, the Committee of Seventy ran their own chairman, William Havemeyer, for the mayoralty in 1872. Havemeyer, now sixty-eight, had been mayor in 1848-49 and didn't like much of what had happened since then. Elected to City Hall in a divided campaign, Havemeyer and Comptroller Andrew Haswell Green imposed a vigorous retrenchment policy on New York. They laid off city workers and cut salaries of government officials, hoping to drive out professional politicians and draw in public-spirited elites. They jammed the brakes on development to cut costs and lower the taxes of the propertied classes who were Havemeyer's biggest supporters. Work on the uptown boulevards ceased. Grading of West Side thoroughfares was halted. The viaduct railway was scuttled. Central Park expansion (and maintenance) was curtailed, and work on the proposed Riverside and Morningside parks was pushed off into the future. The elaborate plans to develop the waterfront were canceled and a cheaper, more circumscribed plan adopted.

Declaring the city “finished,” the mayor even argued that New York should refuse any further assistance to the Brooklyn Bridge, then rising in the East River

Also in 1872, some of the outraged businessmen and professionals who had toppled Tweed tried to displace the corruption-ridden Grant administration. The collection of dissidents formed a third party, called themselves Liberal Republicans, and nominated the sixty-one-year-old Horace Greeley to run against President Grant. The Democratic Party seconded Greeley’s nomination, hoping to ride his coattails to the White House—against the better judgment of Democratic national chairman August Belmont, who thought the Greeley nomination “one of those stupendous mistakes which it is difficult even to comprehend.” Belmont was right. Grant, the old war hero, aided by boom-time prosperity and a last spurt of northern outrage at Klan outrages, won every northern state. Few municipal reformers backed Greeley, whom they saw as too close to the Democratic Party. They endorsed independent candidates instead, including Frederick Law Olmsted for vice-president. The city’s bourgeoisie stuck with Grant. “I was the worst beaten man that ever ran for that high office,” Greeley lamented. Weakened by the arduous campaign and depressed over the death of his wife just before election, Horace Greeley came home to his beloved New York City to find that Whitelaw Reid had seized control of the *Tribune* in his absence. Broken in spirit, he died three weeks later on November 29, 1872.

BACK TO THE TEN-HOUR DAY

Having crushed Tweed, the forces of order lit into the labor movement, which, in the spring of 1872, had launched its strongest bid yet to institute the eight-hour day. Building trades struck first and, to their delight, got a boost from President Grant. Bricklayers working on the new post office had complained to him about ten-hour workloads. Grant, with one eye on the upcoming elections, denounced this violation of the federal eight-hour law and issued an Executive Proclamation entitling them to overtime pay. This galvanized other construction workers to join the strike, and by early June most small building contractors had knuckled under.

Inspired by these successes, other workers downed tools and walked off. Soon twenty thousand—including plumbers, upholsterers, pianomakers,

masons, marble cutters, quarrymen, tin and slate roofers, sugar refiners, and gas men—were fighting for the eight-hour day. The city's employers dug in their heels, and the test of wills spiraled upward into a near-general strike—the biggest labor conflict in New York's history thus far—pitting a hundred thousand workers from fifty-two crafts (two-thirds of the manufacturing workforce) against a newly unified manufacturing elite supported by most of the city's bourgeoisie.

The fiercest clashes came in the woodworking trades. In May militant German journeymen of the Furniture Workers League shut down various woodworking factories. On the other side were the piano manufacturers, who ran the most highly mechanized and subdivided woodworking trades. The most vigorous opposition came from Steinway and Sons, a firm far larger and wealthier than most of the vulnerable cabinetmaker shops who had given in to union demands. Seeking to head off trouble, the company offered workers at its Fourth Avenue plant an increase in pay if they would stick with ten hours. When some accepted, a mass meeting of piano workers (held June 5) denounced the rank-breakers and marched, thousands strong, to ring the factory and muscle the ten-hour men away. Steinway called on the new probusiness city government for police protection, and got it. "Captain Gunner arrived with about 80 men," William Steinway noted in his diary, "who charged on the strikers and clubbed them on the arms and legs, they running as fast as their legs can carry them."

The Eight-hour Movement—Procession of Workingmen on a “Strike,” in the Bowery, June 10, 1872, from Frank Leslie’s Illustrated Newspaper, June 29, 1872. Note that many marchers are smoking cigars. Cigar-making remained a major source of employment in New York, although production was shifting from small craft shops to factories and tenement houses. (Courtesy of American Social History Project. Graduate School and University Center. City University of New York)

With momentum faltering, the Iron and Metal Workers League called out its fifteen thousand members, and the strike revved up again. Crowds of blacksmiths surrounded J. B. Brewster’s Carriage Factory and the Singer Sewing Machine’s plant—both bastions of the ten-hour day in metallurgy—and brass founders, pattern makers, wireworkers, pen and pencil makers, church organ builders, brewery workers, packinghouse butchers, and bakers entered the fray.

Now employers organized. On June 18 the industrialists and building contractors joined forces with the woodworking bosses and, at a meeting of

over four hundred employers, formed an Executive Committee of the Employers of the City, dedicated to smashing the eight-hour movement—now depicted as the stalking horse for something far worse. As one steam pump manufacturer harangued the meeting: “I see behind all this the specter of Communism. Our duty is to take it by the throat and say it has no business here.”

Soon, indeed, employers brought in the police, who sent platoons, then battalions of men, many of them recent veterans of the Orange Riot suppression, to club picketers away from plants and open avenues for scabs. One after another the strikes crumbled. Steinway and Singer triumphed. The iron men surrendered in July. Many earlier gains were lost, and apart from some in the building trades, most New York workers were forced back to a ten-hour regimen by jubilant employers.

SPECIAL AGENT ANTHONY COMSTOCK

With the municipality’s political and economic order under control, reformers set out to restore decency to its moral affairs, with the earnest young Anthony Comstock serving as point man. Comstock, another New England migrant come to the big city, had been born in 1844 to a once-affluent New Canaan farm family come on hard times, from whom he received a rock-ribbed upbringing as stony as their Connecticut soil. With the outbreak of civil war he joined the army, only to discover it full of “wicked men” who swore and drank. His vigorous opposition to such pursuits did not endear him to his comrades—indeed he discerned a “feeling of hatred” on the part of his fellow soldiers—but, convinced that his critics were “under Satan’s power,” he prayed earnestly, if ineffectually, for their conversion.

After the war, like Horatio Alger, Comstock left Connecticut for New York, where he moved into a rooming house and found work as a porter in a dry-goods store. In a career that Ragged Dick would have envied, he was promoted to shipping clerk and in 1869 made salesman. By 1871 his salary had climbed from five to twenty-seven dollars a week. He used the five hundred dollars he had saved as down payment on a house in Brooklyn, married the daughter of a New York businessman, and joined the Clinton Avenue Congregational Church. For all Comstock’s success, what most occupied his attention was the shocking behavior of his fellow clerks.

Comstock didn't think himself a stuffed shirt—he was fond of practical jokes (of the exploding cigar variety)—but he drew the line at drinking, gambling, whoring, and particularly pornography (a “moral vulture,” which “steals upon our youth in the home, school, and college, silently striking its terrible talons into their vitals, and forcibly bearing them away on hideous wings to shame and death”). Early in 1872 he tried to shut down a circulating library of “vile books,” only to have a policeman warn the owner. Comstock got him dismissed from the force, then teamed up with a reporter from the *Tribune*, toured the Ann Street and Nassau Street porn purveyors, and organized a (well-publicized) police raid.

The muttonchopped one-man vice squad now came to the attention of Morris Ketchum Jesup, merchant, banker, railroad financier, and president of the Young Men's Christian Association. Under Jesup's leadership, the YMCA had been taking a carrot-and-stick approach to combating the deleterious impact of the brothels, gambling dens, saloons, and “licentious books” that distracted young men from serving their employers, saving their money, and rising in the world. In 1868 the Y had built a grand new residence for unmarried men, at Fourth Avenue and 23rd Street, which offered lectures, classes, reading rooms, parlors, and a picture gallery. Additionally, its members had gone to Albany and got the legislature to ban obscene material.

Jesup, himself a Connecticut immigrant of devout but impoverished background intent on imposing an unambiguous moral code on the metropolis, took an instant liking to Comstock. On May 9, 1872, Jesup invited him to meet a group of YMCA backers—leading businessmen (including J. P. Morgan), clergy, and lawyers, men as determined to restore decency to cultural affairs as political ones. They agreed to support his work as a vice fighter by giving him a stipend to supplement his income and a clerk.

Much buoyed by this powerful backing, Comstock now took on Victoria Woodhull, who had been more or less constantly pilloried since her emergence as a feminist spokesperson, with associates and relatives of Henry Ward Beecher prominent among the assailants. On November 2, 1872, she struck back with an article in *Woodhull and Claflin's Weekly* intended to “burst like a bombshell into the ranks of the moralistic social camp.” That it did. Within hours New Yorkers were scrambling to read

“The Beecher-Tilton Case,” in which Woodhull laid bare the story of Henry Ward Beecher’s adultery with Mrs. Elizabeth Tilton, the wife of Theodore Tilton, one of his closest friends and associates.

Woodhull condemned not Beecher’s philandering but his hypocrisy. This was, after all, the minister who had maligned Jim Fisk as a “glaring meteor, abominable in his lusts and flagrant in his violation of public decency.” Indeed Woodhull praised Beecher’s “physical amativeness,” claiming him (with tongue in cheek) as a covert member of the Free Love ranks, and urging him to accept a leadership role in its future endeavors.

Beecher frostily ignored the piece, but Anthony Comstock did not. He approached the district attorney (a leading member of Beecher’s Plymouth Church) with a request for an arrest warrant on grounds that Woodhull and Claflin had violated state law by sending obscene literature—the exposes in the *Weekly*—through the mails. The DA found the argument compelling, and Comstock, in what would prove to be the opening salvo of a decades-long campaign to suppress public discussion of sexual matters, summoned two police officers to his aid, arrested both Woodhull and her sister, and had them incarcerated in the Tombs, where they spent the month of November. When released on bail in December, Woodhull promptly circulated the hot issue on the black market and gave a dramatically unrepentant speech. Comstock arrested her again. She got herself bailed out again. He grabbed her a third time in February, but after a June 1873 trial, a judge threw out the charges, saying the 1872 law didn’t apply to newspapers.

In 1872, while doing battle against Comstock and Beecher, Woodhull campaigned for President on the People's Party ticket, with Frederick Douglass as her running mate. This scene, reprinted from M. F. Darwin's pamphlet, "One Moral Standard for All," depicts her nomination at Apollo Hall on May 10 of that year. (© Collection of The New-York Historical Society)

Woodhull now expanded her attacks on the sexual hypocrisy of New York's male bourgeoisie. She publicly exposed the Rabelaisian masked balls—those gatherings of "the *best* men" and "the worst women in our city" in which the boxes of the Academy of Music were used "for the purpose of debauching debauched women; and the trustees of the Academy know this."

While Woodhull pressed onward, Comstock pressed for stronger legislative weaponry. In January 1873, again with powerful YMCA backing, he traveled to Washington to lobby for federal legislation that

would ban obscenity from the mails. His timing was excellent. The Grant administration, swamped by corruption scandals, was in no position to be seen supporting immorality. It didn't hurt that federal authorities were more dependent than ever on access to New York capital, access controlled by the likes of YMCA stalwart J. P. Morgan. After Comstock exhibited some obscene books and postcards to (putatively) shocked congressmen, they swiftly passed (and the president signed, on March 3, 1873) what soon became known as the Comstock Law. The U.S. government, virtually without debate, had gone into the censorship business.

To enforce the act, Congress instituted the office of special agent of the United States Post Office and gave the job to Comstock. He accepted it, without pay, and would keep it for the next forty-one years of a career devoted (as he said) to hunting down violators "as you hunt rats, without mercy." Roaming New York City—and, by rail, other cities—armed with warrants, revolver, and handcuffs, he broke down doors, arrested the inhabitants, and confiscated smut. By January 1874 he had seized a small mountain of it—130,000 pounds of books, 194,000 "bad pictures and photographs," and fifty-five hundred indecent playing cards. No publishers were safe—even those previously considered respectable. Comstock kept Frank Leslie, editor of the well-known weekly, under arrest for advertising obscene books until Leslie promised not to print whatever he disapproved of. He arrested the editor of *Fireside Companion* for issuing dime novels that Comstock found excessively racy (in later years, Horatio Alger would find his works proscribed).

Comstock steadily broadened his definitions of obscenity. He banned any depiction, no matter how indirect, of the act of intercourse; one arrestee "had box containing figures of hen and rooster which by pulling out lid placed it in indecent posture and was offensive to decency." He banned any discussion of sexual acts, words for sexual parts, or overly frank discussion of changes in the institution of marriage. He arrested Dr. E. B. Foote, author of *Medical Common Sense*, a book filled with criticism of sexual taboos that had, by 1870, sold 250,000 copies. "Obscene," said Comstock, and his was the opinion that counted.

Comstock's backers were a bit dismayed by this whirlwind of action, especially as some of it generated bad publicity for the YMCA. But they had no intention of abandoning their urban vigilante: though nervous at the

notoriety, they applauded the action. After generations of fruitless exhortation, here was someone who would, if need be, *coerce* people into proper behavior. The *Times* too applauded the assumption of public power into private hands; true, it resembled the work of “vigilance committees, regulators, or lynch policemen,” but that was a point in its favor.

Still, this was not the sort of image appropriate to the YMCA. The solution was to cut Comstock loose and set up a new organization just to support his crusade. In May 1873 the New York Society for the Suppression of Vice was incorporated, with Anthony Comstock as agent and secretary. Behind him was a blue ribbon board. It included Jesup, J. P. Morgan, William Dodge Jr. (heir to the Phelps-Dodge copper fortune), Samuel Colgate (head of the New Jersey soap business), Alfred S. Barnes (the textbook publisher), and lawyer William C. Beecher (Henry Ward’s son).

Comstock now expanded his purview to encompass the behavior of New York’s bourgeois women.

“THE SLAUGHTER OF THE INNOCENTS

After the war the American Medical Association had renewed its prewar efforts to suppress abortion. Doctors asserted abortion was morally wrong, in itself and because it helped women evade their maternal duties. An 1868 study found perhaps two hundred full-time abortionists at work in the metropolis and estimated that one out of five New York City pregnancies ended in abortion. This latter number—which included many reputable married females of the better classes—suggested a widespread selfishness, claimed Dr. Horatio Storer, a leader of the crusade to punish both those who performed the operation and the women who sought it. Ladies, Storer said, were aborting simply to seek “the pleasures of a summer’s trips and amusements.” By diminishing the native Protestant birth rate, moreover, they were allowing immigrant Catholics to advance demographically. It was time, therefore, to reaffirm that woman’s place was in the nursery, and certainly not, some doctors muttered privately, in medical school.

In 1868 the State Medical Society pressured the New York legislature into passing the first antiabortion legislation in twenty-two years. The act banned all advertisements alluding either to abortion or birth control. The following year a still tougher law made the destruction of a fetus—at any

stage—manslaughter in the second degree, a great victory for physicians. It made little dent, however, in the widespread belief that an early abortion was a woman's right. City practitioners—notably Madame Restell—continued to thrive. Indeed the brazen Restell regularly turned up at afternoon carriage promenades in Central Park, in a coach pulled by a matchless team of Cuban horses.

The concatenation of Commune, Orange Riot, Tweed prosecution, and labor crackdown drastically changed the moral and political climate. In 1871 the *New York Times* launched a full-scale attack on abortions, at the same time, and in much the same spirit, as the paper's assault on Tweed (whose regime, the *Times* was convinced, connived to keep the trade going). After undercover reporters visited and exposed some of the sleazier of the city's practitioners, arrests were made, and prosecutors damned defendants in flaming language. One lawyer, referring to Restell's mansion-office on Fifth Avenue, spoke of "that den of shame in our most crowded street, where every brick in that splendid mansion might represent a little skull."

At the height of this whipped-up public indignation—concurrent with the October 1871 arrest of Tweed—a young girl, victim of a botched abortion, was found stuffed in a trunk that had been mailed to Chicago. It was traced back to one Rosenzweig, promptly labeled the Fiend of Second Avenue, who was tried, convicted, and almost lynched. Many abortionists fled the city, and many papers stopped carrying the ads of those (like Madame Restell) who remained.

It was in this context that Anthony Comstock not only joined the antiabortion crusade but declared war on contraception generally. He attacked those who advertised abortions on the grounds that references to female complaints and cures, however delicately phrased, were obscene and arrested those who manufactured or retailed "rubber goods for immoral purposes."

Comstock's job was made easier in April 1872, when, after the Rosenzweig affair, the state legislature made the abortion-related death of a fetus or woman a crime punishable by up to twenty years. It also banned advertisement, manufacture, or sale of abortion-inducing materials. The following year he made sure that the Comstock Law banned contraceptive devices from the mail, and in June 1873 he got Albany to make the mere

possession of obscene matter, including “any drug or medicine, or any article whatever, for the prevention of conception, or for causing unlawful abortion,” punishable by three months to two years at hard labor. By the end of the year he had confiscated 3,150 boxes of pills and powders used by abortionists and 60,300 “articles made of rubber for immoral purposes” and had thrown several abortionists—though still not Madame Restell—into jail.

The response of New York’s bourgeois women to Comstock’s campaign was mixed. Elizabeth Cady Stanton and Susan B. Anthony’s National Woman’s Suffrage Organization protested an initiative, spearheaded by male businessmen and male professionals, that sought to foreclose women’s access to abortions and information about sex, and muzzle feminist publications and periodicals. Others were intimidated into silence or actively supported Comstock’s crusade as the lesser of two evils. Middle- and upper-class women had been unhappy about the rampant commercialization of sex in New York City. The flagrant spread of concert saloons and brothels provided, in effect, an alternative sexual structure to the family. It facilitated husbandly philandering and freed many men from matrimony altogether. The feminist magazine *Hearth and Home* complained in 1871 that 125,000 young single men in New York City refused to marry, preferring to live indecent lives and patronize “lower and more infamous” forms of amusement. As contraception and abortion helped sustain this freewheeling system, Comstock’s imposition of respectability helped suppress it.

Feminists who had been ardent proponents of spreading knowledge about sexual physiology rejected Comstockery. The many women who found such openness alarming, on the other hand, were prepared to take shelter in Comstock-inspired prudery. And despite the new access of a handful of females to the professions, women remained economically dependent on men and quite aware that, while individual freedom could bring relief from oppressive customs and laws, it could also pitch women into a competitive world in which the deck was stacked against female players.

The fate of those who transgressed conventional boundaries provided a scary object lesson. Victoria Woodhull’s challenge to Henry Ward Beecher was a case in point. The reverend denied his adultery, and many in his

congregation rallied around him and denounced his accusers. When Tilton finally sued his former friend for alienation of his wife's affections, it led to a sensational 1875 trial, which ended, after six months of testimony, in a hung jury. While respectable opinion didn't completely exonerate the minister, he soon recovered most of his standing in the community. Beecher boats continued to ferry crowds to Plymouth Church on Sundays; he still got a thousand dollars per lecture, while Elizabeth Tilton was hounded into oblivion. The double standard had survived a most vigorous challenge.

It would be left to a small but highly vocal band of sex radicals to contest, on libertarian principles, the new coercive circumspection. Ezra Heywood (author of "Cupid's Yoke") and Robert Ingersoll (who founded the National Liberal League in 1876) struggled against the right of church and state to limit expression of sexual ideas. They boldly printed and distributed "obscenities" and challenged the vice crusaders' attempt to force discussion of sex and contraception behind closed doors. Comstock went after them too and, after a few temporary setbacks, emerged triumphant. In New York City, De Robigne Mortimer Bennett, an iconoclastic, anticlerical freethinker, helped mount an effort to repeal the Comstock Law that gathered over fifty thousand signatures. But Comstock, who considered Bennett "everything vile in Blasphemy and Infidelism," nailed him for mailing an "obscene" scientific pamphlet (*How do Marsupials Propagate?*) and in 1879 got a landmark decision against him.

Another prominent casualty was Victoria Woodhull, attacked not only by Comstock but by her comrades in the IWA. In the aftermath of the disastrous 1872 strike, the International Workingmen's Association fell into internal warfare between immigrant socialists and American radicals. The Germans thought their native-born allies' attachment to temperance chauvinistic, their professions of spiritualism preposterous, and their devotion to greenbacks ludicrous, but most of all the Germans had no sympathy with the Americans' feminism. The Americans found German atheism excessively materialistic, considered socialist devotion to the gold standard incomprehensible, and insisted "the extension of equal rights of citizenship to women must precede any general change in the relationship between capital and labor." The IWA purged itself of feminists and "fanatics" but, fatally weakened by internal discord and external defeat, eked out an existence for only a few more years, then limped into history.

Woodhull's last attempt to rally feminists and assorted reformers was her People's Party presidential campaign in 1872, which was crushingly defeated. After this the women's movement would distance itself from radicalism. So would Woodhull, who in 1876 packed herself off to England, married a nobleman, repudiated her scandalous Free Love views, and settled into respectability and good works.

Among the last holdouts was the sixty-seven-year-old Ann Lohman—Madame Restell. As late as 1878 she was still running her business on Fifth Avenue (though dispensing only pills, not abortions, that industry having been driven underground and turned over to the unscrupulous and the untrained). Comstock, calculating that the once immune Restell was now safely isolated by the new repressive moral climate, called on her incognito, got her to sell him a contraceptive device, and arrested her. He also made sure that every paper in town was invited to witness her arraignment at Jefferson Market Police Court. Restell managed to post bond, though with considerable difficulty as most people were afraid to be publicly associated with her. As the weeks before her trial dragged on, with the press lambasting her daily, she became convinced Comstock would succeed in hounding her back into prison. Rather than accept such a fate, she lay down in her tub, filled it half full, and slit her throat from ear to ear. The *New York Times* declared it “a fit ending to an odious career.”

Work or Bread!

At ten o'clock on Thursday morning, September 18, 1873, leading Wall Street bankers and brokers gathered at the New York office of Jay Cooke and Co. The Philadelphia-based investment banking house had long been considered one of the strongest in the country, but it was now teetering at the edge of bankruptcy, and Cooke's men pleaded for an immediate transfusion of funds. Their pleas were refused. At eleven o'clock, they closed their doors and telegraphed the bad news to Cooke in Philadelphia. He promptly shut down the entire concern. A titan of American finance had crumpled.

When news of Cooke's suspension was announced on the floor of the New York Stock Exchange, "a monstrous yell went up and seemed to literally shake the building." Now "dread seemed to take possession of the multitude," the *Tribune* reported. Brokers began trampling one another to sell off stocks that were suddenly, terrifyingly vulnerable.

All that day and all the next, as a *Nation* reporter observed from the gallery, a "mad terror" swept through the "great crowds of men [who] rushed to and fro trying to get rid of their property, almost begging people to take it from them at any price." Jay Gould reigned jubilant amid the carnage. Having gauged the market correctly and bet on a massive decline, he had already made an instant fortune and now sought to claw down prices even farther. Vanderbilt, champion of the bulls, bought desperately to buoy prices. He protected his New York Central but was unable to do much more. Many Vanderbilt concerns were battered down, and Gould (with his ally Russell Sage) scooped them up. Brokerage firms failed on all sides. Banks buckled. On Friday, despite a pelting rain, a "seething mob" filled Broad Street. Frenzied depositors surged through the mud to remove their funds from banks whose vaults were stuffed with railroad bonds deteriorating in value by the minute. One broker moaned that the unfolding catastrophe was the "worst disaster since the Black Death."

By Saturday the governors of the Exchange had had enough. At eleven o'clock they shut down trading "for an indefinite period." Wall Street, in its

extremity, turned to Washington for help. President Grant and Secretary of the Treasury Richardson hustled north to take charge. At a crisis conference in the Fifth Avenue Hotel, bankers, brokers, merchants, manufacturers, and railroad men—laissez-faire scruples jettisoned for the moment—pleaded with Grant to deposit twenty to forty million greenbacks in the city's banks. The administration judged that such an action would exceed its authority, but it did agree to buy government bonds in the open market, injecting some currency into the system.

It wasn't enough. Next week the Exchange stayed closed, but crowds bought and sold sinking securities on the streets. Bank runs multiplied (as did defalcations by bank officials). Brokerage houses collapsed. By the following Friday, most of the major banks and insurance companies, and almost all the second-rank institutions, had shut down. The panic spread rapidly from New York to the rest of the country. Chicago, its banks paralyzed, was reduced to barter.

TAKING STOCK

Reporters besieged Vanderbilt asking what had gone wrong. The ill-tempered Commodore blamed the crisis on excessive railroad promotion. "There are," he argued, "many worthless railroads started in this country without any means to carry them through." To raise money, entrepreneurs had turned to "respectable banking houses in New York, so called," who affixed them with "a kind of moral guarantee of their secureness" and sold the bonds in Europe. But the roads, many of which went "from nowhere to nowhere," soon got into difficulties. "If people will carry on business in this madcap manner," he concluded, "they must run amuck."

Vanderbilt had a point. To convince investors to buy his Northern Pacific Railroad stocks, Jay Cooke had had public relations experts crank out stories that the bleak right-of-way through the Dakota and Minnesota territories was in fact a "vast wilderness waiting like a rich heiress to be appropriated and enjoyed." Cooke's campaign formed the basis for Mark Twain and Charles Dudley Warner's *Gilded Age*, a satire on boomtime ethics. Cooke enticed some immigrants with his planted fairy tales, but nowhere near enough. Investments fell off. To save his existing stake, Cooke cooked books, corrupted politicians, and milked capital to meet debt payments. Rivals spread rumors of his deteriorating position. Bond sales

dwindled to nothing, European creditors called in their notes, and the Northern Pacific went bankrupt, dragging the House of Cooke down with it.

The Northern Pacific's story, though larger than life, was not atypical. Far more roads had been built than the transport market demanded. Many ran at a loss most of the year, hoping to make up deficits during harvest time's mass movement of crops to markets. But they could never squeeze enough profits out of the farmers, who, themselves confronting lower commodity prices, vigorously resisted railroad exactions. This left the heavily indebted lines highly vulnerable to contraction elsewhere in the economy.

Another source of strain was the now familiar end-of-boom diversion of capital into speculative channels. *Bankers Magazine* had fretted at all the money pouring into the call market, pursuing interest rates that ranged from 12 to 24 percent. These funds, in turn, had fueled the sporting of bulls (including Vanderbilt) and bears (such as Gould and Sage). Wall Streeters had become convinced that crises like those of 1837 and 1857 were no longer possible as governmental safeguards had been erected. The secretary of the treasury had been given so much power, said the *Herald*, that "it is difficult to conceive of any condition of circumstances which he cannot control."

Among the many things the secretary could not control were the capital markets of Europe. The American rail boom had been sustained by overseas funds, but overexcited European investors had spiraled off into a wild speculative binge, often snapping up absurd or fraudulent prospectuses. One Viennese journalist expected any day to see a company formed "to transport the aurora borealis in pipelines to St. Stephen's square." And it was in Austria that the great Panic of 1873 started. It spread to Berlin, jumped to Paris and Amsterdam, then slammed into London. European markets lost interest in American railroad stocks, and it was this, together with seasonally tight money and news of widespread corruption, that brought down the New York market.

Beyond this lay still vaster problems with the global capitalist economy. Since the 1840s it had been powered by the international development of the railway system, which in turn had stimulated coal-, iron-, and steam-based industrialization. In the 1870s the limits of that expansion were reached, and the world economy tumbled into a slump of unprecedented

proportions. The U.S. economy, more globally integrated than ever, tumbled with it. The depression would last from its inception in 1873 until a partial recovery in 1879, with effects far more disastrous than those of any slump before it. The fifty-one hundred bankruptcies of 1873 rose to 10,478 in 1878. By 1876 half the nation's railroads—twenty-one thousand miles' worth—had defaulted on their bonds and were in receivership. Blast furnaces shut down. Farmers were foreclosed. Within a year an estimated three million people were unemployed.

WORK OR BREAD!

New York City's economy fell apart with frightening speed. Wall Street brokerage houses took the first hits, but the damage swiftly spread to other financial institutions that had invested heavily in railroad stocks and bonds. Life insurance companies crumbled: of the thirty-two companies chartered since 1861, only eight remained in 1877. A score or more savings banks collapsed as well. Investment bankers too were gloomy: "Everything looks dark," August Belmont wrote his son in October 1873. It was impossible for him to "imagine the utter prostration of all business."

The real estate bubble burst. Inflated values collapsed; the equities of thousands of property owners were wiped away, one industry spokesman wrote, "as with a sponge." An avalanche of foreclosure proceedings drove down land values, and lots near Fifth Avenue that fetched a hundred thousand dollars in 1873 went for forty thousand in 1876, if they found a buyer at all. Row after row of middle-class houses, thrown up so confidently, now went begging. Fully half the speculators who had built them were, said the *Real Estate Record and Buyers' Guide* in 1875, "swept out of sight [by the] momentous and unprecedented crisis." Construction projects declined 70 percent between 1871 and 1877. The grand plans for uptown improvement went into hibernation. The boom on the metropolitan frontier deflated. Small investors who had bought Queens lots in the auction sales of 1870-73 couldn't pay their taxes and were foreclosed. Promoters went bankrupt. The development of Queens came to a complete stop.

In Manhattan the blight spread from the financial district up lower Broadway, which by 1876 was plastered with FOR LET placards. Many former wholesale stores were now occupied by auction marts selling off bankrupts' goods. Two years later, "vacant shops, stores and

manufactories,” the mayor reported, “stare at us in every street.” Steinway agreed that “business seems to be perfectly dead,” with “not a single order coming in.”

As usual, most people’s loss was some people’s gain. Sharks cruised the roiled stock market waters, snapping up sinking securities. Jay Gould emerged the master of Western Union. The young George F. Baker bought out the majority shareholder of First National Bank. Drexel, Morgan made a substantial profit in 1873, and with Jay Cooke removed, the big treasury offerings would now go to them, to New York’s other Yankee house, Morton, Bliss, and to the two major German-Jewish firms run by Seligman and Belmont. In the land market too, as prices scraped bottom, well-heeled buyers moved in to scarf up bargains: Belmont was active; so was newcomer William Rockefeller.

As usual, working people bore the brunt of things. By the winter of 1873-74, 25 percent of the city’s labor force had lost their jobs, and the wages of the rest declined steadily. Hunger and homelessness spread. The shanty-dwelling population of the West Side burgeoned. Thousands sought shelter on the floors of police stations or almshouses. The New York Commissioners of Charity relief rolls soared. “Formerly,” one official said, “[we confined] relief to women. Now the men come to us hungry with hollow cheeks. . . . It is terrible, terrible.” Too terrible for some: in August 1875, Andreas Fuchs, a forty-year-old shoemaker, shot himself to death in Central Park, leaving a note for his wife and children that explained, “I have no work and do not know what to do.”

As in prior depressions, hard times stirred popular discontent. Workingmen disliked charity. The YMCA sold “dinner tickets” to New York businessmen to give to the unemployed, but the New York Workingmen’s Central Council rejected “crumbs that fall from the tables of the rich.” Nor did they like the police lodgings—“living charnel houses” that reeked “with filth and vermin.”

New-York Historical Society)

The Spring Street International (the American reformers recently expelled from the IWA) argued that the unemployed were entitled to better, as a matter of right. The government had showered aid and assistance on the wealthy; now it should “legislate for the good of all, not the few.” In October 1873 it proposed a comprehensive anti-depression program. New York should provide public employment on street and park improvements and in building a rapid transit system. The city should also establish municipally owned markets where people could buy necessities at cost.

Such ideas rapidly gained popularity. The Workingmen's Central Council announced plans for a mass meeting to demand “Work or Bread.” J. P. McDonnell, an Irish Fenian and socialist, argued in the *New York Sun* that to make “wealthy citizens and law-makers” listen, labor should mount the “greatest demonstration ever held in New York.” Leading trade unionists endorsed the idea. So did German socialists, currency reformers,

and neighborhood mass meetings around the city (including one of fifteen hundred French workers and refugees from the Commune). Wagons paraded through the streets with placards announcing the December 11 gathering at Cooper Institute. On the appointed day four thousand crammed their way in, leaving thousands more outside, as speakers analyzed the nature of the depression (in German and English) and how to respond to it.

Many blamed the financial system. Bankers and brokers—the “moneyocracy”—had obtained special privileges by corrupt deals with politicians, then used their ill-gotten wealth to “speculate in stocks, money, gold, or other commodities.” These operations had brought on the crisis that now endangered the producing classes and the republic itself. One long-term answer was to set limits on the accumulation of personal wealth, at a maximum of three hundred thousand dollars, by imposing a graduated income tax. In the short run, the city should undertake massive street, pier, and park improvements and construct housing for the homeless.

Socialists at the Cooper meeting offered similar prescriptions and added some novel ones, including suspension of evictions for nonpayment of rent during the coming winter and dispensation of a week’s supply of food or money to distressed families. Peter J. McGuire, a young socialist carpenter, later endorsed the meeting’s no-violence pledge but argued that if relief were not forthcoming, then “a provisional committee” in each ward should “take food” to keep people from starving and “send the bills to the city for collection.”

The Cooper meeting appointed a fifty-man Committee of Safety—nomenclature borrowed from the Paris Commune—and selected German, French, Irish, and American representatives. The committee organized ward clubs of the unemployed throughout the city and called for a meeting with city authorities. When Mayor Havemeyer did get together with a delegation of workers, it became clear that they inhabited different universes. Havemeyer expressed concern for the men’s plight but suggested, none too subtly, it was their own fault for not having prepared themselves for such contingencies. “I know that it is hard for you to be out of employment,” he said, “but don’t you think that workingmen should lay up something for a rainy day?” “Yes, sir,” a delegate replied, “that’s all very well, but workingmen can’t save much out of their wages. Rents are so high; and then many of us can only work four or five days out of a week.” The mayor

responded with homilies: “Men who get rich, gentlemen, are men who save. When a man has Sioo in a bank he becomes a capitalist.” His father (a wealthy sugar manufacturer), Havemeyer remarked pointedly, “didn’t go to the beer shops and theaters every night.” Besides, public works meant higher taxes and the “confiscation” of property and so were out of the question.

The press was even less diplomatic The *New York Graphic* said that “there is no point in railing at the rich nor in scowling at the capitalists nor in condemning corporations simply because one’s stomach is empty and he happens to be dinnerless.” The paper went on to snarl, “Whining and whimpering are as useless as they are disgusting.” The *Times* loftily lectured the unemployed on the hard facts of political economy. The “natural laws of trade” were “working themselves out.” Governments could “only watch the process.” Finally, “things must regulate themselves.”

TOMPKINS SQUARE

“Things” got rapidly worse. Unemployment rose as the thermometer dropped, and the Committee of Safety issued a call to all “in sympathy with the suffering poor” to rally in Tompkins Square on January 13, 1874, and then march on City Hall to demand a municipal contribution of a hundred thousand dollars to a Labor Relief Bureau for the unemployed.

The press, badly alarmed, insisted the meeting be suppressed as a “communist agitation.” The Committee of Safety was adopting the “favorite tactics of the worst class of European socialists,” and on behalf of the unemployed—a “thrifless and improvident” lot. More hysterically (or cynically), it was asserted that leaders of the defeated Commune had smuggled diamonds—stolen from the churches of Paris—into the city to buy ammunition and bombs to launch a revolution. The Department of Parks had already given permission to use the square, but the Police Board, composed of wealthy entrepreneurs and powerful politicians, forced it to renege at the last minute. Word of the revocation did not reach the working-class quarters.

The next morning, by eleven o’clock, over seven thousand people had turned out despite below-freezing temperatures. The ten-acre park was filled, and the crowd, which included many women and children,

overflowed into the surrounding streets. One corner of the square was occupied by twelve hundred resolute members of the German Tenth Ward Workingmen's Association.

At that moment the police commissioner and a squad of patrolmen marched into the square. Announcing, "Now, you all go home, right away!" they immediately waded into the assemblage with clubs flailing. The crowd scattered "like wild birds" except for the German workers, who battled back until mounted police drove them from the square. As the demonstrators fled into adjacent streets, a *Sun* reporter noted, the police kept "close at their heels, their horses galloping full speed on the sidewalks," their batons flailing. One zealous young German socialist, Justus Schwab, marched boldly back to the square waving the red flag of the Commune, only to be attacked and arrested. The police continued clubbing groups of workers for hours, Samuel Gompers remembered, in "an orgy of brutality," until, finally, the area was cleared and still.

The Tompkins Square clash was a minor affair materially—a few score bloodied heads and arrested bodies—but a major one symbolically. It hardened attitudes on both sides of the class divide and shaped larger patterns of response to the depression.

Organized labor bitterly attacked the police, asserting their rights of free assembly and free speech had been violated. Iron molders rejected the way "every protest, petition, or demand of labor is met with the cry of 'Commune.'" Unions and ethnic organizations raised funds for the arrested, tried and failed to oust the police board, and held protest meetings. The *New York Graphic* and the *New York Sun*—both editorial antagonists of the unemployed movement—similarly condemned the "clubbing of innocent and peaceful men."

Police charge the Tompkins Square demonstrators, from *Frank Leslie's Illustrated Newspaper*, January 31, 1874. (Library of Congress)

Such reactions were exceptional. The authorities, the press, and the upper and middle classes were virtually united in their satisfaction with the outcome. Mayor Havemeyer was delighted: "Nothing better could have happened," he declared. The police commissioner was elated: "It was the most glorious sight I ever saw the way the police broke and drove that crowd. Their order was perfect as they charged with their clubs uplifted."

The press was convinced that vigorous action had forestalled a host of horrors. Behind the Tompkins Square "rabble," the *World* was sure, stood "the red spectre of the commune." The *Times* reported (incorrectly) that all those arrested were "foreigners," which at least proved that communism was not a weed of "native growth." Religious spokesmen were even more ferocious, with one prominent clergyman vowing that if workers "lift their hands against law, order, and good government, they will be mowed down like grass before a scythe."

The depression overrode middle-class republican inclinations to respect the “rights of labor,” or even labor’s right to public protest. Also set aside was the notion that capital and labor shared a fundamental harmony of interest. In smaller cities and towns the urban middle classes would continue to harbor older republican convictions and even blame the newly rich for many of the nation’s ills. But in New York City a social and cultural chasm had opened up, and for the moment, most of the middle class jumped to the side of the rich and powerful.

In this atmosphere employers rapidly mopped up remaining union resistance. In October 1874 stevedoring companies united to humble the longshoremen’s union. After a five-week strike, the union’s power on the docks was shattered. Wages plummeted to twenty-five cents an hour; they would not return to their 1874 levels for another forty years. Whitelaw Reid, Greeley’s successor at the *Tribune*, proved as ruthless an employer as editorialist, slashing his printers’ wages and replacing construction workers on the new *Tribune* building, when they struck in 1874, with Italian laborers.

The city did its part. Police smuggled spies into labor and socialist meetings, pressured landlords to evict radical groups, broke up picket lines. The city also (in 1876) laid off many public employees, hiring day laborers through private contractors instead, resulting in reductions of wages by as much as 65 percent. This in turn helped dampen wages in the private sector.

In these circumstances, union militancy melted away. When the Cigar Makers Union rank and file complained of their leaders’ inaction, they begged members to “remember the adage that prudence is the better part of valor.” Members chose instead to melt away themselves. New York City’s labor movement was not utterly destroyed, as it had been in 1837 and 1857, but by the late 1870s its rolls had shrunk from forty-five thousand to five thousand.

RETRENCHMENT

In the chaotic aftermath of Tweed’s fall, wealthy Democratic Party leaders like Tilden, Belmont, and Hewitt—coming to be known as “Swallowtails” for the cut of their fashionable coats—demanded a housecleaning. To refurbish Tammany’s image they selected former city sheriff John Kelly as

the new leader. Kelly was a shrewd choice. “Honest John” had not been implicated in the scandals. As a deeply religious Catholic, a respectable Murray Hill resident, and a relative-by-marriage of Archbishop John McCloskey (who in 1875 was appointed the first American cardinal), Kelly had strong support in the immigrant community, especially among the Irish middle class.

Once installed, Kelly consolidated the Tammany hierarchy, formalized and centralized its lines of command, muted the power of working-class ward heelers, weeded out remaining Tweed supporters, and by 1874 had become the acknowledged boss of a revitalized machine. Setting out to topple the nonpartisan and deeply unpopular Mayor Havemeyer—who had given total support to Comptroller Andrew Haswell Green’s slashing cutbacks, which had only accelerated after the onset of the depression—Kelly ran William H. Wickham, a prominent and Tammany-connected diamond merchant. Wickham campaigned on a platform of kick-starting the economy (and aiding the poor) with a vast program of public works, while simultaneously reassuring the taxpaying community he would continue reducing expenditures.

Wickham won, as did the Democrats generally, and after January 1875 New York City was again in Tammany hands. The mayor made an initial effort to fulfill his pledge by appointing developer William Martin—eager as ever to launch public building programs—to run the Parks Department. But the landowners, insurance companies, trust companies, and savings banks—whose property investments had dropped drastically in value during the depression—fervently resisted new municipal programs, and their agent, Comptroller Green, stonily pressed on with retrenchment.

Kelly sought Green’s removal, to restart the flow of patronage. But Green’s patron, Swallowtail-in-Chief Samuel Tilden, had just been elected governor and was now the presumptive presidential nominee of the Democratic Party. Tammany, accordingly, backed off and committed itself to retrenchment. Even when Green’s term expired in December 1876, and Kelly himself took over as comptroller, the Tammany leader adamantly opposed demands from developers, labor unions, and radicals for a depression-combating program of public works. Indeed, determined to win the business community’s confidence, Kelly cut Green’s austerity budget even further, reducing the city’s debt.

Taxes declined too, despite complaints by city and state tax commissioners and several legislative investigations that the city's wealthy, far from being fiscally overburdened, were flagrantly evading their fair share of such taxes as existed. Real estate in the mid-1870s was seldom assessed at more than 60 percent of its value—less in the case of the Astor family and Trinity Church—and evasion of even shrunken impositions was commonplace. “Personalty” income got off even more lightly, despite the fact that in the postwar era the value of such holdings—money, goods, debts due, bonds, mortgages, and public or corporate stocks—had grown far faster than landed wealth. City tax commissioners conservatively estimated local personalty to be worth between two and three billion dollars, even though in 1879 only eighty-nine hundred people on the tax rolls admitted having any such holdings at all. Liquid portfolios, moreover, were even more grossly undervalued than real estate, via subterfuges like shifting taxable capital into nontaxable forms, or more straightforwardly through fraud and perjury.

Not only did William H. Vanderbilt pay taxes on half a million dollars of personalty income, though his total such holdings were estimated at forty million, but his New York Central railroad, while reporting a capital of \$143 million, paid taxes on only twenty-two million. Corporations in general proved particularly skillful tax dodgers, deliberately violating the rules by cooking books, establishing phony indebtedness, or simply by bribing tax collectors. Investigators calculated that corporate evasion alone cost the state and city millions each year, but the notion of increasing revenues rather than cutting expenses was not to be placed on the political table.

“CHARITY RAGES LIKE AN EPIDEMIC”

In their continuing search for new ways to slice the budget, reduce taxes, and restore investor confidence, municipal officials turned their attention instead to the burgeoning relief budget. In 1873 five thousand families had been receiving public assistance; by 1874 twenty-four thousand were being aided. In March of that year, Mayor Havemeyer, aware that Tweed's Department of Charities and Correction had been implicated in corruption, and convinced that the level of “destitution and suffering” did not seem “to warrant the interference of the Municipal authorities,” announced the

suspension of all public outdoor relief from July through December. Aid resumed for a time on Mayor Wickham's watch, in the hard winter of 1875. But in 1876, pressed by welfare reformers, the new Board of Estimate and Apportionment—which included the mayor, comptroller, and president of the Department of Taxes and Assessments—announced that such assistance would henceforth be permanently discontinued, apart from cash stipends to the blind and fuel handouts to the proven poor (an exemption that pleased Democratic coal merchants). The Board of Aldermen protested, saying there were “more needy and deserving poor in this city than ever before in any one winter, rendered so in consequence of the general prostration of business,” but the post-Tweed-charter reform of 1873 had rendered them powerless in the matter. Outdoor relief would not return to New York City for nearly sixty years.

The termination of assistance to the poor in their own homes did not increase the almshouse population, as the commissioner of Charities and Correction took steps to ensure that indoor relief remained an unenticing alternative. “Care has been taken,” he noted, “not to diminish the terrors of this last resort of poverty, because it has been deemed better that a few should test the minimum rate at which existence can be preserved, than that the many should find the poor-house so comfortable a home that they would brave the shame of pauperism to gain admission to it.” Spending on almshouse inmates actually dropped, to a per capita twelve cents a day.

Brooklyn too tightened its municipal belt, insofar as the poor were concerned. When relief rolls began to climb after 1874, the city slashed its per capita expenditures so that actual outlays stayed relatively steady, despite the growing number of recipients. Handouts took the form of either food (flour, potatoes, rice, tea, sugar) or coal, never both in the same week, and never in amounts exceeding a dollar per week per family of four. Critics attacked the inclusion of tea and sugar as profligate and debated deleting coal, which though cheaper to give out was often sold by recipients for cash to buy other commodities. Soon, not to be outdone by their neighbors across the river, Brooklyn reformers began demanding the total abolition of outdoor relief. Not only was it a symbol of wasteful public spending, but corruption had been uncovered in the (Democratic) Department of Charity, which the (Republican) County Board of Supervisors was determined to end.

Leading the crusade was Seth Low, the youthful and independently wealthy Republican whose grandfather had founded Brooklyn's Association for Improving the Condition of the Poor (AICP). Low and his allies urged that, as an experiment, outdoor relief be phased out over a two-year period, disbursing only coal in 1876-77, then nothing the following year. In the winter of 1876-77, however, the charity commissioners protested, noting that starving people were congregating at warehouses where food was stored, begging they be opened. When the commissioners took it upon themselves in mid-January to vote an emergency appropriation and give out flour and potatoes, enraged reformers denounced them in editorials. The Board of Supervisors subtracted the appropriation from the commissioners' salaries; in 1878, it succeeded in shutting down the program altogether.

Low acclaimed welfare reform as a great success—and it did launch his political career—on the grounds that money had been saved, and corruption curtailed, without any increase in suffering of the poor. It was true that some with other sources of income, who had been fraudulently obtaining relief, carried on much as before. It was also true that there was no great increase in the poorhouse population (jammed as it already was) and that some of the poor who borrowed, pawned, and lived on credit from landlords, grocers, or kin managed to get by for a year or two. But it was true as well that hunger and cold sent many to the city's hospitals or police station basements; that many impoverished parents sent their children to asylums, where they cost the county forty dollars a month rather than one or two dollars in home relief payments; and that while women sought jobs as live-in servants, many men took to the streets seeking charity or work—and triggering a new round of complaints by reformers.

OF BEGGARS AND TRAMPS

In May 1874 the American Social Science Association organized a conference of charitable organizations, at which participants denounced the increase in street begging and petty crime, clucked about “imposter paupers” on the charity rolls, and deplored the way “charity assisted labor in the combat to keep up wages.” Not only were beggars (aided by soft-hearted benefactors) nullifying the law of supply and demand by refusing to sell their labor at whatever price employers were willing to pay, but the police were abetting them in their malingering. Under existing statutes,

officers of the law could, at their own discretion, summarily arrest vagrants and lock up them up pending trial in police court, usually without benefit of jury, with suspects presumed guilty unless they could give “a good account of themselves.” Those found guilty, in deliberations that seldom lasted more than a minute, were taken to the workhouse and set to hauling coal, breaking stone, laying pipes, and making bricks—a procedure workingmen protested as a throwback to fugitive slave laws. Reformers found the process satisfactory in theory but claimed that the police were insufficiently zealous and that judges too often acquitted the poor; and indeed, although vagrancy arrests in New York City soared in the depressed 1870s, not all those arraigned were convicted.

Reformers were ever more exercised by “tramps,” a new and pejorative word for the homeless unemployed (one of its earliest uses occurred in the *New York Times* in February 1875). The term referred to those who boarded in the cheapest lodging houses in the winter or bedded down in doorways, docks, empty warehouses, or Central Park, or along the Battery, on tolerable nights. When the weather turned bitter, many resorted to the verminous police basements. Touring one of them, a *Herald* reporter noted that his flickering gas lamp sent “feeble rays through the laden air and every ray touches a pile of rags which in the morning will hatch out a tramp.” The stations gave lodging on a one- or two-night basis, forcing users to move repeatedly to a new precinct (hence their label of “revolvers”). In 1874 and 1875 thirty thousand were said to be so circulating.

In the summer many of the unemployed roamed the surrounding countryside, looking for handouts or doing chores for farmers’ wives in return for food and shelter. Those few who bullied or stole what they wanted had their crimes splashed across the front pages, and out of these stories was conjured up the “tramp evil.” The press routinely treated the homeless not as victims but menaces. Some papers defined “tramp” in racial terms—as an urban Indian—or, in the words of one professional, “a lazy, incorrigible, cowardly, utterly depraved savage.” The *Times* suggested that readers worried about tramps “procure a large dog who understands how to insert his teeth where it will do the most good.”

Finally, the scientific reformers were dismayed, as they had been for decades, by New Yorkers’ stubborn penchant for undisciplined benevolence. Mayor Havemeyer had felt free to suspend outdoor relief in

part because he was convinced that the needs of the poor were being “adequately met by private donations and the various Christian and charitable institutions.” Many churches indeed struggled to help during the depression. Thirty-four free soup kitchens fed five to seven thousand daily, and missions provided refugees from the freezing streets with shelter (and sermons). The St. Vincent de Paul Society declared: “Let all strangers be received and welcomed as Christ himself.”

Such efforts infuriated the AICP. Appalled at the “outgush of morbid sympathy,” the organization applauded the end of public outdoor relief and urged an end to scattershot beneficence as well. “Charity,” agreed the *World*, “rages like an epidemic,” and to what end? It only encouraged “idleness and dependence in the lower classes” and gave “impetus to worthlessness and vagrancy” by making “begging more profitable than labor.” Cutting off charity, on the other hand, would ensure that “the large class drawn hither by the possibility of living without work should be compelled to return to the country, where their hands are needed, by the stern necessity to work or starve.” E. L. Godkin declared in the *Nation*, “Free soup must be prohibited,” and “all classes must learn that soup of any kind, beef or turtle, can be had only by being paid for.”

The AICP was partly mollified when, after 1876, the city’s Board of Estimate and Apportionment began giving large sums of municipal money directly to a few private charities—the AICP chief among them—on the grounds that they would provide home relief (as they already did institutional relief) more efficiently. The AICP had resisted the idea at first, but when its expenses almost doubled in the depression’s first year as its income from contributions dropped, it decided (in December 1876) to accept the new policy of public subsidies with private controls, then through careful scrutiny managed to disqualify the majority of the approximately sixty thousand who were stripped of public aid.

But reformers believed that more concerted and coordinated action was needed to bring down vagrancy and beggary, and the State Charities Aid Association (SCAA), established in 1872 by Louisa Lee Schuyler, pillar of the wartime Sanitary Commission, took the lead in generating fresh thinking. The SCAA, another private organization with public responsibilities, had accepted the task of visiting and inspecting all charitable institutions receiving state aid. Now, in 1877, it summoned a

grand assemblage of charity reformers at the fashionable Saratoga Springs resort.

Almost all those present agreed that tramps were socially defective beings. One person did suggest there might be a connection between the depression and homelessness, but the idea that tramps couldn't find work was generally decried as absurd. Some, notably eugenicist Richard T. Dugdale of the New York Prison Association, argued that vagrancy and pauperism were hereditary traits, and one conference participant drew the obvious conclusion: "I don't think a pauper has any right to marry nor do I think the State has a right to allow him." There was also interest in Charles Loring Brace's proposal of a pass system (like one used in England) that would require tramps to carry papers certifying they were genuinely unemployed and looking for work.

In the end, the preferred (if not so fresh) solution was the one advanced by the SCAA's Committee on Able-Bodied Paupers, set up the previous year to investigate the tramp problem, under the chairmanship of Josephine Shaw Lowell, whose prominence at the gathering was itself remarkable. In 1855 Josephine Shaw had moved with her family from Boston to Bard Avenue, near West New Brighton, on Staten Island. The wealthy and patrician Shaws, despite their Fourierist and abolitionist convictions, moved easily into New York's genteel society, and Josephine's older sister soon married George William Curtis, editor of *Harper's Weekly*. The Civil War tore her comfortable existence to pieces. An ardent Unionist, she joined a branch of the Sanitary Commission and threw herself into war work. Her brother, Robert Gould Shaw, was soon cut down while leading the first African-American regiment in action in South Carolina; and the following year, her husband, Charles Russell Lowell, died in battle. Widowed at twenty, Josephine Shaw Lowell would wear black (and keep her hair tightly coiled) for the rest of her days.

After working in Virginia with the Freedmen's Relief Association, Lowell was invited by Louisa Lee Schuyler to join a committee visiting Bellevue and other hospitals. She then helped found the SCAA and made the investigation of able-bodied paupers her specialty. She came to public attention in 1876 after an infant died at the breast of Julia Deems, a young woman who had been nursing her baby on the freezing city streets while asking alms from Christmas crowds. When the *Tribune* suggested this was a

shocking demonstration of social indifference, Lowell wrote a spirited letter insisting that the real fault lay with the errant Mr. Deems, with lax enforcement of the beggary laws by the police department, and with New Yorkers who opted for “indiscriminate almsgiving” over providing appropriate shelter.

In the same year, and in a similar vein, Lowell completed her SCAA report, which suggested that the key to solving the tramp problem was recognizing that they were not only “vicious and idle” but carriers of moral contagion, capable of infecting others. To limit the “corrupting influence of these worthless men and women,” they should be “committed, until reformed, to district work-houses, there to be kept at hard-labor, and educated morally and mentally.” This analysis so impressed Governor Tilden that he appointed her the first woman commissioner of the New York State Board of Charities.

In a step toward accomplishing Lowell’s program, the SCAA prevailed upon New York City to end the police department’s program of giving free lodging. Those deemed “worthy” were sent to special lodging houses like that established in 1876 by the Night Refuge Association of New York in the Old Strangers Hospital, on Avenue D and 10th Street. The vast majority were arrested as vagrants and jailed. Soaring prison occupancy rates prompted Lowell, in March 1878, to again appeal to the state legislature to construct workhouses.

In 1879 she proposed a law to incarcerate all women under thirty who had been arrested for misdemeanors or who had produced two illegitimate children. To prevent them from transmitting their “moral insanity” to others, they would be sentenced to a reformatory, under the exclusive management of women, where, under “tender care,” the “weak and fallen creatures” would undergo rehabilitation. “The very character of the women must be changed”—they must “learn to enjoy work”—and as this could not be done overnight, the reformatories should be places “where, if necessary they may spend years.” Though the legislature refused to embark on an extensive building program of either workhouses or female reformatories, it did pass an Act Concerning Tramps in 1880 that imposed imprisonment at hard labor in the nearest penitentiary for up to six months.

DISPENSING WITH DEMOCRACY

In 1874 Governor Samuel Tilden, elected in large measure on the strength of his role in prosecuting Tweed, set up a commission to study the “decay of municipal government.” Its members included intellectuals and influentials, like *Nation* editor E. L. Godkin and railroad lawyer Simon Sterne, who had been arguing for some years that the root of New York City’s problems was an insufficiently fettered franchise. In March 1877, after nearly two years of deliberation, the commission revealed what it thought should be done.

It called for a constitutional amendment that would establish a Board of Finance, to be elected solely by men who paid taxes on property worth over five thousand dollars or an annual rent higher than \$250. This board would appoint all financial and legal officers of the city and take control over all municipal revenues and expenditures. The rest of the citizenry could still participate in electing the mayor and Board of Aldermen, but these worthies would be effectively stripped of their power to distribute public goods and services. The city would become more like a business corporation, where ultimate authority was reserved to those who provided the capital, in this case the leading taxpayers. The proposed Board of Finance would in effect institutionalize the power the bourgeois Committee of Seventy had temporarily seized during the fight against Tweed. It would guarantee, Sterne explained, that New York’s propertied elite “would no longer find themselves in contest with the loafer element, which would eventually outnumber and beat them.”

The commission’s proposals were an instant hit in upper-class circles. The Chamber of Commerce, the New York Stock Exchange, the Produce Exchange, the Cotton Exchange—indeed every leading business organization—endorsed them enthusiastically. So did Astor, Vanderbilt, Dodge, Havemeyer, and leading newspapers like the *Times*, the *Herald*, and the *Tribune*, whose publisher Whitelaw Reid opined that “ignorant voters” were “as dangerous to the interests of society as the communists of France.”

At a mass meeting held April 7, 1877, to rally support for the amendment, speakers hammered away at the necessity of taking power away from the “the idle, the vicious and the scheming politicians.” They dismissed as “preposterous” the idea that “a mere majority should direct how the public expenses, paid by the minority, should be regulated.” Democracy, acceptable for a small town, was lunacy in a large city like

New York. Most towns, after all, had an “intelligent, orderly American population,” whereas Manhattan was filled with dependent proletarians and “desperadoes from all ends of the earth.” (Nor was it much better across the East River: the *World* believed that the “uncivilized classes in Brooklyn are quite as murderous as the savage in Montana.”)

Urged on by Governor Tilden, the state legislature passed the proposed amendment in the fall of 1877. Under existing rules, if it passed again the following year it would go into effect. In the fall of 1878, unfortunately, New York City voters gave Tammany Hall a controlling influence in the state legislature and the Common Council. Despite John Kelly’s heretofore extraordinary willingness to court businessmen’s approval, he recognized the Tilden Commission’s suffrage restriction plan for what it was—a device to dethrone politicians by disfranchising their electoral base—and when the proposed constitutional amendment came up for reconfirmation, it was scuttled. For the moment, neither the propertied nor the new-model politicians could rule without the other, and an uneasy power-sharing arrangement was cobbled together in which Kelly maintained control of the party, and the wealthy contented themselves with strategic positions in the government and on independent boards and commissions.

A MONUMENTAL ASIDE

During the period when the city’s political and economic elite were striving mightily to rein in democracy and the immigrant masses, New York City played host to an object that would become the quintessential emblem of them both. Auguste Bartholdi, one of the many Frenchmen who had arrived in New York in 1871, was not a Communard seeking refuge but a sculptor seeking a site. Bartholdi was the emissary of a group of activist French intellectuals, of moderate republican stamp, who were intent on erecting a monumental statue in the United States, dedicated to liberty, to commemorate the upcoming centennial of 1776. The leader of this group was Édouard-René Lefebvre de Laboulaye, a prolific writer who had produced a three-volume *Histoire des États-Unis* and a book, *Paris in America*, about a Parisian transported to Manhattan.

Laboulaye was fascinated with the United States because he saw it—especially after the northern victory—as the kind of ideal republic he wanted to establish in France. He had worked to liberalize Napoleon’s reign

from within, and after the fall of the empire he became a republican member of the royalist-dominated National Assembly. To advance his cause he fastened on the idea of having a collaborative Franco-American group erect a statue in America, far enough away to avoid provoking a monarchist backlash, yet close enough to foster (by association) a republican image for France. Hence Bartholdi's scouting mission. In addition to meeting with American notables, he inspected various locations and found his ideal spot on Bedloe's Island, situated in what was now unquestionably the gateway to the United States, the harbor of New York City.

The project advanced slowly during the 1870s. In 1873, in a kind of test case, the French government commissioned Bartholdi to execute a larger-than-life bronze statue of Lafayette, to give to New York City for having sent aid to Paris after it had been besieged by the Germans in the winter of 1870-71. It would be delivered and erected in Union Square for the 1876 centennial of the American Revolution.

By 1875 Laboulaye and his colleagues had gained the ascendancy and established the Third Republic. Now a French-American Union was created (with Laboulaye heading the French side), and Bartholdi forged ahead with producing a prudent Statue of Liberty, one that embodied republican ideals but steered clear of any taint of the Commune. The initial fragmentary result—Liberty's hand and torch—destined for display at the Philadelphia Centennial, was first parked in Madison Square, where New Yorkers could enter and climb to a viewing platform. Lest anyone mistake the symbolism, Laboulaye underlined that Bartholdi's figure "does not hold an incendiary torch, but a beacon which enlightens."

FAREWELL TO RECONSTRUCTION

As the metropolitan bourgeoisie worked to wrest power from the urban masses, they grew ever more understanding of, and sympathetic to, the efforts by southern elites to recapture power from Reconstruction governments. New York Democrats hoping to restore their prewar southern allies to power had long sought to topple Radical Republican regimes, routinely denouncing them (in the *World's* words) as "Semi-Barbarians Led into Horrible Excesses by the Very Scum of Northern Carpetbaggism." Now many Republicans, alarmed by their own urban barbarians, had come to agree. George Templeton Strong, who had long backed Grant's policies,

now excoriated southern governments as “nests of corrupt carpetbaggers upheld by a brute nigger constituency”—the equivalent of New York City’s “celtocracy.” The *Tribune*, the *Nation*, *Scribner’s*, *Harper’s*—all began to depict Reconstruction as a monstrous inversion of the natural order, in which the men of “intelligence and culture” had been sidelined by the lower orders.

Many white Republicans also thought it was time to stop courting electoral disaster by supporting blacks. In 1869 their party had backed black suffrage and been trounced at the polls. In 1873 African-American Republicans led by Henry Highland Garnet got Albany legislators to pass a statewide Civil Rights Act, which outlawed the exclusion of blacks from “full and equal enjoyment of any accommodation, advantage, facility, or privilege furnished” by public conveyances, innkeepers, theaters, public schools, or places of public amusement and expunged the word “white” from previous statutes. In 1874 their party was again crushed at the polls. The remnants of support for Reconstruction collapsed. It was time, said the Best Men of the North, to come to an understanding with the Best Men of the South, end misguided reform efforts, and unite in defense of property.

The presidential election of 1876 became the vehicle for arranging this detente. Samuel Tilden, the Democratic nominee, was not a personally popular figure. “Silk Stocking Sammy,” even his associates agreed, was vain, ambitious, cold, and aloof. But Tilden had won credit for his part in breaking Tweed. He was also a rich man—having made his fortune reorganizing bankrupt railroad lines and representing the likes of Gould and Fisk—and he was backed by rich Swallowtails like August Belmont and Abram Hewitt.

Tilden’s opponent, Rutherford B. Hayes, had his own wealthy backers in New York City, but Tilden was a Democrat and a favorite son, and by the closing minutes of November 7, after having spent the evening at Everett House on Union Square tallying votes, it seemed clear he had carried city, state, and country. Tilden returned to his Gramercy Park home, where a crowd gathered at his doorstep acclaimed him as the next president. In the early morning hours of November 8, however, someone at Republican headquarters discerned a possibility of reversing the popular victory in the Electoral College, if Republicans in three southern states took appropriate action. Telegraphs were dispatched from New York to this effect, starting a

chain of events that led, in March 1877, to Hayes's selection as the next chief executive and the swift abandonment of Reconstruction.

THE GREAT STRIKE

For the New York bourgeoisie, the president's pulling of federal troops out of southern politics and back to their barracks came not a moment too soon, as it meant that ample firepower would now be available to deal with the nationwide rail strike that broke out four months after Hayes was inaugurated.

The depression had exacerbated cutthroat competition between those railroads that had survived the crash. Fierce rate wars led to savage losses and repeated attempts to arrange a lasting truce. But invariably some opportunistic free enterpriser pursuing short-term profits—Jay Gould notable among them—would break ranks shortly after a price-fixing accord was reached. On those rare occasions when it seemed that rail executives might actually succeed in collectively hiking their rates, shippers and merchants protested, especially in New York City. In 1874, after forty rail lines agreed to a rateboosting Saratoga Compact, the New York Chamber of Commerce and the Cheap Transportation Association attacked the Erie and the New York Central for their participation, claiming it would harm New York City's trade. This in turn led to the spectacle of the presidents of the two roads denouncing the “destructive communistic characteristics” of the New York Chamber of Commerce.

The primary alternative to raising prices was cutting wages, and it was a wage reduction that sparked a skirmish at Martinsburg, West Virginia, on July 16, 1877, which spread to Baltimore, then Pittsburgh, then to most major cities in the country. The struggle of railroad workers to reverse depression-era losses attracted support from other unionists and from the disaffected urban poor. Heavy-handed military responses provoked counterviolence, which in some cities—especially Pittsburgh—crescendoeed to full-scale urban warfare.

The strike spread to the Erie and Central lines. Buffalo railmen went out and were joined by sympathetic factory workers, and the struggle spread east to Rochester, Syracuse, and Albany. The governor declared martial law, Albany was ringed with troops, and the great conflict seemed about to roll

south into New York City—but it didn't. Part of the reason was that the metropolis was not really a railroad town; neither rail companies nor rail unions occupied the same commanding position as they did in smaller cities. But there were other reasons for the city's escape from the national cataclysm: a phenomenal mobilization of military might directed at would-be strikers and supporters, and, in sharp contrast to other urban battlegrounds, a closure of ranks and hearts by the upper and middle classes against the urban working class and its depression-era hardships.

As the strike spread, New York opinion makers had waxed ever shriller in denouncing it. The *Tribune* saw the strikers as "Communistic and law defying, against all law, order, and civilization," and if the upheaval spread to New York City, it should be "met by the shooting of every rioter within range of a musketball." The Congregational journal the *Independent* was more bloodthirsty still: "If the club of the policeman, knocking out the brains of the rioter, will answer, then well and good; but if it does not promptly meet the exigency, then bullets and bayonets, canister and grape" were the proper remedy: "Napoleon was right when he said the one way to deal with a mob is to exterminate it."

Congregationalist Henry Ward Beecher, still a moral tribune despite his recent contretemps, gave two sermons on the strike in mid-July. Though agreeing that the "oppressed" working class was entitled to organize "for mutual protection against the mutual selfishness of employers and of capital," he denounced the railroad strikers. Their effort was immoral because it contested the workings of "natural law," which was "on the side of the largest, always, whether men would have it so or not; and no meddling on their part can interrupt it." To this Spencerian outburst he added divine benediction, asserting that God "has meant that great shall be great and that little shall be little," and the poor must "reap the misfortunes of inferiority." Besides, he told his comfortable Plymouth parishioners, the poor's misfortunes weren't all *that* great. "It is true that a dollar a day is not enough to support a man and five children, if the man insists on smoking and drinking beer. Is not a dollar a day enough to buy bread? Water costs nothing. [Laughter] Man cannot live by bread [alone], it is true; but the man who cannot live on bread and water is not fit to live." More laughter, capped by applause.

Three days after Beecher's second sermon, the Workingmen's Party was scheduled to hold a strike support meeting in Tompkins Square. Railroad executive William H. Vanderbilt wrote mayor Smith Ely urging him not to allow it, but the mayor refused. The authorities did, however, cancel all police leaves, call out the First and Second divisions of the New York National Guard, summon the men of the Seventh Regiment back from vacation, connect Tompkins Square to armories by telegraph wires, garrison the New York Central roundhouse and depot, place two gatling guns at the heads of Wall and Pine, and dispatch seventy-five volunteers to defend the subtreasury. Frederick Law Olmsted surrounded Central Park headquarters with loaded howitzers. The Treasury Department, anxious about the millions stored in the Custom House, arranged for troops to be transferred to New York garrisons. The navy secretary sent a vessel that could, if necessary, clear the streets surrounding the Custom House. When told streets in the financial district were too crooked, Evarts responded: "The big guns will straighten them." Finally, with over a thousand sailors and marines at the ready, and an estimated eight thousand rifles and twelve hundred clubs in place, New York was ready to put down a "Communist riot."

On the evening of July 25, in the glare of hundreds of torches and calcium light at each corner of Tompkins Square Park, a crowd of twenty thousand turned out to hear socialist orators hold forth from a platform draped with an American flag. (All speeches were repeated in German at a second stand.) David Conroy, labor union leader, opened the giant rally saying: "I hope and trust that you, fellow citizens and workingmen will show to the press of New York tonight that you are an orderly people and that you are no rioters." Temperate speeches followed, expressing sympathy with the railroad strikers. An address to President Hayes was proposed, decrying the fact that all the government had offered workers hard hit by depression was "the hangman's rope and the soldier's bullet." There were calls for "political revolution through the ballot box" and the nationalization of transport, communication, and banks. John Swinton, editorial writer for the *New York Sun*, attacked Beecher's recent effusions as particularly unseemly coming from a man who made thirty thousand dollars a year.

After two hours, just as the meeting adjourned, policemen charged in, clubbing people without apparent provocation, yet without sparking

resistance. As Emmons Clark of the Seventh Regiment summed up, the “large and dangerous assemblage in Tompkins Square was inspired with a wholesome terror” and “sullenly dispersed.”

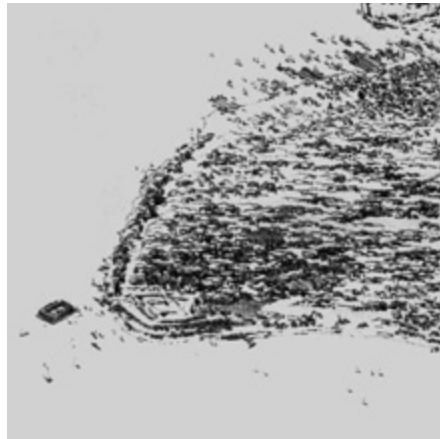

In the strike’s aftermath, the War Department began constructing a system of armories in major cities. The labor press bitterly opposed the notion of establishing a standing army. The *New York Sun* said it presaged a “radical revolution of our whole republican system of government.” Even the *Commercial and Financial Chronicle* opposed the armory program, fearing the military could be used “against business itself.”

But an armory program had already been launched in New York City. The Seventh Regiment had been pushing for new quarters since 1873 and in 1874 had asked the city to provide them the plot of land bounded by 66th, 67th, Fourth, and Lexington. In 1875, after the state legislature authorized New York City to spend money erecting new armories, the aldermen appropriated \$350,000 and assigned the desired parcel. Then budget cutter Andrew Haswell Green vetoed the expense, and the regiment decided to build the armory itself. At first subscriptions were slow, despite the *Tribune*’s exhortation that “banks, insurance and trust companies, in fact all the large corporations of every kind, owe to themselves as well as to the regiment, ample aid in this matter.” Then came the 1877 strike, and money poured in. John Jacob Astor, A. T. Stewart, William H. Vanderbilt, Brown Brothers, Harper Brothers, Singer Manufacturing Company, Equitable Life, and Drexel, Morgan were among the many benefactors. In the end it cost \$589,000, twice the sum raised for the Statue of Liberty, but when it opened in November 1879 it was the finest armory in the world. Its huge hall, ample enough to accommodate regimental maneuvers, was stoutly defended by a bronze gate, a bronze portcullis, and a solid oak door half a foot thick. Loopholes for riflemen enfiladed all approaches, and two or three gatling guns could be quickly mounted in the tower to sweep Fourth Avenue.

The Seventh Regiment Armory was only the first of many to follow, but for all the bourgeoisie’s readiness to militarize Manhattan, many of its leading figures—John Pierpont Morgan chief among them—were becoming convinced that this was not a viable long-term solution to the problems and divisions wracking city and country. Morgan was appalled by the chaos of the national economy. Unrestrained competition, rate wars, depressions, strikes, and warfare in the streets—this was not the way to attract European

investors for American securities. As the depression hit bottom, Morgan busied himself with developing an alternative: the consolidation of the continental economy under the aegis of a manageable number of large-scale corporations, manageable, that is, by him and his fellow investment bankers in New York City. As Morgan reorganized many of the era's failed railroads, he took care to obtain seats on the boards of the new, more powerful companies he fashioned. In 1879 the New York Central itself passed into Morgan's control, after he brokered the sale of 250,000 shares owned by Commodore Vanderbilt's heirs. Slowly he and his fellow financiers were accumulating unheard-of levels of power. The consolidation of a nationwide corporate economy under the control of Manhattan bankers in the next two decades would have enormous consequences for the global economy, for the United States, and, perhaps above all, for New York City.

PART FIVE INDUSTRIAL CENTER AND CORPORATE COMMAND POST (1880-1898)

In 1879 the national and metropolitan economies swung upward again. Reconstruction was over, the South was wide open for investment, and cotton billowed north again. Out west, the U.S. Army was winning its way to the rich trans-Mississippi territories, and within a decade obstinate Apache, Nez Perce, and Oglala Sioux resistance would be only a memory, the stuff of Wild West shows and dime novels. Farmers were reaping bountiful harvests, just as European crops were coming up short. The balance of trade turned favorable. For the first time in thirty years New York's bankers, merchants, and industrialists faced no significant obstacles to profitmaking. Years of depression had crippled unions. Wages were down, the working day up. Activist judges intervened in economic disputes with admirable partiality on the side of capital. Municipal government was no longer wasting taxpayer money on outdoor relief or public works. The federal government too was in splendid hands. The gold standard was back, the income tax was no more, interest rates were down. Not surprisingly, railroad construction exploded. The need for iron horses to shuttle settlers west, and wheat and ore east, seemed limitless. Annual track construction spun up from 2,665 miles in 1878 to a staggering 11,569 in 1882, inducing tremendous output from steel mills, iron mines, the entire industrial sector.

The capital demands of this railroad "boom"—a word first used in this era to describe economic acceleration—revived Wall Street. From 1879 on, frock-coated, silkhatted brokers jostled and pushed at the New York Stock Exchange, buying and selling millions' worth of stocks amid a great din. Outside, along Nassau, Pine, and William streets, outdoor curb traders created a bedlam of their own, while all around them bank messengers and telegraph boys with yellow envelopes darted to and fro amid the throng. Trading continued at fever pitch through 1882, boosted by the willingness of brokers to extend margin credit—an investor could buy a stock by putting down a mere 10 percent of its purchase price—and by the return of European investors who had sworn they would never again buy American stocks even if endorsed by angels.

But the railroad wars revived as well. Rival barons had agreed to a new “pool” in 1877—a cartel to curtail competition, fix prices, and divvy up markets. Unenforceable at law, the arrangement was soon in tatters. Supply rapidly outstripped demand. When one line proved a route’s profitability, others jumped in and built another, forcing the established firm to slash rates. Profits spiraled downward. Faced with catastrophe, the roads formed new pacts, only to find them quickly violated by predators.

The biggest shark of all was Jay Gould. With fellow manipulators like Russell Sage, Gould bought up western lines, puffed their stock, sold out at profitable highs, and turned a final profit by selling short on the way down. Gould joined pools, then sabotaged them without compunction, precipitating yet another round of conflict.

By the early 1880s each major line was struggling to transform itself into a giant, self-contained, nationwide system capable of withstanding all possible rivals. Gould expanded his core lines in all directions and by 1882 owned over fifteen thousand miles of road, 15 percent of the national trackage. William Vanderbilt retaliated with his own massive expansion program. So did Henry Villard and the group of New Yorkers—including August Belmont, Robert Goelet, and the young Edward H. Harriman—who controlled the Illinois Central. But all this did was reproduce the warfare at a higher level.

By 1883 the combat was buffeting Wall Street. At first there were just isolated failures: high-flying financiers like Henry Villard plummeted suddenly into bankruptcy. Then, as competition blighted earnings, rail stocks declined, and iron stocks dipped downward. Alarmed European capitalists retreated again across the Atlantic. Rumors spread of an impending collapse. The president of the Exchange asserted that “the situation now is in no respect like that which preceded the panic of 1873”—a sure sign of trouble.

By 1884 the contraction had become so pronounced, the speculative marketplace so vulnerable, that anything might have triggered disaster. In the event, the unwitting precipitant turned out to be Ulysses S. Grant Sr.

After the war, an unscrupulous young man named Ferdinand Ward had plunged into the stock market and scored with a series of modestly successful speculations. On the strength of this, Ward persuaded Ulysses

“Buck” Grant Jr., airhead son of the expresident, that he could make him a millionaire overnight. Grant and Ward, stockbrokers, was born. Next, the smooth-talking Ward convinced Grant Senior—the general had moved to New York City in 1881 and settled into a brownstone on 66th Street—that he could advance his son’s career by joining the firm too. Then Ward went to James D. Fish, president of the Marine National Bank, and hinted lucrative government contracts were on the way to the ex-president’s firm. Fish took the bait and advanced large sums of depositors’ money, which Ward used for stock market speculations.

Ward, unfortunately, bet on a bullish market just as stocks turned bearish. He lost heavily but continued to pay dividends to Grant and Ward’s investors—including the Grants—by arranging further loans from Marine Bank. The Grants, *père et fils*, thought themselves rich.

In April 1884, with both Ward and Marine Bank desperate for funds, Ward went to the credulous general and said the bank, and thus his brokerage house, were in a spot of temporary trouble. Could the general borrow \$150,000 from William Vanderbilt to tide things over? Grant did as requested, though Vanderbilt, who like most rich businessmen had a great affection for Grant, said: “To you—to General Grant—I’m making this loan, and not to the firm.”

Grant turned the check over to Ward, who promptly cashed it, pocketed the funds, and prepared to flee the city. He didn’t move quickly enough. Fish announced the Marine Bank’s failure. Crowds of enraged depositors milled outside its closed doors, baying for Fish’s head. They organized a posse, captured Ward, and clapped both in Ludlow Street Jail. When word reached Grant at his G&W office, the stunned old man, a dead cigar clutched between his lips, hobbled out into the street and headed home, as cynical Wall Streeters doffed their hats out of respect for the tragedy unfolding before them.

More banks collapsed. Eminent directors were revealed to have stolen millions and plunged, ineptly, into railroad securities. Stocks nosedived. Panic swept the district. Brokerage houses failed. High rollers were laid low: Gould himself came close to collapse.

General Grant went bankrupt. The public, correctly convinced he had known nothing of his partner’s swindles, offered sympathy and cash. Grant,

down to his last eighty dollars, accepted reluctantly. Greatly distressed about his debt to Vanderbilt, he signed over his properties, medals, and presidential memorabilia to the financier. Vanderbilt refused to accept them, until Grant pointed out that creditors would take them anyway; the magnate turned the medals over to the government.

Detail from *The Panic of 1884*, from *Harper's Weekly*, May 24, 1884. (Library of Congress)

At this darkest hour Grant recalled a request by *Century Magazine* that he write articles on the Civil War. He produced a series of successful pieces, then landed a book contract for his memoirs. In 1885 Grant learned he had

contracted terminal throat cancer. Despite great suffering, he pushed on and finished the book—later a spectacular success and the salvation of his heirs—before dying on July 23, 1885.

His adopted city did better by him in death than it had in life. Grant's body lay in state at City Hall for three days, then embarked on a six-mile-long funeral procession through the city's streets, past an estimated million and a half spectators, to a temporary tomb on Riverside Drive. The following year, the Department of Parks authorized creation of a permanent memorial and gravesite, and after April 27, 1897, when Grant's Tomb was finally dedicated, the old soldier finally lay in peace beside the Hudson.

THE CORPORATE SOLUTION

The stock market chaos of 1884 proved less catastrophic than the breakdowns of 1819, 1837, 1857, and 1873—in part, the *Nation* observed, because previous crises had broken upon good times “like thunderclaps out of a clear sky.” In the mid-1880s, however, business had already slumped, and unemployment had risen to 7.5 percent from its normal 2.5 percent. The panic's limited impact was also due to prompt and decisive action by the financial community itself, now far better prepared to meet such crises. The Clearing House pumped credit into the system, and dozens of banks and brokerage firms were hauled back from the precipice. One of the coolest and boldest players was J. P. Morgan, who stepped in and purchased stocks almost as fast as panicked speculators sold them, thus helping restore confidence. When the crisis passed, Morgan had emerged as Wall Street's preeminent leader.

Morgan, chewing on his big cigar, surveyed the bloody economic battlefield from the mahogany partners' room at 23 Wall and decided it was time to end the railroad wars. Morgan had himself participated in them vigorously, bankrolling combatants and mending casualties, both highly lucrative endeavors. But the London investors he represented were fed up, as he barked at one recalcitrant railroad president: “Your roads! Your roads belong to my clients!” With competitive conflagrations now threatening Wall Street itself, Morgan and other New York investment bankers decided to intervene aggressively.

On a hot and muggy July day in 1885 a clutch of railroad executives boarded Morgan's 165-foot, black-hulled steam yacht, the *Corsair*. While the vessel cruised up and down the Hudson River, the banker spelled out his displeasure at the "fever for building and extending competitive lines." The assembled magnates agreed to reject unbridled competition and establish spheres of influence. But the "Corsair Compact," like previous pools, lasted little more than a year. The wars commenced again, this time with the Vanderbilts as rate cutters and Gould promoting stability. There seemed no way to quit the free enterprise merry-go-round, so the ride spun on, propelled by fear of failure, accumulated rancor and mistrust, monumental egoism, and the sheer exhilaration and momentum of combat. In 1887 matters worsened further when farmers, passengers, small businessmen, and the New York City merchants assembled in the National Anti Monopoly League convinced Congress to outlaw pools altogether. Wars of unparalleled ferocity chewed up earnings, and the economy tipped downward once more. In 1888 Morgan summoned the presidents of sixteen major roads to the library of his Madison Avenue mansion and hammered out another pact—which quickly crumbled.

Industrialists, facing much the same dilemma, had meanwhile invented the "trust," a legal device they believed might solve the problem. Oil refiner John D. Rockefeller and his leading rivals had joined forces in a Standard Oil cartel that used its collective domination of processing capacity and railroad transportation to force thousands of combative oil producers to stabilize prices, with William Rockefeller dispatched to New York City to handle the Standard's export operations. When competitors threatened to bypass this arrangement by launching pipelines that would pump crude oil directly to New York Bay for refining and export, the Standard fought back. It gained control of most independent metropolitan-area outlets—folding Charles Pratt's Astral Oil company (which Rockefeller had bought up secretly in 1874) with other Hunter's Point and Newtown Creek operations into Standard Oil Company of New York (SOCONY)—and ran its own pipeline from the Pennsylvania oil fields to newly centralized operations in Bayonne, New Jersey.

The problem was that this enormous enterprise lacked a legal and administrative superstructure—until 1882, when New York attorney Samuel C. T. Dodd conceived the Standard Oil Trust. Shareholders of the cartel's

now forty companies exchanged their stock for certificates in the trust, which in turn was authorized to “exercise general supervision over the affairs of the several Standard Oil Companies” out of a unified headquarters in New York City. Here, clearly, was an outfit that knew how to overcome competition, and indeed boasted of it: “The day of combination is here to stay,” John D. declared. Industrial consolidation, he announced, was a step up the evolutionary ladder. It represented the “survival of the fittest,” Rockefeller said, “the working out of a law of nature and a law of god.”

Inspired by the Standard’s example, ten other processing industries established trusts and all but two located their central offices in New York City. In 1887 Elihu Root, corporate attorney and pillar of the Manhattan Bar, helped Henry O. Havemeyer wring competition out of one of New York’s oldest industries. Seventeen metropolitan sugar refining companies, representing 78 percent of the nation’s capacity, came together in a Sugar Trust, which consolidated its members’ production and purchasing and proceeded to drive remaining competitors out of business, a process it acclaimed as advancing “the common good.”

Small businessmen, farmers, and consumers disagreed. They denounced trusts for raising prices and concentrating power. In 1890 these opponents won passage of the Sherman Act, which declared the trustee device an illegal restraint of trade. Gloomy businessmen faced another murderous round of free enterprise.

At this juncture, Wall Street attorneys James Brooks Dill and William J. Curtis (a partner in Sullivan and Cromwell) took a new tack. Dill drafted a law that permitted one manufacturing company to purchase and hold stock in any other company “manufacturing and producing materials necessary to its business.” In effect it allowed competitors to combine in a single corporate body. This simple and elegant solution was enacted by the New Jersey state legislature after Dill and Curtis, both Jersey residents, convinced the governor it would attract new corporations and strengthen the state’s budget. It soon passed judicial muster, as courts found that elements of a single firm, no matter how large, could act in concert without their association constituting an illegal restraint of trade.

Between 1890 and 1893 half a hundred companies converted to the corporate holding company form. Some were old trusts, forced into reformatting by the Sherman Act: when the Sugar Trust was declared illegal

in 1889 and ordered dissolved, Root recommended the Havemeyers try incorporation, and within a few years the new American Sugar Refining Company controlled nearly 98 percent of the national output. Some of the new corporations were “Morganized” railroads, formed when J. P. Morgan and other New York City investment bankers reassembled bankrupt competitors into viable corporate entities, set up their headquarters in Manhattan, and pocketed million-dollar fees and directorships for their trouble. Some were metropolitan wholesale merchants—like H. B. Claflin’s—who had discovered the virtues of the corporate form.

Some of the new corporations were industrial concerns, like the American Tobacco Company (1890), a newcomer to New York. In the mid-1880s James Buchanan Duke, a North Carolina chewing tobacco manufacturer, switched to cigarette production. Duke relocated his operations to Manhattan—the largest urban tobacco market in the nation and an industry center since Pierre Lorillard had opened his snuff factory on Chatham Street back in 1760. Backed by lines of credit from New York financial houses, Duke opened a massive factory at First Avenue and 38th Street, using cheap female labor and fifteen of the new Bonsack machines capable of producing 120,000 cigarettes a day. By 1889 he was rolling over eight hundred million cigarettes annually. The following year Duke subsumed his five leading competitors into his giant new ATC corporation (and a few years later P. Lorillard Company as well).

The financial community rapidly thawed its frosty attitude toward “industrials.” Bankers and brokers had long considered manufacturing operations too small or too unstable to warrant investment. Through the 1880s the New York Stock Exchange had refused to list industrials, with the single exception of the Pullman Palace Car Company. Now funds flowed to newly merged companies. By 1897 eighty-six industrial corporations, each capitalized for over a million dollars, had been formed and financed, most of them on Wall Street. Mining and petroleum stocks traded in unprecedented numbers. Foreigners plunged in too and by the early 1890s had sunk roughly three billion dollars into U.S. firms, up 50 percent since 1883. Poor’s, Moody’s, and Dun’s began publishing analyses of the new corporations, and many began filing annual reports with the Exchange.

It seemed, finally, that a stable future was coming into being, one in which incorporation would replace competition, antagonistic companies

would be consolidated, and their oversight operations would be centralized—in New York City, emerging capital of an emerging corporate economy.

ASSOCIATES AND AGENTS

In the 1880s and 1890s many industrial and railroad magnates relocated themselves—as well as their corporations—to Manhattan. Cleveland's John D. Rockefeller joined his brother William in 1884. Collis P. Huntington came in from California; the Armours arrived from Chicago; Andrew Carnegie shifted from Pittsburgh. They and their companies were drawn, chiefly, by the gravitational pull of money. They wanted direct access to the great investment banks and their connections to vast pools of domestic and foreign capital. New York was host to virtually all the leading firms: Drexel, Morgan (which in 1895 became J. P. Morgan and Company); August Belmont and Company (run after his death in 1890 by his son August Junior); Kuhn, Loeb (led, after the original partners retired in 1885, by Jacob Schiff); and the Seligmans, Lehmans, and Speyers. Even Boston banks like Lee, Higginson and Kidder, Peabody felt obliged to open outlets in New York.

Some newcomers entered the banking world themselves. The Rockefellers cycled their oil profits into the National City Bank, Moses Taylor's old operation until his death in 1882. From 1891 it was in the steady hands of the steely James Stillman (two of whose daughters married sons of William Rockefeller), and Standard Oil connections and cash would make National City Bank a power in the city.

Manhattan was attractive to businessmen for other reasons too, especially its great assemblage of experts. Among the vast array of talented metropolitan professionals, none were more crucial to the emerging corporate order than lawyers. Since George Templeton Strong died in 1875, firms like his had been joined by a host of crack legal firms. They specialized in providing legal, managerial, and financial advice to large corporate clients on a regular basis, not just at the point of litigation. Indeed many corporate attorneys withdrew from trial work altogether, dealing instead with the growing number of regulatory state agencies that corporations were answerable to, or serving as businessmen's emissaries and lobbyists (shuttling back and forth between Washington or Albany and New York City), or serving in public office themselves.

Lower Manhattan grew thick with corporate law firms. Bangs and Stetson, ancestor of Davis, Polk, and Wardwell, boasted Francis Lynde Stetson, known as J. P. Morgan's attorney general for his work counseling the financier on industrial and railroad reorganizations. When Grover Cleveland lost the White House in 1888, he moved to New York City and worked at Bangs, Stetson, forming close alliances with Morgan and other financiers before returning to Pennsylvania Avenue in 1892.

Morgan also turned to William Nelson Cromwell of Sullivan and Cromwell (1879), as did Henry Villard and E. H. Harriman. Anderson, Adams, and Young (1866)—later Milbank, Tweed, Hadley, and McCloy—became the “Rockefeller firm” in 1888 when George Welwood Murray brought in John D. as a client; Murray remained his legal adviser and confidant for decades. Joseph Choate counseled Standard Oil and American Tobacco, Elihu Root advised big sugar, and future legal giant Henry Lewis Stimson got his start advising railroad and streetcar companies.

Most firms remained modest in size—five partners constituted a large operation—but some of them, Strong would have been glad to know, began to replace the old apprenticeship system, which had relied on unpaid law clerks, with a more professional approach. Walter S. Carter's firm, Chamberlain, Carter, and Hornblower, began hiring graduates of elite law schools as paid “associates,” who specialized in particular departments (corporate, real estate, trusts and estates) and served as the pool from which future partners were drawn. Among the first recruits and graduates was Paul D. Cravath, a brilliant Columbia Law graduate who would later develop the new approach so extensively at his own firm that it became known as the “Cravath system.” At the same time, law schools and the “white shoe” firms they fed became ever more socially exclusive. There were a few Jewish or Catholic organizations, and after 1890 women were admitted to NYU Law School, but the new procedure helped make Wall Street law firms into overwhelmingly white, Protestant, upper- or middle-class, Republican, and male bastions.

New York's attractiveness to corporations was enhanced by its advertising industry, which underwent a transformation akin to the legal profession's. Advertising had a dubious reputation in the postwar era, due in part to its most prominent clients: the patent medicine manufacturers who laced their products with alcohol and opium. Business self-promotion

seemed Barnumesque; it smacked of desperation and unsoundness. Even the best agencies, like Samuel Pettengill, New York's and the country's largest, shilled for newspaper and magazine publishers and lied shamelessly about circulation figures to wrest higher rates from advertisers.

The throng of top hats in this downtown lunchroom conveys the ever-increasing density—and thoroughly masculine tone—of the city's business district during the 1880s. *Harper's Weekly*, September 8, 1888. (© Collection of The New-York Historical Society)

George P. Rowell enhanced the industry's image when he began bringing out annual editions of *Rowell's American Newspaper Directory*, which provided reasonably accurate figures on circulation and rates for over five thousand U.S. and Canadian papers. By evaluating media, he shifted the business toward representing advertisers rather than publishers. In 1888 Rowell started a trade journal, *Printer's Ink*, that advertised the very notion of advertising. In the same year, Pear's Soap obtained clerical benediction for its product, and for the practice of promotion itself, from Henry Ward

Beecher's cautious testimonial: "If cleanliness is next to Godliness, soap must be considered as a means of Grace, and a clergyman who recommends moral things should be willing to recommend soap."

Carlton and Smith, another New York agency, also gained respectability by convincing Methodist magazines that running ads was both wise and virtuous. By 1870 the firm worked with four hundred religious weeklies, many of them headquartered in New York. William Carlton's young assistant James Walter Thompson followed this up by persuading genteel journals like *Scribner's* and *Harper's* that they too could carry ads without losing integrity or offending subscribers. In 1878 Thompson bought Carlton out and renamed the agency after himself.

"Advertising is the steam propeller of business success," Rowell claimed, and giant corporations and insurance companies agreed. They turned to professionals like Thompson, and the growing number of firms clustered around Newspaper Row, to create copy rather than simply broker it. Consumer goods manufacturers used ads to familiarize a national market with their product's "brand name." In the mid-1870s a New York firm, Enoch Morgan's Sons, peddled its scouring soap by adopting a Latinsounding brand name (Sapolio) and giving retailers pamphlets that sang its praise in verse penned by Bret Harte, then scratching out a marginal living in the metropolis. In 1884 the firm hired a professional advertiser to place its proverbs ("Be Clean!" "Sapolio Scours the World") in publications across the country, posted them in streetcars, and blazoned them on a huge sign in New York harbor.

Companies relied on metropolitan agencies to promote *types* of products too. Admen taught consumers to prefer breakfast cereals in boxes, rather than scooped from grocers' barrels; to shave themselves, rather than patronize barbers. By 1889 Duke's American Tobacco Company was spending eight hundred thousand dollars a year to expand the cigarette-smoking public, win tobacco chewers and cigar smokers over to the newer product, and force retailers to distribute his merchandise. Ad agencies placed Duke propaganda in papers and periodicals, on billboards around the city, in programs for theatergoers and handbills at ballfields and boxing matches. In the 1890s other corporate manufacturers used professional pitchmen to launch new commodities, and campaigns designed for Procter & Gamble and Colgate-Palmolive, Pabst and Postum, Coca-Cola and

Cream of Wheat, similarly dwelt on the compatibility of their wares with modern urban lifestyles.

The number of ad agencies swelled from forty-two in 1870 to over four hundred by the end of the 1890s. Like law firms, they grew larger and more internally specialized. At J. Walter Thompson's, "account executives" supervised copy writing for particular companies, then liaised with their counterparts in the corporation's sales and marketing divisions, and with the advertising departments of New York's newspapers as well. In the 1870s the daily press had gotten less than one-third its income from advertisements. As journalism's costs increased, papers relied more heavily on such revenues, which jumped to 44 percent of income by 1880 and 55 percent by 1900. The ratio of editorial to ad matter swung from seventy-thirty to fifty-fifty in the same period, and self-promotional gambits flourished as papers sought to assemble an audience to sell to advertisers.

TALL TOWERS

Burgeoning professional and corporate concerns needed lots of office space. Continental-scale companies like American Tobacco had to control the flow of product from factory to retailer, oversee sales agents throughout the country, maintain a large central depot in New York, audit costs, manage labor, track inventory, compile reports, pay taxes, and initiate legal transactions. Companies with international outreach, like I. M. Singer and Company—led by Edward Clark since 1876, the year after Singer's death—established agencies in Latin America, Canada, and the Far East, which dispatched reports back to the central office in New York City. Sales, purchasing, legal, auditing, and manufacturing departments, in turn, required ever-expanding support staffs: typists and stenographers to handle intra- and extra-company correspondence, clerks to file it all, office boys to handle miscellaneous chores.

Particular entities had special space needs. Insurance companies needed to keep huge record bases for premium and claims payments, manage investments, and develop actuarial statistics. In the case of a company like Metropolitan Life, which sold "industrial insurance" to workers, headquarters had to direct the army of agents who sold policies and collected premiums each week. Law firms needed bigger libraries as national reporting of case law expanded the number of publications to be

researched. Specialized segments of the import-export fraternity (iron and metal, petroleum, produce, cotton, coffee, and coal) needed their own gathering places; no longer would a single Merchants' Exchange do.

To meet this demand, Manhattan's real estate industry—itsself newly organized and housed in a Real Estate Exchange (1883)—generated a tremendous volume of commercial construction, much of it now in red brick neo-Renaissance rather than Second Empire, though mansard roofs remained popular. Some construction was commissioned, but much was erected “on spec” for rental to bankers, brokers, and railroad and insurance companies; the building boom created havens for capital in more ways than one.

The result was a dramatic enlargement—horizontally and vertically—of the city's business district. The high cost of land encouraged tall towers. “Real estate capitalists,” according to “Sky Building in New York,” an 1883 article in *Building News*, had “suddenly discovered that there was plenty of room in the air, and that by doubling the height of its buildings the same result would be reached as if the island had been stretched to twice its present width.”

In 1882 the cornerstone was laid for George Post's mammoth, arcaded Produce Exchange. Over the next two years, it rose at the corner of Broadway and Beaver—site of Peter Stuyvesant's weekly “Monday Market”—until it loomed ten stories tall over Bowling Green. In 1884 William Rockefeller commissioned a headquarters to house the new Standard Oil Trust at 24-26 Broadway, and two years later its ten stories were filled with managers and employees directing the production, refining, and marketing of oil. By the end of the 1890s over three hundred buildings nine or more stories tall would have gone up in Manhattan.

Though such structures did not overtop the previous era's Tribune and Western Union buildings, they did surpass them in technology. Most lofty predepression structures had been masonry buildings, whose thick weight-supporting walls ate up floor space and dictated small windows. Post's Produce Exchange used cage construction: iron columns and girders carried the weight of the floors, allowing exterior walls to get slimmer. Post also experimented with “skeleton” construction for some of the walls, using a metal frame to support them as well.

New York ambled farther into the technological future in 1888, when Bradford Lee Gilbert, an experienced railroad station architect, announced he would raise an eleven story building, 158 feet tall, that relied completely on skeletal construction. His decision was immediately attacked by architects, engineers, newspapers, and public officials who believed such a structure would be precarious. Gilbert defended himself by pointing to recent engineering developments. Gustave Eiffel, for example, had just designed an internal steel-and-wrought-iron armature for the 151-foot Statue of Liberty (completed in 1886) that could withstand a wind load factor of fifty-eight pounds per square foot. At 50 Broadway, Gilbert would use the most up-to-date wind bracing, using iron diagonals in each bay to transmit wall weight through girders and columns down to the footings and foundation of timber piles driven forty feet down to hardpan.

Despite the skeptics, Gilbert's Tower Building won a city construction permit and overcame the worries of the owner, who feared his narrow building (only twenty-one feet wide) might well blow over. One blustery Sunday morning, the usual gawkers were watching laborers work on the building's tenth story, when the weather turned really fierce. Throngs poured down to Broadway expecting to see the thin tower topple. As the wind howled, Gilbert clambered to the top, lowered a plumb line, and discovered to his great satisfaction that the building vibrated not at all.

Gilbert's design ambitions were less daring than his technological ones. Eschewing the approach favored by Chicagoans of having exteriors "honestly" match construction principles, Gilbert swathed the slender base in rusticated stone and enslabbled the remainder with a conventional facade. Just looking at the completed Tower Building in 1889, one would never have known that New York had entered a new era. But after Joseph Pulitzer's building was finished the following year, there would be no mistaking the fact.

In 1888 the *New York World's* publisher had the great satisfaction of buying up French's Hotel at Park Row and Frankfort Street and having it torn it to pieces. During the Civil War, the elegant establishment had ejected Pulitzer, then a newly arrived Hungarian immigrant and volunteer Union Army cavalryman, because his frayed uniform annoyed the fashionable guests. Pulitzer had grand plans for the site. In the previous few years, his newspaper had dwarfed the circulation of James Gordon Bennett's *Herald*

and Charles Henry Dana's *Sun*. Now he would have George Post erect an edifice that would dwarf his competitors' nearby buildings, though it would not be as technologically sophisticated as Gilbert's Tower Building, as Post opted here for cage construction.

On December 10, 1890, the governor and mayor teamed up to celebrate the opening of Pulitzer's dazzling 309-foot structure—the tallest building in the world. The *World* tower was topped by a glittering gilded dome, which now would be the first thing to strike the eye of passengers on vessels arriving in the harbor. It was also the first building to overshadow Trinity Church (284 feet), physical ratification of the passage of metropolitan power from sacred to secular. At the top was Pulitzer's huge semicircular office with three great windows, frescoed ceilings, and walls of embossed leather. One wag reportedly got off the elevator at the top floor and in a loud voice asked, "Is God in?" The editors on the eleventh floor were delighted to find they could lean out the windows and "spit on the *Sun*."

Appropriately enough, in the years following Pulitzer's coup, the term "skyscraper" first gained common currency. It was not a novel word, having had a long history of other associations. Since the eighteenth century it had been used to describe the triangular sails, set above the royals in calm latitudes, called skyscrapers or moonrakers due to their great height. Now, in the early 1890s, it fastened itself irrevocably to the tall buildings sprouting up in lower Manhattan. The new principle of skeletal construction won official sanction, building laws were revised appropriately, and the city made clear its willingness to tear down old masonry structures and erect steel ones, to the delight of ironmasters like Andrew Carnegie and Abram Hewitt.

More was involved here than a prosaic expansion of commercial office stock. In succeeding so admirably in overarching its competitors—making runts of the *Times*, *Herald*, *Sun*, and even the *Tribune*, whose campanile peaked at a paltry 260 feet—the World Building broke new cultural as well as material ground. Pulitzer's publishing success owed as much to his paper's exuberant self-advertising and ferociously competitive spirit as to its innovative content. His architectural initiative extended this warfare onto a new terrain. The World Building was more than a mere office building; it was a corporate self-proclamation, a brand name shouting itself in iron and

stone, a shrewd Barnumesque statement by a man well aware that appearances could constitute reality.

Other corporate moguls would follow Pulitzer's lead and seek their own boardroom-eyries. It would be a few years yet before the process accelerated sharply, but soon a corporate competition for sensational self-presentation—and rentable floor space—would be unleashed. The ensuing frenzied space race would drive New York spectacularly skyward.

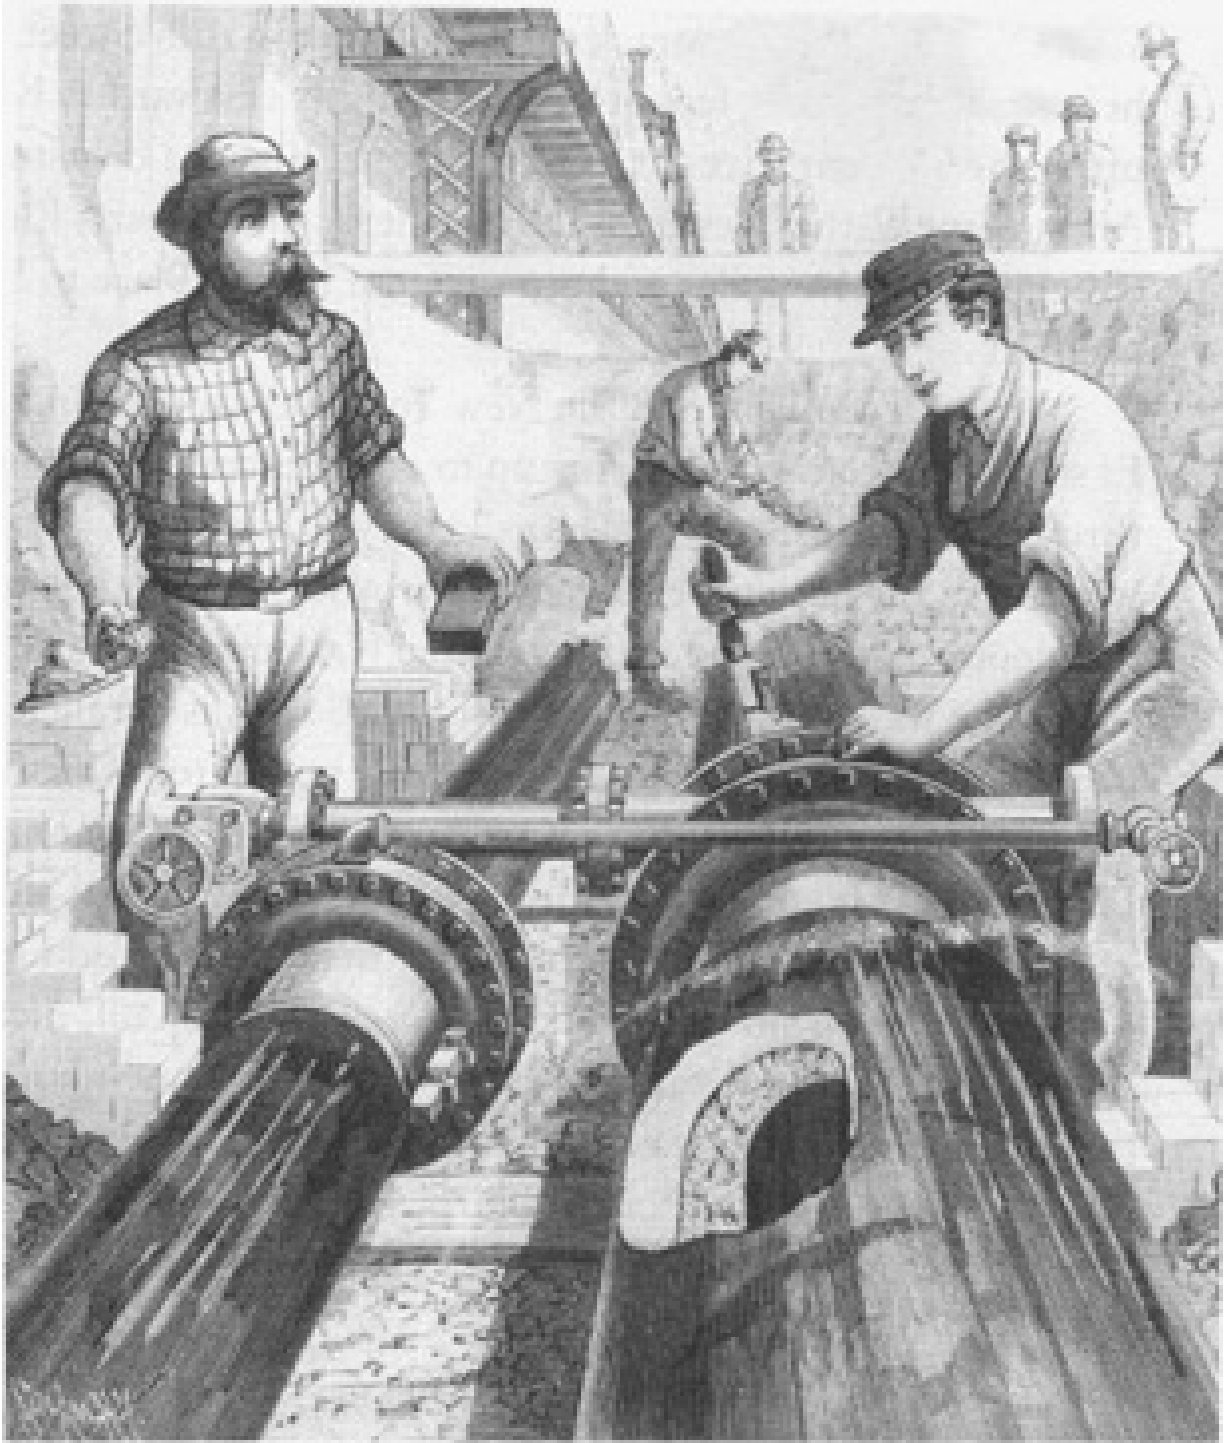

The city's silhouette was also transformed in these years by two devices that became (and have remained) two of New York's most distinguishing features: water tanks and steam pipes.

As commercial buildings rose to six stories, beyond the reach of fire ladders, and then even higher, beyond the reach of fire hoses dependent on Croton-generated water pressure, the fire department, city government, insurance industry, and tall-tower occupants grew steadily more alarmed, especially when it became clear how quickly flames shot up elevator and air shafts. Western Union, whose building was among the first to confront this problem, had adopted an extremely costly solution. The company dug wells seventy feet deep in its cellar and installed powerful steam pumps to drive the water up through iron mains to the roof, from which heavy streams of water could be played on surrounding buildings. This was not a practical solution to mounting fire losses—which in the dry-goods district alone surpassed six million dollars between 1877 and 1882, less than a third of which had been covered by reluctant insurers. In the latter year the burning of the former World Building on Park Row produced four hundred thousand dollars in damages and twelve deaths, starkly underscoring the peril.

Water sprinklers were part of the answer. The Parmelee Automatic Sprinkler, a heat-triggered device connected to piping installed on each floor, was introduced in 1874 and replaced in 1881 by the improved Grinnell Sprinkler. But sprinklers, as much as hydrants and hoses, required a sure source of pressurized water. The solution, adopted at first on a piecemeal basis, was to have barrelmakers construct a bulky wooden water tank, which looked like a huge washtub on stilts, up on the roof, where it gravityfed water into the sprinkler pipes that wove back and forth through the building beneath. Fire insurance companies lowered rates on buildings that installed these tanks. In the 1890s, companies emerged to build them (of which two remain, the Rosenwach Tank Company and Isseks Brothers).

And the city's Building Code was amended to require them (or a cellar pump equivalent) on all buildings over 150 feet tall.

Another solution to problems raised by tall buildings was the creation of a network of underground steam pipes to heat them. If each of the new behemoths had a separate heating plant, their gargantuan coal requirements, which would have to be delivered through narrow downtown streets, would soon have rendered the area impassable. To obviate the problem, the New York Steam Company, formed by a merger of competitors in 1881, got a Common Council franchise to lay such pipelines (for which it paid a paltry hundred dollars a year) and in 1882 supplied its first customer, the United Bank Building at Wall and Broadway. By year's end sixty-two clients in the Wall Street area had signed on to be connected to the Steam Company's boiler plant at Dey and Greenwich. By 1886 it had 350 customers and five miles of mains, and to this day visitors are periodically startled to see clouds of steam erupt from beneath the streets, as if the city rested on a foundation of geysers.

HIGH ROLLERS

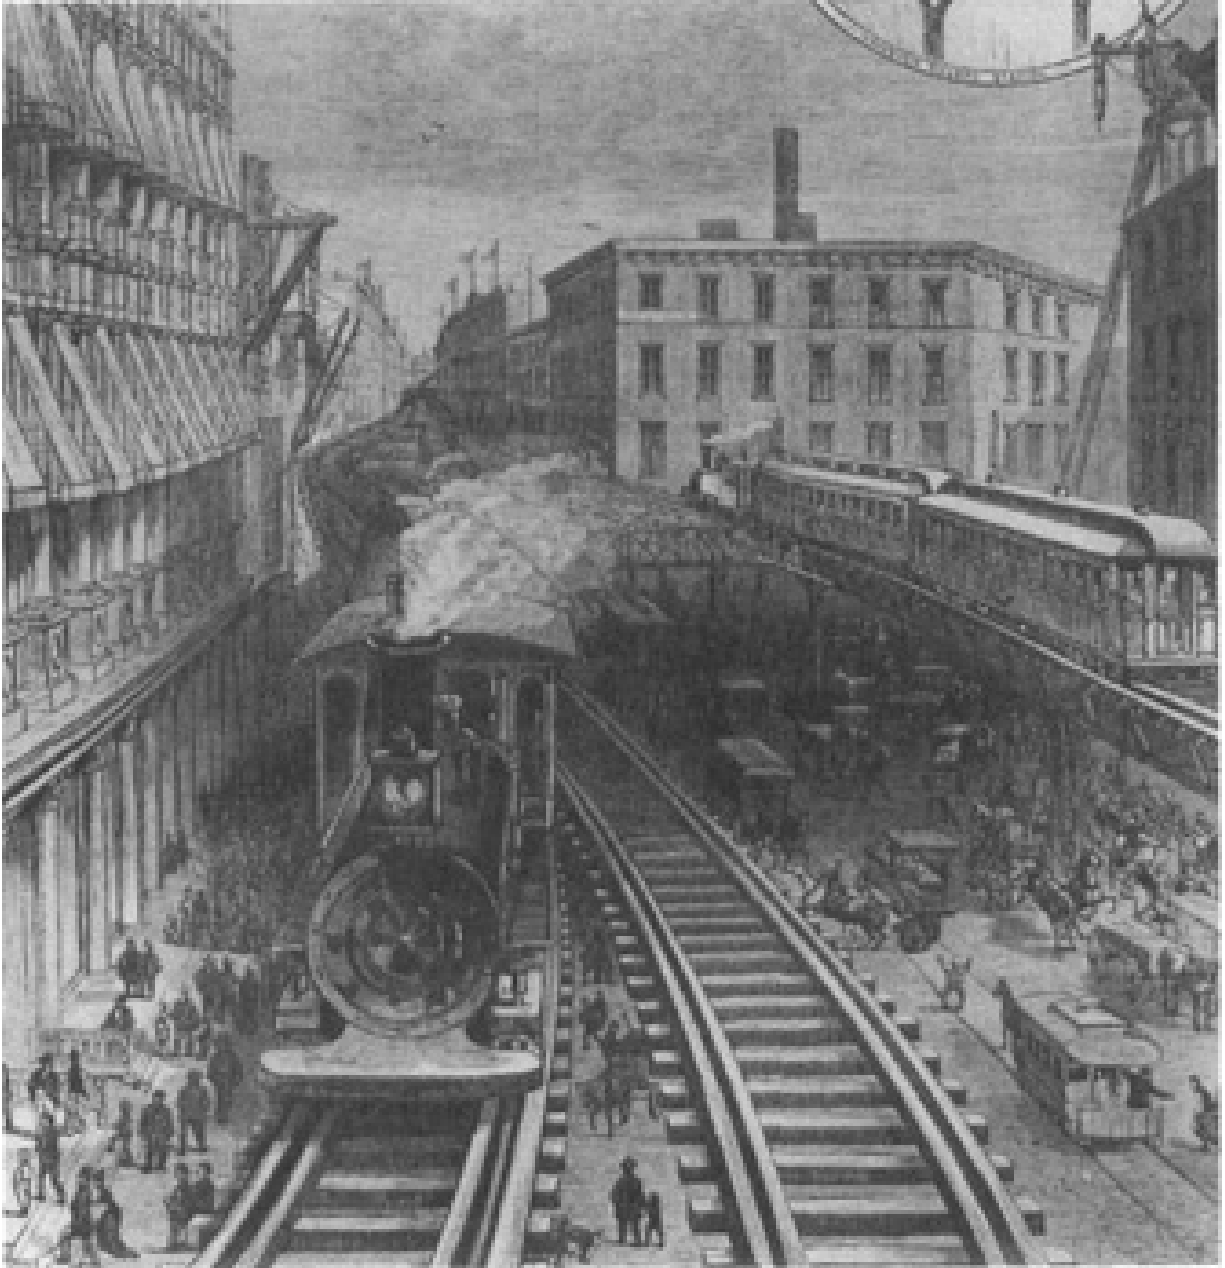

Conduits below were matched by conduits above, as the system of elevated railroads was spurred to fruition by the need to accommodate the city to the growth of corporate enterprise. Rapid transit made the skyscrapers possible by ferrying vast numbers of uptown workers to the downtown high-rise business district, and indeed the “els” accelerated tall-tower construction by driving property values sky high and making efficient use of space ever more desirable.

During the depression, the availability of cheap labor had galvanized promoters to win passage of a Rapid Transit Act (1875), which authorized handing out franchises to private entrepreneurs, and by the early 1880s locomotives were steaming up and down Manhattan. On Ninth Avenue, Charles Harvey’s old road, rebuilt and extended, reached 81st Street in mid-1879, spurring long-delayed development on the Upper West Side. By 1881 the track continued on to 110th Street, where, at the spine-tingling height of sixty-three feet, it swerved giddily eastward to Eighth Avenue, then loped on up to the Harlem River at 155th. At 53rd Street a crosstown feeder linked the Ninth Avenue line to the Metropolitan (formerly the Gilbert) Elevated Railway, whose trains chugged at twelve miles an hour up from Rector Place to Sixth Avenue and on to Central Park.

After December 1878 the New York Elevated Railroad Company’s Third Avenue El stretched from South Ferry up to 129th Street. The company obligingly ran cars all through the night—“Owl Trains” every 15 minutes—which conveyed homeward late workers in the newspaper offices or carousers out on the town, rolling northward across the gloomy and still largely untenanted Harlem flats while the lights of Astoria twinkled across the water in the distance. From 1880 it was paralleled by the Manhattan Railway Company’s Second Avenue road that ran north from Chatham Square.

The new transport lines were not restricted to Manhattan. At first, Third Avenue El passengers bound for the Bronx could only transfer—for a separate fare—to the so-called Huckleberry Line, a horsecar that meandered along the Annexed District’s Third Avenue so slowly that passengers could hop off, pick huckleberries in the fields, and reboard the same car. After 1886, however, the Suburban Rapid Transit Company (1880) ran an elevated service that crossed the Harlem River on an iron drawbridge and (by 1891) traveled up Bronx’s Third Avenue through Mott Haven, Melrose,

and Morrisania to 177th, spurring a building boom along the corridor. Passengers bound for the Annexed District could also connect with the New York and Northern (which became the New York Central's Putnam Division) running up through Highbridge, Morris Heights, and Kingsbridge. Or they could catch the New York and Harlem Railroad, whose ash-spewing locomotives carried them up the Bronx's central corridor, past Mott Haven's solid brick clock-towered station, through Melrose, Morrisania, Tremont, Fordham, Williamsbridge, and on past Woodlawn's country mansion station with its landscaped flower beds, to White Plains and points north. Wealthy folk could simply hop the Hudson line to Riverdale.

Southbound travelers, once they reached the Brooklyn Bridge—which opened with great fanfare in 1883—could take a cable-drawn car, which commenced operation in 1885, from Park Row to Sands Street. From there

—also after 1885, when Mayor Seth Low helped inaugurate it—Brooklyn Elevated Company trains (the city’s first) ran through downtown to Lexington Avenue, then headed east to Broadway and Gates. A rival, the Kings County Elevated Rail Road, established service along Fulton Street to Nostrand Avenue by 1888, to Brownsville by 1891, and to East New York and the city line in 1893. By that year Brooklyn’s elevated system was complete, differing companies having built the Bay Ridge, Myrtle Avenue, and Broadway lines. These trains handled over thirty million passengers annually, most of them commuting from homes in Brooklyn to jobs in Manhattan.

Different lines served different clientele and had correspondingly different styles. Manhattan’s Sixth Avenue El, which transported a predominantly middle-class ridership, was built for delight as well as convenience. Its dainty green stations, topped by graceful iron pavilion roofs, were designed by landscape artist J. F. Cropsey to simulate tasteful cottages and contained heated, gas-lit waiting rooms for gentlemen and for ladies. The trains that pulled up were equally ornamental, their Pullman palace-style cars manned by conductors in braided blue flannel uniforms.

The Third Avenue line, a working-class conveyance, was not quite as spiffy, though it had its devotees. The Marches—a fictional middle-class couple in William Dean Howells’s *Hazard of New Fortunes* (1890)—were thrilled by the theatricality of nighttime rides on it, by the “fleeting intimacy you formed with people in second-and third-floor interiors.” You might see, as you passed their windows: “a family party of workfolk at a late tea, some of the men in their shirt-sleeves; a woman sewing by a lamp; a mother laying her child in its cradle; a man with his head fallen on his hands upon a table; a girl and her lover leaning over the windowsill together.” At 42nd Street, the Marches noted, you could look south along the long stretch of “track that found and lost itself a thousand times in the flare and tremor of the innumerable lights.” The couple gazed in fascination at “the coming and going of the trains marking the stations with vivider or fainter plumes of flame-shot steam.”

Not everyone was quite so taken with the trains. Many of those in the windows the Marches swept by complained furiously about ear-splitting noise, soot and cinders, and those “plumes of flame-shot steam”—which seemed far less picturesque at close quarters. Stephen Crane, stirred to more

mordant imagery than Howells's, wrote of the darkened Bowery where "elevated trains with a shrill grinding of the wheels stopped at the station, which upon its leglike pillars seemed to resemble some monstrous kind of crab squatting over the street." The truly powerful denizens of Fifth, Park, and Madison had already banned elevateds from their avenues. Finally, in 1883, some of the more affluent owners of properties abutting existing lines sued the elevateds and won, the Court of Appeals ruling they had been illegally deprived of "light, air and access." The prospect of a series of heavy damage payments effectively halted all further elevated construction in built-up sections of Manhattan.

Apart from this victory, disgruntled citizens made little headway in attaining redress of grievances because of the elevateds' structure of ownership. At first, the spurt of el building in New York had paralleled the outburst of railroad construction on the national level and involved many of the same players. Rival financiers, aware of the elevateds' enormous potential, had taken control of them and engaged in the same free-for-alls that characterized rail warfare at the continental level. In New York City, however, the combatants were able to come together and obtain the monopoly control—and bonanza profits—that eluded them in the national arena.

The early contenders had leased their shares to a holding company, the Manhattan Elevated Railway Company. Jay Gould and Russell Sage swallowed it up in 1881 by driving its stock price down, then buying it up. They continued to use it as a financial plaything, much as Gould, Fisk, and Drew had done the Erie: heavily watering its stock; clearing millions on market manipulations. Some people kicked up a fuss, but Gould bought legislators, corrupted judges, and expanded his control, taking over the Third Avenue line too.

Private control and public interest clashed again in 1883, when the state legislature passed a bill to lower the monopoly's fares from ten cents (and five cents at rush hour) to five cents all day. The bill was popular, but the Manhattan's owners denounced it as an attack on property rights. They were backed by Drexel, Morgan, William H. Vanderbilt, and fifty other leading capitalists, who successfully petitioned Governor Cleveland to veto the offending legislation.

Gould and Morgan failed, however, in their effort to turn Battery Park into a switchyard and elevated loop. The intense anger generated by the Manhattan's attempt at appropriating the only park accessible to the Lower East Side's working-class families was compounded by the company's maladroit dismissals of its opponents as tramps, rascals, and immigrants. Tammany Hall, usually in the Manhattan's pocket, had to back away from it on this one, and the company abandoned its plan.

Popular protest might stop a Manhattan Company initiative but it couldn't start one. By the late 1880s success had bred crowding, especially on the East Side lines—crowding that swelled to dangerous dimensions at rush hour. Station platforms got so jammed that passengers, unable to fight their way out of cars during the all-too-brief stops, were often carried one or two stations beyond their destination, while pickpockets fingered through their possessions. Given the absence of competition, and the presence of handsome dividends paid regularly on heavily watered stock, Gould, Sage, and Morgan had no incentive to relieve the miserable conditions, and so they didn't.

If monopoly had drawbacks, so did competition, as became clear during the horsecar wars. The thirty-two rival street lines, whose routes often underlay the new elevated tracks, had been damaged by their overhead rivals but still made money. They did so by scrimping on upkeep (the cars were dirty and badly ventilated, their straw-strewn floors full of vermin). They also slashed labor costs (drivers and conductors worked sixteen-hour days, constantly exposed to the weather, for beggarly wages, conditions that would lead to violent labor upheavals in 1886). In addition, the lines still operated on perpetual franchises they had cozened out of compliant aldermen over the previous half century, for which they paid little or nothing to the city. Highly parochial and viciously competitive, each refused transfer privileges to its rivals. Journeys, accordingly, were badly splintered: traversing Manhattan at 14th Street required three car changes and four separate fares.

The horsecar wars spilled into municipal and state politics in the mid-1880s. Jacob Sharp, the wealthiest and shrewdest of the streetcar magnates, had been trying for thirty years to get a franchise allowing his Broadway and Seventh Avenue Railroad, which ran from 59th Street to Union Square, to use lower Broadway to reach the Battery. Though long blocked by

powerful Broadway retailers and real estate princes like the Stewarts, Astors, and Goelets, by 1883 Sharp was close to having his way with a tractable state legislature. Suddenly a new rival emerged, the New York Cable Railway Company, composed of a group of businessmen that included Thomas Fortune Ryan, a Virginia-born, Irish-American stockbroker and protege of a Standard Oil partner. The cable interests, who planned to substitute horsepower for horses, also wanted a Broadway franchise.

In Albany, in 1884, Sharp's lawyer, Francis Lynde Stetson (whom he shared with J. P. Morgan), introduced supportive legislation, while Sharp's lobbyist, "Whisky" Halloran, disbursed two hundred thousand dollars to the legislators, handily outbribing the cable forces. Matters now shifted to the ever pliable Board of Aldermen, to whom Sharp gave half a million. To do battle effectively, Ryan added William Collins Whitney to his board of directors. Whitney, a dapper young attorney, was wise in the ways of local politics, having served as the city's corporation counsel from 1875 to 1882, and been prominent among the Swallowtail Democrats. He was also well connected, having married Flora Payne, sister of his Yale roommate (and Standard Oil partner) Oliver Payne.

Whitney drew a group of Philadelphia millionaires into the Cable syndicate and easily topped Sharp's bribe to the aldermen, coming up with \$750,000, but stumbled in offering only half in cash and the rest in bonds in the new company; the politicians accepted Sharp's all-cash incentive. Whitney recovered quickly, however. Announcing that had the franchise been sold at public auction he would have offered the city a million-dollar annual rental for it, he demanded an investigation of exactly why the aldermen were planning to give it away for a feeble forty thousand. In the ensuing uproar, an inquiry led to the indictment and conviction (or flight to Canada) of many of the now infamous "boodle" aldermen (their leader got nine years' hard labor in Sing Sing). Sharp himself was sentenced to four years in the slammer, but the Court of Appeals reversed the verdict on technicalities and ordered a second trial, which Sharp avoided by his timely demise in 1888.

Whitney, Ryan, and the Philadelphians, left in possession of the field, consolidated their control over New York's surface transit system. They organized a holding company, the Metropolitan Traction Company, at the

suggestion of Francis Lynde Stetson and their chief legal counsel, Elihu Root. (Of him Whitney reputedly said: “I have had many lawyers who have told me what I cannot do; Mr. Root is the only lawyer who tells me how to do what I want to do.”) Using the techniques of national merger makers, the Metropolitan began buying, leasing, or conquering the independent horsecar companies, issuing vast amounts of heavily watered stock as it went. By 1897 it would control nearly every line in Manhattan.

As fast as they were acquired, Whitney and Ryan welded their roads into an integrated system. They instituted highly popular free transfers that finally made it possible to travel long distances for a nickel. They also understood that true rationalization required mechanization: the horse would have to go. By 1892 they had, at great expense, installed a cable line along Broadway. Powered by a steam engine in the basement of the handsome new nine-story Cable Building at Broadway and Houston, two endless steel strand loops ran, taut and humming, just below street level, one down to Bowling Green, the other up to 36th Street. Once a motorman gripped the cable, his streetcar was jerked along at thirty miles per hour, far faster than horses.

There were problems, however. Speed couldn’t be varied at corners, so cars whipped passengers around spots like Dead Man’s Curve at Union Square, gongs clanging wildly. Accidents—which were frequent—required stopping the belt, halting traffic all along the line. And when the forty-ton cables broke, which was often, they were not easy to replace. In short order the experiment would be declared a failure. Further problems emerged when George Gould, who succeeded to control of Manhattan Elevated when his father died in 1892, proceeded to declare war on the Metropolitan, a struggle whose consequences would reverberate into the next century. Most disturbing of all, while the street railway franchises proved enormously profitable to their owners, the city received virtually nothing by way of financial return, and speculators like Gould had no interest in promoting orderly and planned development in advance of existing settlement.

Still, for all their drawbacks, the city’s combined transport facilities helped weld Manhattan and its surrounding suburbs into an integrated regional economic unit. The Manhattan Elevated carried 75.6 million passengers in 1881; by 1891 it was conveying 196.7 million; and by the

latter year, counting all means of travel, well over a million people poured into New York each day and flowed back home each night. Titans and typists, merchants and clerks, insurance men and accountants, storekeepers and shopgirls, lawyers and advertisers and journalists—they streamed, in their hundreds of thousands, across the Brooklyn Bridge to Brooklyn Heights, Bedford, and Bay Ridge; boarded the Staten Island ferry to New Brighton, where they caught trains out to Arrochar and Bowmans; clambered on cars at Grand Central that whisked them north to Yonkers, White Plains, and New Rochelle; ferried east to the Long Island Rail Road terminus at Hunter's Point and west to Jersey for connections to Newark and Morristown. The great human tide ebbed to a hundred domestic destinations, regathered its energies, and was transported next morning back to the tall-tower workplaces, in time for the opening of yet another business day.

Bright Lights, Big City

In the 1880s New York got wired for sound and light, and the whirlwind rise of the electrical industry, and its equally rapid consolidation by New York financiers, was a telling sign of the times. It was probably inevitable, in the absence of government funding, that electrification, the largest industrial investment in the nation's history, would be pioneered in the metropolis. Wall Street's capital pools were here. So were the new corporations, who swiftly realized that electric power worked synergistically with tall towers and rapid transit to increase the velocity and efficiency of business operations. Manhattan also had a well-established tradition of innovation. Its interlocking commercial and civic cultures had nurtured Fulton's steamboat and Morse's telegraph into fruitful life, and now, in the corporate-professional postwar decades, a diverse mix of financiers, engineers, workers, lawyers, and publicists stood equally ready to promote scientific experimentation and harvest its most profitable applications. The city's cosmopolitan openness to new ways of doing things, moreover, guaranteed a swift embrace of electric opportunities by leading economic, social, and cultural actors. *Son et lumière* would thus transform everyday urban life at the same time it strengthened the emerging corporate order and New York's claim to be its capital.

HELLO, CENTRAL

In the early 1870s Western Union, the New York-based communications giant, was having technical difficulties. It had solidified its grip on the country's telegraphic system, crushed efforts to create a government-run service, and, in alliance with the Associated Press, come to dominate the flow of information to the nation's newspapers. But success had generated a staggering increase in the volume of messages, clogging the system. As a result, many telegraphers—the cantankerous, tobacco-chewing, hard-drinking, iconoclastic, peripatetic, and poorly paid men who worked the wires in stations across the country—had taken to spending their off-hours trying to strike it rich by inventing a “duplex,” a device to send two messages over the same wire at the same time.

Thomas Alva Edison was one of the tinkering telegraphers. He had displayed a bent for experimentation as a child in rural Ohio and developed a rudimentary mastery of mechanics and electricity in his years of wandering from one midwestern post to another. In the late 1860s, having been fired repeatedly for tying up lines for his research or alienating workmates with crude practical jokes, Edison was living in Boston, working on a duplex. He made ends meet by traveling to New York City, buying up stock tickers (just recently invented), and reselling and installing them for Boston financial firms. Beginning in 1869 he spent more and more time in New York, working on improving the ticker. He soon devised Edison's Universal Printer, which was snapped up by Wall Street companies, becoming another of the technological struts supporting Manhattan's financial preeminence.

In the summer of 1870 Edison ran across Daniel H. Craig, a bitter enemy of Western Union, who hired Edison to invent a way to automate telegraphic transmission. Funded by Philadelphia financiers eager to undercut the giant Manhattan firm, Craig set up the long-impooverished Edison in a large workshop in Newark, stocked with the finest machines and tools. Together with a draftsman, a machinist, and some theory picked up in a course at Cooper Union, Edison created a working duplex, then began designing a quadruplex that would allow one line to do the work of four.

News of this invention factory reached Western Union, then under Vanderbilt control. The firm summoned the twenty-four-year-old to company headquarters and proposed to help him perfect his device and let him test his models on Western Union lines. When Edison succeeded, however, the Vanderbilts refused his asking price for the rights. Aware that his Philadelphia backers had been weakened by the Panic of 1873, they figured the inventor would come to terms. They were right: with his debts mounting, Edison gravitated, as he always would, to where the money was that would fund his experiments and sustain his household, and in the crunch, the money proved to be in New York, not Philadelphia.

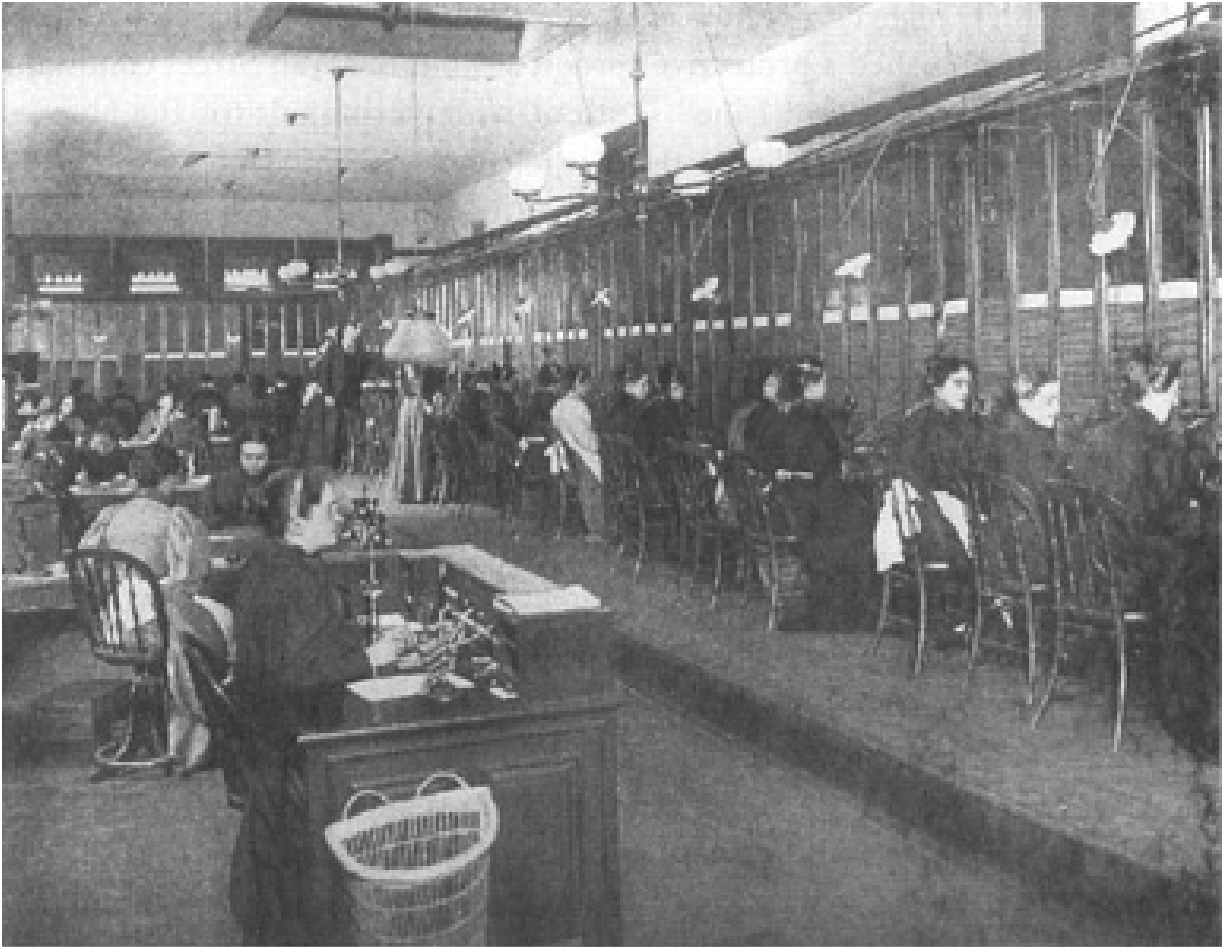

Edison moved from Newark twelve miles south to the farming village of Menlo Park, remote yet easily accessible to Manhattan (it stood three hundred yards from the railroad station). Here he established the first significant industrial research laboratory in the United States. Edison now

spewed out inventions—cooking up plans, and sometimes models, for electric pens, dental drills, and fax machines. Occasionally he would break for a weekend jaunt to New York, dining with his wife at Delmonico's and spending the night at the Astor House, or carousing with cronies at music halls and theaters, losing himself in the Bowery's nighttime throng.

In early 1877, in Boston, Alexander Graham Bell transmitted vocal sounds—conversation itself—over the long lines. Bell exhibited the instrument in New York, giving lecture-demonstrations at Chickering Hall. Western Union assigned Edison to producing an improved apparatus, which they hoped would be distinctive enough to ward off patent infringement suits. Edison came up with a receiver that could amplify sounds more loudly. He arranged a long distance concert and had piano selections wired in from Philadelphia to a huge audience, including Professor Bell, jammed into Steinway Hall. By December the device was in production by the new American Speaking Telegraph Company, hustled into existence by Western Union investors, and Edison, at thirty-three, was one of the richest men in the country. But Western Union lost the ensuing legal and technological war and, threatened on its flank by Jay Gould, agreed to stay out of telephony if the Bell forces would stay out of telegraphy. Local telephone service therefore came to the metropolis under the corporate aegis of the Boston-based American Bell Corporation.

In May 1878 American Bell licensed a Metropolitan Telephone and Telegraph Company to commence service in an area thirty-three miles in all directions from City Hall. In March 1879 subscribers—who paid sixty dollars a year, soon upped to \$150—were linked together by New York's first telephone "exchange," at 82 Nassau Street, and listed in the first directory, a small card listing 252 names. To reach a subscriber users turned a crank, lifted the earpiece, and asked the "operator" to connect them. At first, following the telegraph industry model, young men were used as operators, but their rowdy switching-room behavior—they drank beer, fought, and swore at customers—proved ill adapted to an industry that still had to seduce clients away from telegraphy. Native-born white women came presocialized with the proper decorum, and the new "Hello Girls" proved successful at soothing irate customers (equipment and connections being frustratingly unreliable). Many clients came to consider "Information" operators like Miss Katherine M. Schmitt, who joined the

company in 1882, as being what she described as a “combination of personal-service bureau and general guide to the city of New York.” Schmitt routinely fielded queries such as “Where is the fire?” “Did anyone call me while I was out?” and “How do I get to Central Park?”

The Cortlandt Street Board of the New York Telephone Company, 1894, by which time women “operators” were the norm. Observed a writer in the *Metropolitan Magazine*: “It may seem, to one visiting the operating room of a telephone exchange, that the girls appear uncomfortably like prisoners. The galley-slave of old, bound to his oar by chains, was not held closer to his work than these, with their curious headgear of steel bands and black auricles, and the short stretch of wire which holds them, literally by the head, at their places in front of the switchboard.” (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

By the mid-1890s there were twelve exchanges, each of which averaged 150,000 calls a day. Residential subscribers accounted for only 10 percent of this traffic, however, as household phones were far too expensive for most people (service was available at banks and drugstores). Only after the Bell patents expired in 1894, and independent companies rushed in, would phone service become more accessible.

Businesses, however, leapt to install the new instruments, with banks, brokers, professionals, the Stock Exchange, dry-goods firms, publishers, jewelers, and druggists leading the way. Phones promoted internal organizational coherence as well as communication with the outside world. Bankers and brokers scattered them through their offices. Department stores put instruments at sales counters. Factories installed them to keep the main office in touch with shop foremen. Engineers ran vertical wires along rising skyscrapers to allow contractors below to confer with foremen aloft. Once a tall tower was built, moreover, telephones eliminated the need for messengers to be endlessly riding up and down elevators to deliver telegrams. This helped make upper-story offices as profitable as ones nearer the ground. After long distance service arrived—New York was connected to Boston in 1884, Philadelphia in 1885, and Chicago in 1892—it also became easier for corporations headquartered in Manhattan to direct their far-flung operations.

Telephones were also deployed to help guard the central business district itself. In 1880 Chief Inspector Thomas Byrnes, head of the police department's detective bureau, established a protective cordon around the Wall Street community, declaring Fulton Street a "Dead Line" south of which criminals (of the blue-collar variety) would not be tolerated. Using the new telephone, he connected Mulberry Street Headquarters to every station house. More conventionally, Byrnes saturated the financial district with police and maintained an elaborate system of underworld informants. Grateful businessmen like Jay Gould dispensed market tips, helping Byrnes accumulate a fortune of \$350,000 on an annual salary of two thousand.

While New Yorkers were adopting the telephone, Edison was making other breakthroughs in sound, including a machine that could register and print voice patterns. By December 1877 his apparatus repeated words spoken into it in a faint metallic tone. With Barnumesque attention to publicity, he took the machine—the sound writer or "phonograph"—to the

Manhattan offices of *Scientific American*. As one astonished participant recalled, Edison “turned a crank, and the machine inquired as to our health, asked how we liked the phonograph, informed us that *it* was very well, and bid us a cordial good night.” On January 2, 1878, the machine went on display at the Western Union building. People came, heard, and were convinced.

Edison brimmed over with moneymaking ideas for the phonograph. He licensed two Brooklyn men to incorporate it into clocks and watches that would call out the time, wake people up, and emit advertising messages. He groped toward stereo by working up a two-sided disk, both sides of which could be played simultaneously. He aimed to market an educational toy phonograph that would help children learn the alphabet. And to promote the new machine in the most colossal manner possible, Edison proposed that when the Statue of Liberty finally rose on Bedloe’s Island, a phonograph be put in its mouth so that it could talk and whistle to ships passing by in the harbor.

LET THERE BE LIGHT

In 1879 New York’s Common Council decided to experiment with arc lighting. Back in 1808 Humphrey Davy had discovered that when an electric current arced across the space between two carbon electrodes, it heated the carbon points to white heat, giving off a powerful incandescent light. For many decades this “arc light” found only intermittent uses, as carbons burned up rapidly and batteries were prohibitively expensive. By the 1870s, however, the development of electric generators had reduced the cost of power and a device had been invented to automatically replace burned out rods. Arc lights were now deployed here and there in Europe—St. Petersburg’s Winter Palace and Nevski Drive; Paris’s Place de la Concorde and Arc de Triomphe—and even more so in the United States, where Charles F. Brush’s company erected huge “sun towers” in several western cities. The towers were cheaper to install than hundreds of lampposts, and it was believed that the carpet of illumination they spread equally through all parts of town was somehow a more democratic, more American light.

New York City’s Gas Commission authorized the Brush Electric Light Company to set up a generating station at 25th Street, consisting of two

Corliss steam engines and two dynamo-electric generators. These would power a series of arc lights along Broadway. Each was mounted on a twenty-foot-tall ornamental cast-iron post, one per block, between the lower end of Union Square, opposite Delmonico's, and Madison Square. On December 20, 1880, the boulevard was bathed in brilliant light—a Broadway show that garnered rave reviews.

The Brush Electric lights on Broadway, near Madison Square. This view looks south across 23rd Street, with Fifth Avenue on the right. The clock tower, which stood outside the Fifth Avenue Hotel, remains to this day. (© Collection of The New-York Historical Society)

During 1881 the city commissioned lights for Fifth Avenue and the crosstown streets of 14th and 34th. In addition it tried out “sun towers” in Union and Madison squares—160-foot masts topped with clusters of arc lights. The system was far from perfect, and storms often triggered power failures, but progress in driving back the darkness seemed evident.

Over the next few years, electric arc illumination spread along selected streets. By 1886 fifteen hundred lamps were in operation on Fourth, Fifth, and Seventh avenues, between the Battery and 59th Street, and up the thoroughfares flanking Central Park. Brush Electric Light (and soon its rivals) also began stringing wires on street poles and delivering power to illuminate industrial and commercial spaces: factories, railroad stations, building construction sites, Gansevoort Market Square, wharves, and the lobbies of hotels, theaters, office buildings, and department stores. The brilliant lights offered security for a burgeoning nightlife and drew vast numbers of visitors to commercial establishments.

At first there was no equivalent change in domestic lighting, even though by the 1870s gas light was rapidly falling from public favor. Once celebrated as a clean energy source, it now seemed impure, dirty, unhygienic. Gas jets produced headaches by eating oxygen and giving off ammonia, sulphur, and carbon dioxide, and they blackened ceilings and wrecked parlors with their soot. But arc lights were too dazzling for domestic use. Gas light was measured in the dozens of candlepower, arc light in the thousands. Unlike gas, moreover, an arc's intensity could not be varied, and though they didn't use up oxygen, their carbons gave off noxious fumes as they burned.

In 1878 Thomas Edison announced to the press that New York's interiors would not be left in flickering half-light much longer. He intended to develop an incandescent lamp—not “a large light or blinding light, but a small light having the mildness of gas.” On the strength of this pronouncement, the Vanderbilts, heavy investors in the gas business, decided it was time to switch horses. They offered to form a company that would help Edison develop his ideas. The inventor, now canny in the ways of Wall Street, retained a high-powered corporate attorney, and a deal was hammered out.

A consortium of capitalists set up the Edison Electric Light Company to issue three hundred thousand dollars in stock, of which Edison would hold \$250,000. The businessmen put up fifty thousand in cash to get him started experimenting. The twelve-member board of directors included Vanderbilt representatives, Western Union delegates, and J. P. Morgan himself (Drexel, Morgan would be the company's banker). Henry Villard, flamboyant railroad financier, invested in the firm and urged his German banker

connections to do likewise. In Vienna, Baron Rothschild got wind of events and sent August Belmont out to Menlo Park to investigate. Morgan himself crossed the Hudson to negotiate a deal for lighting Great Britain and Europe. And all this before Edison had generated much more than brash and unsupported promises.

Edison, supremely confident, spent a hefty portion of his advance money erecting a greatly expanded workshop, as well as an elegant library, with plush leather furniture, in which to greet visiting plutocrats from New York. Then he set to work, and in December 1879, syndicate members were invited out to a demonstration of what Edison had wrought. As the financiers watched in awe, globes decorated with flowers and papier-mâché glowed evenly and steadily, with the intensity of a gas jet, roughly twenty-five watts of luminosity.

During the following year, Edison prepared for the electrification of New York City. He laid out in the Menlo Park fields a grand mockup grid of Manhattan's streets, replete with four hundred of the new lights. After a test performance in December 1880, to which he invited an enthralled Sarah Bernhardt, Edison was ready for New York's officialdom. He gave a gala demonstration to assorted aldermen and commissioners, followed by a Delmonico-catered feast, at which he explained his intention to install subterranean electric wires in the square mile stretching from Wall Street to Canal. The assembled worthies gave Edison three hip-hip-hurrahs and, two weeks later, permission to lay his power mains.

Edison now transferred operations to Manhattan, taking over a four-story brownstone on lower Fifth Avenue near 14th Street. He illuminated it with a hundred globes, making it the first building in New York lighted exclusively by electricity and an irresistible nighttime beacon for residents. He also dismantled the Menlo Park machine shop and relocated it at Roach's ironworks. To house the power station, he purchased two old buildings at 255-57 Pearl Street, near the Fulton Fish Market, though he professed to be flabbergasted at the \$155,000 asking price for what he considered "the worst dilapidated street there was."

With expenses soaring, financiers complaining, and rivals emerging, Edison reduced his target area to the fifty square blocks encompassed by Spruce, Nassau, Wall, and the East River—a territory that contained New York's key financial, commercial, and manufacturing establishments and

backed up on City Hall and Printing House Square. Throughout the summer, from eight at night until four in the morning, his men dug fifteen miles of trenches, laid the massive, solid copper power mains, and insulated them with a mix of Trinidad asphalt, linseed oil, paraffin, and beeswax. By fall new, improved, twenty-seven-ton generators, named “Jumbos” after Barnum’s giant elephant, were in place at the Pearl Street Station.

Finally, on September 4, 1882, the dynamos fed power—“direct current”—into the system. Eight hundred lamps winked on in two score locations, including the *New York Times* and the Drexel, Morgan building, where Edison himself, sporting a new Prince Albert coat, presided over the epochal event.

BRIGHT LIGHTS

The first private house in the city to convert entirely to incandescent lighting was J. P. Morgan’s Madison Avenue mansion. Despite an explosive mishap that scorched the walls and carpets, the banker professed great pleasure; less so his neighbors, annoyed by the clanking of the generator installed in his garden. The Vanderbilts wired all three of their uptown palaces, though William H. backslid to gas after some mechanical disruptions. Within a year over five hundred wealthy homes were electrified: New York’s bourgeoisie now glowed in the dark with new intensity.

Houses of commerce switched to electricity with dispatch. The New York Stock Exchange installed three “electroliers” of sixty-six lamps each above the main trading floor. Scant steps away, at Broad and Exchange Place, the new nine-and-a-half-story Mills Building (1883) became the first office building in the city, and likely in the world, to have its own electric generation plant: it powered the 5,588 lights in quarters rented by bankers, brokers, and railroad and insurance companies and in the top-floor restaurant. In 1889 the first electric elevators began gliding up and down, and by the following year they were being purchased in lieu of hydraulic models. The first escalator would follow a decade later.

Industry lit up too. Machine shops, piano factories, sugar refineries, and newspaper plants went incandescent. Edison talked eagerly about converting 240,000 sewing machines to electricity: “In the tenement-house

districts our business will be simply enormous,” he enthused. Manufacturers and financiers—the sorts who joined Edison in becoming members at the new and exclusive Electric Club (1886)—boasted that direct current would make it possible to significantly lengthen the working day, a prospect not greeted with universal acclaim.

What did delight almost everyone was the electrification of nightlife. Department stores shifted from gas to bulbs in the late 1880s. Freed from fear of fire, their window displays now shimmered in the night air, lending new glamour to commodities, providing virtual theaters for audiences passing by. Actual theaters seized on Edison’s lights too. In 1883 Niblo’s Garden featured “novel lighting effects by the Edison Electric Light Company,” including an illuminated model of the new Brooklyn Bridge and chorus girls who flourished electric wands.

The lady in the harbor went electric too. In 1886, when the Statue of Liberty was officially dedicated, its hand was brilliantly illuminated—too much so for mariners, and it had to be toned down—and its base was garlanded with eight-thousand-candlepower lamps. On a more domestic note, a New York Edison vice-president lit up his Christmas tree with incandescent colored globes, creating an instant popular sensation.

Hotels, restaurants, cafes, and shops—all beckoned customers with their radiance. Even shady places opted for the spotlight: Edison personally installed electric lights at Harry Hill’s, and the enterprising “French Madame” screwed bulbs into sockets on her doorstep. Illumination spilled down from the elevateds, which lit up their station platforms. It shone in from luminous Hudson River steamers and the yachts of the Bennetts and Goulds. Electric nights drew throngs of festive boulevardiers to the streets, linking its big-city image indelibly to the bright lights of its avenues. This identification was fixed forevermore with the emergence, in the mid-1890s, of what people began calling the “Great White Way”—a stretch of Broadway between 23rd and 34th streets that began to blaze with electric advertisements. The first large illuminated sign—a fifty-foot-high and eighty-foot-wide display at Madison Square—used fifteen thousand lights, which winked on and off in a sequence controlled by an operator in a shanty on a nearby roof, to trumpet Coney Island hostelry. It was soon superseded by a forty-five-foot-long Heinz (“57 Varieties”) pickle, outlined

in bright green bulbs against an orange background, easily visible a mile away.

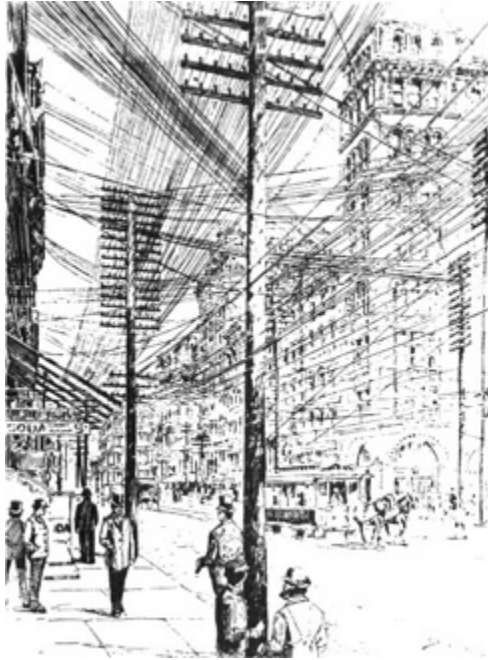

In 1887 Mayor Hewitt declared that nocturnal effulgence had become essential for the “prevention of crime” and the preservation of “the good order of the city.” So quickly had New York grown accustomed to electric street lights that whenever they went off in substantial numbers, extra police were ordered out as a matter of course.

The alacrity with which New York adopted the new technology did have its drawbacks. Most notably it generated a vast and proliferating network of wires that threatened to bury Manhattan. Western Union, Bell Telephone, the Gold and Stock Ticker Company, the Brush, United States, and East River Electrical Lighting companies, the fire department, police department, and private burglarproofing companies who installed alarm systems—all these strung their power lines on poles or across rooftops. As firms rarely deigned to share space, the streets were soon festooned with posts, each between fifty and ninety feet tall, each carrying a dozen to two score crosstrees, each crosstree bearing perhaps twenty wires. Some poles groaned with the weight of two hundred strands.

Increasing numbers of these snapped, dropping writhing live wires to the street below. In 1884 the legislature, impressed by the success of Edison’s underground operations, insisted that all other electrical supply systems be buried as well. The telephone, telegraph, and lighting companies ignored the order. Four years later, the blizzard of 1888 deposited twenty-two inches of snow on the streets and coated the wires with ice, sending them crashing down, terrifying the city. Mayor Grant led an ax-and-nipper patrol around town, slashing at the wire tentacles, but the Brush Company threatened to leave the city, and Jay Gould, now Western Union’s chieftain, got an injunction.

The public’s growing anxiety was heightened by Edison’s war against George Westinghouse, who was promoting “alternating current.” This rival system could be used to transmit power at high voltage from generating stations sited near waterfalls or dams hundreds of miles away, bypassing Edison’s entire patented system of direct current stations, which had to be located near their customers. Edison issued shrill warnings about the danger of high voltage lines, and, in the fall of 1887, when the state legislature asked for his help in inventing a more humane method of execution, he set

aside his opposition to capital punishment and arranged some public demonstrations with test animals—using alternating current. When a competition was held to name the

In response to the huge demand for telephones and electricity during the 1880s, a forest of utility poles sprang up along the streets of downtown Manhattan. (Consolidated Edison)

method, candidates included “electromort” and “electricide” (Edison held out for “Westinghoused”) but in August 1890 a convicted murderer was “electrocuted” for the first time, a bungled job that produced an “awful spectacle.” “They could have done it better with an axe,” Westinghouse said.

In October 1889 a Western Union lineman had been electrocuted on a wire gridiron in the heart of the business district. Thousands watched as the body dangled from overhead lines for nearly an hour, its mouth spitting blue flame. The next day the mayor ordered unsafe wires chopped down. It took another two months for incensed public uproar to overcome corporate legal stonewalling, but finally the poles began to fall. By 1894 there would still be lots to bury, but New York’s Board of Electrical Control announced that millions of feet of wire had been banished belowground and that Manhattan now possessed a sixteen-hundred-mile-long electrical arterial

system from which 6,790 arc lamps, 268,000 incandescent lamps, and nearly ten thousand telephones drew sustenance.

USEFUL AND UNUSEFUL UTILITIES

While working on the electric light, Edison, aware that his generator run in reverse could serve as a motor, took a break from his primary experiments, purchased some secondhand horsecar tracks, and built a model roadbed one-third of a mile long. Then he mounted a twelve-horsepower dynamo on a truck, installed brushes on the wheels to pick up current from the rails, and on May 13, 1879, gleefully rolled along at twenty miles per hour in a horsecar filled with twenty passengers. Railroad companies clamored for Edison to develop his invention, and the president of the Long Island Rail Road offered tracks for testing, but though Edison did work now and then on an electric locomotive, there just weren't enough hours in the day.

It was Frank Sprague, an academically trained electrical engineer who'd worked for Edison then struck out on his own, who invented a superior motor and installed it successfully in Richmond, Virginia. In the late 1880s Sprague electrified New York's Fourth Avenue street railway line between the post office and 86th Street. In the 1890s, driven by competition, first the Third Avenue line and then the Metropolitan Street Railway Company began the enormously expensive process of switching their motive power. The Manhattan Company, however, under Gould, Sage, and Morgan, refused to follow suit. Sprague had successfully tested a system for electrifying New York's elevateds back in 1886, but the complacent monopoly proved no more willing to invest in installing the requisite six-hundred-volt third rail than they were in relieving crowding. The Manhattan would stick with steam into the next century, nearly a decade after Chicago had junked its heavy and dirty steam engines.

Brooklynites' problem was not corporate recalcitrance but excessive zeal. Brooklyn streetcar companies, not hampered by Manhattanites' abhorrence of high wires, strung power lines above their tracks. The first conversions were completed in 1890, and within five years trolleys had almost completely replaced horsecars throughout the city, an extremely mixed blessing. Horsecars clopped along at six miles per hour. Electric cars could hurtle through streets at a terrifying thirty miles per hour, carrying three times the number of passengers, but though they had the weight and

power of locomotives, their brakes were still those of a horsecar. Worse, companies set out to maximize profits by increasing the number of trips required for drivers to earn their daily wage, forcing them to careen through streets at near maximum speed. The result was carnage. By 1895 trolleys had killed 105 and maimed 407, most of them children, and become a symbol of random death. Calls for the municipalization of transit companies would grow steadily.

There were calls as well for the municipalization of the power supply. Once bourgeois neighborhoods and homes were wired, street and domestic lighting in Manhattan diffused at glacial pace because electric lighting was treated as a commodity, not (as in some European cities) a subsidized public service. Poor streets and outlying areas like Harlem would remain gas-lit until well into the twentieth century, and a blend (in William Dean Howells's words) of "the moony sheen of the electrics mixing with the reddish points and blots of gas" would long characterize the Manhattan nightscape. Working people couldn't afford electricity in their houses—a bulb alone cost a dollar, half a day laborer's wages—or gas either: kerosene lamps remained their mainstay for illumination, and kerosene or coal stoves served for cooking and heating.

Gas itself grew more expensive as the industry grew less competitive. During the 1880s Manhattan's many gas companies, panic stricken at the arrival of electricity, moved to conglomerate their operations. Primacy of place was seized by the Consolidated Gas Company (1884), a holding company organized by H. H. Rogers of Standard Oil, with backing from William Rockefeller and National City Bank. Consolidated Gas gained sufficient complete control of the marketplace to jack up prices— 25 percent in 1885 alone—and deliver poorer quality gas, while paying high dividends on wildly overcapitalized stock. William Rockefeller also gained a power base in Brooklyn's gas industry, and once again the price went up and the product declined.

Substantial gas users such as hotel owners grew increasingly restive at the steady monopolization of the industry. Establishing a Gas Consumers Association, they called for the state legislature to investigate the situation; the resulting report denounced rampant stock watering and excessive profit-taking. In 1886 the state passed a bill lowering the maximum price from \$1.75 to \$1.25 per thousand cubic feet, though a reputed seventy thousand

dollars in gas company bribes spread around Albany warded off threats to Consolidated itself. Gasmen proved unable to freeze out powerful new competitors, however. In 1894 the New York and East River Gas Company (1893) built a tunnel under the East River from Long Island City, permitting delivery of Ravenswood gas to Manhattan, and both Russell Sage and J. P. Morgan weighed in with new companies. Outfits like these exerted sufficient pressure to lower prices enough to satisfy big users, and the issue of gas reform was taken off the table.

Morgan achieved a clearer preeminence in electricity than the Rockefellers did in gas. In May 1889 Henry Villard set about consolidating Edison's various American properties into a new Edison General Electric Company, capitalized at twelve million dollars. The initial stock offering, handled by Drexel, Morgan, was parceled out among various German and American banking concerns, and Morgan became the major investor in his own right. The merger provided Thomas Edison with enormous sums to run his laboratory—and to improve his living standard: he leased a Gramercy Park mansion, bought a yacht, and expanded both his investment portfolio and waistline.

In 1890 Edison General president Henry Villard set out to end what he considered the “ruinous competition” between his company and the other major players in the new electric universe. Villard first worked out a price-fixing agreement, but it was nullified by the Sherman Anti-Trust Act. He then tried to persuade Edison to merge with his enemies, but Edison objected that “no competition means no invention.” Events were no longer in the Wizard's control, however. Morgan arranged a grand consolidation that in November 1892 pulled rivals together into General Electric, more popularly if less affectionately known as the Electric Trust. A scant fourteen years after Edison had invented a practical electric light, General Electric and Westinghouse between them had swallowed all competitors and controlled the market in generating equipment, transformers, meters, motors, and lighting apparatus. Edison, distraught at his loss of control and the obliteration of his name, announced he would “not be held responsible for the acts of an organization in which my voice is but one amongst a great many.”

Capital-intensive electrification helped make the old republican competitive free enterprise order seem hopelessly inefficient and quixotic,

as the AC-supplied electric grid made feasible ever bigger generating stations for the centralized supply of power. The financial grid would make entrepreneurial autonomy seem equally outmoded and facilitate the concentration of economic power in a handful of centralized financial institutions.

Electrification-cum-corporatization would also force the issue of how vital city services were to be delivered onto the metropolitan agenda. Should energy provision remain in private and largely unregulated hands, to be distributed to citizens on the basis of their ability to pay? Or should the city and state again become more active agents in the production and distribution of social goods, the model New York had followed in the development of its water and canal systems? And if so, would countering private corporate power perhaps require the metropolitan area to construct a civic grid, connecting the various independent political constituencies scattered around the harbor? These were murky issues, and it would take more than an Edison to illuminate them.

Châteaux Society

In the winter of 1883 Mrs. William Kissam Vanderbilt, born Alva Smith of Mobile, launched an assault on New York Society's inner circle—still presided over by Caroline Astor and Ward McCallister—by announcing a fancy dress affair intended to eclipse the Patriarch's Balls over which the reigning duo presided. The Vanderbilt fete would inaugurate the new château, at Fifth Avenue and 52nd Street, that she and her husband had commissioned from beaux-arts master Richard Morris Hunt, expressly to outclass the brownstones lower down the avenue.

Hunt had long been wishing New Yorkers would take an architectural leap forward. Now, with three million dollars at his command, he showed them how to do it, producing a palatial residence that, in the opinion of the *Times*, went way beyond anything “heretofore attempted in New York.” Well aware how mock-castles like Chambéry and Chenonceaux had delighted the parvenu bankers and merchants of the Renaissance, Hunt erected an adaptation of Francis I's sixteenth-century Château de Blois, filled it full of Renaissance and medieval furniture, tapestries, and armor, and had it ready for Alva's ball in 1883.

The city's elite gave itself over to a flurry of preparations. A hundred-plus dressmakers labored night and day for weeks. Groups of young women practiced “quadrilles”—complex dance presentations—among them Miss Caroline (Carrie) Astor and her friends, who planned to appear as pairs of stars. As daughter of the Queen of Society, she simply assumed, rashly, that her invitation was on the way.

It was not. As the magic night of March 26 approached, Mrs. Vanderbilt casually let it be known that no invitation would be forthcoming for the charming Miss Astor as, alas, she had never properly made her acquaintance, or that of her mother. The queen surrendered forthwith. A footman in Astor-blue livery was dispatched from the 34th Street mansion to deliver, a mile up Fifth Avenue, an engraved calling card to a servant in Vanderbilt-maroon livery. With her arrival in society thus duly certified,

Alva Vanderbilt authorized a return delivery of the last of the twelve hundred invitations.

The affair, as every New York paper blared in front-page next-day stories, was the grandest social event to date in the city's history. The barely completed halls and rooms, lined with roses, orchids, palm fronds, and bougainvillea, had been transformed into a tropical wonderland. The Louis XV salon was resplendent with Gobelin tapestries, and wainscoting ripped from old French châteaux. The triumphant hostess, costumed as a Renaissance princess, welcomed her equally gorgeously attired guests—including an array of Mary Stuarts, Marie Antoinettes, and Queen Elizabeths; her brother-in-law Cornelius was dressed as Louis XVI, but his wife, more au courant, came as The Electric Light. Alva presided happily over a spectacular dinner and a round of dancing. Many gave highest accolades to Mrs. S. S. Howland's group for their Hobby-Horse Quadrille, in which the dancers appeared mounted on life-size model horses made of genuine hides, but Mrs. Vanderbilt perhaps warmed most to the graceful moves of Carrie Astor's Star Quadrille.

FROM THE FOUR HUNDRED TO THE TWO THOUSAND

By her grudging accommodation of Vanderbilts and other new Medici, Mrs. Astor preserved her hegemony for another decade. She became, in fact, something of a national institution. Over the next years, as the country followed with awe (or outrage) the shimmering doings of New York Society, Mrs. Astor's verdicts and edicts as conveyed by the press—her remarks invariably couched in the third person—enthralled readers from coast to coast.

With the assistance of her chamberlain, Ward McCallister, she sustained, for a time, an unfortunately enlarged but still acceptably exclusive inner circle. In 1888 McCallister opined to a *Tribune* reporter that the core group was in fact small enough to fit comfortably into Mrs. Astor's ballroom: "Why, there are only about 400 people in fashionable New York Society. If you go outside that number you strike people who are either not at ease in a ballroom or else make other people not at ease. See the point?" This pronunciamento created something of a stir and led to rampant speculation about who was (or was not) included on the gilded list of "the Four Hundred." Finally, on the occasion of Mrs. Astor's ball of February 1, 1892,

McCallister issued a more precise inventory to the *New York Times*. It contained a mere 273 names, drawn mostly from the community of Patriarch's Ball invitees.

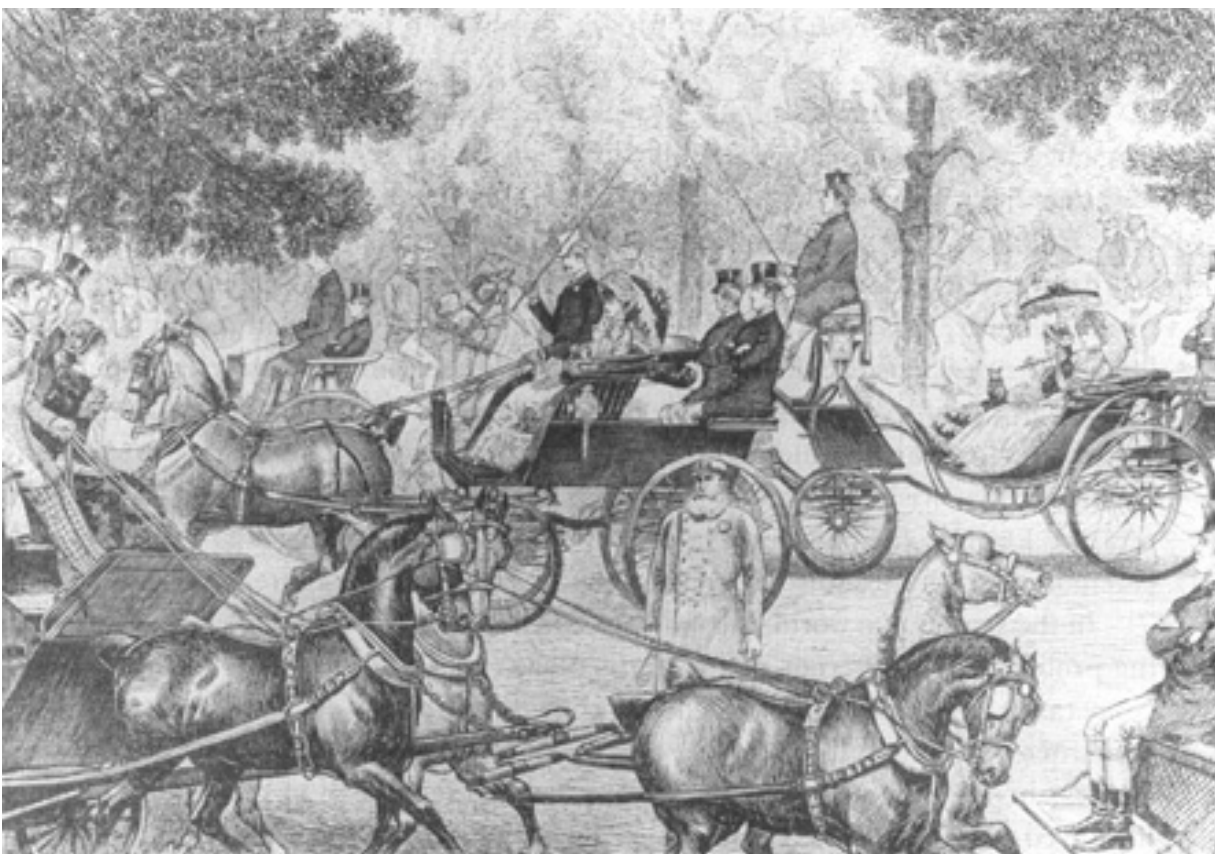

Wealthy would-be socialites denounced this magisterial accounting with all the fervor of populists attacking railroad pools, and in a sense naming the Four Hundred was an attempt to create a Social Trust. But the ranks of the wealthy, augmented by millionaire arrivistes from around the nation, had swelled far beyond the bounds of Mrs. Astor's ballroom. As in the larger economy, competitive forces proved too fierce to be contained by informal mechanisms that had worked for generations.

Mrs. Astor's regime began to come unglued. Powerful rivals carped, mocked, and rejected her rule. Mrs. Burton Harrison, in 1895, said flat out: "I am an unbeliever in the body corporate which, for want of a better term has come to be popularly known as the Four Hundred of New York." Fortunately another mechanism had evolved as a way to delineate a Society now clearly numbered in the thousands, not the hundreds.

Maurice M. Minton, an enterprising blueblood, had pointed the way by printing up his mother's visiting list and merging it with another to form the *Society-List and Club Register*. In 1887 this example, and that of the recently introduced telephone directory, inspired Louis Keller to launch *The Social Register*. Keller, independently wealthy (though just barely), had his eye on more remunerative possibilities. With the support of friends at the Union and Calumet clubs, he assembled a list of nearly two thousand socially prominent names and printed it up as a handsome book with orange and black binding. To make it indispensable, he included addresses, telephone numbers, maiden names, wives' names by previous marriages, clubs, colleges, places of summer residence, and names of yachts—everything one needed to keep up with old friends and screen potential new ones. (To get the lowdown on highbrow enemies, one could also turn, after 1885, to the pages of *Town Topics*, a Society scandal sheet that tattled about upcoming divorces and impending bankruptcies, using information secured from Fifth Avenue butlers and chambermaids. Fortunately one could forestall the display of dirty laundry by bribing the editor into discretion.)

With the advent of *The Social Register*, dictatorship gave way to an accommodating bureaucracy; now thousands could make the social grade. But with outspending one's rivals the only definitive route to preeminence,

a steady inflation in extravagance ensued as members of opposing cliques scrambled to convert Wall Street revenue into Fifth Avenue social standing. Dinner parties corkscrewed upward in lavishness—black pearls in oysters, cigars rolled in hundred-dollar bills, lackeys in knee breeches and powdered wigs. These glittering affairs attracted platoons of elegantly attired jewel thieves, whose takings were kept to a minimum by equally nattily dressed police detectives supplied by Inspector Byrnes, the same man whose Dead Line cordoned off Wall Street by day.

The Drive-Central Park-Four O'Clock, from *Harper's Weekly*, May 19, 1883. Upper-class New Yorkers still regarded an afternoon drive in the park as an opportunity to see and be seen, but ascertaining who belonged to “society” was becoming increasingly difficult. TO THE OPERA HOUSE

The social wars raged as fiercely on the male side, though here the front line ran through the opera house. Old-guard families had undergirded their position by cornering the market on Academy of Music boxes. From these seemingly secure perches, Bayards and Beekmans, Cuttings and Schuylers, and a few properly patinaed former upstarts like August Belmont had peered down contentedly on tycoons in the seats below. When William H. Vanderbilt offered a whopping thirty thousand dollars for a box in 1880, the old set snubbed him as they had his father, the Commodore, before him.

Vanderbilt embarked on a grand flanking movement. First he gathered together a formidably monied strike force, including many of the most powerful figures in the emerging corporate economy—his sons William Kissam and Cornelius II, J. P. Morgan, William Rockefeller, Jay Gould, William C. Whitney, George F. Baker—as well as some older patricians like Ogden Goelet, Adrian Iselin, and William Rhineland. Then Vanderbilt announced they would construct a new opera house, as grand as those of Milan and Vienna, and eclipse the 14th Street bastion forevermore.

Belmont and company panicked and offered to add twenty-six boxes to the Academy's existing eighteen, but it was too late. Way uptown, at Broadway and 39th Street, a mammoth edifice slowly took shape, the grandly named Metropolitan Opera House, capable of seating over thirty-six hundred people, and accommodating wealthy patrons in *seventy* opulent boxes. On opening night, October 22, 1883, with *Faust* as the inaugural performance, these were packed with opera lovers whose collective worth was estimated at \$540 million. "The Goulds and the Vanderbilts and people of that ilk," wrote the *New York Dramatic Mirror*, "perfumed the air with the odor of crisp greenbacks."

The Metropolitan was an instant triumph. The doomed Academy of Music hung on gamely a few more years, then folded with an announcement from its manager that "I cannot fight Wall Street." Musically its early years were somewhat shakier. To fill the huge hall, the Metropolitan called on Leopold Damrosch, a devout Wagnerian. Damrosch devoted the 1884 season almost entirely to German opera. Singers were imported from Bayreuth. This appealed to the city's massive German population, but boxholders loathed the new music, couldn't see one another's finery in the Wagnerian gloom, and bustled and gabbled throughout the performances. When rebuked by the Germans below, the

directors maintained that the stockholders had a perfect right to disturb whomever they wished. Conductor Anton Seidl, who had assisted Wagner at Bayreuth, replaced Damrosch on his death in 1885 and maintained the German program for several more years, until a full-scale revolt brought back Italian and French opera.

In the symphonic world, musically inclined industrialists and financiers were having problems of a different sort with the New York Philharmonic. The old German cooperative presented only half a dozen concerts each year. As the orchestra couldn't guarantee members full time work, they spent most of their time playing at balls and dances; hence their performances were less than highly polished, though much improved after Theodore Thomas was taken on as conductor. Neither their less than professional standards nor traditional repertoire bothered old-fashioned elites, but both failed to satisfy new tycoons. A capitalist combine including Vanderbilt, Rockefeller, Morgan, and Carnegie underwrote a rival, the New York Symphony Orchestra (1878), another Leopold Damrosch project. Orchestra war ensued. In one notable sally Damrosch stole the American premiere of Brahms's First Symphony from under Thomas's nose.

On Leopold's death in 1885, his son Walter succeeded to Symphony leadership, and the younger Damrosch convinced Andrew Carnegie that what the group needed was a permanent home—the Metropolitan Opera House being inadequate for orchestral performances. Carnegie agreed to support construction of a first-class concert hall. On May 5, 1891, a vaguely Italian Renaissance structure—including the velvet-lined, acoustically superb Music Hall, as it was then known—opened at another untraditionally uptown venue, Seventh Avenue and 57th Street. Nestled in their boxes, subscribers Whitney, Rockefeller, Frick, and, of course, Carnegie himself heard Episcopal Bishop Henry Codman Potter say that while in European countries culture often depended on state patronage, “it is a happy omen for New York that a single individual can do so princely a thing.” Then they and their guest of honor, Pyotr Ilich Tchaikovsky—the symphonic giant had been lured by Carnegie with a fee of twenty-five hundred dollars—listened to Walter Damrosch and the New York Symphony Orchestra inaugurate a five-day festival.

New money thrust its way into the world of men's clubs with equal dispatch. In this case it was the Union Club—the city's most prestigious—

that gave offense. Patrician members had opened its exclusive doors just enough to allow a few newly monied to squeeze inside, but the rate of access was far too slow for those clamoring to be admitted. This time it was J. P. Morgan who assembled the group of *refusés*. Again, a new edifice was built, a regally scaled Italianate structure. Again, the newcomer was grandly titled the Metropolitan. And again, its backers situated the building, which opened in 1894, far uptown from the center of established clubdom—at Fifth Avenue and 60th Street.

CHÂTEAUX COUNTRY

Hunt's château for the Vanderbilts proved an epochal success. Previous elites had rejected efforts, by A. T. Stewart and Leonard Jerome, to break the brownstone mold. But the eighties' elite loved the Vanderbilt mansion's scale, materials, and ornate sensuousness. They hailed it as a liberation from what their own Edith Wharton would call New York's "mean monotonous streets," lined with buildings "of a desperate uniformity of style" and a "universal chocolate-coloured coating of the most hideous stone ever quarried."

Not all the elite was swept off its feet, to be sure. In 1882 J. P. Morgan was making a decent half million a year and could well have afforded something ostentatious. But Morgan despised fashion and vulgar display (except in yachts) and opted for a brownstone at Madison and 36th, in the no longer cutting-edge Murray Hill. And when the staunchly Baptist John D. Rockefeller arrived in town, he too settled in a brownstone, albeit one within blocks of the Vanderbilt château.

Nevertheless, Hunt would be kept busy until the day he died fashioning urban mansions for the rich, and their homes away from home as well. During the late 1880s and 1890s—as the elite fled Saratoga for Newport—Hunt constructed colossal summer places for them, like the Marble House for William Kissam Vanderbilt, and the Breakers for his brother Cornelius II. Indeed so great was the flow of commissions from avid haute bourgeois househunters that it begat a whole new generation of New York architects, of whom perhaps the most influential were Stanford White and Charles McKim.

McKim studied at the Ecole des Beaux Arts in 1867-70, came back to work in H. H. Richardson's New York office, then drifted out of Richardson's Romanesque orbit into that of Hunt's Renaissance. When the Vanderbilt 52nd Street château went up, it seized his imagination; he got into the habit, he later recalled, of walking up Fifth Avenue late at night to admire it and "always slept better for enjoying the sight." But even during the 1870s McKim had begun designing town houses in what was coming to be called the Queen Anne style, based loosely on English Renaissance sources. He also came to love the architecture of England's American colonies—McKim was among the first to appreciate eighteenth-century vernacular buildings—and he held in high regard the civic decorum and classical orderliness of New York's Federal structures.

Stanford White traveled a similar trajectory. Born in New York in 1853, he grew up in the city's artistic and reform community. His father, Richard Gant White, was a cosmopolitan essayist who penned articles on music, art, literature, the stage, and English life and manners for the *Galaxy*, *Nation*, and *Century* magazines. The elder White was also a friend of Calvert Vaux and Frederick Olmsted. It was through Olmsted that young White got an apprenticeship in Richardson's firm in 1872, replacing McKim, who had opened his own firm in collaboration with William Mead. Seven years later, White joined the other two, and the trio of McKim, Mead, and White would dominate New York's architectural scene for the next generation.

The firm, a brilliant combination of talents, was described as a vessel of which McKim was the hull, White the sails, and Mead the rudder and anchor. McKim, who styled himself "Bramante," produced restrained, fine designs. Mead organized the staff along the same lines as the other corporate and professional headquarters then going up in Manhattan, and by 1892, with 120 draftsmen, it was the largest architectural office in the world. White provided drama and flair—both in his work and his personal life—and brought in most clients.

White, the self-styled Benvenuto Cellini of the profession, was indeed a renaissance man. Apart from his architectural work, he painted, designed furniture and jewelry, collected antiques. He was also a man-about-town—he loved making a grand entrance at the opera in cape and red mustache—and was a vigorous, not to say ubiquitous clubman. His various memberships allowed him to mingle with moguls and pull in commissions

from Knickerbockers and nouveaux riches alike. The firm's list of clients included Astors, Fishes, Goelets, Morgans, Pulitzers, Stuyvesants, Vanderbilts, and Villards.

McKim, Mead, and White didn't monopolize the field; they shared it with a formidable array of practitioners—including William Ware, Richard Upjohn, James Renwick, LeBrun, and others who formed, in 1881, the Architectural League of New York, seeking to elevate their skills to *Ecole des Beaux Arts* standards. Devoted to European models, many used books of photographs they had snapped on their grand tours to convince clients of the accuracy of their imitations. No stylistic consensus emerged; rather the new generation ransacked all European history.

The Vanderbilt-Hunt collaboration inspired, and the eighties' upturn made feasible, a building boom in town houses. Even the mid-1880s recession spurred construction, as investors frightened by chaos in the stock market shifted their capital into real estate. Soon upper Fifth was chock-a-block with millionaires—Harry Payne Whitney, Charles Harkness, Jay Gould, Collis P. Huntington, Benjamin Altman, Robert Goelet, Solomon Guggenheim, Russell Sage—and even the Astors, followers now rather than leaders, abandoned lower Fifth. The queen had Hunt build her a white French Renaissance palace at 65th Street, where she lived out the closing years of her reign. William Waldorf Astor sidled northward to a cream-colored Touraine château at the corner of 56th, three blocks south of the great complex of luxury skyscraper hotels clustered around 59th that included the Plaza, the Savoy, and his own seventeen-story New Netherland Hotel.

Fifth Avenue north from 65th Street, 1898. The château that Hunt designed for Caroline Astor stands on the near corner, anchoring a line of mansions that stretches uptown as far as the eye can see. (© Museum of the City of New York)

Some plutocrats pressed slightly eastward, to Madison Avenue, though not so far as the newly (1888) and misleadingly renamed “Park” Avenue, still fatally blemished by ventilation holes belching smoke and steam from the trains below. In 1882 McKim, Mead, and White started on a complex—between 50th and 51st, just behind the recently opened St. Patrick’s Cathedral—of six town houses grouped around a court. Their client, railroader Henry Villard, got a monumental Italian Renaissance structure, based on the Cancelleria in Rome, outwardly austere, richly embellished on the inside. Unfortunately for Villard, as the buildings were going up he was suffering career reverses. During the 1884 panic he moved into the

unfinished house, hoping to save on hotel bills, but angry crowds besieged him there, as they hunted down Ward and Fish elsewhere in the city. After a few weeks Villard moved out, never to return, and in 1886 he sold the complex to *Tribune* publisher Whitelaw Reid.

The Seventh Regiment's new armory at 66th Street facilitated elite expansion into heretofore drowsy Lenox Hill. The French medieval-style fortress (with elegant interior for the unit's social functions designed by White and Louis Comfort Tiffany) guarded against the concentration of working-class Germans and Irish stretching from Third Avenue down to the East River, providing a sense of security for the northward-streaming rich. Elegant mansions went up, interspersed with rows of individualized Queen Anne town houses sporting facades with square and polygonal bows and bays, and oriels of every shape.

Lenox Hill remained Society's outer periphery until the 1890s, when mansions advanced up Fifth to Prospect Hill, encouraged by the new Eighth Regiment Armory (1894) on Park Avenue between 94th and 95th, which bulwarked the area against laboring masses to the east. Even so, only a handful of the wealthy—chiefly Germans like the Rupperts, Untermeyers, and Ehrets—braved such proximity to the tenement world.

Not everyone in *Châteaux Country* could afford a grand-scale mansion, and some who could afford luxurious-but-not-magnificent accommodations found the cooperative apartment house an appealing alternative. In 1880 Philip G. Hubert, a French emigré architect, organized his first Hubert Home Club, a device for allowing “gentlemen of congenial tastes, and occupying the same social positions in life,” to buy shares in a joint stock company, which then bought land and erected an apartment building. Each cooperator got a perpetual lease to an apartment, its size dependent on how much he put in (costs ranged from ten to fifty thousand dollars). Each was assessed a share of the combined operating expenses: taxes and insurance, light and heat, janitors and elevator boys. Each got the right to approve, together with other leaseholders, the mere tenants to whom some suites were rented in order to pay off the mortgage.

The cooperative apartments of the 1880s, as well as those raised wholly by speculators for rental purposes, were a cut above the French Flats of the previous generation. They were huge—eight to twelve stories in height, as tall as or taller than most downtown skyscrapers. They were elaborate,

châteauesque, awash in turrets and gables. The suites, which could include as many as twenty rooms, came with the parlors and reception rooms that guaranteed cachet. They offered all sorts of conveniences, grand public spaces and courtyards, dining facilities, and building staffs that, as *Harper's* noted in 1882, allowed families to make do with half the usual number of servants.

Luxury apartments tended to cluster in or near already affluent areas and to bear distinguished-sounding names. There was the Gramercy (1883) at Gramercy Park, the Berkshire (1883) on Madison at 52nd behind St. Patrick's, and the Chelsea (Hubert's most popular project), an immense, red-bricked, multigabled cooperative on West 23rd near Seventh Avenue.

The densest concentration, however, lay just south of Central Park. Hubert's first Home Club, the Rembrandt, went up on West 57th Street in 1882, next to the future site of Carnegie Hall. Nearby were the Plaza at 59th Street, the Osborne Apartments at Seventh and 57th, and the grandest of them all, completed in 1885, the Central Park Apartments (a.k.a. the Navarro Flats, after their builder) at Seventh and 59th. From a distance the Navarro appeared a single Moorish mass of turrets and dormers. In fact it consisted of eight ten-story personalized towers, each with its own entrance and name (Granada, Valencia, etc., hence yet another nickname, the Spanish Flats), all of them wrapped around a tremendous courtyard filled with trees, flowers, and fountains. Each apartment had its own floor; most had views of Central Park. It was by all accounts the largest and most elegant apartment house in the world.

The *Real Estate Record and Builders' Guide* called these behemoths "tenements of the rich," and with the cost of ground and building easily topping a million dollars, most cooperative shareholders were among the city's most affluent. But very well off professionals and managers could handle the rental prices: a ten-room in the Spanish Flats could be had for eighteen hundred dollars a year, and the Chelsea, which rented out thirty of its ninety apartments, embraced an even wider spectrum of tenants.

There was, however, another alternative for venturesome members of the "comfortable bourgeoisie": the "American Belgravia" of the Upper West Side. In 1879 Edward S. Clark, the Singer Sewing Machine magnate now branching out into real estate development, read his paper entitled "The City of the Future" to members of the West Side Association. Clark argued

that pulling the right sorts of people northward required a mix of single-family homes and some truly striking apartment houses, where “the principle of economic combination should be employed to the greatest possible extent.”

Clark delivered the latter in grand fashion in his Dakota Apartments (1884). “Dakota” was synonymous with distance and wealth—gold having been discovered in the far-off territories in the 1870s—and Clark’s monumental Renaissance palace, looming over Central Park at 72nd Street in splendid isolation, embodied both. The nine-story structure by Henry Hardenbergh boasted a *cour d’honneur* manned by a concierge and an interior courtyard large enough to accommodate a carriage turnaround. Occupants of the fifty-eight suites (which ranged from four to twenty rooms) had access to hotel-style amenities, a wine cellar, a large dining room for private parties, and additional rooms under the mansard roof for Irish cooks and coachmen. It was fully rented by the day of its completion, peopled not with millionaires or fashionables (not a single tenant made the *Social Register* in 1887) but prosperous professionals and businessmen, many of them associated with the arts.

The Dakota Apartments, from *Frank Leslie's Illustrated Newspaper*, September 7, 1889. As affluent residents flocked to the West Side, the shanties quickly disappeared. (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

The Dakota fixed the West Side's character not only in spawning a rash of westernnamed buildings—the Wyoming, Yosemite, Nevada, and Montana—but in helping draw the affluent to town houses that went up along the avenues (some with suitably upgraded names: Eleventh became West End Avenue in 1880; Eighth became Central Park West in 1883). No chocolate brownstone uniformity here, but rather individualized, eclectic, historical styles, jumbling together Jacobean, French Gothic, and Dutch Renaissance. Indeed McKim, Mead, and White touched off a Dutch Colonial revival in 1885, with their row houses on West End and 83rd, and soon the area resembled a new New Amsterdam. Better still, by 1893 (*King's Handbook of New York City* reported)—while the Four Hundred were not in evidence—the West End locale had become “to a certain extent fashionable,” so much so that “even society countenances it.”

MANHATTAN RENAISSANCE

To decorate their interiors—the term “interior decoration” dates from the late 1870s—the wealthy patronized local artists as well as local architects, commissioning craftsmen to design walls, windows, and woodwork. The flood of orders fostered formation of a small, interlocking network of artists whose work gave luster to the city's, and the elite's, cultural reputation. Indeed the rich generated such a swirl of activity that they half convinced themselves, in the words of one artist, “that the days of the Italian Renaissance were revived on Manhattan Island.”

The Vanderbilts, again, were among the foremost patrons, with Cornelius II assembling a platoon of artists to decorate his mansion. For glasswork he turned to John La Farge. The New York-born son of a cultivated French family, La Farge had studied in France, where he'd been inspired by impressionists, Japanese prints, and stained glass. On his return he invented (and patented) an opalescent glass and produced fabulous windows and ceiling panels. For sculptural details Cornelius turned to La Farge's friend and collaborator, Augustus Saint-Gaudens. Son of a French father and Irish

mother, Saint-Gaudens too was brought up in New York, where he studied at Cooper Institute before attending the Ecole des Beaux Arts, and now provided Vanderbilt with Renaissance ornamental motifs.

Vanderbilt also employed the firm of Associated Artists, formed in 1879 by Louis Comfort Tiffany. Tiffany's atelier was a mix of Renaissance workshop and corporate headquarters. Each partner had his own department—fabrics and wallpapers, carving and wood decoration, textiles and embroideries—the whole presided over by the master. Tiffany also ran the glass department and, like La Farge, patented novel production processes. These craftsmen, following the path of contemporary professionals, formed their own organizations (like the Society of Decorative Art, 1877), their own social groups (like the Tile Club, 1877), and their own schools and periodicals.

In fact, however, Manhattan Medici imported the bulk of their artwork from Europe, turning to professional art consultants to certify their purchases. Among the most prestigious were Joseph and Henry Duveen, English-based importers of antique porcelain. Sensing a lucrative market opening up in New York, the Duveens started a branch operation in Manhattan. Henry brought over high-quality porcelain, silver, tiles, and tables, and business began to click the day Stanford White wandered into the store. White introduced Duveen to his wealthy friends, notably J. P. Morgan, then in the market for tapestries to cover the vast walls of his new mansion and furniture to cover its floors. Happily for all concerned, rich aristocrats were junking tapestries left and right, in favor of William Morris wallpaper, and clearing out their old armor and furniture. Joel stripped and shipped noble interiors to Henry's Fifth Avenue offices, and Henry cultivated new clients, like department store magnate Benjamin Altman, whom he began assisting in 1888.

In the world of painting and sculpture, would-be collectors had, until the mid-1880s, turned to local dealers like Michael Knoedler, Jean-Baptiste Goupil, and Samuel P. Avery, whose styles tended toward the private and personal. The boom years changed all this, generating a vigorous and highly visible art market pioneered by Thomas Kirby, an art auctioneer of long standing. Kirby's profession, like advertising, had a somewhat shady reputation, which may account for his invariably impeccable appearance: wing collar, cutaway morning suit, and clipped, pointed imperial beard. In

1883 Kirby joined forces with two men who ran an art gallery on the south side of Madison Square, transforming it into the American Art Association (AAA), a salon “for the Encouragement and Promotion of American art.” When his 1887 sale of the late A. T. Stewart’s collection fetched over half a million dollars, the AAA was firmly established as the city’s foremost marketplace for sales of fine art, antiques, rare books, and jewels.

For all Kirby’s talk about the “Promotion of American art,” however, he and his buyers were fixated on Europe. But within those parameters he was willing to take some chances. In 1886 the AAA arranged to have the famous dealer Paul Durand-Ruel send over 289 works of modern French art. The first massive French impressionist show in the United States included oils by Renoir, Manet, Degas, and Pissaro, among many others. The New York press was underwhelmed—“Is this Art?” asked the *Times*—but the perceptive Durand-Ruel found New Yorkers were far more open to his painters than Parisians had been at first, and the following year he opened his own gallery at 297 Fifth. Impressionist collectors like Louisine and Henry Osborne Havemeyer—awash in Sugar Trust money—soon proved him right, and New York became established as modern art’s portal to America.

PORK INTO PORCELAIN

In March 1880 President Hayes joined frock-coated trustees, and their wives in silk dresses, in dedicating the Metropolitan Museum of Art’s new building. To reach the entrance of Calvert Vaux and Jacob Wrey Mould’s barnlike, red brick structure, guests had to troop along a boardwalk that ran from Fifth Avenue to the main entrance on the building’s west side. Once they were settled, Joseph C. Choate, one of New York’s leading corporate attorneys, addressed the distinguished conclave.

He stressed the civic purposes of the new museum. It would not, as in Europe, be a plaything for wealthy connoisseurs—a “mere cabinet of curiosities which should serve to kill time for the idle”—but rather a democratic institution that by its “diffusion of a knowledge of art in its higher forms of beauty would tend directly to humanize, to educate and refine a practical and laborious people.”

Choate also pointed to the benefits awaiting the museum's patrons. New York's rich could gain personal immortality by converting some of their fortunes—transient and perishable in any event—into a more permanent legacy. Wall Street, he enthused, should “convert pork into porcelain, grain and produce into priceless pottery, the rude ores of commerce into sculptured marble, and railroad shares and mining stocks—things which perish without the using, and which in the next financial panic shall surely shrivel like parched scrolls—into the glorified canvas of the world's masters, that shall adorn these walls for centuries.”

Choate's stress on public benefits was politic. The museum, though privately owned, had been built with municipal largesse, including the parcel of Central Park on which it sat and the half-million dollars that had paid for its construction. But while director Luigi Cesnola believed the museum a source of “civilizing, refining, and ennobling influences,” the *Tribune* suggested that “from the very beginning it has been an exclusive social toy, not a great instrument of education.”

The Met had developed a snobbish reputation, in large part because most of the public couldn't get in. On Sunday, the one day the purported audience of working-class citizens could attend, the doors were shut fast by a board of trustees dominated by stoutly Sabbatarian Presbyterians. As early as 1881 ten thousand petitioned the Department of Parks to force the Met to open on Sundays, an appeal supported by almost every paper in the city and by reformers who argued that the museum could aid the “struggle against gigantic vices” by allowing access to its uplifting precincts. The Met trustees held firm for a decade, caving in only when the state legislature threatened to block a proposed North Wing expansion. On the first open Sunday, May 31, 1891, twelve thousand came, and Sunday remained the institution's most popular day ever after.

The museum nevertheless continued to cultivate wealthy art collectors, whose donations were a crucial source of accessions, and their artistic preferences shaped the museum's collections. William H. Vanderbilt liked sugary canvases of landscapes, allegories, and scenes of the wealthy at leisure, like the aptly titled work by Erskine Nicol called *Looking for a Safe Investment*. Henry Gudron Marquand, who had made a fortune in real estate, banking, and railroading, assembled an important collection of Van Dycks, Rembrandts, Hals, and Vermeers, which, when lent to the Met in

1888, instantly put the institution in the forefront of American museums. Most art that reached the museum was safely conventional in style and subject. At one point a group of young turk trustees pushed for including some of the impressionists, but the revolt on behalf of “advanced canvases” was put down by an old guard led by Marquand, Dodge, Rhineland, and (trustee since 1888) J. P. Morgan.

So far as local painters were concerned, the Manhattan Medici were at best lukewarm patrons. Director Cesnola dismissed complaints by New York artists unrepresented in the Metropolitan as crassly self-interested men who wanted the museum to be “a kind of marketplace where their works were to be sold at exorbitant prices and permanently exhibited as their professional advertisement.” This dismissal—a sharp contrast to their underwriting of decorative artists—was the odder because many youthful painters were producing just the kind of academic work that moguls seemed to favor. Yet the elite passed them by, preferring to patronize the London-based John Singer Sargeant, who in 1887 began painting full-blown portraits in New York City.

The truly unconventional did worst of all. One of the founding members of the Society of American Artists—a breakaway group from the National Academy of Design—was Albert Pinkham Ryder, a red-bearded, dreamy-eyed visionary. Ryder had begun his art career in the customary way, studying at the National Academy and setting up a studio near Washington Square. But after 1880 he was drawn to New York’s “nightbird” tradition, best exemplified by Poe, and his canvases veered toward the romantic, the mysterious, even the sinister. He loved to walk around the city at night, soaking up the effects of moonlight on clouds, though his work never dealt with metropolitan “reality” in any but the most mediated way. Ryder was ignored by critics and public alike.

MAKING HISTORY

In the mid-1870s, as de facto editor of the *New York Sketch Book of Architecture*, Charles McKim reprinted images of old Manhattan treasures, especially Mangin and McComb’s City Hall, which he called the “most admirable public building in the city.” In revaluing the city’s built remains, McKim helped fashion a turn toward the past, one that particularly appealed to old Knickerbocker and mercantile families who couldn’t muster the

financial resources for the social arms race. “Life here,” rued Frederic J. DePeyster in the early 1890s, “has become so exhausting and so expensive that but few of those whose birth or education fit them to adorn any gathering have either strength or wealth enough to go at the headlong pace of that gilded band of immigrants and natives, ‘The Four Hundred.’”

There were, of course, many old-timers who could well afford to “go the pace.” Descendants of Knickerbockers and merchant princes who owned large amounts of Manhattan real estate had profited from the city’s transformation into a corporate headquarters. Others had invested wisely in the new industrials. When the *Tribune Monthly* published a list of millionaires in 1892, a respectable one-fifth of the names belonged to antebellum families: Livingstons, Schermerhorns, Rhinelanders, Stuyvesants, Astors, Beekmans, DePeysters, Morrisses, and Van Rensselaers. Even more tellingly, 60 percent of the leaders of New York’s national corporations, investment banks, and railroads were descendants of old-monied families.

Still, out of penury or principle, many of those caught up in the status struggle emphasized what they had and upstarts didn’t—*a pedigree*. Ever since the confrontation in the 1820s between Knickerbockers and New Englanders, bluebloods at bay had organized social bastions based not on wealth, or even accomplishment, but on heredity. Now the St. Nicholas Society (1835) and the Knickerbocker Club (1871) were joined by a host of others, like the Society of the Sons of the Revolution in the State of New York (1884) and the Holland Society (1885), which required a colonial ancestor in each member’s closet. As Knickerbocker Robert B. Roosevelt told the Holland Society men in 1886, theirs was a haven for the “old residents of New York”—a race, added William D. DeWitt, that was “being outnumbered and overrun in its own land.”

Soon such sanctuaries abounded, and members snuggled into their pedigrees, hunted up coats of arms at the Genealogical Society, and burnished their forebears’ image the better to shine by reflected glory. Patrician women—like those in the New York chapter of the Daughters of the American Revolution (organized at Sherry’s in 1891)—reenacted colonial teas using their ancestors’ cups and wearing their greatgrandmothers’ gowns.

Some ancestral societies, however, adopted a more activist stance toward New York's history. Noting (with Frederic DePeyster) that "the mighty city of today knows little or nothing of our traditions," the old guard turned to publicly promoting them. They placed tablets at historic sites, raised commemorative statues in public parks, and in 1889 began publishing *Old New York*, a journal of city history and antiquities. Documentary reclamation projects got underway as well: in 1891 the state legislature authorized verbatim republication of the colonial laws, and in 1894 the Society of Iconophiles set out to publish both contemporary and facsimiles of early views of New York.

A string of city histories appeared, some in the elegiac vein pioneered by Abram Dayton's *Last Days of Knickerbocker New York* (1882), others works of substantial scholarship, much though not all of it written by women. Martha Lamb's *History of the City of New York* was published beginning in 1877; in 1884, Benson J. Lossing published his two-volume *History of New York City*; and Mariana Griswold Van Rensselaer penned historical essays for *Century Magazine*, which prefigured her later two-volume study of the seventeenth-century city.

Many female historians stuck to the history of women's sphere, writing, as had antebellum scribbling novelists, about home and hearth. Gertrude Lefferts Vanderbilt declared, in her *Social History of Flatbush* (1880), that "as a woman, I have inclined to the social side of life, and have endeavored to record the changes which time has made among the people in their homes and at the fireside." Alice Morse Earle, a member of the Society of the Colonial Dames, did the same in *Colonial Days in Old New York* (1896). And the redoubtable May King Van Rensselaer made clear, in *The Goede Vrouw of Mana-ha-ta at Home and in Society, 1609—1760* (1898), that while "history is generally written by men, who dwell on politics, wars, and the exploits of their sex," she would chronicle "household affairs, women's influence, social customs and manners."

Old-monied men and women also embraced historic preservation, a decidedly un-New York sort of enterprise. Provoked by the latest spasm of vanishing churches, inns, and houses, preservationists rallied in 1889 to save Alexander Hamilton's Grange by shifting it to a new location. And in 1892, when the 1763 Rhineland Sugar House at Duane and Rose was

demolished, a portion of the building was reerected, together with an inscription, alongside the old Van Cortlandt house up in the Bronx.

Their most heroic campaign helped save City Hall. By 1893 efforts to tear it down and build anew had gotten as far as an architectural competition for its replacement. In 1894 the Sons of the American Revolution published a piece by Andrew Haswell Green calling for “The Preservation of the Historic City Hall of New York,” and that year Green and Frederic J. DePeyster organized what would become the American Scenic and Historic Preservation Society. *Harper’s* ratified the effectiveness of their intensive protests when it declared: “The majority of cultivated persons in New York would regard the demolition of City Hall not only as a municipal calamity, but as an act of vandalism.”

Old-guard New Yorkers did not stand alone on the ramparts of history. Fashionable members of Châteaux Society also exhibited a penchant for the bygone days of pre-Reformation and Renaissance opulence, and some tycoons responded to the Knickerbockers’ lineage challenge by purchasing instant pedigrees through marriage into titled European families. Clara, adopted daughter of railroad magnate Collis P. Huntington, wed Prince von Hatzfeld Wildenburg in 1889. Florence, offspring of corporate lawyer John H. Davis, became the second marquise of Dufferin and Ava in 1892. And in 1895 Pauline, daughter of horsecar magnate William C. Whitney, became the baroness Queensborough.

Dukedoms didn’t come cheap. Impecunious earls insisted on a quid pro quo for their bloodline transfusions. It cost \$5.5 million to ransom the daughter of the despised Jay Gould into respectability. Even this outlay paled before the transatlantic exchange of assets arranged between Alva and William Kissam Vanderbilt and the ninth duke of Marlborough. In 1895 they virtually bludgeoned their daughter, Consuelo, to the St. Thomas altar and gave her away in the most spectacular nuptials in New York social annals. “Gave” is perhaps not the right word, given that compensation for His Grace included fifty thousand shares of Beech Creek Railway, the rehabilitation and maintenance of Blenheim Palace, and the construction of Sutherland House in London—an eventual Vanderbilt outlay of over ten million dollars.

In the right circumstances, the newly monied could be drawn into celebrating local history as well. In 1874 the country had kicked off a series

of centennial commemorations by honoring the Continental Congress's first meeting in Philadelphia. By 1883 it was New York's turn. To celebrate the hundredth anniversary of Britain's exodus from the city, the metropolis revived Evacuation Day—the local holiday that, apart from a brief Tammany-inspired revival in the mid-1860s, had been pretty much supplanted by Independence Day before the Civil War. New Yorkers with Revolutionary ancestry claimed a special role in these ceremonies, but William Astor and William Vanderbilt helped finance the festivities too. The culmination of the event was the unveiling of John Quincy Adams Ward's twice-life-size statue of Washington on the front steps of the Sub-Treasury, site of Federal Hall. Ward, unusually, depicted Washington as civilian gentleman rather than martial equestrian, a decision that pleased the bankers and brokers over whose Wall Street community the genteel bronze Washington would now preside.

Evacuation Day redivivus proved mere prelude to a full-blown reenactment, six years later, of Washington's inauguration in 1789. The old-guard New York Historical Society and New York Society of the Sons of the Revolution again tried to preempt the event, but by now the wider New York bourgeoisie had developed a passion for local history almost as strong as their romance with the Renaissance and the world of Marie Antoinette. The Chamber of Commerce demanded a role in the planning, as did many others—so many that in 1887 two hundred interested parties merged in an ecumenical Committee of Citizens, which proceeded to fashion a glittering three-day event honoring the Court of Washington and the Court of Contemporary New York.

The pageantry began on April 29, 1889, with the arrival of President Benjamin Harrison from Washington City. He reprised his predecessor's cross-harbor voyage from New Jersey on a replica of the original barge, crewed by shipmasters from the New York Marine Society, the organization that had conducted Washington to Manhattan a century earlier. Landfall was followed by a march up Wall Street, a formal reception for four thousand of New York's business and professional elite at the Lawyers' Club, and a more intimate French feast for sixty at Café Savarin, whose souvenir menu listed the names of the City Council of yore (noting pointedly the absence of "Divvers, Flynns or Sheas").

Evening brought seven thousand guests to the Metropolitan Opera House for a grand Centennial Ball. Ladies and gentlemen, selected by Ward McCallister after a careful genealogical search, opened the gala by doing a Centennial Quadrille in colonial costume. To no one's surprise, Mrs. William Astor led the dance, brilliant in diamonds and a Worth creation. Some women did wear gowns "after the colonial period," but far more New York aristocrats favored apparel from the courts of Louis XV and XVI.

Not all the events were so exclusive. A reenactment of the swearing-in, which featured an address by New York Central's Chauncey Depew, attracted huge numbers of spectators, as did the Grand Military Parade. An estimated million people, vast numbers of whom had poured in by excursion trains, watched as fifty thousand members of various state militias marched from Wall Street up to the heart of Châteaux Country at 59th and Fifth. Finally, at the tail end of the events, a second float-filled parade allowed participation by those so far restricted to spectating. Immigrant societies, butchers in knee breeches brandishing sausages, plasterers tossing new-made busts of Washington to the crowd, firemen, policemen, and the sachems of Tammany Hall predominated here, though the accent remained aristocratic.

In the end, the colonial revival provided a way for new money to bow to old money's values, while old money acknowledged newcomers' superior resources. Perhaps appropriately, its most lasting legacy proved to be the practice of collecting "antiques"—a craze for amassing historical commodities having been ignited by the sixweek-long Centennial Loan Exhibition of old gold and silver plate arranged by a Metropolitan Museum curator at the Metropolitan Opera House. New money also made its way into the Historical Society. While it was Rufus King's grandson who presided over the sanctum for much of this era, the drive for a costly new building, planned for Central Park West between 76th and 77th, made the participation of Cornelius Vanderbilt and J. P. Morgan particularly welcome.

INCLUSIONS

Upper-class New Yorkers had other settings—boarding schools, country clubs, exclusive resorts, elite universities, and Protestant churches—in which blood and money could forge a common culture. In the 1880s and

1890s, these elite institutions displayed both a new cosmopolitanism and a new parochialism, the first evidenced by a willingness to mix and mingle with provincial and professional elites, the second by the rise of anti-Semitism.

Magnates and Knickerbockers alike sent their sons to exclusive, usually Episcopalian private schools. They didn't mind that nearly all the influential prep schools of the 1880s and 1890s were more in Boston's than New York's cultural orbit. Nor did they object to their sons mixing with wealthy young men, from around the country, who would one day would join with them in owning and managing the corporate economy. Together they learned classics, sports, and social graces, while developing the habits of command and taste for public service that would become the hallmarks of their class.

From boarding school the elite-in-training headed on to college. Columbia remained a patrician citadel, with old-line mercantile supporters like the Lows and Schermerhorns joined by industrialists and financiers, but increasingly both elite branches found the college too parochial. Roosevelts and Fishes, who had for generations sent their sons to Columbia and served as its trustees, now opted for Harvard or Princeton or Yale, and Morgans and Vanderbilts followed in their footsteps.

Like prep schools, colleges brought New Yorkers into fruitful contact with youthful members of the propertied and professional classes from around the nation. Elite scions bonded in Greek-letter fraternities like Delta Kappa Epsilon (both Theodore Roosevelt and J. P. Morgan were members). This facilitated formation of "old boy" alumni networks that would help bind together a class capable of withstanding the centrifugal forces of competitive capitalism. Ivy League schools also served as socializing and recruiting grounds for senior subalterns, the managers who would run the banks, mercantile houses, and industrial corporations, along with leading lawyers, architects, and physicians.

An "old girl" network emerged too, as elites, especially affluent professionals, expanded educational opportunities for their daughters. These institutions tended to be closer to home, especially the new primary and secondary schools like Dwight School (1880), Brearley (1884), and Miss Spence's School for Girls (1892). When Columbia refused to admit

females, Barnard College (1889) became the first secular institution in New York City to grant a BA to women.

Ecclesiastically speaking, Episcopalianism remained the favored denomination of both new and old Protestant elites. Henry Codman Potter, who became Episcopal bishop of New York in 1887, was pastor to the smart set and had several relatives on Ward McCallister's Four Hundred list. He loved officiating at weddings between English aristocrats and the New York rich, and when he traveled to church conventions he rode in J. P. Morgan's private railroad car. The General Theological Seminary expanded rapidly under Eugene Augustus Hoffman, its dean from 1879. Hoffman, descendent of an old Dutch family and owner of real estate worth millions, was said to be the richest clergyman in the world and was widely known as a sporting parson for his love of shooting and fishing and his active membership in the New York Riding Club.

Many believed that St. Thomas, on Fifth Avenue at 53rd Street, now surpassed Grace Church as the city's most fashionable. It was certainly more sumptuous than ever after its reworking by Stanford White. (Other Episcopal Churches would strive for most sumptuous status, with the Church of the Ascension at Fifth Avenue and 10th Street employing the combined talents of Stanford White, La Farge, Louis Saint-Gaudens and D. Maitland Armstrong, and White designing an elaborate portal for St. Bartholomew's at Madison and 44th.) Membership in St. Thomas was kept exclusive by charging pew rents of \$500-700. On Easter Sunday, ladies of the church began parading up Fifth Avenue in all their finery, carrying the spectacular flower arrangements used for the service to patients at nearby St. Luke's Hospital.

Way uptown, moreover, plans were under way for the erection of the biggest religious edifice in the city, indeed in the country—indeed in the western hemisphere. Bishop Potter took the first steps toward building the Cathedral of St. John the Divine at the end of the 1880s. The cathedral project gained important support from both prestigious Knickerbocker families and the more recently monied; the biggest contributors included John Jacob Astor, August Belmont, Cornelius Vanderbilt, and the man described as “the financial and spiritual force behind the project,” J. P. Morgan.

EXCLUSIONS

The obverse of inclusion being exclusion, the upper class identified itself by the kinds of people to whom it denied access: Catholics and African Americans, of course, but increasingly, departing from prior patrician practice, Jewish New Yorkers as well. During the first postwar decades, most wealthy German Jews had lived amicably among their class counterparts in integrated neighborhoods. They sustained their own institutions, of course. They attended the Byzantine-towered Temple Emanu-El (1868) on Fifth Avenue and 43rd, sent their children to the Sachs Collegiate Institute (1871) on West 59th Street, and joined their own men's club, the Harmonie Gesellschaft (1852). Many emphasized their Germanness: the Loebes and Lehmans spoke German at home, followed German affairs closely, vacationed at German spas, employed German governesses. But this cultural clustering was not the result of anti-Semitic rebuffs by their Fifth Avenue neighbors, as was evident from the ongoing memberships of assorted Seligmans, Hendrickses, Lazaruses, and Nathans in such exclusive precincts as the Union, the Union League, and the Knickerbocker clubs.

In 1877, moreover, when banker Joseph Seligman arrived at Saratoga Springs by private railroad car only to be turned away from the Grand Union Hotel by Judge Hilton, executor of A. T. Stewart's estate (and soon-to-be hotel magnate), the incident produced widespread condemnation. *Harper's* and the *Tribune*, *Daily Graphic*, *Commercial Advertiser*, *Sun*, and *Herald* all denounced anti-Jewish snobbery. When one hundred leading Jewish merchants successfully boycotted Stewart's Department Store—also administered by Hilton—a *Puck* Christmas editorial offered “all honor to the Jews for their manly stand in this instance.”

The hotel did not, however, withdraw its exclusion policy, and indeed the practice spread. Starting in 1878 the Greek-letter societies at the City College of New York (as the old Free Academy had been renamed in 1866) barred Jewish members, something Bernard Baruch (class of '89) would long remember. And in 1879 Austin Corbin banned Jews from Manhattan Beach Hotel, explaining that such “detestable and vulgar people” were driving away respectable guests. Again, most New York papers denounced Corbin's policy as mean-spirited, even shockingly un-American, and in

1881 the New York civil rights code that prohibited discrimination in public places for reasons of race was amended to include reasons of creed.

Nevertheless, anti-Semitic social ostracism grew steadily more acceptable during the 1880s, and by the early 1890s it had become a social given. In 1892 Theodore Seligman was blackballed when he sought to join the Union League Club—of which his father had been a founder—without eliciting a word of protest from members like Elihu Root and J. P. Morgan. This precipitated the resignation en bloc of all other Jewish members, many of long standing. Yet this time, while the *Evening Post* regretted Christians' refusal to associate with even well-bred Jews, it also allowed as how people really shouldn't try to push in where they weren't wanted. Sephardic aristocrats and German financiers alike found doors around town slamming shut: Jews were excluded from the *Social Register*, banned from Four Hundred functions (not one was invited to the 1892 ball), and rejected from private schools. Some affluent Jews responded by assimilating all the more thoroughly; others circled their own wagons more tightly and established a "Hebrew Select" society.

Social exclusion fostered economic segregation. With prep schools explicitly geared to turning out Anglo-Saxon "Christian Gentlemen," and colleges giving preference to sons of alumni, and few if any Jews (or Catholics, or African Americans) being accepted at top clubs, it became difficult, if not impossible, to accumulate the requisite old-boy connections, and banks, corporations, and law firms became Anglo-Saxon Protestant enclaves. Shoved to the side, Jews would advance only in industries they already controlled (merchandising and one wing of the investment banking community) or in fields still open to entrepreneurial innovation (entertainment and mass communications).

Yet the sequestration of elite Jewry would prove no more fatally corrosive of upperclass solidarity than the internecine combat between Astors and Vanderbilts or the acid rivalries of merchants and financiers. For all their internal conflicts, the issues uniting wealthy New Yorkers were far more compelling than those that divided them, and in the mid-1880s none was more urgent than the challenge issued to their political and economic authority from a very different part of town.

“The Leeches Must Go!”

In the industrial precincts of the East and West sides, the metropolitan labor movement had revived along with the quickened economy. The world of German socialism, in particular, had been newly reinvigorated by the arrival of thousands of immigrants fleeing Bismarck’s repression. Newcomers slipped comfortably into various of the German-speaking craft unions leagued together in the United German Trades. Many also joined the Socialist Labor Party (SLP), as the old Workingmen’s Party was now called, and indeed political and labor organizations overlapped substantially—with the Brewery Workers, a pioneering industrial union, making significant gains under socialist leadership. German socialism, with its labor lyceums and schools for children, was deeply rooted in, though largely limited to, Kleindeutschland.

A second constellation of unionists, known as the “pure and simple” variety, concentrated on mustering skilled workers into disciplined craft-based organizations. Cigarmakers, led by Samuel Gompers, were the strongest advocates of this approach. Gompers, born in 1850 in London’s East End to Dutch-Jewish parents, was brought to New York in 1863. He spent his teens and twenties helping his father make cigars in their East Side tenement apartment. He attended lectures and classes at Cooper Union, joined debating clubs and the Odd Fellows, and developed a fierce attachment to the fledgling Cigarmakers Union. In the early days, he and his intimate associates—men like Adolph Strasser and Peter J. McGuire—shared the socialists’ conviction that unions should struggle for the ultimate transformation of society at the same time as they fought to improve working conditions in the present.

The depression years changed his thinking. Watching (and dodging) rampaging policemen at Tompkins Square in 1874 convinced Gompers that those in power would not shrink from violently repressing radical challenges to the existing order. His conviction was deepened by the hysterical response of police, press, and pulpit to the Great Strike of 1877 and by the failure of the Cigarmakers’ own walkout that year.

If capitalism were here to stay, then working people, Gompers believed, and particularly skilled craftsmen, should prepare themselves for a long-haul struggle. Following the example of British trade unions, he and Strasser (in 1879) revamped the Cigar Makers' International Union's structure on "businesslike" lines. Charging high dues, they built up a tough and self-sufficient organization, with ample reserves for strike funds and sick benefits.

The new model union bade farewell to what it now saw as the socialists' Utopian fantasies. It would fight only for carefully delimited targets: better wages, hours, working conditions. Gompers made clear to capitalists that they had nothing fundamental to fear from unions such as his. At a Senate investigation in 1883, Strasser was asked what the Cigar Makers' ultimate ends were. "We have no ultimate ends," he replied. "We fight only for immediate objects—objects that can be realized in a few years."

The Cigar Makers' new policy set them on a collision course with the Knights of Labor, the largest working-class organization in the city. The Knights, formerly a clandestine operation, had flowered with the economy: national enrollment had shot from under ten thousand in 1878 to over seven hundred thousand by 1886. American workers were attracted by the Knights' hybrid attention to the immediate and the Utopian. Despite Grand Master Terrence V. Powderly's disapproval of strikes—he thought them too easily crushed—the Knights walked out repeatedly in the mid-1880s in pursuit of very specific goals, often with considerable success. But the Knights were also convinced that capitalism—and its associated evils of degraded crafts, fevered competition, rapacious individualism, and urban squalor—threatened the artisan-yeoman republic. They believed that an alliance of the "producing classes" could regenerate America and transform it into a cooperative commonwealth.

The Knights regarded exclusionary craft unions like the Cigar Makers as shortsighted. Labor had to organize not just skilled craftsmen but semiskilled industrial workers and unskilled day laborers as well. The Knights were ecumenical on other fronts too, embracing Protestants and Catholics, whites and blacks, natives and immigrants, men and women. When Knights of Labor telegraphers struck Western Union in 1883, they demanded equal pay for equal work, well aware that females made up a quarter of the Morse operators at 195 Broadway. The Knights' definition of

the “producing classes” was so all-encompassing that it included manufacturing employers as well. Indeed the only people *not* entitled to sup at labor’s table were bankers, brokers, speculators, gamblers, and liquor dealers.

Most New York workers adopted one or another of these positions, and sometimes more than one. Many individual Socialist Labor Party members joined the New York Knights, even though they felt culturally and politically ill at ease there. In socialist eyes, the Knights failed miserably to grasp the inevitability of class struggle, and its temperance schemes dismayed lager-loving Germans. Gompers’ Cigar Makers opposed the Knights altogether, resenting their embrace of semiskilled working men and women who, in the cigar trade, were replacing skilled craftsmen like themselves. They also thought it foolish to treat bankers rather than industrialists as labor’s chief enemy.

THE FIRST LABOR DAY

In January 1882 Robert Blissert, an activist in the Knights of Labor and the Tailors Union, led a rally at Cooper Union that led to formation of a citywide trades’ assembly. Within weeks, a core group of a dozen unions had constituted the Central Labor Union (CLU) of New York, Brooklyn, and Jersey City. The CLU grew as rapidly and spectacularly as had the Knights (who composed roughly half the CLU’s members). By 1884 thirty-six unions were affiliated. By 1886, spurred by the mid 1880s panic and recession, over two hundred organizations, representing perhaps fifty thousand workers, had joined New York’s “parliament of Labor.”

The Central Labor Union, like the Knights, was ecumenical. Its ranks included craft-based printers and builders, industrialized brewers and machinists, and unskilled (and unorganized) salesclerks and day laborers. Its aims were equally variegated. The CLU demanded the eight-hour day, an end to child labor, equal pay for equal work, government- (not bank-) issued currency, the abolition of tramp laws, and, quite grandly, an end to “all class privileges.”

To make its new voice heard in the wider city, the CLU revived the tradition of artisanal festivals and parades, which had once been integral to New York’s working-class world. The CLU proposed that one day each

year be set aside as a holiday dedicated to and celebrated by working people, and under its aegis the United States' first Labor Day parade was held on September 5, 1882. Wearing their regalia and hoisting transparencies, the contingents formed up in Park Place near City Hall. The Jewelers Union of Newark led off smartly behind their own band. Then came the bricklayers in their white aprons, the jewelers in derby hats and dark suits, and a group seven hundred strong from Big Six (the typographical union). The marchers were festive but sober; no drinking was allowed. They carried mottos proclaiming: LABOR BUILT THIS REPUBLIC AND LABOR SHALL RULE IT, NO MONEY MONOPOLY, and (most shocking to next day's dailies), PAY NO RENT. Twenty thousand strong they strode north past Broome and Canal streets to Union Square, as hundreds of seamstresses at windows along the route waved handkerchiefs and blew kisses. Finally, after passing by a reviewing stand filled with labor dignitaries, the participants adjourned, via the elevated, to an uptown picnic at Elm Park. There they danced to jigs played by Irish fiddlers and pipers and were serenaded by the Bavarian Mountain Singers while the flags of Ireland, Germany, France, and the USA flapped in the autumn air.

Union Square Demonstration, September 5, 1882—the first Labor Day parade in the United States. As the head of the column passes the reviewing stand on the north side of the park (17th Street), thousands more can be seen marching up Broadway in the distance. *Frank Leslie's Illustrated Newspaper*, September 16, 1882. (Library of Congress)

The following year, in an effort to broaden its constituency, the CLU reached out in two directions. On March 20, 1883, it sponsored an enormous gathering at Cooper Union to commemorate the recent death of Karl Marx. Most speakers were socialists, but the packed crowd was composed of workers of many ideologies, nationalities, and trades, who joined in raising funds to publish an English-language edition of the *Communist Manifesto*. Their second initiative was to induct Henry George into the Knights of Labor.

PROGRESS AND POVERTY

A few weeks after the bloody finale of the Great Railroad Strike of 1877, with New York and the country still mired in depression, Henry George, a young San Francisco newspaperman, sat down to write a book. He was determined to make sense of the awful economic storms that periodically wracked the republic and to grapple as well with the terrible paradox of misery amidst plenty.

The short and scrappy redhead—friends called him the bantam cock—had been battered by economic depressions for most of his life. His father had published Episcopalian books until hard times drove him out of business and thrust the family into poverty. He himself had taken up the printer's trade, only to be pitched into unemployment by the depression of 1857. After the war he founded a penny paper with reformist principles; his sheet decried the way America's bountiful riches flowed into the pockets of a few. In 1869 George made a trip to New York City, in a failed attempt to get a franchise from the Associated Press. The metropolitan experience underscored for him just how profound the contrast could be between "monstrous wealth" and "debasing want." Then came the crash of '73, which sank his theretofore successful paper. Thus galvanized, and with shoestring support from a job inspecting gas meters, he wrote *Progress and*

Poverty: An Inquiry into the Cause of Industrial Depressions and of Increase of Want with Increase of Wealth.

George blamed crises on the “principle of competition upon which society is now based.” Under conditions of competition, American individualism, which he valued highly, too easily degenerated into “cruel selfishness and monstrous greed.” The republic had to reject cutthroat competition and become “a family, in which the weaker brethren shall not be remorselessly pushed to the wall.”

George also blamed hard times on the growth of monopolies, and the worst monopolists were landlords—parasites who cornered an irreplaceable resource and exacted outrageous charges for its use. When an increase in population and productive resources made land more valuable, landlords creamed off most of the benefit. Worst of all were speculators who deliberately held property off the market until its price reached unconscionable levels.

It was landlords’ gouging, George asserted, that forced factory owners to cut workers’ wages, in order to offset the high cost of land. The solution was straightforward: tax the landlords and confiscate all their unearned profits. This one single tax would generate such phenomenal revenues that the country could eliminate all other taxes. Unfettered entrepreneurs would then be able to pay fair wages. Capital and labor would be reconciled; strikes and poverty would become things of the past. The single tax would also “lessen crime, elevate morals, and carry civilization to yet nobler heights.”

George mailed off his manuscript to publishers in New York City. Harpers and Scribner’s turned it down, but D. Appleton and Company agreed to print some copies if George supplied the plates. The book received little attention in the press, however, so in August 1880 the forty-one-year-old author moved to New York City to promote it, as well as to look for work. He soon made modest headway on both fronts. The book received a series of notices that, while hardly all favorable—the *Times* and *Nation* damned it—attracted enough attention to land him several journalistic assignments. George brought his family east and relocated to a porter’s lodge on the outlying Kingsbridge Road.

The one really enthusiastic review for *Progress and Poverty* came from Patrick Ford's *Irish World*. Ford liked George's analysis of American conditions, and even more its relevance to Ireland's current dilemmas. In the late 1870s crop failures, rack-renting, and mass evictions had revived fears of famine. Two hundred thousand angry tenants organized the Irish Land League, which demanded a halt to evictions and the transfer of property from aristocratic landlords to working farmers. The league was led by Michael Davitt, a militant Fenian and son of an evicted tenant farmer, and Charles Stuart Parnell, a wealthy Protestant landlord who had been fighting for home rule.

In 1880 Parnell came to New York City to raise funds and organize American branches. He was spectacularly successful. Catholic Irish Americans and mainstream Protestants alike gave him a jubilant reception and bountiful patronage, and by September 1881 the new American Land League had over fifteen hundred branches. In New York City the Catholic hierarchy, Tammany Hall, and the Irish-American middle class—many of whom had condemned Fenianism—rallied to the Land League, reassured by Parnell's brand of constitutional and parliamentary nationalism. At the same time, the day laborers and servant maids for whom Ford was the leading spokesman were fired with enthusiasm for Davitt's radical antilandlordism. It was this wing of Irish-American nationalism that found Henry George's work compelling. Ford printed up a cheap edition of *Progress and Poverty*, and soon working-class chapters of the Land League were studying it avidly.

In October 1881 Ford dispatched George to Ireland as a special correspondent. Soon he was wiring back articles castigating English despotism and landlord oppression. He also lectured around the Irish countryside, blossomed into a commanding orator, was arrested by the authorities, and returned to New York an Irish-American working-class hero.

Many in the Knights of Labor now took George's teachings to heart. Grand Master Powderly, himself of Irish descent and prominent in the Land League, promoted *Progress and Poverty* vigorously, sponsoring lectures by George around New York and out west. Though not convinced the single tax was the answer to all labor's problems, Powderly applauded George's raising of the land issue.

For his part, George was cautious about linking up with the union movement, given his convictions about the harmony of interest between capital and labor. But the Knights' old republican belief in the essential unity of the producing classes mirrored his own, and the tangible injustices he had witnessed on his travels moved him emotionally, so George joined the ranks of the workingmen.

“CHRIST HIMSELF WAS BUT AN EVICTED PEASANT”

Among George's new admirers was Father Edward McGlynn, the Soggarth Aroon (Gaelic for “Priest of the People”). McGlynn, a New Yorker born and bred of Irish immigrant parents, had begun his ministry in a Civil War military hospital. He worked his way up from a floating ministry to Irish squatters, assigned him by Archbishop Hughes, to pastorship of the beautifully frescoed St. Stephen's on East 28th Street, between Lexington and Third avenues, spiritual center of the largest and one of the poorest parishes in the city. McGlynn had long sought to promote the material as well as spiritual needs of his parishioners, and when he read *Progress and Poverty*, it explained to him why all his efforts on behalf of poor parishioners had come to nought. A magnetic speaker, the enormously popular McGlynn teamed up with George in speaking out against Irish and American landlordism, from secular as well as sacred pulpits. “Christ himself was but an evicted peasant,” McGlynn asserted, fashioning an Irish Catholic counterpart to Protestant workingmen's veneration of “Jesus the brother carpenter who banned money changers from the temple.”

McGlynn was also a venturesome theologian, and he headed a remarkable group of New York City clerics who were urging democratization on a local hierarchy that was traveling rapidly in the opposite direction.

New York's Catholic Church was thriving. Over 40 percent of Manhattan's population (and a somewhat smaller percentage of Brooklyn's) was now Catholic, and Catholics accounted for perhaps three-quarters of the city's active churchgoers. With nearly four hundred priests and perhaps two hundred churches and chapels, the archdiocese was unquestionably the largest in the United States. In 1875 the Vatican had recognized New York's importance, when Pius IX sent a red hat across the Atlantic to John McCloskey, Archbishop Hughes's successor. And on May 25, 1879, the

cardinal, with forty-five archbishops and bishops in attendance, had sung a dedication Mass, before an immense crowd of dignitaries, at the high altar of the finally completed St. Patrick's Cathedral—now the most imposing ecclesiastical edifice in New York City.

Cardinal McCloskey died in 1885. Power passed to New York's third archbishop, Michael Corrigan. Corrigan was the son of a Dublin cabinetmaker who had emigrated to Newark in 1829 and become, by the 1850s, a prosperous wholesale grocer, liquor dealer, and real estate investor, one of the wealthiest Catholics in the city. Michael, born in 1839, had grown up in the comfortable world of the emerging Irish middle class. In 1859 Corrigan studied for the priesthood at the new American College in Rome, where his prefect was the strappingly masculine Edward McGlynn, who apparently looked down on the bookish Corrigan, a slight that would be remembered. Ordained in Rome, Corrigan returned to America and rose to become bishop of Newark in 1873, where he stayed until summoned in 1880 by McCloskey to help administer the huge and rapidly growing archdiocese of New York.

In 1885, now himself archbishop, Corrigan found himself pitted against his old nemesis McGlynn, on matters both sacred and secular. Corrigan had moved swiftly to centralize ecclesiastical authority, but McGlynn, like many priests in New York, thought the American Church should adopt a more democratic style, one better suited to the American people. Corrigan also believed that New York's Catholics should band together socially, and he launched a massive parochial-school building program, with Democratic Party backing. McGlynn, however, decried Corrigan's goal of withdrawing into a Catholic ghetto, publicly opposed state aid to parochial schools, and decried the Church's alliance with Tammany. The pastor of St. Stephen's urged Catholics to break down differences with their fellow citizens rather than erect new barriers between them.

The two men did not see eye to eye on labor issues either. McGlynn wanted the Church to actively support working-class organizations like the Knights and CLU. The archbishop, like others of the affluent Irish upper middle class, was a strong supporter of the status quo and gratified that upper-class Protestants had come to see the Church as a source of stability. It was appropriate, Corrigan thought, for workers to want improved conditions, but they should wait patiently for such improvements to come

their way, rather than engage in militant and clerically unsupervised self-help. Corrigan even urged a ban on the Knights of Labor but was thwarted by more liberal bishops in other cities.

Finally, Corrigan opposed political radicalism of any stripe. He was at one with the Council of Trent in condemning the “false doctrines or negations which flourish in our time and eat like a cancer into society.” These included agnosticism, materialism, naturalism, rationalism, any doctrine proposing that civil power issued from the people and not from God, and—most emphatically—“socialism and communism, the twin monsters threatening the social order of mankind.” When McGlynn took up with Henry George—a close-enough socialist to Corrigan’s way of thinking—it was the last straw. McGlynn, for the moment, was muzzled.

DYNAMITE!

The confluence of Catholic radicalism, Irish nationalism, and labor militancy greatly strengthened the ability of working-class organizations—and working-class neighborhoods—to bring pressure to bear on obdurate employers. When relatively powerless workers like bakers, store clerks, freight handlers, cloakmakers, or unskilled cigarmakers struck for shorter hours or union recognition, they were now backed both by the Central Labor Union and by newly energized communities.

Sometimes this support reached riotous dimensions. In March 1886 the miserably exploited horsecar drivers and conductors of the Dry Dock line along Grand Street went on strike to lower their sixteen-to-seventeen-hour workday (with no time off for dinner) to twelve. Organized labor raised funds to back the drivers’ efforts, and when on March 4 the city sent policemen to escort scab operators, sympathetic neighborhood crowds blockaded the tracks with barricades of wagons and rubbish. The superintendent of police now dispatched 750 men (25 percent of the force) to aid the company, posting five hundred along Grand Street and a phalanx of 250 around a car as it edged out of the stables. Now (as *Harper’s Weekly* noted) thousands of neighborhood residents and factory girls “groaned, hissed, and jeered from the sidewalks, while from every window there were angry jabbering and shaking of fists.” Crowds heaped coal, lumber, cobblestones, and bricks on the tracks while throwing rocks, eggs, and rotten vegetables at the police. When three hundred officers charged and

clubbed protestors at Forsyth Street, rioters overturned and fired cars, but police bulled the car through from river to river.

In response the CLU that evening voted a citywide “tie-up” of every streetcar line, and the next day over sixteen thousand drivers, conductors, and stablemen refused to show up for work. Surface transit was utterly paralyzed, and though the elevateds kept running they couldn’t handle the overload. When the Dry Dock Company gave in, it touched off wild celebratory parades, cheered by thousands of men, women, and children waving blankets, sheets, flags, and brooms. The horsecar corporations had the last word, however, when the Third Avenue line beat back a strike, aided by indictments against union leaders and a mammoth police presence provided by the city, despite the recent revelations that Jacob Sharp, the company’s owner, had won special privileges via massive bribery of the Board of Aldermen and that his company had cheated the city out of a million dollars in back taxes.

March 4, 1886: club-wielding policemen attempt to clear Grand Street of striking streetcar workers and their supporters.

Harper's Weekly, March 13, 1886. (© Collection of The New-York Historical Society)

Since the depression of the 1870s, violence had been an ever-increasing fact of life for New York's laboring classes. Year after year platoons of police cracked skulls, broke up meetings, and smashed picket lines while press and politicians acquiesced or applauded wildly. Nationally, too, employers employed squads of Pinkertons to combat strikers: Jay Gould was thought to have boasted he could "hire one half of the working class to kill the other half." Some New York German socialists responded by forming Lehr-und-Wehr Verein (education and defense societies). Resolved to never again be beaten or shot without resisting, they trained, drilled, and, on special occasions, marched in the streets. Such activities proved particularly appealing to newly arrived German immigrants, who had experienced at first hand Bismarck's antisocialist laws, which disbanded unions, suppressed newspapers, and arrested radicals. They too were determined to draw the line.

In Lower East Side cafes and saloons where intellectuals, writers, workers, and students hung out, there was talk of going farther, of taking the offensive, of launching an armed struggle to rip up the old order "root and branch." When the Socialist Labor Party denounced such notions, dissidents formed the Social Revolutionary Club. Derided as "anarchists," they adopted the name as a badge of pride. Their headquarters was First on First—Justus Schwab's saloon at First Avenue and 1st Street, a tiny beer hall with a bas-relief of Marat behind the bar. Schwab, the Social Revolutionary Club's president, was a tall, powerfully built man who had raced through Tompkins Square in 1874 waving the Commune's red flag, and when he sang the "Marseillaise" at First on First, his deep voice rattled the glasses on their shelves.

The anarchists remained a tiny, unknown sect devoted to drill and discussion until December 18, 1882. Then, after a terrible crossing, a steamship out of Liverpool limped into Pier 38 at the foot of King Street and unleashed Johann Most on the American scene. Schwab and his associates had invited the famous European comrade. They hastened him to a mass meeting at Cooper Union, where Most delivered a flaming speech that electrified his listeners, then set off on a national speaking tour that within six months transformed the anarchist movement into a national

presence. Back in New York City, Most set up his newspaper *Die Freiheit* on William Street and issued pamphlets filled with apocalyptic appeals to violence.

The quickest route to the Cooperative Commonwealth, Most explained, lay through a field of capitalist corpses. “The best thing one can do with such fellows as Jay Gould and Vanderbilt is to hang them on the nearest lamp-post.” Dynamite was his favorite panacea. Dynamite would enable ordinary workmen to stand up to police, Pinkertons, and militias, even armies. As gunpowder had brought down feudalism, so dynamite would blow up capitalism.

In 1884 Most took a job in a Jersey City dynamite factory to explore its mysteries, and in July 1885 he issued a seventy-four-page booklet, *Revolutionary War Science: A Little Handbook of Instruction in the Use and Preparation of Nitroglycerine, Dynamite, Gun-Cotton, Fulminating Mercury, Bombs, Fuses, Poisons, etc., etc.* In this manual of urban guerrilla warfare, Most explained how to destroy bridges, capture arsenals, and sabotage telegraph and railroad lines. He also offered helpful tips on exterminating the bourgeoisie (the whole “reptile brood”), recommending that charges be placed at “an opulent banquet” or “a ball where monopolists are assembled.”

Some anarchists were excited by this verbal ferocity, despite, or perhaps because of, its being all talk: Most had never thrown a bomb, placed a charge, or hanged a single capitalist. During the miserable mid-eighties, years of recession and repression, *Revolutionary War Science* sold like lager at picnics and meetings around town, at ten cents a copy. Serialized in the anarchist press, it roused readers across the country. Young Emma Goldman, a seamstress up in Rochester, decided to move to New York City and ask Most to help her become an anarchist.

Overwhelmingly, however, New York workers were repelled by Most’s posturing. Schwab and the local anarchists broke with him, branding his fulminations dangerous and immoral. The socialists and the Knights would have nothing to do with him. But by matching the levels of rhetorical violence that middle- and upper-class spokesmen had employed routinely since the depression of the 1870s, Most provided an all too convenient symbol for those intent on portraying all challenges to the status quo as lethal menaces.

The press made Most into an archetypal terrorist. Cartoonists like Nast (of anti Tweed fame) pilloried him constantly. Joseph Keppler of *Puck* used him as model for a bewhiskered foreign-looking anarchist, bomb in one hand, pistol in the other, though Most usually dressed in a business suit and had neatly trimmed hair. These images, along with characterizations of anarchists as “reptiles” and “leeches” worthy of extermination, raised the rhetorical stakes. General Sherman, now a resident of West 71st Street, foresaw an imminent and “armed contest between Capital and Labor” as the “better classes are tired of the insane howlings of the lower strata, and they mean to stop them.”

MAY DAY!

It was in this venomous atmosphere, on May 1, 1886, that organized labor launched a nationwide offensive. The tremendous growth of the Knights of Labor, and a run of successful strikes in 1884 and 1885, had given unionists the idea that perhaps a general strike would win the eight-hour day.

Across the country over three hundred thousand turned out. In New York City forty-five thousand walked off work, including streetcar conductors, cigarmakers, building tradesmen, pianomakers, and machinists. Many of the strikes were swiftly successful. Others were ferociously resisted, particularly after May 3, when in Chicago’s Haymarket Square someone exploded a bomb amid policemen who were attacking an anarchist demonstration. The *New York Times* blamed the police deaths on the “doctrine of Herr Johann Most”—who was promptly arrested—and called for the application of “hemp, in judicious doses.” The Knights of Labor scrambled to distance itself from the affair, denouncing the anarchists accused of inciting the crime as “wild beasts.” It did them no good; public sympathy was abruptly alienated by the Haymarket bombing, and the eight-hour movement went down to defeat.

More alarming, Central Labor Union organizers were convicted and jailed for using a boycott. The tactic had its roots in the Irish practice—developed during the land wars of 1879-83—of cutting off social intercourse with rack-renting and evicting landlords. New York City’s workers used it against employers, targeting their products rather than their persons. With so many consumer goods locally produced for local sale, working-class boycotts that disciplined businessmen through the

marketplace were often more effective than strikes. By the mid-1880s, the CLU had mounted scores of them successfully against recalcitrant employers who made or sold beer, bread, cigars, shoes, hats, clothing, and house furnishings. An alarmed press and pulpit denounced the tactic as (in *Harper's* words) a "new form of terrorism." Businessmen brought criminal prosecutions, and by 1886 over a hundred tailors, bakers, musicians, and waiters had been arrested and indicted.

In the latest instance, Knights of Labor musicians had called for, and the CLU had sanctioned, a boycott against George Theiss, proprietor of a beer garden on East 14th Street. Workers also boycotted beer produced by George Ehret's brewery, because Theiss's hall served it, and canceled picnics at Jones' Wood, because it sold Ehret's beer. Ehret, feeling the pressure, arranged a sit-down that ended in mutual concessions and a deal. Despite this a grand jury charged the five CLU negotiators with conspiracy and extortion, and they were sentenced, on July 2, 1886, to terms ranging up to four years in Sing Sing prison.

"HONEST LABOR AGAINST THIEVING LANDLORDS AND POLITICIANS"

Within two weeks the CLU decided to enter politics, something labor had not done effectively since the 1830s, when the Workingmen's Party, similarly infuriated by court decisions, had taken to the hustings. Badly burned then, and in minor forays since, organized workingmen had shunned the electoral arena. The CLU itself banned politicians, lawyers, and public officials from membership. It refused to elect a permanent president lest he sell out the organization to a political party. But employers' ease of access to police and courts convinced union men that control of city government was an indispensable prerequisite to workplace organizing.

In August the CLU called all city labor organizations to a meeting, and on the appointed day 402 delegates, representing 165 groups and over fifty thousand wageearners, formed a United Labor Party (ULP). Over the next two months it hammered out a platform and considered candidates. Finally, on September 23, after a mighty speech by Father McGlynn, it nominated Henry George as its candidate for mayor of New York City.

George had been chary of making the race. When a CLU committee first visited him at his new home up in Harlem, he declined the honor, dubious

about a third party's chances in a city where even Republicans were perennial runners-up. A nervous Tammany inadvertently decided George by sending secret emissaries to offer him a safe congressional seat if he declined the nomination. He couldn't be elected, the delegation explained, but "his running will raise hell." That settled it for the truculent George: "You have relieved me of an embarrassment," he responded. "I do not want the responsibility and the work of the office of Mayor of New York, but I do want to raise hell!" He would run, but only if the new party demonstrated its potential strength by getting thirty thousand backers to pledge their support in writing.

On October 5, 1886, George worked his way through the mammoth crowds outside Cooper Union and in the jam-packed interior, finally reaching the Great Hall. There he mounted a stage decorated with sheaves of petitions, arranged like floral offerings, that contained over thirty-four thousand signatures. Formally accepting the ULP nomination for mayor, George addressed the party's three major concerns: labor, politics, and land.

He ratified the platform's call for higher pay, shorter hours, better working conditions, government ownership of railroads and telegraph, and an end to "officious intermeddling of the police with peaceful assemblages," adding his own denunciation of "industrial slavery."

He declared that "this government of New York City—our whole political system—is rotten to the core." Politicians had made a trade out of assembling votes and selling them to powerful interests; revelations about horsecar magnate Jacob Sharp's scandalous bribery of boodle aldermen back in 1884 were front-page news just then, with twenty-two aldermen (Democrats, Republicans, and Independents alike) having been arrested. What business got in return was police protection, lax enforcement of housing and health codes, friendly judges, and fat franchises. To purify the political order, working-class voters had to sever ties to all the established parties and choose candidates from their own ranks, not what John Swinton called the "fleecing classes."

Finally, George applied *Progress and Poverty's* analysis to metropolitan landlordism. "Why," he asked, "should there be such abject poverty in this city?" What is it that "forces girls upon the streets and our boys into the grog shops and then into the penitentiaries"? The answer was insanely high levels of rent. New Yorkers sweated for landlords because Manhattan real

estate had long since been monopolized: “We are toiling, perhaps, for Mrs. Astor” or “the heirs of some dead Dutchman.” The majority of those piled in tenement barracks, as Peter McGuire had noted, had “paid by way of rent enough to purchase for themselves, not only one house but several,” yet they remained at the mercy of landlords who could and did get an eviction order from a district court judge if rent was three days late.

Worse, while New Yorkers were penned up in the tenement districts —“nowhere else in the civilized world are men and women and children packed together so closely”—there was plenty of empty land available, “miles and miles and miles of land all around this nucleus. Why cannot we take that and build houses upon it for our accommodation?” Because land monopolists were warehousing it, waiting for its price to rise. Taxing their properties would force landlords to disgorge vacant but valuable land and make it available to working people. “There is no good reason whatever why every citizen of New York should not have his own separate house and home; and the aim of this movement is to secure it.”

Taxing away the unearned profits of the idle rich would also generate enormous revenues, which could be used to improve city services, particularly in education and transit. George was grateful to Peter Cooper for providing the hall in which they now met, but education for working people should be a matter of right, not charity. The people of New York should establish *twenty* Cooper Institutes, and pay for them out of “our own estate.” Streetcars and elevateds should be taken out of the hands of men like Jay Gould and Jacob Sharp and be operated as a public service. “We could take those railroads and run them free, let everybody ride who would, and we could pay for it out of the increased value of the people’s property.”

THE “TAILBOARD” CAMPAIGN

George had proposed an alternative way to run the city and urged formation of a new governing coalition to run it. Now United Labor Party troops poured into the streets to do electoral battle. The German socialists came on board. So did Sam Gompers and the Cigarmakers, albeit reluctantly. Quite apart from the prominence of so many Knights and socialists in the movement, Gompers and his colleagues believed all politicians were crooks and would sell out labor’s interests to the highest bidder. Even if the ULP did elect candidates pledged to prolabor measures, executives would refuse

to enforce such laws, or the courts would quickly reverse them. Nevertheless, the “pure and simple” men were as enraged as other workers by the blatant police and judicial support for capital. Given the phenomenal support building up in the working-class districts for George, it seemed that perhaps this crusade would be able to make some fundamental changes in New York City.

The George campaign set up headquarters in the Colonnade Hotel on Broadway (near 8th Street) and translated the enormous amateur enthusiasm into a formidable electoral army. To finance the challenge, union members across the city were assessed twenty-five cents a head. Heaps of pennies poured in, and the candidate could often be seen at headquarters helping roll coins for distribution to campaign managers around town.

Since Tammany ward heelers held sway in saloons, the new organization took to the streets, shop floors, and union halls. Drawing on the CLU’s logistical experience with organizing boycotts, parades, and mass demonstrations, the ULP created an apparatus of neighborhood meetings, streetcorner rallies, campaign clubs, Assembly District organizations, and trade legions—an entire political counterculture.

With the exception of *John Swinton’s Paper*, Ford’s *Irish World*, and the socialists’ *New Yorker Volkszeitung*, every paper in the city opposed George. One of the campaign’s major complaints was that “the same centers of power that have seized the reins of government. . . have also grasped the press by the throat.” The campaign accordingly launched its own daily, the *Leader*, staffed by eager volunteers from the other papers; by mid-October it circulated to forty thousand readers.

Using the elevators, the candidate whirled around the city addressing labor unions, Irish nationalists, Catholic parish fairs, German *Turnverein*, and middle-class social reformers. On one typical day, George talked at the opening of a church fair at St. Cecilia’s (106th Street between Third and Lexington), spoke at Waiters Union No. 3 at 40th Street and Third Avenue, addressed a mass meeting of eight thousand at Third and 42nd, marched with the Henry George Bohemian Club, and hopped the el downtown to a tumultuous meeting in Chickering Hall.

Even more striking was the “tailboard” campaign in which speakers rumbled by horsecart from one street throng to another, talking from a makeshift backseat podium. From breakfast to midnight, campaign orators hit the docks, factory yards, elevated stations, churches, and tenement districts. They addressed shoppers by day and, with the aid of torches, carousers at night. Speakers drew on a host of notables, including Father McGlynn, Knights leader Terrence Powderly, editor Patrick Ford, liberal Protestant minister Walter Rauschenbusch, and Columbia professor Daniel DeLeon, but the tailboarders also included men of purely local renown. Some were shop-floor and neighborhood activists addressing mass audiences for the first time. Others were merchants, lawyers, doctors, or teachers, drawn into unprecedented coalition with organized labor by George’s synthesis of piety and political economy.

As the campaign rolled on, and volunteer poll workers began training to counter the ward bosses’ election day “hirelings,” it was clear to the entire city—and to the nation, and to Europe, where the campaign was covered via cable—that something extraordinary was happening in the streets of New York. There had not been such a challenge to the established order since the Sons of Liberty contested merchant control of the city in colonial days. The Workingmen’s Party of the 1830s had flamed out quickly; the draft riots of 1863 had been terrifying but undisciplined and ultimately repressible. Now the possibility that had always lurked in a democratic polity seemed finally to have materialized: working people would use the polls to advance their class interest.

THE COLLEGE-BRED TRIBUNE

The prospect caused consternation among the propertied classes. The “present revolt of the working men of this city,” the Union League Club declared, had “become a matter of the first importance.” To battle George, Fifth Avenue sent into the ring another scrappy young bantamweight, named Theodore Roosevelt. The very name Roosevelt was reassuringly redolent of old New York, indeed old New Amsterdam. After the family’s plate glass business had boomed with Manhattan’s postwar expansion, it shifted much of its capital into banking, investment, and city real estate. When Cornelius died in 1871, he left Theodore Senior over a million dollars and a mansion on 57th Street off Fifth Avenue.

In 1876 Theodore Junior, aged seventeen, had gone off to Harvard, not Columbia as had innumerable Roosevelts before him. Despite his unprepossessing appearance—five feet eight inches, 125 pounds, a thin and piping voice, thick spectacles, and a laugh described by his mother as an “ungreased squeak”—his impeccable upper-class credentials and deep pockets got him into the best clubs. He worked hard too, immersing himself in laissez-faire political economy. After graduating in 1880 Teddy married, entered Columbia Law School, and joined the social whirl of New York’s ultrafashionables, dining at Mrs. Astor’s and dancing at Ward McCallister’s Patriarch’s Balls.

On October 10, 1882, Roosevelt invited a score of “respectable, well educated men” to his home at 55 West 45th Street to launch a City Reform Club. He told the press that the club intended that “the respectable, educated, refined young men of this city should have more weight in public matters.” Membership would “be restricted to that class in the community from which its members have hitherto been chosen,” that is, wealthy, native-stock, Protestant businessmen or professionals. In this the club certainly succeeded: a newsman at one meeting noted that the chairman officiated in full evening dress with white butterfly tie, and of the thirty-eight men present, thirty-six carried canes, thirteen wore kid gloves, and twenty-two parted their hair in the middle.

The City Reform Club planned to elect “honest and capable men” who, once installed, would “administer their offices on business principles as opposed to party methods.” In October 1882 Roosevelt himself ran for the state assembly, in a campaign during which, he prided himself, he never pandered to the populace or “paid for a drink or entered a saloon”—admittedly easier to do in a district where one did not have to deal with “the vast majority of the vicious and illiterate population.” Roosevelt later depicted his run as a daring departure from the ideals and practices of his class, but his own social set hailed him as a “college-bred tribune,” and he received strong backing from such clubmen and business leaders as Joseph H. Choate, J. P. Morgan, Elihu Root, and Morris K. Jessup.

Once elected—at twenty-three he was the youngest member of the legislature—TR set about making his mark. “He came in,” one Albany politico recalled, “as if he had been ejected by a catapult.” The assemblymen chortled at the foppish, bespectacled dandy who sought

attention by calling, “Mr. Spee-kar!” in falsetto. Teddy, for his part, considered his new colleagues to be “vicious, stupid-looking scoundrels,” though he soon got on well with (and was indeed fascinated by) the machine politicians.

Placed on the powerful City Affairs Committee, Roosevelt worked hard for his wealthy constituents. He opposed salary increases for New York police and firemen, opposed establishing a minimum wage of two dollars a day for municipal workers, and opposed Knights of Labor attempts to improve working conditions for railroad men. Hailed in city clubs as a watchdog, denounced in labor circles as a silk-stocking tool, he announced grandly that “I represent neither capital nor labor,” and at times he did prove hard to type, as when he bitterly denounced Jay Gould as a member “of that most dangerous of all dangerous classes, the wealthy criminal class.”

On another occasion, Samuel Gompers of the Cigarmakers Union proposed a bill to outlaw tenement house cigar work, and it was referred to a subcommittee where Roosevelt was expected to make short work of it. Gompers, however, presented evidence of horrifying conditions that he had gleaned from a house-to-house survey of the bohemian tenements, disguised as a book agent selling a set of Dickens. The union leader offered to take Roosevelt around to see for himself, and the dapper young legislator agreed. The tour shocked Roosevelt profoundly. To the amazement of his colleagues and constituents, and to Gompers’s delight, he supported the bill despite its being “in a certain sense a socialistic one” and got it signed into law. It was soon overturned by the courts, however, partly on the grounds it endangered the cigarmaker’s “morals by forcing him from his home and its hallowed associations.”

Mainly, however, Roosevelt concentrated on Good Government. His first success was a law reorganizing Brooklyn’s government that stripped the appointment power from the aldermen, Boss McGlaughlin’s creatures, and gave it to the mayor, along with authority to sack his appointees. He chaired a committee that investigated Manhattan’s governance, found it “absolutely appalling,” and in 1884 won passage of civil service reform.

With this triumph, his legislative career came to a sudden and tragic end. After his wife Alice died of Bright’s disease, almost simultaneously with the death of his mother from typhoid fever, Roosevelt resigned, sold his

house, and spent much of the next two years in the Dakota Territory. But in 1886, when his old constituents needed a candidate to take on Henry George, Teddy rode out of retirement. Nominated by Chauncey Depew at a convention presided over by corporation lawyer Elihu Root, Roosevelt promised an end to municipal corruption and the beginning of businesslike administration. The *New York Times* endorsed him and predicted the “uptown vote” would rally “to effectually squelch communism and socialism.”

Soon, indeed, Wall Street businessmen organized a Roosevelt Club, and the Stock Exchange, Produce Exchange, Real Estate Exchange, and Iron and Metal Exchange promised their support. The Union League Club endorsed him. Dry-goods men held rallies. With the setting up of Roosevelt campaign headquarters at the Fifth Avenue Hotel, Fifth Avenue’s white knight, now known familiarly as the “Cowboy Candidate,” was well launched.

BOSSSES, BISHOPS, AND THE MAN OF IRON

The roster of mayoral candidates was not yet complete, however. The organized working class and the organized bourgeoisie had sent in contenders. But the Irish-American middle class, whose nascent power was manifested through the Democratic Party and the Catholic Church, two warily interlaced institutions, had at least as much riding on the outcome.

In the late 1870s and early 1880s, John Kelly had centralized and disciplined Tammany beyond Tweed’s fondest imaginings. He also continued the business community’s program of cutbacks, thus enhancing the Democracy’s standing and making it a more respectable outlet for middle-class Irish ambitions. Kelly did not, however, command sufficient financial resources to do without the well-heeled Swallowtail Democrats. From their Manhattan Club headquarters, now housed in A. T. Stewart’s old marble mansion on Fifth Avenue and 34th Street, men such as iron and steel manufacturers Abram Hewitt and Edward Cooper, corporate attorney Samuel Tilden, and bankerrailroad investor August Belmont still wielded great power. These Protestant businessmen and professionals had access to campaign funds, a social standing that reassured the city’s creditors, an avenue to newspapers, a capacity to dispense patronage in their own enterprises, and powerful connections to the national Democratic Party.

Indeed it was national politics that motivated the Swallowtails to contest Tammany for power in the city. As importers and exporters, manufacturers who relied on imported raw materials, bankers, and railroad investors, they were vitally interested in lower tariffs, hard money, and federal aid to commerce through improved harbors, harbor defenses, coastal surveys, and foreign consulates. Given the equilibrium between Democrats and Republicans at the federal level, New York State was often the most important swing state in a presidential election, and with New York City casting a larger proportion of its state's vote than any other American city, it had provided the margin of national victory in 1880 and 1884, had come close to doing so in 1876, and would again in 1888 and 1892. It was no surprise that the major parties repeatedly nominated candidates for president and vice-president who might attract metropolitan voters.

Tammany had strengthened itself vis-à-vis the Swallowtails by expanding its political base in the burgeoning Irish middle class—appealing to its fraternal organizations and actively cultivating an ethno-religious identity. Under Kelly, who married Cardinal McCloskey's niece, the Democratic Party arranged for public funding of parish activities, particularly parochial schools. In 1880 Kelly's forces elected Swallowtail William R. Grace, perhaps America's most successful Irish immigrant. Grace had left his family's prosperous County Cork estate, went to sea, roved the world, and ended up in Peru, working for a ship chandler's firm, of which he and his brother eventually took control. He moved to New York City in 1865 and founded his own firm, W. R. Grace and Company, to cooperate with his brother's operation and made a vast fortune supplying the Peruvian military and in the South American trade. His election as the city's first Irish Catholic mayor, over the vocally expressed concerns of Protestants that he would help Archbishop Corrigan build a parochial school empire, helped cement Tammany Church relations.

Kelly died in June 1886, just before the mayoral race got underway, and was replaced at the party's helm by Richard Croker, his right-hand man and former Tammany bruiser. Croker, born in 1843 in Clonakilty, Ireland, was brought to New York at the age of three. The family had lived in Seneca Village until his father got a veterinarian job with an East Side horsecar line. After a year's schooling, young Croker worked in the Harlem Railroad's machine shop and later as engineer on a steamboat. A formidable

fighter, Croker also led the Fourth Avenue Tunnel Gang, whose members served as Tammany musclemen and repeaters. He cast his first ballot in 1864, in fact seventeen of them, and in 1868 he became an alderman at age twenty-five. In 1873, thanks to his new patron Kelly, he was elected coroner of New York; ten years later he was made fire commissioner, and in 1886 Croker stepped into the leadership—and into a full-blown crisis.

The United Labor Party presented a potentially mortal threat to the nexus of Catholics, Democrats, and the Irish-American middle class, if it succeeded in reorganizing New York City politics along class rather than ethnic lines. George was backed by Land League nationalists like Patrick Ford and Michael Davitt and by radical priests like Father McGlynn. If the Irish working class followed their lead and abandoned Tammany, it would leave the bosses high and dry. In addition, many an Irish alderman, grocer, and saloonkeeper was deeply invested in uptown real estate, and such men, perhaps even more than upper-class landlords, were banking on precisely the kind of speculative profits that George threatened to tax away.

Croker understood that solid Swallowtail backing was essential to defeating George, so he insisted on nominating ironmaster Abram Hewitt, the impeccably respectable leader of that opposing faction. The Democratic candidate proceeded to attack the very notion of a labor party as an attempt “to organize one class of our citizens against all other classes.” Between capitalists and laborers “there never is and never can be any antagonism,” but if the working classes “as they are called” ever did need special representation, they had their trade unions to speak for them.

Unions were perfectly legitimate bodies, Hewitt admitted, though he himself thought “self-help is the remedy for all the evils of which men complain.” Certainly Hewitt had a deeper sympathy for workingmen than many of his peers, certainly more than did Theodore Roosevelt. A paternalistic employer, he had kept mills open and men employed during recessions. As congressman during the Great Strike of 1877, he hadn’t howled for blood but held congressional hearings, which demonstrated that industrial interests had cheated and abused labor.

Being the son-in-law of the revered Peter Cooper won him additional support among the city’s laboring classes, and Hewitt held up his family’s support for Cooper Union as an example of responsible charity. He went so far as to criticize the Astors for failing to devote their “unearned increment”

to public purposes. He even agreed with George that the city ought to provide education and recreational facilities out of its own coffers. The way to obtain the needed funds, however, was not by taxing land, which Hewitt noted shrewdly would put the burden on modest property holders as well as millionaires. Instead the city should tax the *mansions* of the wealthy, a levy he was sure the rich wouldn't mind paying once Tammany was vanquished.

To working-class constituents Hewitt insisted that despite his considerable wealth, he wasn't the millionaire's candidate: "These rich Republicans and these rich millionaires—nay, have they not at the Union League Club indorsed Mr. Roosevelt?" At the same time he crudely appealed to the fears of the propertied classes, indicting the United Labor Party as "anarchists, nihilists, communists, socialists" who were "enemies of civilization and social order." George's theories, if put into practice, would recall "the horrors of the French Revolution and the atrocities of the Commune." These accusations, though false, proved effective.

Stung by such charges, and with three days left in the campaign, the United Labor Party arranged a grand parade to demonstrate its responsibility. On Saturday, October 30, tens of thousands converged on the Bowery and formed into disciplined ranks. As the Printers Legion led off toward Cooper Union, a light mist gave way to heavy rain. Undeterred, hoisting their bedraggled banners and transparencies, unionists fed into the line of march, forming a human river, two miles long, of tailors, plumbers, painters, brass workers, framers, street railway workers, Cuban cigarmakers, Italian fruit handlers, Bohemian single taxers, and German cooperationists (pushing a huge broom, with which to sweep the election).

As they strode into Union Square, in a cold and drenching downpour, their signs—illuminated by sputtering torches, calcium lights, and colored fires—were clearly visible: THE WORKERS OF THE CITY ARE NOT ANARCHISTS! THE SPIRIT OF '76 STILL LIVES! and George's own campaign slogan: HONEST LABOR AGAINST THIEVING LANDLORDS AND POLITICIANS— THE LAND BELONGS TO THE PEOPLE! As they swung into the last leg heading toward Tompkins Square, their chants rang out over the driving storm: "Hi! Ho! The leeches must go!" and "George! George! Hen-ry George!"

The next day, Sunday, an alarmed Tammany Hall turned to the Church for assistance. Archbishop Corrigan was loathe to appear in cahoots with Boss Croker, but the situation was critical. Only the hierarchy could

possibly counter McGlynn's enormous influence. On September 29 Corrigan had forbidden McGlynn from speaking at a scheduled George rally at Chickering Hall. McGlynn insisted on fulfilling his commitment, telling the archbishop that "I, in view of my rights and duties as a citizen, which were not surrendered when I became a priest, am determined to do what I can to support Mr. George." Two days later, Corrigan suspended McGlynn. The pastor of St. Stephen's made no more speeches for the rest of the campaign but continued to make highly visible appearances at United Labor Party rallies.

The vicar-general, the Right Rev. Monsignor Thomas S. Preston, was authorized to make a forceful preelection statement of Church policy. "The great majority of the Catholic clergy of this city," Preston asserted, "are opposed to the candidacy of Mr. George." Gleeful Tammanyites reproduced Preston's statement and handed it out on Sunday morning in front of Catholic churches.

DENOUEMENT

On Tuesday, November 2, voters trooped to the polls while a mute McGlynn rode through the streets with George, and United Labor Party volunteers oversaw the election process as well as they were able. Hewitt won with 90,552 votes. George came second with 68,110. Roosevelt finished last with 60,435.

George ran best among the second-generation German-and Irish-American working classes of the Lower East Side and Hell's Kitchen. He did especially well with Catholics, who provided perhaps five-sixths of his support. But the poorest, most recent immigrants in the gashouse and slum districts along the East River—motivated by the carrot of Tammany patronage and the stick of Church denunciation—went with Hewitt. George talked well, but these were practical people, and it was the Democratic Party, and its associated network of tenement-world notables like saloonkeepers, grocers, builders, and contractors, that responded most effectively to their day-to-day needs with jobs, credit, legal help, and holiday handouts.

Roosevelt's vote was down by as much as twenty thousand from the usual Republican level. Apparently many wealthy Republican voters,

terrified at the prospect of a George victory, switched to Hewitt, who did well in the silk-stockings districts and middle-income wards.

Despite the loss, George and his supporters were ecstatic. Labor editor John S. Winton pointed out that they had “struck a blow truly astounding under the circumstances.” The *World* agreed that it was “an extraordinary thing for a man without political backing, without a machine, without money or newspaper support” to have polled so many votes. The defeated candidate was convinced that the future was his. “This is the Bunker hill,” George crowed. “We have lit a fire that will never go out.”

In fact the flame flickered for a year or two, sputtered, and died. The United Labor Party ran George in 1887 for statewide office, but during the campaign the 1886 coalition fragmented into its constituent parts.

First to go were the socialists. George and his single-tax followers, never comfortable with their militant class politics, soon read the Germans out of the party. The socialists retreated to their base in Kleindeutschland, where, amid the post-Haymarket wave of nativist hysteria, they languished, isolated, demoralized, riven by factional brawls. Within a few years, German hegemony in the Socialist Party and socialist press was finished, but not before they passed the torch to a new generation of New Yorkers—chiefly Jewish immigrants—who would carry the red banner into a new century.

The Knights of Labor never recovered from being tagged with the anarchist label. In the red scare that followed Haymarket, the organization disintegrated almost as rapidly as it had grown. Gompers and the business unionists went their own way, now *totally* persuaded that workers should shun politics. Gompers threw all his energies into building up the new American Federation of Labor. In the 1890s he would accept the free market economy, viciously attack former socialist comrades, and, despite his earlier inclination for a multiethnic, multiracial organization, preside over the growth of an exclusionary bastion for craft workers. The cigarmakers would fail to overcome the structural problems in their industry—tenement shops remained and flourished—but they would win the eight-hour day and a steady increase in pay.

The year 1887 also witnessed the collapse of Catholic support for class-based politics. Archbishop Corrigan saw to that. After the election he issued

a pastoral letter counseling parishioners to adopt “the loving docility that becomes dutiful children” and “give no ear to those, whoever they may be, who preach a different Gospel.” Father McGlynn responded by giving weekly orations to crowds of two to three thousand people in which he insisted that bishops, even the pope, shouldn’t interfere with American Catholics’ exercise of their political rights. After some priests gave McGlynn guarded support, Corrigan and the Vatican decided to heed an adviser who said, “Dr. McGlynn must be put down or the Archbishop of New York might as well not be Archbishop of New York.”

McGlynn was summoned to Rome, refused to go, and in January 1887 was removed from his post at St. Stephen’s. Thousands paraded in his support. He told the throng he would not obey the pope. On July 3 he was excommunicated. The archbishop circulated a pledge of loyalty for the priesthood to sign. Some refused and found themselves exiled to upstate parishes. So effectively did Corrigan assert the hierarchy’s power that no Catholic clergyman in New York would ever again repeat McGlynn’s defiance.

Corrigan went after the rebel priest’s lay supporters too. He told Catholics that George’s writings were “false and pernicious”—he tried to get them placed on the Index—and forbade attendance at meetings of the Anti-Poverty Society, McGlynn’s secular reform vehicle. Corrigan ousted supporters of George from the thousandmember Catholic Club, making it a bulwark of lay support for archdiocesan officials. The pressure was so fierce that even Patrick Ford took the *Irish World* back into the fold. As Corrigan warred on liberalism in theology and social practice, he also emerged as a major backer of the Vatican. The archbishop strongly pushed Peter’s Pence collections among his wealthier parishioners, an important source of income now that the Papal States had been lost. He also agreed to manage Vatican investments, yet another manifestation of New York’s importance as a financial center. By the time Corrigan was finished, the metropolis had been solidly established as the bastion of conservatism in the American Church.

As to the candidates themselves: George, after his disappointing 1887 loss, and an abortive attempt to build a national labor party, formed local clubs to promote the single-tax movement and worked for free trade within the Democratic Party. One of his most ardent followers, Philip G. Hubert,

founded the cooperative apartment movement, thus making the Chelsea Hotel an indirect Georgian legacy.

Roosevelt went back to reform work and served as a federal civil service commissioner between 1889 and 1895. He would be heard from again.

Hewitt, the victor, began his mayoralty by pushing a program of harbor, street, and rapid transit improvements designed to aid commerce and provide public works jobs. But his administration soon ran aground. When balked in his reforms, Hewitt, a notoriously obstinate and ill-tempered man given to fits of pique and bursts of anger, vituperatively turned on his 1886 constituents. Having at first channeled Croker some patronage, he cut off the supply. Having made bows to working people, he denounced the Knights of Labor.

Most dramatic, Hewitt reverted to his nativist roots. He pushed for a literacy test and a twenty-one-year naturalization period for immigrants and decreed the closing of small saloons on Sundays. He flatly refused to review the St. Patrick's Day Parade, something every mayor had done for thirty-seven years. He even refused to fly the shamrock flag at City Hall that day and starchily told his largely Irish Board of Aldermen that "America should be governed by Americans" and that those who preferred another flag should go back where they came from. In the end, it was Hewitt who was sent back where he came from. Croker refused to renominate him, and when the Swallowtails ran him as an independent, he was trounced at the polls.

THE NEW TAMMANY HALL

The biggest winner of the Henry George election was Tammany Hall, which learned a great deal from its near-loss. What impressed Democrats most about the United Labor Party was not its principles but its organization—the network of union locals, Knights of Labor assemblies, and labor clubs the upstart party fielded. They noticed that one Tammany ward that held its own in 1886 had done so by adopting elements of the ULP approach. Henry Purroy, boss of the Twenty-fourth Ward up in the Annexed District, had established a clubhouse in place of the usual saloon. Purroy had also involved the voters' wives and children on excursions, clambakes, and the like, making the party as much a cultural organization as a political one.

After 1886 Tammany extended this approach throughout the city. By 1893 there was a clubhouse in every Assembly District, all of them linked in the Associated Tammany Societies, with a *Tammany Times* to report on their activities. The clubs replaced the personal and perishable followings of saloonkeepers and gang leaders and gave a bureaucratic underpinning to the machine. They also gave the party an air of respectability, making it more like the American Legion or the Elks than a bunch of brawlers. Clubs also strengthened the leadership, by making it difficult for insurgents without club endorsements to break into politics. Those who wanted construction and carting work or clerical and professional jobs with the city were well advised to join their local party association, as patronage rewards were now reserved for those who labored long and hard in clubhouse vineyards.

There was patronage aplenty under the dispensation of Croker's protégé Hugh J. Grant, the man who rebuffed Hewitt's try for a second term in 1888. Grant, the first New York-born, Irish-American mayor, came from solid middle-class stock. His immigrant father had accumulated a string of successful saloons and left him a substantial inheritance. Grant graduated from St. Francis Xavier and Columbia Law, invested in Upper West Side real estate, built a base of support among Irish-American fraternal organizations, and became a Tammany District Leader and loyal Crokerite—a whole new route to municipal power.

Croker renominated Grant, got him reelected in 1890, then passed the baton to Thomas Francis Gilroy in 1892. Gilroy's rise was even more heavily dependent on the machine, as his background was more plebeian than his predecessor's. The Irish-born Gilroy, brought to New York as a child, attended public school, worked as a printer's apprentice, then worked his way up through the political ranks, serving as a Tweed messenger boy, holding a series of county and court clerkships, becoming district leader on the Upper East Side, then, in 1886, rising to undersheriff of New York County, before being elevated to the mayoralty.

Grant gave virtual control of all city offices and contracts to Croker, who started by making himself city chamberlain at twenty-five thousand dollars a year. With patronage resources beyond anything Kelly or Tweed ever dreamed of, Croker strengthened his control over political officials. No longer would Tammany leaders have to bribe Democratic aldermen into

doing their bidding; from 1888 on the complaisant board took its orders from Croker.

Command over twelve thousand city workers also gave the machine a source of campaign funds (via mandatory assessments) and a vast reservoir of election day labor power. This electoral army was supplemented with the aid of a quarter-million dollars of public money allotted to “poll watching.” Technically controlled by police captains in each precinct, it was doled out to voters at the direction of District Leaders, with perhaps 20 percent of the Democratic electorate on the receiving end. City government had, to a significant degree, become an affair of patrons and clients.

This process of consolidation—like the one taking place in the corporate world—was never complete. Croker could not rule absolutely because District Leaders retained power in their own domain. He would have to deal with proconsuls like Big Tim Sullivan, baron of the Bowery, and George Washington Plunkitt, boss of Hell’s Kitchen. Archbishop Corrigan, who carried out a parallel consolidation in the ecclesiastical realm, did far better than either Croker or Morgan.

Tammany’s new strength did allow its Irish-American leaders to crush their longtime partner-opponents, the Swallowtail Democrats, and their stronghold, the County Democracy, expired in 1892. Independence required Irish-American politicians to develop alternate sources of income. One solution was the establishment of an informal “vice tax,” with the machine offering police protection to gamblers and prostitutes in exchange for cash. Payoffs helped fill Tammany coffers from the late 1880s on, but as the politicians would soon discover, such revenue came with risks of its own.

The other source of working capital was the business community. The rise of powerful corporate entities was aided by, and in turn encouraged, the parallel centralization of political power. In the past, businessmen in search of favors had bribed individual aldermen or state legislators, not Tammany bosses. When Jacob Sharp went after his Broadway franchise, almost all the boodle board lined up for a cut, which was annoying, expensive, and problematic, as one could never be sure the bribed would stay bought. Now men like William Whitney could go straight to the top and achieve in a day what had taken Sharp years.

The utilities became Tammany's greatest source of income. Whitney and Ryan of the Manhattan Elevated Railroad provided top politicians with hefty lawyer's fees, stock market tips, contracts for their construction companies, and pieces of the action in Metropolitan's financial deals. They were amply repaid with valuable franchises, maintenance of high fares, and blockage of utilities reform. Upstate too, after Tammany solidified control of both houses in 1892, corporations seeking favors paid "campaign contributions" to him, not legislators, and Croker then distributed the largesse. Republican boss Thomas Platt adopted the same system and indeed worked closely with Croker.

The old shanty dweller did quite well in the new order. He joined the elite and adopted its favorite hobby of raising thoroughbred horses. By the end of 1893 Croker had a \$250,000 stock farm, \$103,000 worth of race horses, and an eighty-thousand-dollar mansion on Fifth Avenue. Like other monopolists, he justified his personal gains by pointing to larger social benefits. As he explained the merits of his new system to Lincoln Steffens, a young reporter: "A business man wants to do business with one man, and one who is always there to remember and carry on the business." *The Bankers Magazine* agreed: bosses were mercenaries, no doubt, but they offered "financial corporations" the protection of "a Rob Roy who could control the legislative marauders."

Croker made peace with the city's working class as well. Tammany arranged some legislative overtures that redressed some of labor's grievances, and between 1887 and 1894 laws improved working conditions for streetcar workers and provided for arbitration of some labor disputes. But Democratic interventions tended more toward the rhetorical than the substantive. Tammany became the Friend of the Working Man, but not of workingmen. Democratic Party energies—over and under the table—concentrated on maintaining a pro-business climate, particularly low taxes and freedom from regulation. Thomas Byrnes's police continued to deal ferociously with labor unrest and break up radical meetings while tolerating grafters and boodlers. Armories proliferated, like the Twenty-second Regiment's fortified new home at 67th and Broadway (1890), which had slits for cannons and a main entrance that afforded easy passage for cavalry troops. By the mid-1890s New York had 12,800 National Guardsmen, specially trained in riot suppression, and available too as a strikebreaking

force, as its mostly middle-class members had been carefully screened. “Are you connected in any way with any labor organization?” each applicant to Brooklyn’s Forty-seventh Regiment was asked, and anyone who responded positively was rejected.

The new Democratic Party would be of but not for labor. The failure of Henry George’s campaign meant there would be no Labor Party in New York City of the sort taking shape in Britain and Germany. Nevertheless, as Teddy Roosevelt observed dolefully after the 1886 election, while the large vote for George did “not mean a new party,” it did constitute, “unfortunately, a new element to be bid for by the old parties.”

The alliance of Irish-, German-, and Anglo-American workers forged in the labor and political wars of the mid-1880s had laid out an agenda for transforming the city. It had sought changes in work, transportation, communication, housing, taxation, health care, sanitation, charity, education, policing, and the organization of politics—stressing the need for government provision of social services by using tax revenues or undertaking full-scale “municipalization” of private businesses.

In 1886 the labor radicals failed to force Tammany, much less Albany, to significantly address their concerns. But reinforcements were arriving. Ships in the harbor had begun disembarking tens of thousands of Germans, Irish, and Britons, along with hundreds of thousands of Eastern European Jews and Southern Italians. Once again, as in the 1840s and 1850s, a vast second city was rising alongside the existing one.

At first this would hamper radical initiatives, as the newcomers had no shared history with New York’s established workforce, had not forged links in the course of common struggle, and often had but limited command of English. But many brought militant traditions of their own and quickly discovered interests in common. When working-class New Yorkers succeeded in overcoming the latest set of barriers to cooperation, the pressures on Tammany would mount once again, until, in the new century, the machine would find itself forced into adopting policies advanced by the radicals of ‘86.

The New Immigrants

Between 1865 and 1873 over two hundred thousand migrants had arrived in New York City each year. The depression pummeled these numbers downward—in 1877 only sixty-three thousand immigrants passed through Castle Garden—but with the return of prosperity the influx soon set new records.

The old state-run system for processing newcomers buckled, and in 1890 the new federal Bureau of Immigration took over the task. The bureau, surveying the harbor for a site to replace the overburdened Castle Garden, settled on Ellis Island, newly swollen with landfill, and on January 1, 1892, the new immigration station began screening steerage passengers. First- and second-class arrivees were handled onboard ship and allowed to disembark directly on Manhattan. That first year, 445,987 passed through Ellis. By 1897 some 1,500,000 had threaded their way through examinations designed to weed out criminals, lunatics, and potential paupers.

The great bulk of new immigration came from old sources, with German migration actually reaching its peak in the 1880s. Farmers and farm laborers came from Germany's north and east, uprooted by the ongoing commercialization of agriculture and declining wheat prices. Artisans undercut by factory production left towns and villages, found industrial centers in Silesia and the Ruhr valley as yet unable to accommodate them, and crossed the Atlantic in force (some fleeing the antisocialist laws).

In the 1880s 1,445,181 Germans arrived, constituting 27.5 percent of the total incoming migrant stream, and of these, fifty-five thousand stayed in New York City, a figure that doubled in the 1890s. The German-born population rose steadily from 119,964 (in 1860) to 151,203 (in 1870), 163,482 (in 1880), and 210,723 (in 1890), before leaping to its peak (in 1900) at 324,224.

Collectively—and German unification made provincial groups more conscious of their commonalities—German New York stood third behind Berlin and Vienna as a German-speaking metropolis. Kleindeutschland continued to bulk large as a cultural community—so many lived within its

German universe that assimilation proceeded quite slowly—but its spatial boundaries shifted. Kleindeutschland proper shrank to a truncated parallelogram bounded by 14th, Grand, Broadway, and the East River. Second-generation Germans continued their uptown exodus to the East Side (between Central Park and the river) and to Brooklyn (especially Williamsburg), where over one-third the German population lived.

Irish emigration was rekindled too, as agricultural depression in the late 1870s raised the specter of another famine. Emerald Isle reinforcements kept the combined Irish-born population of New York and Brooklyn hovering above the quarter-million mark, rising slightly from 260,450 in 1860 to 275,156 in 1890 (an estimated seventy thousand of them Gaelic speakers). While this represented a decline in natal Irish people as a percentage of the total population—from 24 percent to 12 percent—New Yorkers of Irish extraction constituted some 40 percent of the city in the mid-1880s, 5 percent more than the second-ranked German Americans. The metropolitan area thus retained a pronounced Irish flavor, with the heaviest concentrations in Manhattan's Hell's Kitchen (between 34th and 57th streets, Ninth and Twelfth avenues) and in Brooklyn's Navy Yard and Red Hook areas.

Not all newcomers came through Castle Garden or Ellis Island. African Americans continued to leave the South—over eighty thousand departed between 1870 and 1890, over a hundred thousand in the 1890s alone—and the small but steady influx began to replenish both New York's and Brooklyn's black communities. Still, the two cities had just 60,666 African Americans resident in 1900—less than 2 percent of the total population. In addition, there were 3,552 foreign-born blacks on hand in 1900, most of them recently arrived from the West Indies, the largest such settlement in the United States. The Tenderloin and San Juan Hill in the west 60s hosted the majority of black Manhattanites.

Despite obvious differences, all these groups shared two broad characteristics: their members came, by and large, from small-town or rural hinterlands thrown into turmoil by an advancing capitalist global economy, and they were tossed abruptly into an urban American environment for which they had little preparation. In both these regards, they had much in common with three more novel streams of arriving immigrants: Eastern European Jews, southern Italians, and Chinese.

SHTETLS UNDER SIEGE

For centuries the Jews of the Russian empire had been channeled, by law and prejudice, into particular spaces and particular functions. Territorially, they had been restricted to the Pale of Settlement, which stretched from the Ukraine on the Black Sea up to Lithuania on the Baltic. Within the Pale Jews had been tied to shtetls—market towns—where they provided services to the surrounding peasantry. Shtetl Jews ran shops and weekly markets; peddled goods to the countryside; administered inns, mills, taverns, and estates; and worked as tailors, cobblers, cabinetmakers, metalworkers, weavers, tanners, watchmakers, and bakers.

Jewish islands in a gentile sea, the shtetls survived through community self-help, disciplined religious devotions, and maintenance of rigid class and gender hierarchies. An elite alliance of learned scholars and the wealthy organized rituals and regulations in the holy language of Hebrew. These leaders looked down on the mass of laborers, denigrating both their trades and their language—a vernacular dialect, just coming to be known as Yiddish, borrowed from German and other European tongues. Lowest in prestige were the women, whose labor made men's study possible but who were themselves barred from becoming scholars. Wives managed fiscal affairs, worked in markets and shops, peddled, made their own and their children's clothes, ran the home, performed household religious rituals, and took charge of charity.

The shtetls survived internal strains and external pressures, but imperial liberalization, intended to drag Russia into the Western capitalist world, proved their undoing. Emancipation of the serfs in 1863 undercut Jews who had served as agents of the nobility. Railroads brought the products of urban (particularly German) factories to the Pale, supplanting rough-hewn artisanal output. Trains also brought cheaper grain from faraway markets, debilitating the peasant economy that sustained the shtetls. Citybased commercial and financial enterprises grew, undermining shtetl merchants and moneylenders.

Artisans were hardest hit. Tailors, cobblers, hatmakers—their skills obsolete—found themselves proletarianized. Even with wives and daughters working alongside them, they sank to the status of *luftmenschen*—men who lived on air—or lower still, to the ranks of the *schnorrers*

(beggars). In some shtetls half the population was dependent on charity. To all this was added an intolerable population squeeze. Where there had been one million Jews in the Pale in 1800, there were a suffocating four million in 1880.

So Jews left the impoverished towns and villages and made their way to industrializing cities like Warsaw, Lodz, Bialystok, and Grodno. Some escapees went farther still, to America, that magical land that apparently respected labor and rejected religious oppression. But very few went to such lengths. The Orthodox rejected it as a *trayf* (ritually unclean) country, whose Jews had no respect for Orthodox traditions. Russified Jewish radicals preferred to stay and help populists and socialists transform all Russia.

Then came March 1, 1881. Czar Alexander's imperial carriage was rumbling along a St. Petersburg street, flanked by Cossack guards, when a young man threw a bomb among the horses' legs. Unharmd, Alexander stepped to the street to survey the situation. Now a second man charged him and detonated another bomb, mortally wounding the czar.

The Jewish community of St. Petersburg laid a silver wreath on Alexander's bier in thanks for his modest lightening of Russia's oppression of their people. But the assassination touched off a wave of reaction against their coreligionists. The peasantry identified Jews with rapacious capitalism, despite the fact that most Jews were among its casualties, while the rich blamed them for radical attacks on the established order.

Pogroms broke out, organized massacres unhindered and at times instigated by the government. Jews were beaten, killed. Jewish shops, dwellings, warehouses, and synagogues were attacked and destroyed. The worst violence took place in bulging urban centers like Yelizabetgrad, Kiev, and Warsaw. Over the next decade, new czarist policies imposed forced relocations, banned access to certain professions, restricted admission to the educational system, and, in 1891, forcibly expelled Jews from Kiev, Moscow, and other Russian cities.

These pogroms and policies precipitated flight, with many Jews opting for America. In 1881-82, thousands bolted from southern Russia across the Austrian border to Brody. From there European Jewry's charitable organizations passed many along to Bremen or Liverpool, where they

boarded steamers heading to New York City. Over the next two decades, tens of thousands more made the trek on their own, escaping both sporadic repression and steady economic impoverishment.

In the 1870s roughly forty thousand Eastern European Jews had come to the United States. In the 1880s over two hundred thousand came; in the 1890s over three hundred thousand followed suit. Roughly 70 percent would settle in New York City, the major port of entry. In 1870 there had been about sixty thousand Jews in the metropolis, and by 1880 about eighty thousand. By the early 1890s that number had more than doubled, to nearly 170,000, and by the end of the decade it had reached 290,000—a phenomenal inrush that troubled New York’s long-established German-Jewish community.

OCCIDENTALS, ORIENTALS

In the context of the rising anti-Semitism that characterized the late 1870s and early 1880s city, New York’s German Jews, especially the more affluent among them, worried that the arriving masses would further undermine their decades-long drive for social acceptance. Such anxieties were not unreasonable. At first the wider metropolis rallied against Russian barbarism and anti-Semitism: a large protest meeting at Chickering Hall in 1882 denounced the pogroms, and the *Commercial Advertiser* suggested reprisals against the czarist regime. At the same time, however, faced with refugees who were far poorer and more exotic than had been imagined, less sympathetic opinions surfaced. A two-page cartoon in *Judge* that year depicted a “Ceremony of taking down the last sign of the Christians in New Jerusalem (Formerly New York)”.

The temptation was therefore strong to underscore the differences between German “Hebrews,” still widely respected, and “low-class Jews,” who were increasingly suspect. Thus the Rev. Dr. J. Silverman complained in an 1889 lecture at Temple Emanu-El that the newcomers were “a standing menace” because their “loud ways and awkward gesticulations are naturally repulsive and repugnant to the refined American sensibilities.” The “thoroughly acclimated American Jew,” the *Hebrew Standard* agreed, “is closer to the Christian sentiment around him than to the Judaism of these miserable darkened Hebrews.”

Real differences did exist. In Europe, those inspired by the Haskalah—an earlier German-Jewish enlightenment that had reconciled Jewish tradition to Western culture—had long rejected the power that shtetl rabbis, *melamdim* (teachers), and scholars retained in community affairs, considering it rigid and reactionary. In New York, many haut bourgeois Reform Jews, whose modes of observance had been moving steadily closer to those of their Protestant confreres, considered the Orthodox immigrants little better than fanatics. And even the Conservative Jews—those who balked at the Reform project and founded the Jewish Theological Seminary in 1886—were far more liberal in their theology than the arriving immigrants.

German Jews, moreover, had long contrasted their own progressive “Occidental civilization” with Russian “Orientalism.” Now, made prouder than ever of their German inheritance by the triumphs of Bismarck’s empire, many sought to distinguish themselves from Eastern Europeans on all fronts. They derided Yiddish as a “piggish jargon” and ridiculed newcomers as “kikes,” as their names often ended in *ki*. Many detested the immigrants’ dress and habits, which they thought unhygienic, and found them clannish, backward, and alien. To cultural disdain they added the class contempt that investment bankers and genteel merchants had for peddlers and tailors.

For all this, the Jewish old guard was torn between its class aspirations and its religious loyalties and increasingly began to respond to the combined pull of compassion, kinship, and *zedakah*, the charity required of every observant Jew. Emma Lazarus was the daughter of Moses Lazarus, a wealthy Sephardic New York sugar manufacturer and a founding member of the Knickerbocker Club. She was stung to read a piece in the *Century* magazine that bordered on blaming the victims of the 1881 riots for their own misfortunes, and she wrote a tart rebuttal. When those raising funds for the Statue of Liberty read it, they invited Lazarus to contribute a poem. In December 1883 she read her “New Colossus” at the National Academy of Design, a verse that reformulated the monument’s meaning from spreading enlightenment to embracing immigrants. Unlike the forbiddingly masculine Colossus of Rhodes, Lazarus wrote, America’s monument was a welcoming woman with “mild eyes”—a “Mother of Exiles”—who stood at “our sea-washed, sunset gates,” our “golden door,” lifting a lamp to beckon the

“homeless” and the “tempest-tost”—whom she also characterized as the “wretched refuse” of Europe’s “teeming shore.”

Convinced that without some direct intervention on their part, that the city’s ambivalent acceptance of “wretched refuse” might not long continue, and that they themselves would be irretrievably associated with the newcomers, New York’s wealthy German Jews, for all their misgivings, shouldered responsibility for their impoverished and outlandish coreligionists. Jacob Schiff, B’nai B’rith, the Baron de Hirsch Fund, and the Union of American Hebrew Congregations (among others) underwrote the Hebrew Emigrant Aid Society’s establishment of temporary shelters at Greenpoint and set up another barracks encampment on Ward’s Island, in the grounds of the old lunatic asylum. A fledgling United Hebrew Charities extended direct aid to settlers, reaching one in ten. In 1892 the newly established Hebrew Immigrant Aid Society stationed a representative on Ellis Island to mediate with immigration officials and hand out advice bulletins to newcomers.

Traditionally, *zedakah* was blind. Donors did not know the identity of recipients and vice versa. This precluded using charity to influence or control beneficiaries. But influence was precisely what German-Jewish givers wanted—as did their counterparts in Protestant charities like the Association for Improving the Condition of the Poor or the Children’s Aid Society. The immigrants “must be Americanized in spite of themselves,” one uptowner wrote in *the Jewish Messenger*, “in the mode to be prescribed by their friends and benefactors.”

In June 1889 a group including Jacob Schiff, Isaac Seligman, and Isidor Straus began to raise funds for a Hebrew Educational Alliance. It was conceived, in the consolidating spirit of the day, as a merger of the Hebrew Free School Association, the Young Men’s Hebrew Association (which Oscar Straus had helped found in 1874 as a counterpoint to the Christian organization), and the Aguilar Free Library (founded for new arrivals in 1886, with the goal of “uplifting the mental and moral tone of a class that woefully lacks refining influences”).

The organizers quickly deleted “Hebrew” from the Educational Alliance, which opened its five-story yellow brick building at Jefferson Street and East Broadway in 1891. They did, however, sponsor Hebrew classes for boys and girls, lest parents send them to a *cheder* (religious school), “where

the general surroundings, considered from hygienic, moral and Americanizing standpoints,” as the organization put it in 1894, “are of the very type which it is the chief aim of the Alliance to extirpate.” They drew the line at Yiddish, though, banning its use until the end of the century. Within these parameters, the institute developed pioneering and popular programs—summer camps and arts classes and English and civics programs—which became a model for citizenship courses in public schools.

To another set of German Jews—merchants and manufacturers—the new immigrants seemed less a burden to uplift than a czar-sent opportunity. German Jews had come a long way from the secondhand shops of Baxter and Chatham Street: they now owned 80 percent of all retail and 90 percent of all wholesale clothing firms in the city. To these men, and the garment manufacturers who supplied their wares, the Eastern Europeans constituted a phenomenal supply of cheap labor. Some uptown philanthropies, like the United Hebrew Charities (UHC), stayed in close contact with leading manufacturers and actually funneled greenhorns into the garment business. The UHC gave quick and limited training to new arrivals, steered them to the shops, and on occasion deployed them to break strikes.

There was little need for coercion, however. Unskilled immigrants were well aware that the road to survival led literally to the garment district. Once past customs, most newcomers walked from the Battery up Broadway, turned right up Park Row at the General Post Office, and continued straight ahead along East Broadway, until they arrived at its juncture with Canal and Essex streets, a spot later known as Seward Square. Settling near there left them perfectly positioned to find work, for Canal Street was the center of the wholesale trade and Grand Street, two blocks north, was the axis of retailing.

In the 1880s New York’s textile trades were undergoing yet another transition, which the Eastern Europeans spurred. In the mid-nineteenth century, men’s clothing production had shifted from custom tailoring to ready-to-wear. In the 1880s it was women’s wear’s turn. The breakthrough came in cloakmaking; in the 1890s shirtwaist, skirt, and dress manufacturing followed suit. The number of women’s clothing establishments ballooned from 230 in 1880 to 3,429 twenty years later, while men’s shops continued their expansion, rising from 736 to 2,716 in the same period.

Production of both men's and women's clothing involved increasing mechanization and microdivision of labor. Before the Civil War, merchant-manufacturers had parceled out handcut fabric to skilled German and Irish craftsmen who, with the aid of their families, manually assembled the finished goods at home. Now German-Jewish manufacturers used the new rotary cutting machine (1874) to slice up materials in great quantities. Some finished up the garments in their own factories, employing young unmarried women (only 2 percent of Jewish wives worked outside their homes). But rents were high and the business seasonal, so ninety-seven out of a hundred cloak and suit houses turned cloth bundles over to German-Jewish or, increasingly, Russian-Jewish contractors, for transformation into ready-to-wear garments at a negotiated price.

A contractor then set up a workspace in a rented loft or his own tenement apartment. He rented or bought sewing machines—fifty to a hundred dollars would buy a few used Singers—or required employees to bring their own. Finally he supervised, and usually worked alongside, teams of eight to twenty semiskilled workers, ideally just off the boat. Labor in these “sweatshops” was broken down into thirty or more tasks, with machine work done by operators and needlework, basting, finishing, felling, and pressing reserved for the less skilled.

By 1895 there were roughly six thousand sweatshops in New York City and nine hundred in Brooklyn, employing perhaps eighty thousand workers. Given such fierce competition, few contractors did well. Each had to underbid the other, forcing all to operate so close to the margin that a slack season or a general economic downturn could wipe them out. In some years as many as one-third failed. Those who survived did so by relentlessly exploiting their workers. Contractors demanded six fourteen- to sixteen-hour days a week and drove wages down from fifteen dollars a week in 1883 to seven dollars in 1885.

Immigrant Jews accepted such conditions partly because the sweatshop environment was culturally compatible. They were not (always) forced to labor on the Sabbath; they could work with *landsmen* (fellow countrymen); they could keep their households intact—the family that sweated together stayed together. But mainly they had no choice in the matter. Many were unskilled, in poor health, and locked in competition with one another. Each day at eight A.M. the unemployed shaped up at the corner of Hester and

Ludlow streets; the din of negotiating gave it the name of the Khazzer Mark (pig market).

THE LOWER EAST SIDE

As newcomers poured in, Kleindeutschland morphed into the Lower East Side. The original Jewish quarter rapidly expanded outward from its core near the Canal, Hester, and Grand Street job markets. It spread west to the Bowery, east and south toward the river and warehouse districts, still Irish strongholds, and north to Delancey and beyond, pushing the remaining Germans ahead of it into the now shrunken “Dutchtown” that ran from Houston to 14th Street.

Within this terrain, ethnic subdivision was the rule. So many Russians clustered around the Canal to Grand Street core that by 1890, the old Tenth Ward, once predom- inantly German, was 70 percent Russian Jewish. Galicians roosted from Grand up to Houston; Hungarians occupied blocks north of Houston and east of Avenue B.

Inside this new if unofficial Pale, density soared as landlords subdivided old row houses into five or six apartments and stuffed in tenants. One house at Essex and York, split into sixteen apartments, warehoused two hundred. Bathrooms were scarce, coal and wood remained the main sources of fuel, kerosene provided lighting, and blocks of ice furnished refrigeration. More spacious five- or six-story tenements went up to house the slightly more affluent, offering reasonably adequate plumbing, heating, and ventilation. But their higher rents forced tenants to take in boarders, and soon these structures too were packed. By 1890 the Tenth Ward had 524 people per acre, the highest density in the city. Within ten years the figure would rise to seven hundred per acre, a rate that topped Bombay’s as highest in the world.

Jews stayed packed like herrings in a barrel in part because they couldn’t afford to commute. When job opportunities did open up in more hospitable surroundings, some moved out with alacrity. In the 1880s one such destination was Brownsville, in a faroff and still undeveloped section of Brooklyn. The little village of one- and two-family houses lay at the outlying end of Vaux and Olmsted’s Eastern Parkway, where it ran into Pitkin Avenue. Here, just west of the orchards and farm fields beyond Rockaway Avenue, a Jewish real estate agent invested in local lots in the

mid-1880s, persuaded some cloakmakers to set up shop, and began constructing rows of frame houses for workers (a hundred dollars down, ten dollars a month). By 1892 a Jewish community of four thousand Russians and Poles, complete with synagogues and fraternal organizations, had taken root.

Other newcomers followed trails blazed by Germans and headed to Williamsburg, to Yorkville (where cigar factories provided work), and to Harlem, where by 1890 thirteen hundred Russian and Polish Jews had settled into the Irish-German neighborhood west of Third Avenue. But in such outposts they would remain minorities, whereas the Lower East Side was emerging as a world the Jews had remade for themselves.

Concentration had its benefits. It guaranteed ethnic predominance and cultural familiarity. The streets were packed with *landsmen*, the stores emblazoned with Yiddish signs, the backyards stocked with chickens—it might have been Odessa. Street and cafe grapevines provided information about jobs. Housewives purchased fish, milk, tin, and bits of cloth from the omnipresent pushcarts. It required almost no capital to rent a cart, stock it at the Canal Street wholesalers, and make the rounds. Soon these peripatetic retailers settled down themselves. Hester Street, nestled between Grand and Canal, became the unofficial peddlers' concourse, jam-packed from end to end, patronized by immigrants familiar with European street markets. Soon Grand, Orchard, and Rivington had become open-air bazaars as well. Sex too was for sale here, and by the 1890s Jewish prostitutes worked Allen, Houston, and Delancey streets.

Some peddlers rose to become shopkeepers and served as grocers, bakers, and kosher butchers to the burgeoning community and the wider metropolis. By 1888 perhaps half the city's four thousand meat retailers and three hundred meat wholesalers were Jewish. At a time when other eastern cities had come to depend on midwestern abattoirs, New York's demand for kosher meat sustained the metropolis as an important slaughtering center, and one firm, Schwartzchild and Sulzberger, emerged as a meatpacking giant. By 1890, a mere decade after mass settlement got underway, there were forty-three bakeries, fifty-eight bookshops, and 112 candy stores belonging to East European Jews. The latter dispensed seltzer, a less expensive version of soda water. It was tremendously popular among the generally nonalcoholically inclined Jews, prized as a complement to rich

kosher diets (*belchwasser*, it was often called), and when mixed with chocolate syrup and milk, it got magically transformed into an “egg cream,” neither of which it contained.

E. Idell Zeisloft, who published this photograph of Hester Street in *The New Metropolis* (1899), described it as “the wonderful market of the Ghetto. See it on Thursday afternoon and evening and Friday morning, when all the housewives are making their purchases for the Shabbas . . . a most picturesque spectacle.” (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

Orthodox Jews tried to resurrect the shtetl’s religious life. They founded synagogues in profusion. Many were little more than storefronts or tenement rooms. Others were housed in recycled Protestant churches or German-Jewish synagogues. An exalted few were custom built: in 1886, the Herter brothers produced a glorious Moorish-Gothic-Romanesque temple at 14 Eldridge Street for the Polish Congregation Khal Adas Jeshurun. It was the first to be raised by Eastern European Jews on the Lower East Side.

With the synagogues came *talmudai torah* (religious schools), *chedarim* (Bible and Hebrew classes for young boys), and *mikvehs* (ritual baths). Key shtetl figures resurfaced as well: *shohets* (ritual slaughterers), *mohels* (circumcisors), and *hazzan* (cantors). Newspapers devoted to traditional

ways flowered: the *Yidishe Gazetn* (1874), *Yidishe Tseitung* (1870), *Yidisher Tageblatt* (1890s). So did *chavarot* (mutual benefit societies) and *landsmanshaftn* (self-help groups organized on hometown lines, of which Bialystoker Center was the first). These organizations—housed in attics, basements, and storefronts—provided financial aid, funeral and cemetery benefits, loans, and communal centers.

Re-creating the Old World in the New proved difficult. Leaders were scarce: few Orthodox rabbis emigrated, and indigent scholars were forced to work. Followers were even harder to come by. Many *luftmenschen* immigrants had already been drawn to secularism in Europe. Now, in New York, many abandoned the old customs in a drive to become “regeleh Yankees”: men stopped daily prayers, shed skullcaps, trimmed or shaved beards and sidelocks, and donned Prince Alberts, starched collars, and neckties. Young men were attracted to secular educational institutions, and a small trickle of East European Jews managed to join the several dozen German-Jewish boys who entered City College each year, at a time when the average class numbered fifty. Bernard Baruch graduated in 1889, and in the following years New York Jews developed a close attachment to the institution at Lexington and 23rd, despite its mediocre faculty, its Protestant moralism, and occasional anti-Semitic episodes.

Women doffed wigs and kerchiefs and adopted American fashions. Some even began to question shtetl dogmas about female inferiority, now that they were in a country that considered women elevated creatures. They were less taken, however, with the bourgeois American notion that women should be homebound and passive, accustomed as they were to breadwinning roles. By the early 1890s an estimated twenty thousand young Jewish women, largely American born, were employed as saleswomen, milliners, typists, bookkeepers, stenographers, and public or private school teachers.

By and large, Jewish secular radical intellectuals would have more impact on their countrymen than did Orthodox traditionalists. At first, however, intoxicated by New York’s cosmopolitanism and their newfound freedom from shtetl and czarist controls, the intellectuals devoted most of their attention to debating one another. Some were attracted by socialism, with its optimism, universalism, impressive learning, and ethical appeal, and Tammany was startled in 1886 by the heavy turnout of Jewish voters

for Henry George. Others, like Emma Goldman, opted for anarchism. Goldman, a Lithuanian immigrant who had been sewing overcoats in Rochester for several years, arrived in New York during the summer of 1889 with a sewing machine and five dollars, rented a room on Suffolk Street, and plunged immediately into the political scene, determined, like Russian heroines, to “go to the people.”

Inspired by the impromptu refusal (in 1882) of a group of newly arrived Jewish immigrants to scab on striking Irish longshoremen, the city’s German socialists began holding mass meetings on Rivington Street. Abraham Cahan, a brash young Lithuanian immigrant and former cell member of Vilna’s *Narodnaya Volya*, argued successfully that such lectures, to be effective, must be given in Yiddish. This led, with German socialist assistance, to the formation in 1886 of the *New Yorker Yiddishe Volks-Zeitung* and in 1888 of the United Hebrew Trades (UHT), both dedicated to helping the “Jewish proletariat. . . free itself more quickly from the filth of the pig market.”

The UHT grew swiftly, due in large part to the efforts of Cahan, Morris Hillkowitz (later Hillquit), a twenty-year-old recently arrived shirtmaker who helped unionize tailors, cloakmakers, and pressers, and the flamboyant Joseph Barondess, self-styled king of the cloakmakers. Barondess affected the haughty, not to say arrogant, manners of a bohemian aristocrat, satisfying his followers’ yearning for dramatic militancy, rather as Mike Walsh had done for the Irish half a century earlier. In the 1890 May Day celebrations, Barondess, mounted on a white horse, led his three thousand cloakmakers in a grand parade of nine thousand Jewish workers that marched to the “Marseillaise” up to Union Square, greeted by cheering bystanders waving red banners from windows.

Histrionics aside, with the aid of assistants like Emma Goldman, Barondess in 1890 led a strike by cutters and contractors against the Cloak Manufacturers Association and stood firm as well against the determined opposition of the United Hebrew Charities, which, when asked to extend relief to locked-out cloakmakers, reportedly said: “If they strike on account of their union, let them suffer for it. . . let them starve.” (“Better the whip of *Fonye* [the Tsar],” snarled the *Arbeiter Zeitung*, “than the charity of Eighth Street.”) In the end, Meyer Jonassen, New York’s leading clothing manufacturer and a wealthy uptown German Jew, was forced to boost

wages and recognize the union, though the terms excluded women, who were the bulk of his factory employees.

In the volatile garment industry, successes proved hard to sustain. Concessions were withdrawn, agreements broken. The year following Barondess's triumph, one of the largest manufacturers sent work to nonunion shops out in Jamaica, and Barondess himself was thrown in jail on a trumped-up charge. By the end of the 1890s, after a decade of intense activity and ferocious strikes, which were often widely supported in the community, little more than 15 percent of the garment workers belonged to unions.

Irish and German workingmen were slow to take Jewish unionists into their councils. To be sure, Yiddish speakers like Cahan were now invited to take a place alongside German and Irish orators at May Day parades, and the United German Trades helped promote the fledgling United Hebrew Trades. But it was hard to gainsay the fact that Jews were steadily if indirectly pushing German tailors and Irish dressmakers out of work. The older unionists were even less happy with the Italians.

MEZZOGIORNO MISERIA

Steaming into New York harbor alongside vessels bearing Jewish immigrants were boats from Naples carrying refugees from southern Italy. In crucial respects their immigrant cargoes could not have been less alike. The Eastern Europeans were predominantly families, Jewish, and urban; the Italians mainly bachelors, Catholic, and rural. But both populations had been shaken out of entrenched situations by the economic and political storms sweeping across the European landscape.

Where the Jews had been trapped in the shtetls, southern Italians were mired in the isolated valleys and lowlands formed by the mountain chains into which the *mezzogiorno* was divided. Within these provincial pockets, society was frozen in a quasi-feudal mode. A handful of aristocrats owned the bulk of the land and exacted profit and prestige from peasant tenants as their forebears had done for centuries. With the higher clergy and professionals, they formed a tiny ruling elite, utterly uninterested in agricultural improvements. As a result, the *contadini* (peasants who leased

land or owned small plots) and the *giornalieri* (day laborers) worked the soil essentially as their Roman ancestors had, with wooden plows.

The area also suffered from primitive housing conditions, illiteracy (perhaps the highest rate in Europe), microdivision of farm plots, an absence of public welfare programs, limited diet, earthquakes, deforestation, soil erosion, malaria, and harsh sirocco winds blowing up from North Africa. The result was *La Miseria*—a miserable, impoverished way of life.

To survive, local communities hunkered down into tight defensive units whose loyalties and interests traveled no farther than the sound of the village church bell. The bedrock institution was the intensely patriarchal family, whose members, with good reason, distrusted all outside and higher powers, ecclesiastical as well as secular. The southern Italians were dug into the baked soil as deeply as their olive and chestnut trees. As with the shtetl Jews, it took a powerful confluence of outside events to dislodge them.

Italian unification provided much of the impetus. The northerners dominating the new nation considered southerners little better than African barbarians, and just as available for colonial plundering. The authorities failed to provide roads or schools, which could help eliminate backward conditions, but siphoned off in taxes what capital and resources existed. Unification also abolished customs barriers and thus opened up the *mezzogiorno* to northern and European economic penetration.

Exposure to developed capitalism proved disastrous. Free trade destroyed fledgling industries. Commercial agriculture foundered too, as the inefficient orange and lemon growers of Calabria, Sicily, and Basilicata faced ruinous competition from growers in Florida and California.

Meanwhile—as in Eastern Europe—the population mounted steadily, rising 25 percent from the 1870s to the 1890s. Overpopulation, like unemployment, disease, oppression, and neglect, contributed to the growing realization that the region had been sentenced to lingering death. Beginning slowly in the 1870s, therefore, and picking up steam in the 1880s and 1890s, southern Italian cultivators and laborers and a smaller number of artisans began making their way to the United States. Overwhelmingly—between 75 and 90 percent depending on the year—they were single men between the ages of fourteen and forty-four, though single women also

came, intent perhaps on earning a dowry and improving their prospects of finding a good husband when they returned. Overwhelmingly they were poor: in 1892 the average Italian arrived in America with eleven dollars in his pocket. And virtually all arrived in New York City.

MANHATTAN COLONIA

From the beginning of the Civil War until 1880, Italian immigration to the United States had never exceeded thirty-five hundred a year, predominantly from the northern provinces. Then, from 1881 to 1890, the average annual figure jumped to over thirty thousand. In the succeeding decade, Italians poured in at an annual average rate of sixty-five thousand, becoming the most numerous ethnic group entering the United States.

Not all Italians who landed at Castle Garden or, later, Ellis Island stayed in New York. But enough did to transform it into the Italo-American capital of the United States. In 1850 there had been a grand total of 833 Italians in the metropolis. By 1880 the figure had climbed to twenty thousand (of whom twelve thousand were foreign born). By 1900, after two decades of immigration and local reproduction, there would be a quarter-million Italian Americans living in New York City.

Residence meant something different for Italians than it did for Jews. Many young Italian men thought of themselves as migrant workers, perched here only temporarily. Many planned to and did return to Italy once they had saved enough to set themselves up with a farm; others retreated across the Atlantic for a breather—or permanently—when faced with economic adversity. Altogether during these decades perhaps fortythree of every hundred immigrants went back, becoming known, to those who had never left, as *Americani*.

Even while in-country, their primary mission of making money quickly led them to consider New York more home base than home. They moved about the country to wherever the jobs were, with their precise destinations arranged by *padroni*, the Italian equivalent of the Jewish garment contractors. *The padroni* packaged up gangs of Italian laborers in New York (and sometimes in Italy itself) and supplied them to corporate employers around the country, in mines, agriculture, railroads, and construction sites.

During the winter, or in hard times, thousands of these seasonal laborers would either return to Italy or camp out in New York City.

Others never left the metropolis, where a substantial and growing number of jobs were available. Transplanted peasants avoided factory jobs, considering them physically confining, socially unrespectable, and personally demeaning, but they flocked to hard physical labor on the city's docks, roads, rapid transit lines, aqueducts, and building sites.

This invasion of New York's labor market met with mixed reactions from established workers. In the building trades the Italian takeover of casual day labor work (their share zoomed from 15 percent in 1883 to 75 percent in 1893) was accepted by Irish and German immigrants and their sons, who were busy consolidating their hold on the more highly skilled crafts of carpentering, plastering, and masonry. In public works, too, older immigrants gave ground with relative grace, abandoning such unskilled and unpleasant jobs as garbage scow trimming, ditch digging, snow shoveling, excavation, sewer laying, and hod carrying—until by 1890 perhaps 90 percent of the laborers employed by the Department of Public Works were Italian. Certain “service” jobs were also rapidly Italianized. By 1894 the great majority of barbers and streetcorner fruit vendors were Italians, as were 97 percent of the bootblacks—the latter job, like organ grinder assistant, reserved for children.

Other job niches were hotly contested. In the late 1880s and early 1890s, resolved to crack the Irish monopoly on longshore jobs, dock bosses began hiring Italians—especially during strikes—to take over the more menial work. The Italians were prepared to scab because they were transients, with little stake in transforming local labor conditions, and because they resented the union's discriminatory policies: its high fees, arduous apprenticeships, and obvious lack of interest in trying to win them over. This led to violent conflicts at job sites and to enduring bad blood between the two groups. Relations were better in the skilled trades, where Italian shoemakers, masons, bricklayers, stonecutters, and marble workers joined unions or mutual aid societies.

Italian women took jobs outside their homes in small tobacco or candy factories or in noxious shops where they glued paper boxes together. The great majority stayed (or were kept) at home in cramped tenements where they looked after kin and boarders or did needle-trades outwork. For wages

one-third less than the already abysmal compensation paid Jewish seamstresses, they felled and finished garments or made artificial flowers.

To save money to bring over their wives, sisters, and parents, Italian men accepted wretched living conditions, especially as the meanest Manhattan life was often an improvement on what they'd left behind. They headed for slum streets just west of the Bowery (between Canal and Houston), where earlier poor Italian immigrants had settled in among the Irish, and worked as scavengers, selling their rags, bones, and cans to nearby junk dealers. By the late 1890s Italians had supplanted the Irish along Mulberry, Mott, Hester, Prince, and Elizabeth streets, making the "Mulberry Bend" area the most concentrated Italian "colony" in the city.

Slum landlords welcomed the new arrivals: no matter how cramped and squalid the housing, they paid their rent and seldom complained. A three-room apartment (at twelve dollars a month) might house sixteen: a husband, wife, four daughters, two sons, and eight male lodgers. A two-room apartment (eight dollars a month) could hold eleven: a widow, her son, and nine male lodgers.

As Mulberry Bend filled to bursting, the colony threw off satellite settlements. Some were virtually contiguous: newcomers spread north and west of Houston into Greenwich Village south of Washington Square, pushing remaining blacks out of the former Little Africa toward the Tenderloin. Others left Manhattan altogether. In Brooklyn they clustered near the Hamilton Ferry, along Union and President streets, near the docks, warehouses, and factories of Red Hook. Newcomers also went to Williamsburg, Greenpoint, Fort Greene, the Navy Yard area, and Sunset Park; by the end of the 1890s there were also small colonies in Astoria, Long Island City, and Flushing.

The preeminent offshoot was up in East Harlem. Italians came to northern Manhattan in the 1870s when an Irish American contractor building the First Avenue trolley tracks imported them as strikebreakers, and a workers' shantytown sprang up along the East River on 106th Street. As construction opportunities expanded in the booming Harlem community, Italians made their way to the wide-open uptown spaces. Wide open didn't mean pastoral: the area stank from gasworks, stockyards, and tar and garbage dumps. By the mid-1880s four thousand had arrived. They boarded with families or pooled expenses in all-male rooming houses where they

shared cooking and washing, even made their own wine. By the end of the 1890s Italians had pushed north to 115th Street and west to Third Avenue, pressing hard against Irish, German, and Jewish neighborhoods.

A Black and Tan Dive on Thompson Street, photograph by Jacob Riis. As Italians moved into Greenwich Village, Riis wrote, the neighborhood once known as “Africa” was “fast becoming a modern Italy.” (© Museum of the City of New York)

Italian Harlem, unlike Mulberry Bend, was new enough for residents to leave their mark on it. *Paesani* settled near one another—Neapolitans between 106th and 108th, Basilicatans from 108th to 115th, Aviglianese at First Avenue and 112th—but a broader Italian community also emerged, with distinctive sights, sounds, and smells. The populace resisted Americanization (few became citizens), eschewed the English language (perhaps a third couldn’t make themselves understood to natives), and foreswore Yankee clothing (women wore peasant costumes with red bandannas or yellow kerchiefs; men clung to traditional garb). People stuck

close to the cultural shelter of the colony and when they traveled to lower Manhattan were apt to say: “I have been down to America today.”

Community leadership fell to those who organized relations with “America”: the *padroni* and the *banchiere*. The latter group was composed of immigrants who, having acquired some capital as grocers, barbers, or saloonkeepers, now set up as bankers. In addition to lending and changing money and transmitting funds to the old country, the *banchiere* provided a wide array of services, acting as travel agents, scribes, marriage brokers, and legal advisers. Together with the small number of better-off professionals—doctors, dentists, pharmacists, merchants, and lawyers—the *banchiere* and *padroni* dominated colony life. These *prominenti*, who owned or financed the mutual aid societies, community organizations, and ethnic newspapers, were highly conservative, concerned about their status, and antagonistic to working-class efforts at self-help. The leading newspaper, *Il Progresso Italo-Americano*, was founded in 1879 by Carlo Barsotti, a wealthy contractor-*padrone* who styled himself “his excellency Chevalier Carlo Barsotti.” Under his leadership, the paper pugnaciously opposed unions, independent political parties, and any laws that would regulate *banchiere* or *padroni*. The leading mutual aid association, the Società Italiana di Beneficenza (1882), was also under the thumb of wealthy *prominenti* like its banker-*padrone* president, Commendatore Louis V. Fugazy (“Papa Fugazy”). In the ecclesiastical arena, however, immigrant workers took matters into their own hands.

THE MADONNA OF 115TH STREET

To the Irish hierarchy and Irish parishioners, their new coreligionists seemed barely Catholic at all. They seldom came to church, apart from baptisms, weddings, and funerals. In 1884 Archbishop Corrigan noted that of fifty thousand Italians in the New York area, not more than twelve hundred attended mass. In addition, the newcomers refused to contribute to the building programs Corrigan promoted, and they rejected his parochial schools in favor of the free public school system. The Italians had no great respect for priests, even their own, and were given to ribald speculations about clerical sins and to denunciations of priests as lazy hangers-on. Socialists objected to the Church’s identification with wealthy landowners, nationalists to its opposition to Italian unification.

To the Irish, such “Catholics” seemed more than half pagan. Yet the Italians were capable of amazing devotion. The immigrant men filled their rooms with sacred images—pictures and statues of the Virgin and their hometown patron saints—which they either brought with them or sent home for. In their thousands of cramped rooms, laboring men set up little shrines at which they offered prayers for families left behind. Such intensely personal devotions were considered acceptable, if unorthodox. Far more shocking to Irish-American clerics was the way such practices spilled into the streets.

In the summer of 1881 immigrants from Polla formed a mutual aid society named after the Madonna del Carmine, the town’s protectress. The following year they began annual *feste* in her honor. From 1883 these were held behind a 111th Street boardinghouse, at a little chapel in the back yard where ragpickers sorted, washed, and packed their daily hauls. In 1884 the confraternity—a lay organization—obtained from Polla a statue of the Madonna and turned their *festa* into a popular celebration.

The growing cult alarmed Bishop Corrigan and the Irish hierarchy. Now fully alive to the “Italian problem,” the archdiocese invited to New York the Pallottine fathers who had been ministering to Italian immigrants in London. Their first priest, Father Emiliano Kirner, arrived in 1884 and was given care of the little 111th Street chapel. Father Kirner soon discovered the East Harlemites wanted to build a more beautiful and dignified residence for their patroness. He encouraged them, and soon the locals established the all-male Congregazione del Monte Carmelo della 115ma Strada. Its laborers and junkmen, after their own exhausting workdays were over, threw themselves into erecting a church with their own hands. When the masons’ union objected to the use of free labor, neighborhood women took over the job.

The Church of Our Lady of Mount Carmel was the first Italian-built church in Manhattan. But because it was situated on the border with the Irish and German community, and the bulk of the funds for its construction had come from older immigrants, Italians were sent to the basement to worship. La Madonna too, her gown now covered with precious stones, was placed in *la chiesa inferiore*.

This exile to the lower depths rubbed against Italian sensibilities—already raw from their dealings with Irish foremen and contractors, or with

Irish nuns who placed Italian parochial school children in the rear of the room. In part as spiritual defiance, the festival, and others that now sprouted around the city, grew to enormous proportions by the 1890s. Thousands flocked to the food and games, bands and dancing, costumes and parades. The gathering also provided a stabilizing center for dislocated migrants, and by parading La Madonna through the neighborhood's streets and parks they put their cultural stamp on a piece of the alien New York world.

The archdiocese remained dismayed by the cult's "pagan" quality, its barefoot faith, its flashy street religiosity. They resented the dominance of the Mount Carmel society over the *festa*, correctly seeing it as a lay challenge to ecclesiastical control over immigrant religious life. They were also unsettled by feast-day inversion of patriarchal proprieties. Normally, Italian street life was dominated by men, who milled in front of their regional and social clubs, playing boccie and card games, but during the *festa* of La Madonna women commanded the streets. Finally they feared the *festa* would hinder Italians' Americanization, a concern shared by German Jews vis-à-vis their Russian coreligionists.

In 1887 Archbishop Corrigan called for clerical reinforcements. He asked Rome and religious orders for additional Italian priests and encouraged the Missionary Sisters of the Sacred Heart to work here. With the pope's particular blessing, Mother Frances Xavier Cabrini arrived with a few sisters in 1889, founded an orphanage, and opened Columbus Hospital in 1892. New Italian parishes were established, joining Mount Carmel and the Franciscans' 1866 Church of St. Anthony of Padua in Greenwich Village. Corrigan authorized eight Italian churches, including the Scalabrinians' Saint Joachim on the Lower East Side's Roosevelt Street in 1888 and the Jesuits' Missione Italiana della Madonna di Loreto, established in 1891 on Elizabeth Street.

Still, the disconcerting 115th Street *festa* continued. The matter was referred to higher levels. Unfortunately for Irish prelates, the decisive precincts were in Italy. In the next decade East Harlemites petitioned Pope Leo XIII to elevate their Mount Carmel shrine to the dignity of a sanctuary under the special protection of the Virgin. Only two such existed in the New World: Our Lady of Guadalupe in Mexico and Our Lady of Perpetual Help in New Orleans. The pontiff would decide that the devotion met two of the formal requirements for coronation: evidences of favors granted the devout

by the Virgin and popularity of the cult. Leo waived the third criterion, antiquity, perhaps on the grounds that in New York, where everything moved so fast, twenty years was the equivalent of two hundred in Europe. More likely, Leo was well aware that the crowning asserted the authority of the Roman-centered papacy over Irish-American prelates, and in America's most modern city to boot. And so, before an enormous crowd in Jefferson Park, the Madonna of 115th Street would receive her crown, made in New York out of the melted-down golden rings, brooches, and family heirlooms contributed by grateful immigrants. After decades of uncertain commitment to the American metropolis, the Italians, symbolically as well as demographically, had arrived.

CHINATOWN

Although the Chinese came in minuscule numbers, compared to the great waves of Southern and Eastern Europeans, the establishment of the first Asian-American community in New York City triggered powerful responses of fascination and fear. For all the tensions evoked among old-stock New Yorkers by the emergence of Polish and Italian enclaves, as Europeans they shared far more with one another than any of them did with men and women from the opposite side of the planet.

There had long been a floating population of Chinese merchants and mariners in Manhattan, for the same sea lanes that carried tea, silk, and porcelain brought traders and transient sailors. By the 1850s a tiny handful, fewer than 150, had established a quasi-permanent presence.

Some, like Ah Sue, served Asian travelers. Cook and steward on a Hong Kong New York packet line, Ah Sue had wearied of maritime travel and in 1847 opened a modest tobacco and candy store on Cherry Street. He operated as well a small boardinghouse for the Chinese, Japanese, Filipino, Hindu, Maori, Hawaiian, Malay, and Annamese seamen whose vessels docked a few blocks away. More boardinghouses emerged, hosting other seamen who switched to land labor, usually in hopes of making a fortune and returning to China. Work was hard to come by, however, and many resorted to peddling cigars and Chinese candies around City Hall Park and the Bowery. Becoming familiar figures, they were collectively referred to as John Chinaman.

At the other end of the tiny group's class spectrum were men like Quimbo Appo. Having survived the British bombing of Shanghai during the Opium Wars, Appo took to the trade routes, tried his luck in the newly opened goldfields of California, then moved to New York and in a Spring Street store began retailing tea, the city's major Chinese import. Like other merchants, Appo mastered English speech and American mores as a requirement of doing business. With no Chinese women in town, Appo, like between a fourth and a third of the resident Chinese men, married a local woman, the Irish-American Catherine Fitzpatrick; wedlock between Irish "apple women" and Asian cigar peddlers was particularly common. Such unions ruffled racists, but the tiny numbers of Chinese involved did not raise the kinds of anxiety black-white "amalgamation" did.

After the Civil War, the community grew somewhat—reaching at most two thousand by 1880—with newcomers arriving from China by way of Cuba. When slavery was banished from British and Spanish colonies, sugar planters in Peru, Guiana, Brazil, Cuba, and Jamaica imported "coolie" laborers from impoverished sections of south China, a practice widely denounced in the United States as cruel and inhuman. In the 1860s Cuban cigarmakers recruited some of these Chinese from the sugar fields to work as hand rollers, a task at which they became expert. Given abysmal wage levels, many then traveled north on the thriving Cuban-New York trade routes. In the city, pioneer Cuban-American cigar manufacturers snapped up the highly skilled Chinese, paying some of them more than they did Germans.

This growth in the number of permanent and land-based residents fostered the emergence of an inland "Chinese Quarter," moving away from the Fourth Ward docks into the Sixth Ward blocks above Chatham Square. Along Baxter Street and lower Mott, where it spilled into Chatham Square, a small number of stores, boardinghouses, mutual aid associations, and shrines emerged to serve the community.

In 1872 Wo Kee, a former Hong Kong merchant, moved his general goods store from Oliver to Mott, dropping the first commercial anchor in the area that would soon be known as Chinatown. A *Sun* reporter, visiting the store in 1880, marveled at the array of goods crammed into front and back rooms of the former residence: Chinese medicines, incense sticks, jade bracelets, dried shark fins, ducks split and baked in peanut oil, opium and

pipes for smoking it, silks, and “exquisite” teas, some of which was served to customers by the proprietor while he calculated sums on his abacus. Wo Kee’s establishment was a social club and entertainment center as well. Men could shop, get mail, pick up tips on work opportunities, gamble in one basement room, lounge and eat in another. Upstairs there were sleeping quarters, with eleven bunk beds for twenty-two people and small rooms for use by cigarmakers. Other such multipurpose centers opened, often catering to people from the same clan and territory.

Soon the little complex received another and far larger demographic infusion, this time from California. Tens of thousands of Chinese, overwhelmingly unskilled peasants from rural Guangdong (Canton) and Fukien, had come to America to build the transcontinental railroad. Its completion in 1869 threw twenty thousand of them out of work. Most of them returned to California, where many entered the hand laundry business. When the depression of the 1870s struck California, many white workers scapegoated the Chinese, whom they considered unwitting capitalist tools. Animoshities exploded into violence—pogroms of a sort—and led California to enact punitive antiimmigrant provisions. Many Chinese fled east along the transcontinental link they themselves had constructed.

Their arrival in the New York region in the late 1870s and early 1880s galvanized a new metropolitan industry. Each week, in Belleville, New Jersey, Captain James Hervey’s Passaic Steam Laundry Factory machine-washed and hand-ironed six thousand shirts newly manufactured in the garment factories of New York City. Considering his workforce of Irish women to be obstreperous in their wage demands, and finding it hard to snare sufficient numbers of greenhorns on trips to Castle Garden, Captain Hervey imported sixty-eight Chinese from San Francisco, sneaking them into his factory compound by dead of night. This touched off protest rallies in Tompkins Square Park against coolie labor. And in the end, the Chinese too proved unsatisfactory, peeling off, as their contracts expired, to open their own hand laundries.

At first “washee washees,” as metropolitan journalists referred to them, were few in number, perhaps thirty by 1877. In 1879, with the West Coast exodus underway, a *Sun* reporter found two hundred hand laundries in Manhattan. By 1888 Wong Ching Foo, a scrappy bilingual journalist-lecturer who wrote about and defended New York’s Chinese, estimated

there were over two thousand such laundries in New York, with another eight or nine hundred in Brooklyn. There was, he explained, no other way to make money as surely and quickly, given “the prejudice against the race.” Start-up costs were low, perhaps a hundred dollars, and the average laundryman could save a nest egg of fifteen hundred or two thousand dollars, sell the laundry to relatives flocking in from the West Coast or Hong Kong, and return to China. Soon nearly every street and avenue in New York was festooned with signboards bearing good-luck names painted in flaming red.

The 1890 census counted 2,048 Chinese in the city, though the true figure was probably four to five times that. Of these, less than 20 percent lived in Chinatown, mostly cigarmakers who worked in the vicinity or merchants, clerks, barbers, doctors, and professional gamblers. Many in the Chatham Square area lived in dormitories, set up in the cheapest parts of dilapidated private houses, further divided into cubicles for those who could afford minimal privacy, with the rest stuffed into tri-tiered bunks, often two to a bed (three-per-bedders got rock-bottom rates of \$i .50 to three dollars a week).

Most Chinese, however, were scattered about the city, domiciled in quarters attached to the hand laundries where many spent 80 percent of their lives. Others lived in mansions of the uptown rich, who had taken to hiring male Chinese house servants—there were still virtually no Chinese women in the city—to replace refractory Irish girls. Isolated and lonely—the only Asian faces they were likely to see were peddlers from Mott Street who carried in provisions—these men were also vulnerable to harassment by gangs, and there were several race-based murders. For them, Chinatown was the source of companionship as well as commodities. Laundry workers would flock to Mott Street in the evenings, or on Sunday, to socialize, gamble, smoke opium, get mail, hear news of their home villages.

Chinatown Restaurant, 1896. (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

The neighborhood grew only slightly in size—inching into Pell, Bayard, Doyer, and Canal—but its internal organization got considerably more complicated. By 1888 there were at least thirty all-purpose store-centers in Chinatown, now often run not by an individual entrepreneur but by mutual aid and protection societies known as *fang* (house), organized by kin or area of origin. These houses provided temporary lodging and financial assistance and sponsored social events and cultural festivals. They also provided deceased members with proper burials in a plot at Green-Wood Cemetery—or, rather, temporary interment, as men came periodically from San Francisco and, for a price, exhumed bodies, collected and packed the bones, and shipped them to Canton and on to home villages for a truly proper burial.

The neighborhood also developed a quasi-criminal wing, as mah-jongg and card games gave way to organized fan-tan gambling, especially after the arrival of Tom Lee. Wong Ah Ling, as he was known before he changed his name, had been a labor contractor in California, moved on to St. Louis, where he became a citizen, and arrived in New York in 1879. Lee did well in the tea and silk trade business, in manufacturing cigars, and in less legal pursuits as well. In 1880 he and some colleagues incorporated the Lung Gee Tong—translated for legal purposes as “the Order and Brotherhood of Masons”—and established a headquarters at 4 Mott. The Lung Gee Tong (later famous as the On Leong Tong) was a lodge of the Triads, or Sam Hop Hui, an underground oppositional society reputedly founded in the seventeenth century by Buddhist monks seeking to return China to Han rule. (“Oppose the Qing, Restore the Ming” was their slogan.) Staunchly nationalist, the secret brotherhood was involved in various revolutionary movements in China; in New York City their muscle was devoted, among other things, to establishing a criminal underworld.

Tom Lee, identifying himself as “the President of the Chinese Society of this city,” wined and dined prominent members of the Democratic Party and won de facto recognition from Tammany Hall as the leader of Chinatown. The only organized opposition to Lee came from the Christian Chinese. In 1875 Sara Goodrich of the Fourth Avenue Presbyterian Church established a mission at Pearl Street that provided English-language classes every evening and religious instruction in Chinese on Sundays, by a missionary back from Canton. By 1883 there were ten Sunday schools operating in Manhattan and another eight in Brooklyn, with a combined enrollment of about six hundred. There was also a Chinese Young Men’s Christian Association and the first independent Chinese church in New York, founded by Huie Kin, a Lane Theological Seminary graduate who arrived in 1885 to work with the Presbyterian schools. He and others dressed as workmen, infiltrated gambling houses, got to know the proprietors, had warrants made out, and took part in ensuing police raids. But the charges were almost invariably dismissed, and the shuttered houses did not remain so long.

The emergence of organized “vice” contributed to a sharp change in the wider city’s attitude toward the Chinese community. The former high esteem for Chinese goods and culture turned to fear and loathing in the late 1870s, and early nineteenth-century images of clever craftsmen transmuted

into harsh portraits of cunning deceivers. Wong Ching Foo, who in 1883 launched the first (and short-lived) Chinese language newspaper in New York, the *Chinese American*, lectured at Steinway Hall and published articles in leading magazines championing the community's reputation, but to no avail.

Part of the reason for this sharp shift of perspective, ironically, was opium consumption. The drug that the West had forced into China at gunpoint, that had been the making of many New York fortunes, and that was widely hawked to middle-class Americans in the form of laudanum-laced patent medicines, cough syrups, and child quieters, came to be considered an evil substance to which Chinese were peculiarly addicted and which they used to subvert the morals of decent white women. Newspapers that had once treated pipe smoking light-heartedly now presented stories about the ruination of adolescent girls, headlined "Horrors of the Opium Dens" and accompanied by drawings of white women reclining alongside yellow men in collective stupor.

The fact that the Chinese had laid claim to an occupational niche that left them isolated from the wider society, against their earlier integrationist inclinations, was used as proof that they were racially inassimilable. Racist images of ravenous Chinese who would devour rats, cats, and dogs mingled with fears that yellow hordes would gobble up American jobs. Labor leaders like Samuel Gompers, whose cigar workers had actually encountered Chinese competition, called for race-based exclusion rather than making an effort to organize the Asians. The combination of middle-class revulsion and working-class animosity won passage in 1882 of the Chinese Exclusion Act.

The law had serious repercussions in New York City. Though it allowed for class exemptions—officials, diplomats, scholars, teachers, students, merchants, and tourists could enter the country—they were denied citizenship, the right to vote, and thus inclusion in the political life of the city and country. The law also indirectly barred Chinese from the licensed professions, most of which required citizenship. It forced Chinese already here to obtain residence certificates, in effect internal passports, which branded them permanent aliens and left them peculiarly subject to political, social, and economic exploitation, especially if they had entered illegally. Finally, the law erected gender barriers, barring Chinese laborers from

bringing their wives to the United States and making it extremely difficult even for members of the “exempt classes” to do so. This guaranteed the perpetuation and exacerbation of a gender imbalance that went way beyond the merely lopsided; it would lead to formation of what would become known as a “bachelor society.”

In response, New York’s Chinatown turned farther inward. In 1883 all the city’s *fang* and clan associations combined into an umbrella organization called the Zhonghua Gong Suo, a group that for much of the next century would serve as Chinese New York’s unofficial but extremely potent local government. In 1887 its officials purchased a building on Mott Street, and Tom Lee, now styled as “Chairman of the Chinese Municipal Council,” raised twenty-five thousand dollars for a new structure. When the building finished in 1890, the organization incorporated itself under state law and came to be called the Chinese Consolidated Benevolent Association of the City of New York (CCBA).

The CCBA was not a conventional Chinese institution transplanted to the metropolis but a local response to local conditions. The organization became the place where groups and powerful individuals settled disputes. It allocated business sites to hand laundries and required them to maintain a fixed schedule of prices. It kept records of leases and business contracts and posted on the board in front of its headquarters notices about partnerships formed and businesses or goods up for sale. Its agents watched docks and rail stations to make sure no one left town without settling debts. It acted as liaison to the rest of the city and defended community interests in municipal forums.

New Yorkers, spared by the 1882 act and its 1892 extension from invasion by “Mongolian hordes,” now embarked on their own invasion of Chinatown. To adventurous uptowners the area’s “evils” seemed attractively exotic, and the early 1890s witnessed a “slumming” craze. Moses King’s 1893 guidebook urged a visit to Mott, Pell, and Doyers—a veritable Chinatown “with all the filth, immorality, and picturesque foreignness which that name implies.” Genteel visitors trooped to the area’s restaurants and the new “chop suey” houses that sprang up. The wilder ones sampled the forbidden pleasures of opium den and fan-tan parlor. All the activity finally created the sin-and-violence-drenched climate originally imagined to exist, as rowdy white Boweryites flocked to local bordellos,

petty criminals took up residence, drunks and bravos engaged in combat, and tong extortionists preyed on Chinese (though never on white) businessmen.

The Chinese community was unique among the new immigrant groups in having its entire community turned into a cultural commodity. Jews and Italians did attract lovers of the “picturesque” to their neighborhoods, and they experienced the larger community’s scorn as well as its curiosity, but they were never subjected to anything quite like the indignities suffered by the Chinese. But the various communities did share something else: a capacity for artistic creativity that, in mutual interaction, would work a cultural revolution in New York City.

That's Entertainment!

If an energetic couple had decided to hike from one end of Coney Island to the other on a summer Sunday in the late 1880s, their five-mile journey would have taken them through four wildly diverse communities.

Landing at the old steamboat dock on Coney's extreme western edge would have plunged them into seedy old Norton's Point. Though now grandly renamed the West End, it remained a year-round colony of crooks and unfortunates where, in season, rowdies congregated for prizefights, gambling, and prostitution. Respectable sorts gave the area a wide berth.

About a mile and half along the beach, past thickening numbers of bathhouses and makeshift eateries, our trekkers would have arrived in West Brighton and found themselves engulfed in noise—brass bands, hand organs, the shrieking whistles of arriving and departing steamers and locomotives, and the happy chatter of tens of thousands of merrymakers. The throngs poured out from Culver Plaza, where the Prospect Park and Coney Island Rail Road, popularly known as the Culver Line (a name that lives on to mystify today's F line riders), debouched Brooklynites. Manhattanites headed for West Brighton could take a steamer to Bay Ridge and transfer to the New York and Sea Beach Railroad (1879), for a round-trip fare of only a quarter.

In West Brighton our visitors, if keen on gaining a panoramic overview, could have headed for the three-hundred-foot Iron Tower, which Andrew Culver had carted back from the Philadelphia Centennial Exposition, and ascended by elevator to a vantage point higher than Trinity's steeple.

If hungry, they might have hustled directly to Charles Feltman's Ocean Pavilion, a gigantic restaurant-cum-entertainment center. In the early 1870s Feltman, a German immigrant, had opened a shanty stand at the beach and begun selling clam roasts, ice cream, lager beer, and what *Harper's* would call a "weird-looking sausage, muffled up in the two halves of a roll and smoking hot from the vender's grid-iron."

Coney Island Panorama, c. 1880. From its low end at Norton's Point (on the far left), through West Brighton, Brighton Beach, and Manhattan Beach (on the far right), Coney's atmosphere became progressively more refined. (© Collection of The New-York Historical Society)

From Feltman's, they might have walked to see the Elephant, a wood-framed, tinskin hotel, 150 feet long and 122 feet high. It had thirty-four rooms in its head, stomach, and feet, a cigar store in one foreleg, a diorama in the other, and a dairy stand in its trunk. "Seeing the Elephant" became New Yorkese for going down to Coney. Equally dazzling landmarks were the two-thousand-foot Iron Piers, erected by steamboat companies in 1879 and 1881, amusement centers on a par with those at Blackpool and Brighton, England.

If our visitors sought excitement, they could have headed for the chaotic and exhilarating carnival quarter. West Brighton's beachfront properties had been leased and subleased into tiny plots, on which small immigrant businessmen, showmen, and vendors had erected hundreds of pavilions, platforms, tents, kiosks, sheds, and shanties. Here visitors could play with lung testers, throw rings at cane stubble, shoot clay ducks, and try to hit a Negro on the nose (his head, stuck through a hole in a cloth, bobbing and weaving to elude the balls). They could get their pictures taken, their fortunes read, their strength tested, their weight guessed. As exiled Cuban revolutionary Jose Marti, entranced by Coney Island, reported to a Bogota

newspaper in 1881, “to North Americans to weigh a pound more or less is a matter of positive joy or real grief.”

If our hikers were venturesome souls, they might have beelined for the mechanized rides, advertised in the *World's* Sunday edition by amusement entrepreneurs like Peter Tilyou and his son, George. Merry-go-rounds were an old divertissement but had been steam powered only since 1865. And only since the mid-1870s had Charles I. D. Looff, a German immigrant carver who worked out of a small Gravesend factory, been crafting the fabulous animals and birds that adorned West Brighton's carousels. In 1883 the first Loop-the-Loop opened for scary (and occasionally mortal) business. In 1884 its offspring the roller coaster was born, the progeny of LaMarcus A. Thompson. His trains, which tore up and down a giant steel structure, were an amalgam of the switchback railroads used in coal mines and the new elevateds crisscrossing the cities.

The roller coaster momentarily relieved riders of their inhibitions, providing welcome opportunities for romance. So did the beach. Many on the strand were tenement families in search of wholesome sea breezes. Mothers rented blue flannel suits and coarse straw hats, changed in the crudely built but affordable bathing houses, then cozied with their husbands while their all too often tubercular children buried one another in the sand. Singles displayed a more boisterous intimacy. At antebellum resorts each sex had taken its turn in the ocean on a fixed time schedule; in the 1880s they tumbled in together. Thousands, of both genders, shed cumbersome beach outfits for tighter-fitting, more revealing costumes and jettisoned much of their reserve as well, with women hugging fellows met minutes before.

Fellows wanting more than hugs repaired, as did flashily dressed sporting men, to the “Gut,” a ten-square-block area up toward West 8th Street, in whose wooden shanties and sheds more carnal appetites were attended to. The Gut's brothels, dance halls, peep shows, and gambling dens provided plentiful helpings of sin, though not without peril. Knockout drops flowed freely, while crooks and swindlers found it easy to avoid the none too vigilant oversight of the Gravesend police.

Teeming West Brighton might well have reminded our sightseeing couple of the Bowery—indeed one of the principal saloon-lined thoroughfares was called “the Bowery”—and it was, overwhelmingly, a

working-class pleasure ground. Skilled craftsmen and small shopkeepers tended to come on organized outings; garment workers, clerks, saleswomen, and servants came on their own or in small groups. Many were on Saturday half-holidays, the new summertime practice of closing at one P.M. adopted in the late 1880s by numbers of manufacturing and retail establishments. Others were at Coney on unpaid holidays: when broiling summer days turned Brooklyn's iron foundries, sugar refineries, and glassworks into infernos, owners shut them down.

The Coney Island Roller Coaster. *Frank Leslie's Illustrated Newspaper*, July 24, 1886. (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

If our revelers had stayed on into the evening, they could have tried “Electric Bathing” in the flare of the arc lights newly installed along the shore, or gone to one of the well-lit music halls and open-air theaters, often managed by Irish barkeepers from New York. There they could have seen and heard pianists, dancers, female impersonators, ballad singers, and comedy acts as broad as the beach. These establishments provided jobs for thousands of recent immigrants, many of whom became full-time Coney residents. They worked as bartenders, cooks, bathhouse keepers, musicians, domestic servants, vendors, and hotel waiters (many of the latter listing their occupation as artist or actor). The percentage of blacks in the year-

round population—8.3 percent—was far higher than in Brooklyn or New York, though their numbers at the beach were far fewer.

If our hypothetical hikers had torn themselves away from West Brighton and pressed on east, they would soon have reached a relatively empty stretch of beach, paralleled by a tree-lined concourse and bisected by Ocean Parkway—Coney Island’s Great Divide. Roughly three-quarters of a mile from the Elephant, they would have come upon the grounds of the enormous, low-slung, mansarded, stick-style Brighton Beach Hotel.

Our travelers had entered Brighton Beach—a different world from West Brighton, and differently peopled too. Sitting on the great hotel’s broad verandas, strolling on its vast lawns down to the boardwalk at surf’s edge, or listening (after 1888) to Anton Seidl direct serenades at the bandstand were large numbers of what one 1890 paper called “good middle-class Brooklynites.” Brighton drew businessmen and their families, doctors and lawyers, white-collar office workers, clerks in insurance firms, and salesmen with manufacturing companies.

Brighton Beach reflected the unified vision and ownership of William A. Engeman, a New York-born carpenter who had made a wartime fortune selling mules to the Union Army. Captivated by Coney and its pecuniary possibilities, Engeman tracked down the various owners of two hundred acres of marshland and sand dunes and bought them out cheap. Then he constructed the four-hundred-foot-wide, two-story Brighton Beach Bathing Pavilion (ready for the 1878 season), and the following year he opened the Brighton Beach Racetrack, a mile-long course that by 1882 was netting him two hundred thousand dollars a year.

Meanwhile, a powerful consortium of Brooklyn businessmen and politicians—including Henry Murphy and William Kingsley of the New York and Brooklyn Bridge Company—had bought half of Engeman’s property and on it erected the Brighton Beach Hotel. The group also built the Brooklyn, Flatbush, and Coney Island Railroad to deliver passengers to its doorstep, placing BF&CI stations conveniently near middleclass Bedford, Clinton Hill, Ocean Hill, and Prospect Park. Brooklynites could train down for a music programme and be home by a reasonable hour, or entire families could settle in for the summer while husbands commuted to work in the cities. The hotel also attracted racing devotees, including Wall Street high rollers, politicians, actresses, and socialites.

Finally, if our trekkers had headed eastward one more time, they would have crossed another half-mile gap, then come upon two magnificent edifices: the Manhattan Beach Hotel with its turreted roofs and pinnacles, and the moorish Oriental Hotel, replete with fanciful minarets. It would not, however, have been easy for our beachcombers to have got near these palaces, as a high fence surrounded the area, and Pinkertons at the private railway station monitored arriving coaches of the New York and Manhattan Beach Railway to screen out undesirables.

Manhattan Beach was the brainchild (and property) of New York railroad magnate and banker Austin Corbin. In the depressed 1870s he had picked up over five hundred acres of shorefront marshland for \$16,500 and given it a glamorous name. Then he inaugurated the railway that whisked Manhattanites directly to his two hotels within an hour. To ensure exclusiveness, he charged the highest prices in the country. To ensure even greater exclusiveness, he banned Jews in 1879.

Corbin's hostelrys succeeded in attracting an elite clientele, almost up to Newport standards. The Oriental drew leading businessmen, visiting aristocrats, famous entertainers, and powerful politicians. The Manhattan Beach Hotel attracted a racier crowd—notably members of the Coney Island Jockey Club, whose leaders August Belmont Jr., Leonard Jerome, Pierre Lorillard Jr., and William K. Vanderbilt organized the nearby Sheepshead Bay Racetrack in 1880, helping make Kings County one of the nation's top turf centers.

PLEASURE AND COMMERCE

Coney Island, in the space of a decade, had leapt from marshy obscurity to preeminence among the world's beach resorts. It was remarkable for its size and for its segmentation—the way its component parts were sorted and sequenced by class, from “low” to “high,” with each zone governed by its own conventions. Even more remarkable—and alarming, to guardians of the traditional order—was the way West Brighton encouraged unconventional behavior. Reformers called it “Sodom by the Sea.” They were upset by the doings in the Gut, of course, but also by the spooning on the beach, the frolicking in the waves, the way people acted (said one shocked observer) “precisely as if the thing to do in the water was to behave exactly contrary to the manner of behaving anywhere else.”

West Brighton was also disconcerting in the connections it was fostering among New York's immigrants. On Sunday ethnic groups that during the week were segregated by work or neighborhood mixed and mingled at the shore. At Coney's rides and beaches, diverse peoples swam, ate, played, and rode together, encouraging development of an interethnic—albeit white—"New York" sensibility, an eclectic camaraderie that paralleled and perhaps undergirded such multiethnic entities as the Central Labor Union and Henry George campaign. Ever since Petrus Stuyvesant's day, the city's upper classes had tried to suppress plebeian ways of having fun that appeared to undermine established authority. But this quest took on added importance in the 1880s, a time when unions, Catholics, ethnic nationalists, and new immigrants—the very people gamboling and gambling at West Brighton—were boldly challenging the city's political, economic, and religious status quo.

In this context, what seemed most unnerving about West Brighton was its unembarrassed air, the way it exuded a sense of entitlement to a band on the city's recreational spectrum. The entire structure of Coney Island seemed to reinforce this claim. All the communities, after all, had undergone their explosive development simultaneously, and they shared the same strand. This temporal and territorial equivalency suggested a moral and cultural equality—as if styles, tastes, and practices at either end of the beach were equally "legitimate."

Worse, West Brighton's wayward ways seemed impervious to criticism or correction, in part because its cultural independence was sustained by powerful businessmen. Entrepreneurs of leisure, since the tavern keepers of New Amsterdam, had always resisted regulation. But never before had entertainment been such big business.

Among those developing amusement parks around the metropolitan area were transportation, real estate, and brewery magnates. Pleasure gardens had become all but extinct in Manhattan, victims of rising land values, but were being reborn, in far grander format, on the urban periphery. Their developers sought to increase traffic on streetcar lines, lure consumers to selling grounds, and enhance property values. In the early 1880s Bowery Bay (site of today's La Guardia Airport), then far from the nearest village, had been a popular Queens destination for picnickers. In 1886 piano potentate and nearby land baron William Steinway, along with brewery

industrialist George Ehret, transformed the isolated strand into Bowery Bay Beach (renamed North Beach in 1891). Soon it was festooned with beer halls, supplied exclusively by Ehret, and swarming with tens of thousands of patrons, who arrived on Steinway-owned mass transit. North Beach grew ever more boisterous, yet ever more profitable, and its owners ever more averse to bluenose interference. And big businessmen had more clout than their smaller predecessors.

This was particularly evident at Brighton and Manhattan Beach, which even more than West Brighton represented substantial investment by large-scale capitalists. Most East End amusements were dignified and genteel, to be sure, but the racetracks, on which much hotel patronage depended, were (in the opinion of reformers) nearly as subversive of public morals as the Gut. In 1877 state legislation had banned the old auction betting system, in hopes of curbing racing. Instead it nourished a new variety of betting, done by at-the-track bookmakers. The growing ranks of professional gamblers, together with the rich horsemen of the Coney Island Jockey Club, formed another influential constellation in favor of cultural *laissez-faire*.

Both ends of Coney, moreover, had powerful political protectors. The island was beyond the jurisdiction of either New York or Brooklyn—legally an appendage of the independent town of Gravesend, which was the bailiwick of John Y. McKane. A stoutframed, red-bearded man, McKane had been born in County Antrim in 1841, had been brought up in Gravesend from 1843, and worked as a farmhand and as a clam digger in Sheepshead Bay, then opened his own carpentry shop. He went into politics and with the help of fellow Irish immigrants supplanted the old Dutch town leaders. Between 1878 and 1893 McKane was Coney's government. He was effective at delivering water and electricity and disposing of sewage. He was also corrupt, assisting those businesses that hired his construction firm, which is to say virtually every hotelier on the beach. McKane permitted gambling throughout West Brighton—making the occasional raid, to quiet moral critics, after warning the targets he was coming. He also protected the tracks from overzealous enforcement of the penal codes, in alliance with sportsmen and gamblers who had their own lines to the Democratic Party.

All these phenomena—the growing vigor of a multiethnic popular culture, the rapid commercialization of entertainment on a hitherto

unmatched scale, the emergence of novel kinds of mass amusement forms, the loosening during leisure time of constraints that governed elsewhere in the city—were present elsewhere in the New York’s far-flung and fast-flowering world of entertainment. In Manhattan, as in Coney, the clashing and blending enclaves of commercial culture were laid out quite tidily along a spatial axis. Here the journey from “low” to “high” ran south to north, rather than west to east. A tourist determined to grasp the city’s complete range of entertainment possibilities would have to begin in the raunchy and interethnic precincts of the Bowery; travel to the Union Square Rialto, now home to the novel and interlinked phenomena of vaudeville and pop music; head on to the peculiarly multipurpose, multiclass venue of Madison Square Garden; and finally reach “Broadway,” the newly transplanted center of the “legitimate” stage (unless a wrong and westward turning had plunged the unwary into Satan’s Circus).

ALL THE WORLD’S ONSTAGE

The Bowery, long the heartland of working-class amusements, had been flagging a bit, weakened by competition from new forms of entertainment, amusement parks among them. Melodramas, downtown’s favorite performance style, were still in evidence, to be sure. Each night on the Bowery boards, working-class heroes triumphed over rich men whose pockets were stuffed with bonds, and poor but pure shopgirls or seamstresses escaped the villain’s machinations (as in Charles Foster’s *Bertha, the Sewing Machine Girl*). Many plays, as before the war, used the city as backdrop, with offerings such as *The Waifs of New York*, *Outcasts of a Great City*, and the inspirational *Tom Edison the Electrician*. But what revived Bowery theater in the 1880s and 1890s, infusing it with terrific new energy, was the establishment of zestful new immigrant communities, which had imported new cultural traditions and the audiences to sustain them.

Yiddish theater, born in Odessa and Bucharest in the late 1870s, blossomed in New York City in the 1880s and 1890s. Amateur companies took the lead, their actors shuttling between stage and sweatshop. The first production came in 1882, and soon there were regular weekend shows at the Bowery Garden, National, and Thalia theaters, starring unknowns like sixteen-year-old Boris Tomashefsky. In 1884, a year after czarist Russia

banned Yiddish theater, professional companies were performing in playhouses along the Bowery, and they flourished over the next decade.

Yiddish melodrama provided glamorous diversion and emotional communion for tenement dwellers and a sense of empowerment for the politically impotent. Ghetto audiences cheered historical spectacles of Jewish heroism, oohed and aahed at tableaux of ancient kings and prophets, shouted denunciations of villains, howled with laughter at tomfoolery and clownishness, demanded popular songs be repeated, and often kept performances running till midnight.

The plays were packed with topical references to life along East Broadway, helping greenhorns learn their way around an alien land. They also evoked heartbroken recollections of loved ones left behind; Tomashefsky always worked a mama song (like “A Letter to Mother”) into his plays no matter what the subject. Masters of bricolage, these Lower East Side playwrights ransacked all European drama for bits of theatrical business and mingled opera tunes and synagogue chants with abandon. They desacralized Shakespeare with a vengeance, domesticating the Bard, turning Capulets and Montagues into feuding Jewish sects; after the first Yiddish *Hamlet* the crowd was so pleased it called for the author. In the 1890s, a new generation of performers and intellectuals—notably playwright Jacob Gordin and actor Jacob Adler—warred against cheap “three-hankie” melodramas and called for “serious” theater. But even then Yiddish drama would remain grand and flamboyant, an affair of shouts and whispers, deeply in touch with the lives of ordinary immigrants.

Poster advertising a performance *at King Solomon* at the Thalia Theater. (Library of Congress)

Popular Italian dramaturgy followed an almost identical course. Amateur actors took to the stage in 1882, with a farce at Concordia Hall. Soon there were several theatrical clubs in action, like the Circolo Filo-Drammatico Italo-Americano (1885), which played in halls like the Bowery's Germania Assembly Rooms, and offered special performances on saints' days in church basements. Like their Yiddish counterparts, Italian actors offered long and varied evenings: thrilling melodramas, commedia dell'arte skits, Pulcinella farces, songs and dances in Neapolitan or Sicilian, and comedies

like *Pasquale, You 're a Pig*. Again, theatrical pastiche was the norm, with Schiller, Sardou, and an Italianized Shakespeare sharing time with local dramas set in Little Italy. In the 1890s Italian theater too entered a more polished phase with the arrival of professional actors lured by the popularity of the *circolo* groups. Antonio Maiori, who came in 1892 and established a company, had a harder time of it than Jacob Adler, however, as opera remained the art form of choice in the community.

New York Chinese theater began with professionals. In June 1889 the traveling Swin Tien Lo (Most Sublime Company) arrived from San Francisco and performed at the Windsor Theater on the Bowery. In 1893 the community got its own company when a wealthy merchant rented a Doyers Street basement, hired thirty actors, and opened a Cantonese theater.

VARIETY: THE SPICE OF BOWERY LIFE

While these cultural stewpots bubbled on their separate burners, the Bowery's variety stage—another pastiche performance form—was absorbing many of their assorted traditions into a more commercialized culture.

Variety emerged as a distinct branch of the entertainment industry only in the 1870s and 1880s, but the presentation of brief entertainment bits by singers, dancers, and monologuists had long been part of New York's theatrical tradition. Until the fifties, variety acts had been interpolated in, or ancillary to, the main dramatic event. Then managers determined to upgrade their houses banished comics and song-and-dance men. Variety acts quickly resurfaced inside minstrelsy and became standard elements of the concert saloon repertoire. When minstrelsy began to fade away—in 1883, for the first time in forty years, New York City was without a resident minstrel troupe—and concert saloons came under attack for harboring prostitution, variety came into its own.

Variety was strictly a downtown affair, housed in Bowery showcases like the London Theatre, Miner's Bowery, and the Globe Museum. These houses jumbled acts together in a way calculated to please a diverse constituency. Minstrels too had presented a succession of turns, but all were performed by members of the same troupe. Variety assembled a melange of performers, a division of labor that allowed for greater range and

specialization. The result was a potpourri of entertainment bits, unconnected by persona or plot, that drew upon a host of plebeian entertainments. From the *Turn-verein* and *Harmonie-Bund* came gymnastic and musical routines; the circus provided animal acts and acrobats; dance competitions supplied Lancashire and hornpipe clogs and jigs.

Variety's staples were its songs and comic sketches. Skits were often ribald and physical, geared to the male and working-class audience. Performers set their topical gags and routines in the city's saloons, sidewalks, and shipyards. The most popular bits were ethnically oriented, with performers mimicking New York's diverse populations, doing Irish turns and Dutch (German) shtick.

Black comics were not numerous in variety. African Americans did pour into minstrelsy in these years, on the strength of the argument that they could "act the nigger"—depict grotesque caricatures of plantation slaves—"with greater fidelity," as the *Clipper* argued of Haverly's Colored Minstrels, "than any 'poor white trash' with corked faces can ever do." White comics fled to variety, where they did their old dialect putdowns of shiftless and irresponsible darkies or used blackface as a cover for raunchier humor than they could get away with if clad only in their own white skins.

As new immigrant groups arrived they were quickly added to the cast of comic characters, with sharp-witted Jews, song-loving Italians, and opium-smoking Chinamen tossed in among the pugnacious Irishmen, lazy Africans, beer-drinking Germans, tight-fisted Scots, and ignorant farm rubes who peopled the virtual Lower East Side. These personas varied from good-humored to derogatory, benign to malignant, and the songs and spiels conveyed both the antagonisms and alliances between groups. Most variety skits never rose above one-dimensional stereotyping, but some did, and in the process gave rise to a new entertainment form, the ethnic sitcom.

"PROMINENT TYPES WHICH GO TO MAKE UP LIFE IN THE METROPOLIS"

Edward "Ned" Harrigan, born in New York in 1845, left home at eighteen to become a traveling song-and-dance man. Tony Hart (originally Anthony J. Cannon), born ten years later, left an Irish slum in Worcester, Massachusetts, and also took to the stage. They teamed up in 1871 and, for the next nine years, settled into Josh Hart's Theatre Comique, a variety

house at 514 Broadway. Soon they were among the most popular performers in New York City.

Where other variety houses rejuvenated their weekly bills by bringing in all new acts, the Theatre Comique relied on Harrigan and Hart to constantly turn out fresh bits themselves. The talented Harrigan wrote comedy sketches in profusion, as well as lyrics for the songs to accompany them. For fresh scenes and characters, Harrigan turned to the Lower East Side. His “The Mulligan Guards,” one of over forty sketches he churned out in the team’s first three seasons, was a takeoff on the city’s hundred-plus immigrant “target companies,” pseudomilitary outfits that on Sundays donned homemade uniforms and went to Jones’ Wood or Hoboken, where they marched, caroused, and shot at targets.

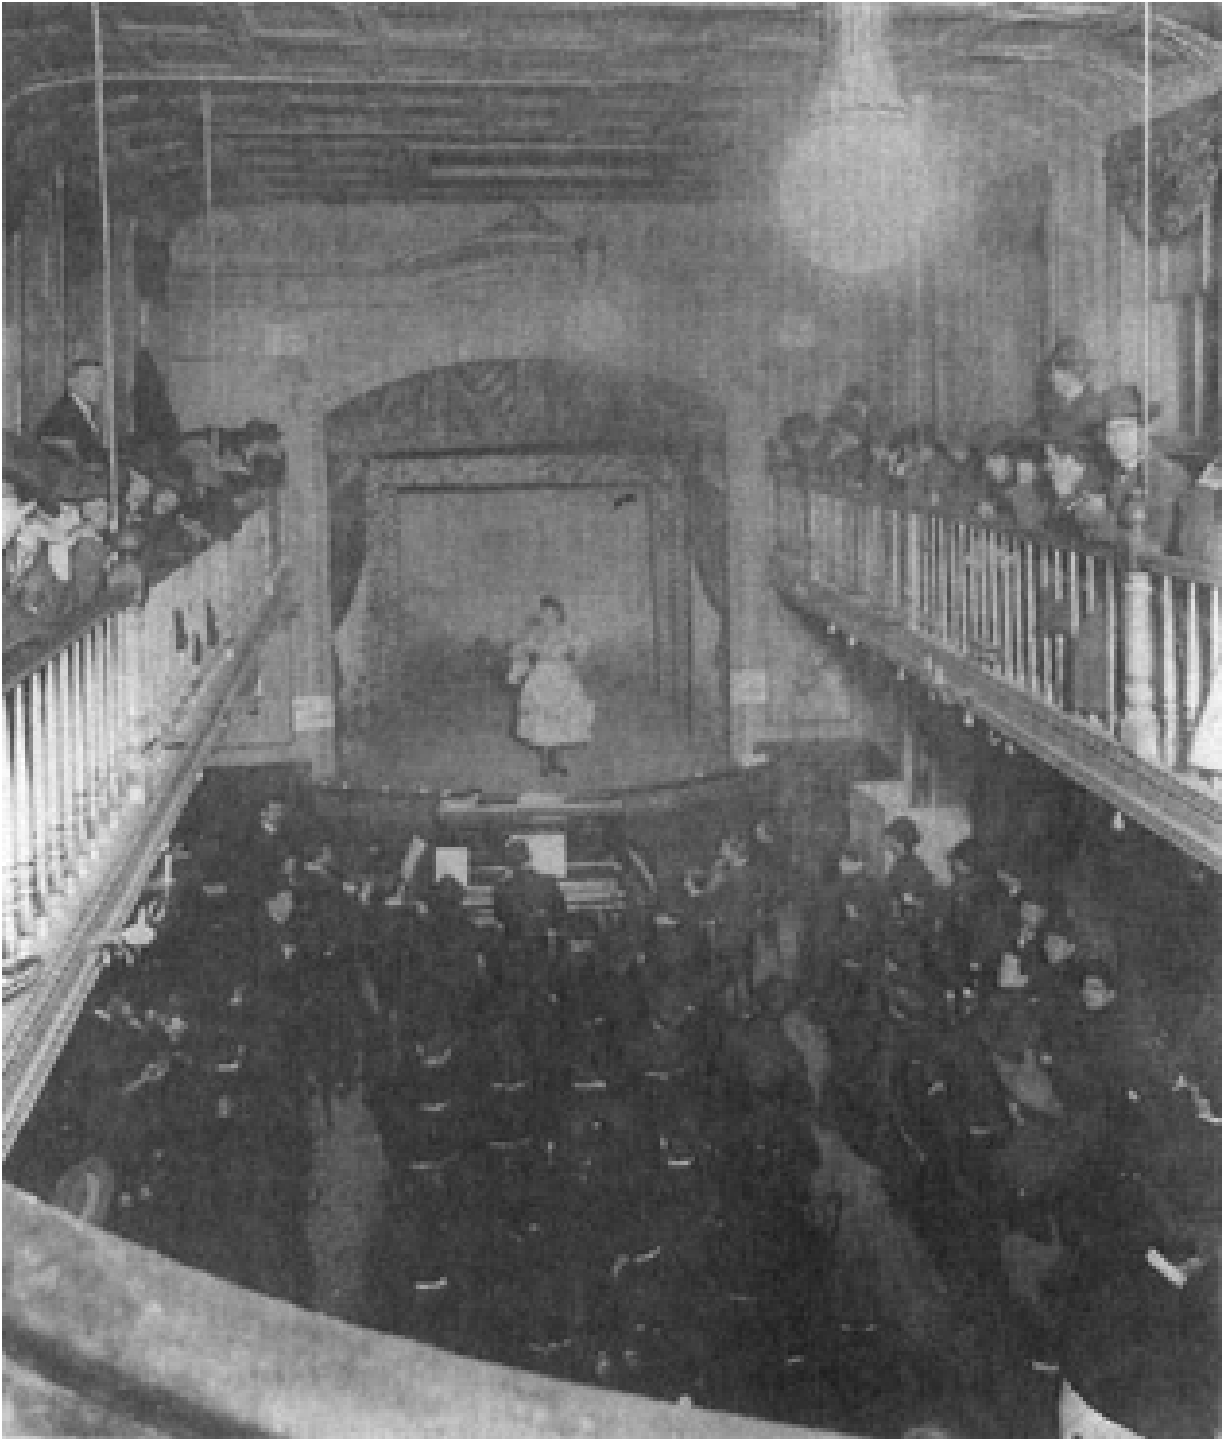

Harrigan’s loving spoof was a smash success, and in 1879 he began turning out a series of full-length plays that developed the character of Dan Mulligan, along with his family, friends, and ethnic neighbors—the “prominent types,” said Harrigan, “which go to make up life in the metropolis.” In fashioning his characters, who were of far greater range and depth than the traditional stereotypes, Harrigan took to the streets to catch “the living manners as they rise.” His daughter, Nedda, remembered him following people around, learning their walk and talk, observing how and where they lived, at times buying the clothes off their backs to use as costumes. Harrigan used realistically painted backdrops to set his scenes on Lower East Side streets, in the Mulligans’ dining room, in black-run barbershops where men gathered to talk sports.

Harrigan and Hart’s comedies were no more into a grim realism than was melodrama or minstrelsy, nor did they completely transcend stereotyping. Harrigan’s Irish were rowdy, garrulous, quick tempered, intemperate; his Germans were slow witted, stubborn, coarse eaters, heavy drinkers; his blacks loved to dress up in overly elaborate costumes, use long words, and mangle syntax. Yet all these characters had redeeming qualities. The Irish came off best, no doubt: Paddy, though given to drink and disorder, was also witty and generous, hardworking and brave. Remarkably, Harrigan’s black barbers and servants were equally complex and, though played for laughs like everyone else, weren’t subjects of ridicule. The Chinese came off much the worst: rat-eating, opiumsmoking, pidgin-English laundrymen with a penchant for stealing clothing.

Perhaps most significant, Harrigan and Hart's assorted characters got on with one another—rather as did many of their real-life contemporaries at West Brighton, or in the CLU, or in the George campaign, or on the Tammany picnics organized by Big Tim Sullivan. H&H's Lower East Siders also exuded a collective sense of downtown's selfworth and power, particularly in relation to the snooty uptown sorts, that appealed to heavily ethnic working-class audiences.

SEX REDIVIVUS

As ethnicity reigned in the melodrama and variety houses, burlesque was ruled by raunch. Lydia Thompson and her impertinent "British Blondes" had created an uproar back in 1868 as much for their streetwise language, male impersonations, and mockery of bourgeois culture as for their revealing costumes. Since then burlesque had been stripped of its more radical components and gone downtown, downscale, and downhill. The dozens of troupes that sprang up in Thompson's wake eliminated cutting-edge criticism and stuck to displaying female bodies to male audiences—the "leg business"—though women on Bowery stages "peeled" only down to their tights.

A Bowery concert saloon, with a “re-fined singing and dancing act” in progress, c. 1890. (© Collection of The New-York Historical Society)

Sex was the mainstay of concert saloons too, like old Harry Hill's, on Houston and Mulberry, which still offered alcohol and licentious entertainment to male audiences, attracting rugged Bowery types, celebrities like Bennett Junior and Edison, and slummers out for a walk on the sinful side, hoping to pick up immigrant girls. But the Bowery's range of sensual possibilities—like the diversity of its ethnic-based offerings—was expanded in this era by new arrivals on the scene, the men called “Nancys” and “fairies.” Ralph Werther, who occasionally went by the name of Jennie June (the celebrated fashion magazinist), moved to the metropolis in 1882 in part because “in New York one can live as Nature demands without setting every one's tongue wagging.” Werther, a middle-class student, attended college uptown but spent much of his free time, usually in drag, at the Columbia Club on the Bowery at 5th Street. Better known as Paresis Hall—paresis being a medical term for the insanity one could supposedly contract by consorting with fairies—the establishment resembled most working-class variety haunts. It had a modest barroom and a small beer garden out back and offered nightly music and comedy routines. Here, however, the performers were men, often of upper- or middle-class background, painted, powdered, and attired in evening dresses, who sang (according to one disapproving observer) “songs with immoral lyrics” that encouraged lewd dances and other acts of depravity. Male prostitutes solicited men at tables, and the upper two floors had small rooms that could be rented by the hour or the night.

There were several such nightspots downtown. Charles Nesbitt, a medical student from North Carolina who visited the city around 1890, went on a slummer's tour and stopped in at beer gardens along the Bowery where, he later recalled, “male perverts, dressed in elaborate feminine evening costumes, ‘sat for company’” and were compensated, as were waiter-girls, with commissions on the drinks clients bought them. The Slide, where waiters with rouged necks sang filthy ditties in falsetto voices, was often recommended by city-smart types to tourists in search of Sodom and Gomorrah.

Wrote a reporter for the paper: "Let a detective be opportuned by people from a distance to show them something outre in the way of fast life, the first place he thinks of is the Slide, if he believes the out-of-towner can stand it." (General Research. The New York Public Library. Astor, Lenox and Tilden Foundation)

The Slide was also, however, a place where fairies felt free to socialize with one another as well as tourists. By the 1890s they had established a community in the interstices of the working-class neighborhood. Nesbitt attended a ball at Walhalla Hall, a Lower East Side establishment popular with local ethnic social clubs. There he found some five hundred male couples waltzing sedately and quite a few "masculine looking women in male evening dress" dancing with other women. So many seemed of

“good” background, Nesbitt marveled, that he could almost imagine himself “among respectable people.”

Ralph Werther reported at least one instance in which solidarity went beyond mere socializing. In 1895 he was invited to join a little club called Cercle Hermaphrododitos, open only to those who “like to doll themselves up in feminine finery.” Its goal was to unite for defense “against the world’s bitter persecution”—making it conceivably the first homosexual rights organization in the United States. Persecution was less prevalent in the working-class neighborhoods than in uptown quarters, the fairies found; Werther enjoyed good relations with Irish and Italian youths. But while Bowery males tolerated these sexual newcomers, they did not respect them, and gang members brutalized them from time to time, as they did the Chinese, well aware their victims would not complain to police.

PASTORIZED VARIETY

Traveling up the Bowery or Broadway brought amusement seekers to the Union Square Rialto, center of a very different kind of cultural production. Union Square remained the hub of the nation’s theatrical industry, and managers and actors lived by the hundreds in area apartments and theatrical boardinghouses. The stock company system completed its collapse in this era. Lester Wallack’s group disbanded in 1887, leaving just Augustin Daly’s old troupe and one newcomer, Charles Frohman’s Empire Theater Stock Company. The stage was now completely given over to combination companies, the assembled-to-order groups that went out on prearranged tours. In the 1881—82 season 138 companies took to the road. In 1894-95 234 groups were hoofing their way across the country, and variety artists and minstrel performers were also assembling troupes and traveling. As the combination system grew ever more reliant on big-name attractions, duly certified success on the New York stage grew ever more critical.

Actors did not leave such crucial notices to chance. Thespians led vivid lives, fashioned personal legends and glamorous personas, and employed dramatic agents to publicize their reputations across the country. Richard d’Oyly Carte, the entrepreneur who produced Gilbert and Sullivan’s *Patience* at the Standard, arranged for Oscar Wilde, whose “aesthetic” movement the play spoofed, to tour the country giving talks. His prospectus promoting Wilde to out-of-town booking agents promised that “he will be

first announced, advertised, and worked up in N.Y. City.” Ballyhooing techniques had developed since P. T. Barnum packaged Jenny Lind. New York talent brokers now drew on methods advertising executives used to market brand-name corporate products. Theatrical portraits of famous personalities were displayed everywhere—in shop windows, hotels, restaurants—and cheaper reproductions graced cards inserted in cigarette packages.

Union Square’s specialization in theatrical marketing, coupled with its proximity to genteel precincts, made it the crucible for the emergence of vaudeville, a new entertainment form that would soon sweep the city and the country. The impresario most responsible for this development was the fat, genial, and handlebar-mustachioed Antonio “Tony” Pastor, a master of the variety stage who set out in the 1880s to change its image. At the age of twelve, Pastor, born in Greenwich Village in 1834, gave his first paid performance, as a blackface minstrel singer, at Barnum’s Museum. Later he joined the circus as an acrobat, singer, and clown, then returned to New York, where he sang topical songs at a Broadway saloon. In 1865 he took over the old Volk’s Garden at 201 Bowery and rechristened it Pastor’s Opera House; there he ran a successful variety show for many years.

In 1881 he moved up to Union Square, opening Tony Pastor’s New Fourteenth Street Theater in Tammany Hall. Following in Barnum’s footsteps, Pastor decided to repackage variety—a brash, plebeian, and male-oriented entertainment form—and make it suitable for a broader and more profitable audience, one that crossed class and gender lines. Union Square was ideally situated for such an initiative, as vast numbers of respectable women came every day to the area’s shops and to Ladies’ Mile, thriving a scant few blocks away. The Sixth Avenue Elevated had poured customers onto the strip that ran from Macy’s at 14th Street up to McCreery’s at 23rd. More giant department stores went up in the 1880s and 1890s, each determined to outdo the others as a spectacular stage for marketing goods.

Pastor launched an ad campaign, aimed at wives, sisters, and sweethearts, announcing the birth of “clean variety.” He barred liquor, banned prostitutes, and sheared the entertainment itself of excessive vulgarity. Once again a cultural entrepreneur had set out to buff the rough edges off downtown culture in order to sell it to uptown audiences. A new

form required a new name, and Pastor's 1881 advertisements proclaimed "the first specialty and vaudeville theater of America, catering to polite tastes." Variety was associated with drink, sex, and the working class; "vaudeville" had French associations and suggested respectability and "class."

There was in fact no structural difference between variety and vaudeville, each being a series of acts strung together, but Pastor's vaudeville was more "tasteful." His offerings included demure dancers, blackface comics, spoofs of uptown light operas, Irish acts, magic lantern shows, puppetry, city sketches ("The Mysteries of Gotham," "The Bowery by Day and Night"), and Tony himself, singing favorites like "Lula, the Beautiful Hebrew Girl" or "Sarah's Young Man" ("On her I grew love sick / She was a domestic / And lived in a mansion / On Washington Square.")

Pastor, though a great success, at first had little wider impact—most variety stages continued much as before—largely because the performer-manager had no ambitions beyond his own theater. It would take an empire builder to press the transformation farther. At the time Pastor was launching vaudeville, Benjamin Franklin Keith came to town to work at Bunnell's Museum, one of the fifty dime museums flourishing in New York City in the late 1870s and early 1880s. Keith was not a performer but an entrepreneur, and after a year at Bunnell's, displaying collections of human curiosities, wax figures, and two-headed chickens, followed by a year on the road with P. T. Barnum's circus, he opened his own Pastor-style vaudeville operation, the New York Dime Museum, in Boston in 1883. Over the next decade, Keith worked out and standardized the vaudeville formula, while his partner, Edward F. Albee, designed special-purpose theaters.

By the time Keith and Albee moved into New York's Union Square Theater in 1893, they had industrialized the master's approach. The Union Square offered "continuous performance," repeating acts throughout the day. Each was no less than seven and no more than twenty minutes long and fit for family viewing. The theater itself was refined too, staffed with a corps of boy ushers in Turkish costumes and with ladies' room maids in lace caps and frilly aprons. Perhaps most important, the managers hired bouncers to cope with any men or boys who, accustomed to stag-house laxity, might shout obscenities at female performers from the galleries.

They also banned smoking, hat wearing, whistling, stamping, spitting on the floor, and crunching peanuts. Not surprisingly, Brighton Beach and Manhattan Beach established tasteful music halls in which they offered patrons the new and respectable vaudeville.

THE ROOTS OF TIN PAN ALLEY

Union Square's sheet music houses had long served primarily as distribution agencies for established songwriters, but in the 1880s, in tandem with the rise of vaudeville, they began producing what one advertised as "Songs Written to Order." In 1886 Witmark and Sons, a Jewish firm like many of the new companies, segued from commercial printing into sheet music publishing and song production. The youthful brothers quickly discovered that test marketing before live audiences was the key to success. At first they kept the operation in the family: Julius, "the boy soprano," became a popular performer at Tony Pastor's, and gave stage-play to songs Isidore wrote. Those that caught on were quickly printed up and marketed.

As new entrepreneurs poured into the business, song salesmanship became a ferociously competitive affair. Rival song "pluggers" stalked popular vaudeville vocalists, snared them on streetcorners, and sang them their songs amid the passing throng. To get real stars to work their ditties into an act, pluggers would buy them drinks or dinners in Union Square restaurants, pay their board bill, purchase their railroad tickets to distant cities. They also wooed bandleaders, managers, and waiters, hired boys in the galleries to take up the chorus, and got organ grinders to spread their melodies throughout the city. In addition, they cultivated the growing number of vaudeville agents who worked in the Union Square area booking agencies supplying acts and songs to theaters and amusement parks across the country.

In the 1890s the stakes and purses grew larger, as evidenced by the Cinderella success of Charles K. Harris. Like most free-lance songwriters, Harris was at the bottom of the emerging industry, way below publishers and performers. When the Witmarks offered him an eighty-five-cent royalty check for one effort, the enraged Harris opened his own company and began churning out melodramatic songs about women wronged and vice reprov'd. In 1892 Harris wrote "After the Ball," a pathetic tale of a young

man doomed to eternal bachelorhood (“Long years have passed, child, I’ve never wed / True to my lost love, though she is dead.”) Harris got songstress May Irwin to introduce it at Tony Pastor’s, and within a few years it sold over two million copies.

Other million-plus sellers followed in the early 1890s, with some of the biggest hits packaging and marketing images of life in New York. “The Bowery” (1892), first sung in the musical comedy *A Trip to Chinatown*, was about the misadventures of a genteel young man who, on his first visit to the metropolis, disregarded advice to stay away from the working-class boulevard:

Oh, the night that I struck New York, I went out for a little walk.
Folks who are onto the city say, better far that I took Broadway.

But I was out to enjoy the sights: there was the Bowery ablaze with
lights;
I had one of the Devil’s own nights, I’ll never go there any more.

In succeeding verses the hapless tourist is bilked at an auction, bounced from a variety hall, and battered in a bar (“I struck a place that they called a dive. I was lucky to get out alive”), with each crisis punctuated by the pointed refrain: “I’ll never go there any more.”

More appealing metropolitan portraits were furnished by “The Sidewalks of New York” (1894) and “The Band Played On” (1895), the latter a song about Matt Casey’s stylish social club in a rented hall where on Saturday night he and his cronies would grease the floor with wax, don their Sunday clothes, and waltz with strawberry blondes. Most of the big hits were waltzes, with lyrics that got to the point as quickly as an advertisement and memorably melodic choruses that made it easy for audiences and parlor performers to sing along.

These blockbuster successes, which kept New York life in the nation’s ear, inspired dozens of other songwriting firms to try their hand. Most continued to locate around 14th Street, until the flourishing Witmark brothers moved uptown to West 28th Street, nearer the new theatrical district. By the late 1890s almost every major music publisher had followed

them, creating a new center for the popular music industry soon to be dubbed Tin Pan Alley.

BIG TENT ON MADISON SQUARE

While Union Square mediated between Bowery and Broadway, Madison Square, a few blocks north, accommodated both simultaneously.

Ever since the old New York and Harlem Rail Road shed at Madison and 26th had been rendered obsolete by Grand Central Depot, the Vanderbilt family had leased the old terminus to various theatrical entrepreneurs. In 1873 P. T. Barnum used the premises, remodeled as the Great Roman Hippodrome, for performances of the world's first three-ring circus. Later, bandmaster Patrick S. Gilmore rented it for boxing matches, marathon running races, and the first Westminster Kennel Club Show (1877).

In 1879 William Kissam Vanderbilt reasserted family control over the site and rechristened it Madison Square Garden, appropriating for indoor halls a word long associated with outdoor "pleasure gardens." In the early 1880s Vanderbilt focused on sports events, relying heavily on six-day-long marathon runs and boxing "exhibitions" featuring John L. Sullivan. But in 1885 a clampdown on the still illegal sport cut off that income stream, and events like the National Horse Show, which started that year, failed to replace it. Vanderbilt decided to raze his "patched-up, grimy, drafty, combustible old shell" and sell out to a syndicate of titans that included J. P. Morgan (president), Andrew Carnegie, James Stillman, and W. W. Astor.

Their Madison Square Garden Company raised over \$1.5 million, solicited Stanford White to design the new structure, and launched construction with a workforce of over a thousand men. Eleven months later, one of the largest public entertainment halls in the world opened its doors. Its vast buff-and-yellow base, girdled by pedestrian arcades and embellished with terra-cotta, was crowned by a three-hundred-foot-plustall tower modeled on Seville's Moorish Giralda. Exceeded in size only by Pulitzer's World Building, the tower became an instant attraction and emblem of New York City. After 1891 elevators carried the public to a loggia, from which stairs provided access to an observation platform 289 feet above the street that afforded bird's-eye views of the metropolis, and on higher still to a two-person perch at the 304-6101 level. At the pinnacle, a

Saint-Gaudens statue of Diana was unveiled on November 1, 1891, with a grand illumination of red fire, colored lights, and rockets. When the bombs bursting in air revealed that Diana was nude, moralists condemned it as an outrage, but J. P. Morgan liked it, and it stayed.

The Garden offered bourgeois audiences orchestral performances, light operas, and romantic comedies in the Garden Theater, as well as an array of deluxe facilities including a ballroom-concert hall, an adjoining supper room-foyer, a restaurant, men's and women's withdrawing rooms, and a roof garden enclosed in glass that could be removed during the summer. The Garden's colossal amphitheater—with no boxes and brilliant illumination from incandescent lamps—became home to elite affairs like the annual National Horse Show, the first big event of each season, and the Westminster Kennel Club Show. After 1891 it hosted the annual French Ball, still an unbuttoned affair. At the 1894 ball, New York clubmen tossed laughing courtesans, bare bosomed, from the dance floor into lower boxes. On one occasion, the bediamonded Miss Western, a leading madam, held court in the Astor family's private box—in the Queen's very seat—as hundreds of males passed by to pay her homage.

As a financial proposition, however, the Garden was a disaster. Elites alone couldn't support the lavishly equipped complex, which seated five thousand (twelve thousand at special events) and cost \$240,000 a year to maintain. Stanford White tried fashioning some large-scale popular entertainments—re-creations of Shakespeare's House and the Globe Theatre—and the management brought in P. T. Barnum's and John Ringling's circuses. Madison Square Garden thus became an institution that oscillated, from night to night, between patrician and plebeian entertainments.

SATAN'S CIRCUS

North and west of Madison Square lay the sin-drenched Tenderloin—or Satan's Circus, as the clergy were fond of calling it. It started at Sixth and 23rd, where since 1879 Bryant's Opera House, one of the last minstrel venues in the city, had been leased by Adam Bial and John Koster for their Koster and Bial's Music Hall. A glorified concert saloon, where patrons in balcony boxes or at ground-floor tables could drink and watch Lillian McTubucks do a Bowery version of the cancan or listen to barrelhouse

baritones, Koster and Bial's was rather tame, though the *Times* called it "lurid." A few blocks north things were considerably lustier.

The notorious Haymarket, on Sixth just south of 30th, had a veneer of outward decency. It forbade its wealthy clientele from close-up dancing with prostitutes and expelled working-class girls who turned out for an evening's fun if they displayed their ankles. At the same time, it thoughtfully provided curtained galleries behind which discreet sex could be practiced. Visiting firemen or men-about-town could also repair to the Haymarket's balcony level, where cubicles featured sex exhibitions or "circuses."

Elite bordellos too had ensconced themselves in the Tenderloin, having pursued their respectable clients northward, like camp followers in the train of an army. As fashionable theaters had now banned third-tier operations, prostitutes met their patrons at the doors of the Metropolitan Opera House or Wallack's or Daly's and escorted them to nearby establishments, like the almost solid row of whorehouses on West 29th Street.

An evening of high culture was hardly a prerequisite for commercial sex, however. Elevated railroads put the area within easy reach of distant patrons. The same el that brought respectable women to shop at genteel department stores by day brought respectable men by night to shop for women. "Ladies' Mile" took on a different meaning at night, as Sixth Avenue between 14th and 34th streets became a brightly lit whore's promenade. A block farther west, patrols of black prostitutes gave the strip of Seventh Avenue between 23rd and 40th streets the name of "African Broadway."

Gambling resorts too settled here in the 1880s and 1890s. Of New York's hundreds of faro banks and policy shops, most of the first-class houses were Tenderloin operations. John Daly, the city's kingpin gambler, had been drawn to New York from Troy by the success of John Morrissey, and his famous house at 39 West 28th, open since 1878, paid a rumored one hundred thousand dollars in annual protection. The era's rising star was Richard A. Canfield, who had started as a poker-room operator in Providence, traveled to Monte Carlo and European spas to learn how aristocrats gambled, then moved to New York. In 1888 Canfield opened the Madison Square Club at 22 West 26th; a more dignified, luxurious, and

honest operation than was customary at the time, it would soon win him international renown.

BEST OF BROADWAY

Those who left Madison Square Garden but stuck to the straight and narrow northward path found themselves in the heartland of the “legitimate” stage, which had fled the old Rialto to upper Broadway between 23rd and 42nd. The chain of theaters began with the Lyceum (1885), the first New York playhouse lighted by electricity, which had been personally installed by Edison. Augustin Daly, the first to gamble on a northward drift, had relocated his stock company to Broadway and 30th in 1879, and Lester Wallack had followed close behind in 1882. Then came the Bijou, the Abbey, the Casino (famed for its Moorish design and novel roof garden), and the Empire, at the very edge of Longacre (not yet Times) Square. By the early 1890s this once sparsely settled stretch of Broadway was ablaze with electric lights and thronged by crowds of middle- and upper-class theater, restaurant, and cafe patrons.

What kept these houses packed—even during the blizzard of 1888—was partly New Yorkers’ traditional devotion to the stage, partly a great surge in out-of-town tourists and businessmen who stayed at the nearby hotels, and partly the greatly improved transportation network of ferries, elevateds, and streetcars, which expanded the accessible theatrical hinterland. Communication technology helped: prosperous Manhattanites with call boxes connected by wire to the nearest telegraph office for summoning a messenger boy to pick up a telegram could also use their device to order tickets from Daly’s Theater, which then were delivered by hand.

For the most part, the content in these new playhouses was as respectable as their audiences. The Lyceum was the favorite haunt of the Four Hundred who, dressed in formal evening attire, took in its drawing-room dramas. Fashionable audiences packed Daly’s for its lavish productions of Shakespeare and mingled during the intervals in its richly furnished lobby. Arthur Sullivan and W. S. Gilbert’s *H.M.S. Pinafore* opened at the Standard in January 1879—they arrived for a visit and were given a gala reception at the Lotos Club—but the Casino became the city’s new temple of light opera, drawing many patrons clad in the new tailless evening coat, the “tuxedo.” Frohman’s did well with English and European

comedies and dramas. While some of these offerings could approach the mildly risqué, uptown promoters assured bourgeois audiences their plays met minimum standards of decency.

Edwin Booth, New York's (and America's) greatest tragedian, strove to make thespians as well as theater more respectable. Society packed the playhouses but kept players at arm's length, even the most highly reputed. Sarah Bernhardt's 1880 American debut at Booth's Theater was the talk of the town a year before she arrived, and the haute monde paid up to forty dollars a ticket to see her, but ladies refused to invite her to their homes, and her Century Association reception was for men only.

Booth, impressed by London's Garrick Club, where actors mixed with fashionable society, decided that a New York counterpart would help in "the elevation of the stage." In 1888 he and his friends bought a stately 1845 house on Gramercy Park, had Stanford White remodel it, and reopened it as the Players Club. Actors flocked to its subdued and dignified precincts. Those of too bohemian a bent were blackballed; they could, however, betake themselves to the Lambs Club, a more uninhibited and convivial watering hole, or to Keens Chophouse, which Albert Keen, the Lambs' manager, had opened on 36th Street in 1885.

This trend toward respectability was hailed by important voices in the larger theatrical community. The city's leading trade paper, the *New York Mirror* (1879; later the *Dramatic Mirror*), urged players to attend church every Sunday. And the genteel drama critic at the *Tribune* exhorted the profession "to instill, to protect, and to maintain purity, sweetness, and refinement in our feelings, our manners, our language, and our national character."

For all this, there was nothing like a whiff of forbidden sensuality to sell tickets, and the boundary between Broadway and the Tenderloin proved a porous one. A series of ravishing overseas visitors such as Lily Langtry and Sarah Bernhardt took to the boards, and the arrival of glamorous Lillian Russell turned out to be a classic case of downtown infiltrating uptown.

Russell was born Helen Louise Leonard in Clinton, Iowa, in 1861. At age two she was taken to Chicago by her father, a newspaperman, and her mother, Cynthia Leonard, a strong-willed feminist and crusader for women's rights, and placed in the Convent of Sacred Heart for eight years;

she first studied music in church choirs. In 1877 Helen's mother, eager to work with the suffrage and socialist movements, took her seventeen-year-old daughter with her to New York. Intending Helen for an opera career, Leonard placed her with famed teacher Leopold Damrosch and then plunged into feminist work: in 1888 she would become the first woman to run for mayor of New York City. Helen, equally strong-willed, abandoned her lessons and joined a chorus, where she caught the eye and ear of Tony Pastor. The variety entrepreneur assigned her a new name and launched her career with a major role in *The Pie-rats of Penyan*, a vaudeville burlesque of uptown operettas.

Russell soon shifted from satire to the real thing, landing a role in Gilbert and Sullivan's *Patience*. In short order the silvery-voiced singer had become the Casino's resident light opera prima donna and was pulling down a salary on a par with those of steel executives and Wall Street brokers. Sexually magnetic—her 165 pounds corseted into the requisite hourglass figure—Russell became one of the most lusted-after women in America, with tycoons pleading to drink champagne from her slippers, yet all the while she maintained a reasonably respectable cachet.

The genteel theater, for all its reservations about actors, public sensuality, and the commercialization of sex, itself dabbled in the “legitimate” business (as one downtown burlesque show chortled). Its marketing of personalities, moreover, was directly tied in with the marketing of commodities. The daily doings of famous actresses were chronicled in the women's magazines, and their choice of clothes, jewelry, and millinery began to set national trends. Women adopted their coiffures and tried to imitate their figures (for a time Bernhardt's “spiral silhouette” banished the bustle). Makeup moved out of theatrical dressing rooms into respectable parlors, beauty shops became almost as common as barbershops, and photographs of Lily Langtry's flawless complexion soon graced ads for Pear's soap.

PULITZER'S WORLD

Manhattan and Coney islands were incubating a new mass commercial culture, but their assorted entertainment zones were strung out over such distances that it was hard for even the most diligent pedestrian to grasp the new phenomenon as a whole. There was one source, however, that even

armchair investigators could easily consult and master: Joseph Pulitzer's *New York World*, which was itself a prize example of the new order.

After the Civil War Pulitzer had moved to St. Louis, worked as a reporter for a German-language paper, got into politics, practiced law, formed the *Post and Dispatch*, and become a successful publisher. By 1883 he was ready to tackle New York again, but the city's field of metropolitan dailies was a crowded one, filled with such potent competitors as Dana's *Sun*, Bennett Junior's *Herald*, George Jones's *New York Times*, and Whitelaw Reid's *Tribune*—just among the morning papers.

There was also the *World*, once the organ of Swallowtail Democrats, now Jay Gould's plaything. Deep in the red, it nevertheless had an Associated Press franchise and a Democratic lineage in a Democratic town, so Pulitzer bought it from the hardbargaining financier for an outrageous \$346,000, payable in installments. Pulitzer had his foothold in Manhattan, and a staggering debt as well. Simply to survive he needed a fantastically rapid rise in circulation.

He got it. When he took over in 1883 the *World* was selling perhaps fifteen thousand copies a day. It passed the sixty thousand mark in a matter of months. The *Herald*, *Times*, and *Tribune*, acting like rival railroad magnates, slashed their prices to keep up, but to no avail. Within a scant two years the *World's* circulation topped 150,000, and in 1890 Pulitzer capped his triumph by erecting the world's tallest building.

Pulitzer succeeded by navigating the course charted back in the 1830s by those master pilots of the penny press, Bennett Senior and Benjamin Day. He also seized on the possibilities of the 1880s: the industrialization of communications technology, the techniques developed by the advertising business, and the strategies deployed by the mass entertainment entrepreneurs on Coney Island, the Bowery, Broadway, and Union Square.

The *World* adopted a breezy and colloquial style. "Condense, condense!" Pulitzer commanded his reporters, following admen in opting for the simple nouns, vivid verbs, and short sentences that made the paper accessible to immigrants learning the language. When chastised by E. L. Godkin of the *Evening Post* for breaking with genteel conventions, Pulitzer replied: "I want to talk to a nation, not to a select committee."

World news stories scrapped leisurely chronology for snappy analysis, putting the who-what-when-where-and-why into an easily graspable lead paragraph. This, together with smaller pages, was a boon to hurrying commuters, explained a trade paper in 1887, as New Yorkers “read largely in the horse cars, the elevated railroads and the omnibuses”—crowded and noisy venues. “We do not want a paper which requires a whole conveyance in which to turn its pages.”

Pulitzer reformatted the front page. Even penny press papers like the *Herald* and the *Sun* had stayed with single-column headlines, simply adding subheads to denote particularly important stories. The *World* went with multicolumn banners that contemporaries likened to department store displays designed to grab shoppers’ attention.

He plunged into pictures. Graphics had long been central to weekly magazines and illustrated papers like *Frank Leslie’s*, and in 1880 the *New York Daily Graphic* had supplemented its zinc etchings and photoengraved line illustrations with the first halftone photograph ever reproduced in a New York newspaper, a picture labeled “Shantytown.” But in the regular daily press, it was Pulitzer who first routinely deployed images to accompany text—an enhancement that, like bold heads and terse prose, appealed to the barely or recently literate. He also furthered the development of cartoons (the *Daily News* had run a strip since 1884) and broke new ground in 1894 with the first colored comic strip—also, curiously, called “Shantytown.” This was followed by the introduction of “Hogan’s Alley,” featuring a hairless, single-toothed street urchin dressed in flowing yellow robes. The “Yellow Kid” would be spun off as a strip in its own right.

Pulitzer’s content, like his style, appealed to a mass audience. Immediately on assuming control, he had called his inherited, dignified staff together and announced: “Gentlemen, you realize that a change has taken place in the *World*. Heretofore you have all been living in the parlour and taking baths every day. Now I wish you to understand that, in future, you are all walking down the Bowery.” This unnerving prospect prompted several on-the-spot resignations, allowing Pulitzer to bring in replacements from his St. Louis paper.

Pulitzer, like Harrigan and Hart, drew on working-class life for material. The *World* chronicled ordinary people, using human interest stories to

spotlight and dignify members of the metropolitan crowd. Pulitzer's reporters routinely quoted the kind of New Yorker who had rarely appeared in print before, like the gashouse laborer who had just learned of the existence of Central Park and attended a Sunday concert there: the *World* passed on to the world his remark that "to-day I have been as happy as a king." Graphically too the paper was broad gauged. It filled its pages with visages of hotel clerks, artists, cooks, and cops, as well as portraits of judges, politicians, and financiers. The paper also practiced skillful tribal journalism, scorning the English on behalf of Irish readers, providing Kleindeutschland with news of Bismarck's doings, and paying close attention to Jewish holidays for patrons on the Lower East Side. Pulitzer covered, as well, aspects of commercial culture usually relegated to specialized journals like the *Spirit of the Times*, *Clipper*, and *Police Gazette*; he inaugurated a sports page in the 1880s.

The *World* treated as front-page news such dramatic moments in the life of the city as the Festival of Connection marking the opening of the Brooklyn Bridge. It promoted investigative reporting: *World* reporter Nellie Bly (nee Elizabeth Cochrane) feigned insanity, got herself committed to the Blackwell's Island Asylum, and wrote up a story on the abominable conditions there that led to a grand jury investigation.¹ Pulitzer certainly exploited sentiment for the sake of sales, but his paper also promoted public generosity and helped foster an ethos of civic solidarity.

Pulitzer made his paper news as well as newsmaker. In 1885 the Statue of Liberty languished unassembled in France, efforts to raise money for a pedestal having stalled. Crying, "Let us not wait for the millionaires to give this money," Pulitzer appealed to "the people" to rescue the monument and avoid an "irrevocable disgrace to New York City." Tens of thousands of small contributions rolled in, the pedestal was constructed, and, in the process, the *World* became associated indelibly with the enterprise (Pulitzer even incorporated the statue into the paper's nameplate).

The *World* took great pains to attract women readers, a constituency most dailies gave scant attention. Pulitzer understood, as did manufacturers and purveyors of consumer goods, that in the 1880s women did most household purchasing, and their patronage was therefore the key to attracting advertisers. The *World* accordingly argued that "what the New York woman of the higher order is likely to have as her special denotement

is style,” unlike her Boston sister who was “severely intellectual or burdened with scholarship.” Maintaining this stylish lead was a difficult and never-ending process, and the *World* was there to help.

The *World* also walked a fine line between the prudery demanded by genteel opinion and a sale-boosting prurience. The paper’s pages, for all their surface propriety, were suffused with erotic innuendo, sternly condemning sinfulness in general while recounting in detail the doings of particular sinners. The *World* served up scandals, particularly when they involved the respectable and prosperous, and waged campaigns against prostitution, abortionists, variety shows, and opium dens—campaigns simultaneously sanctimonious and titillating.

Pulitzer adopted a similar strategy in depicting violence, wrapping concupiscent accounts of bloody deeds in pious disapproval. Sensational headlines—“Who Murdered Mrs. Bush?”—dragged attention to graphic coverage of gruesome incidents, often accompanied by precisely labeled crime-scene sketches (“Bed Covered with Blood”; “Sink in Which the Knife was Found”). Executions were featured because judicial murders were simultaneously gory (“Dragged Resisting to a Prayerless Doom”) and legitimate. Reviving an ancient urban practice, the very first issues of the revamped *World* carried lurid accounts of executions, dwelling on the last hours of condemned killers.

If Pulitzer paid extravagant attention to most sensational aspects of the urban underworld, affording bourgeois readers the opportunity for armchair slumming, he provided equal opportunity voyeurism in the *World*’s society pages, peeps inside the grand châteaux that afforded the twin pleasures of virtuous condemnation and vicarious sybaritism. The paper attacked the culture of the “watered-stock aristocracy” and lit into the ostentatious glitter of the new and “vulgar wealthy,” denouncing their urban châteaux, Newport palaces, and valet-guarded boxes at the Metropolitan Opera House. It was equally scathing about the old guard, ruthlessly lampooning the “snobocracy” and its pretensions to noble lineage.

Pulitzer also kept a critical edge on reporting about the everyday life of the working classes. Proclaiming that the *World* would henceforth be “dedicated to the cause of the people rather than that of purse potentates,” he ran stories on squalid tenement housing, impure milk, infant mortality, female and child labor, and strikes. In one of the earliest instances of what

would later be called muckraking, Pulitzer denounced Rockefeller's Standard Oil as "the most cruel, impudent, pitiless, and grasping monopoly that ever fastened upon a country," and his crusades for antitrust legislation helped pass the Sherman Act in 1890.

The *World* pointed out and excoriated the connection between big money and politicians—if they were Republican politicians. In the 1884 presidential race, when 180 financiers attended a sumptuous Delmonico's dinner for candidate James G. Blaine, the *World* denounced "the Royal Feast of Belshazzar." A huge front-page political cartoon depicted Blaine and the "Money Kings"—with precise caricatures of Gould, Vanderbilt, Astor, Depew, Carnegie, Seligman, Sage, and others shown drinking "Monopoly Soup" and downing "Lobby Pudding," heedless of the pleas of an unemployed worker, his emaciated wife, and his ragged child for crumbs from the groaning board. The *World* also made much of Blaine's meeting, earlier the same day, with a group of Protestant New York clergymen at the Fifth Avenue Hotel. The spokesman, the Rev. Samuel D. Burchard of the Murray Hill Presbyterian Church, had suggested the Democrats were the party of "rum, Romanism and rebellion." A tired Blaine failed to contradict the remark, a silence the *World* converted to vigorous assent to a proposition that affronted Catholic citizens.

Despite its sharp, even shrill attacks on great wealth, the *World* was not a radical paper. It railed at the Rockefellers but rejected socialism and anarchism, arguing that an enlightened capitalism could avoid class warfare if—with the help of the press—it rid itself of excesses. For all its quarrels with corruption, it was a staunch Democratic Party organ. In the 1886 mayoralty campaign it supported Abram Hewitt, not Henry George.

The *World* was a triumph, but Pulitzer proved unable to enjoy it. Long burdened with psychological problems (he was probably a manic depressive), his eyes and nerves deteriorated, forcing him to spend much of his time in a darkened room, and he became extremely sensitive to unexpected sounds. In his later years, the man who had mastered and marketed the city's cacophonous commercial culture would retreat to a McKim, Meade and White mansion on 73rd Street; its utterly noise-proofed annex—double walls packed with mineral wool, and triple-glass windows—served as Pulitzer's refuge from the slightest city sound, a burden the neurotic publisher now found intolerable.

Purity Crusade

The Great Fire broke out first in Murray Hill, where enraged and drunken mobs sacked and torched the mansions of millionaires. Then hungry men from the Bowery began pouring into fashionable restaurants, gorging themselves, setting the eateries ablaze, and moving on to loot and burn. Perched atop an elevated railroad platform, a reporter watched the conflagration spread out from Fifth Avenue in “billows and waves and worlds of smoke and flame.” The fires roared south, incinerating the great newspaper offices, sending rivers of now-molten lead type flowing out from Franklin Square. Finally the inferno swept into the poor and industrial districts, and soon “the oil, the gas, the rum, the thousands of filthy things which man in his drunken greed had allowed to accumulate on the face of the island appealed to heaven for purification,” and purification was at last attained when the colossal firestorm, having consumed hundreds of thousands of lives, seared on and on till it “burned and burned and burned to the very bed-rock!”

Or such was the premise of popular writer Joaquin Miller’s *The Destruction of Gotham*, issued by Funk and Wagnalls in the year of the Henry George campaign. While Miller’s book added luster to his reputation, as apocalyptic literature it was soon eclipsed by Ignatius Donnelly’s *Caesar’s Column* (1889), which would sell a quartermillion copies and become one of the century’s bestsellers. Donnelly depicted New York City, a century in the future, as being locked in a death struggle between the Oligarchy, a cabal of acquisitive and vicious Hebrew capitalists who had seized wealth and power through “subtle combinations,” and the Brotherhood of Destruction, composed of “vast, streaming swarms” of beaten-down proletarians of all nations, commanded by the Italian-born giant Caesar Lomellini. After Lomellini’s forces routed the evil Oligarchs with “dynamite bullets,” the “brutal and ravenous multitude”—with no one left to keep order—broke loose “like a huge flood, long damned up” and flowed “full of foam and terror” in every direction. Maddened men chased well-dressed individuals “like hounds after a rabbit,” tore them apart, and whirled the dead bodies to delighted spectators, who hauled them off in

gory chariots to Union Square. There, by the light of blazing bonfires, the drunken victors set sixty thousand prisoners (“merchants professional men, etc.”) to stacking and cementing a quarter-million cadavers into a colossal column of corpses—“in commemoration of the death and burial of modern civilization.”

Like Miller, Donnelly saw cities—New York in particular—as breeding millionaires, tramps, and urban Armageddon. “The classes from which we have most to fear,” agreed Josiah Strong in *Our Country* (1891), “are the two extremes of society—the dangerously rich and the dangerously poor.” Like other popular Cassandras, Strong, who was secretary of the Congregationalist American Home Missionary Society, emphasized that “a mighty emergency is upon us”—us being the country’s imperiled Protestant middle classes, who were fast losing any ability to rein in either irresponsible monopolists or “ignorant and vicious” aliens.

In New York itself, the comfortable middle classes were finding the final decades of the nineteenth century a strange and perplexing time. They knew they lived amid unprecedented progress and prosperity. Yet everywhere they beheld portents of danger: poverty, corruption, licentiousness, militant unionism, political radicalism, open strife between capital and labor, and a surge of immigrants so vast and alien that it was hard to imagine what would become of the old Anglo-Saxon republic.

Badly buffeted by the upheavals of the mid-1880s—the recession, the rise of the Knights of Labor, the great strikes for the eight-hour day, the burgeoning immigration, the near-triumph of the Henry George campaign, and the Haymarket bombings—many middle-class New Yorkers would enlist in movements dedicated to warding off the now so frequently prophesied apocalypse. Some would direct their energies toward checking the unbridled growth of corporate power, others would concentrate on constraining or transforming the disorderly poor, and others still would find their selfassigned mission of preserving order and civility in urban affairs leading them in both directions at once.

ARMIES OF SALVATION

Among those most rattled by contemporary disorders were metropolitan ministers, to whom it had become grimly apparent that Protestantism had

lost any influence with the urban working class. This conviction was aired and ratified in December 1888 at a Chickering Hall Christian Conference organized by prominent clergymen. Minister after minister stood up to testify that New York's Protestant churches, by moving north with their uptown congregations, had abandoned the lower city to Catholicism, Judaism, secularism, anarchism, and socialism.

In *Modern Cities and Their Religious Problems* (1887), Samuel Lane Loomis suggested another reason that the masses of immigrant workingmen avoided Protestant services apart from lack of proximity: their (misguided) conviction that these were “the churches of the capitalists,” simply because they were “usually attended and sustained by persons of means and intelligence.” The deplorable consequence was that most laborers (overwhelmingly Catholic) “never breathed a Christian atmosphere” and—separated from good influence—fell prey to drink, crime, and anarchism.

Some evangelicals still hoped that old-time proselytizing would solve the problem. The Sunday school movement and urban revivalists pressed ahead with renewed vigor, while the New York Mission and Tract Society updated its publications and, with substantial Chamber of Commerce support, tried aggressively to convert the Jews. But the immigrant wards seemed impervious to such efforts.

There *were* Protestants who had more of an impact, though their successes were of limited comfort to the established ministry; their advance guard had arrived on Wednesday, March 10, 1880. A Pioneer Party of the Salvation Army had marched down the gangplank of the steamer *Australia* at Castle Garden, singing hymns and carrying a flag emblazoned BLOOD & FIRE NEW YORK NO. 1—to the amazement of a curious throng of bystanders and reporters who mistook them at first for a traveling concert troupe.

Founded two years earlier in England by Methodist William Booth, the Salvation Army had taken evangelical aim at the most destitute members of the London poor, then decided to expand to America. A company of seven female volunteers was dispatched under the command of trusted Booth lieutenant George Scott Railton, a former clerk turned full-time missionary. Immediately on arrival the little vanguard set out to “wed ourselves to the fate and fortunes of the so-called dangerous classes.” Spurning offers of church pulpits, they scandalized respectable opinion by accepting a proposition from the notorious Harry Hill to “do a turn” at his music hall

that Sunday. The ensuing revival service—covered in the *World* under the headline “A Peculiar People amid Queer Surroundings”—was treated by most of Harry’s clientele as a great joke. But one participant, a well-known Manhattan drunkard known as Ash-Barrel Jimmy, was wrested from the Devil’s grip that day, becoming the Army’s first American convert. Word of this miracle brought large crowds to hear Jimmy’s “testimony” and, soon, that of other reformed drunkards. When the Army’s rented halls overflowed, they took their meetings to the streets.

Uniformed soldiers of the Salvation Army conducting a worship service, *Harper’s Weekly*, April 3, 1880. (© Collection of The New-York Historical Society)

The Army promoted its orthodox Wesleyan message of grace, forgiveness, and love—and total war on drink—with novel methods. Stirring brass bands, drums, and tambourines, clearly audible over the din of city traffic, attracted passers-by. So did the rousing versions of religious texts set to popular melodies, including barroom ballads, love songs, vaudeville ditties, and minstrel tunes. Ranks and titles gave a new sense of

importance and purpose to converts. So did the handsome blue uniforms (and black straw bonnets for women), which made all soldiers, even those too poor to purchase decent clothing, equal participants in the Great Salvation War. Women, who quickly advanced to leadership positions, were attracted in great numbers. The Army displayed a Barnumesque flair for publicity, as when they burned the Devil (the Enemy Commander) in effigy. And they showed a canny, Pulitzerian grasp of effective public prose by hewing to the injunction “Everything short, sharp, striking, vigorous.”

The Army supplemented its psychic and spiritual appeal with tangible social benefits. The October 1886 issue of its weekly publication, the *War Cry*, announced the opening in Brooklyn of a Rescue Home for Fallen and Homeless Girls, a haven for husbandless pregnant women, the most desperate of outcasts from respectability. In 1889 they opened a “creche” on Cherry Street where infant care was provided for mothers at work or in jail, a shoestring program sustained by donated pennies, baby clothes, and rice. The same year the Army began sending pairs of “Slum Sisters” to the streets. The women helped stroke victims, washed babies, cooked meals for invalids, and dressed the dead for the undertaker. Salvation Army girls, often alerted by bartenders, entered Bowery saloons or dance halls and rescued girls stupefied from drink or drugs, fighting off men who wanted to keep them there. The program was hailed even by the cynical as an angelic ministry.

At Christmas time in 1891, the Army opened a Cheap Food and Shelter Depot in the basement of a deserted old Baptist church on Bedford and Downing streets. At this New York Lighthouse men could get a box bed and a shower for seven cents (half that charged by commercial lodging houses, for much cleaner, safer, and drunk-free surroundings). A restaurant served staples for pennies. The totally penniless could work for the shelter for two hours in the morning, splitting wood, which was then sold to poor families. Soon larger quarters were opened on Front Street, with attendance at evangelical meetings a prerequisite for coffee and buns. Before long their urban enterprises included day nurseries and Salvage Brigades that collected old clothes, hired the poor to repair them, and sold them to the needy.

This combination of material and spiritual aid was spectacularly successful. The crusade expanded rapidly—by 1890 the Salvation Army

was established in forty-three states—with national headquarters at the Brooklyn Lyceum. But such success did not please genteel church leaders. They were offended by the Army's hoopla and made uncomfortable by its bumptious vitality, which they felt degraded the Christian heritage. While there was some admiration for its expanding social program, overall they found plebeian Protestantism—and its biblical literalism—hard to swallow.

“FRIENDLY VISITORS”

The welfare reforms of the 1870s, by halting municipal outdoor relief and handing public monies over to private agencies for disbursal, guaranteed that metropolitan charity would be governed by well-worn axioms: poverty most often stemmed from individual moral and character defects (probably hereditary), and the task of scientific charity was to dispense assistance, cautiously and grudgingly, to the deserving while incarcerating or rehabilitating the remainder.

In 1881 State Board of Charities commissioner Josephine Shaw Lowell surveyed the city's existing private charities in the light of this flinty perspective and found too many of them “wasteful” and “encouraging pauperism and imposture.” New York's alms enterprise remained insufficiently coordinated, despite the decades-long efforts of the Association for Improving the Condition of the Poor (AICP). “So important a business as the administration of charity has become in New York City,” Lowell concluded, “requires to be carried on on business principles.”

In 1882, accordingly, Lowell launched the New York Charity Organization Society (COS), modeled on the London Society for Organizing Charitable Relief and Repressing Mendicity (1869), established by professionals intent on curtailing indiscriminate almsgiving by aristocratic West Enders. As the group's “guiding spirit” she presided over a thoroughgoing amalgamation of Protestant almsgiving organizations and families. Emerging as something of a Charity Trust—the philanthropic equivalent of Standard Oil—New York COS pooled the resources of over five hundred churches and societies and nearly a thousand private families, embracing old monied (Robert W. De Forest was president) and new (J. P. Morgan was a generous patron). In 1893 this consolidating impulse received architectural expression when COS erected a United Charities Building (on Fourth Avenue and 22nd Street) and persuaded other

charitable organizations such as the Mission and Tract Society, the Children's Aid Society, and the AICP to move in with them (merging with the latter in all but name).

To block multiple handouts, COS established a centralized Registry Bureau to which outdoor relief agencies, asylums, churches, and the city's Department of Public Charities and Correction sent in data on their clients. By 1887 COS had accumulated data on nearly ninety thousand families and 27,400 houses "occupied by the dependant and disreputable classes." By the mid-1890s, when COS had files on 170,000 families or individuals, it was making the information freely available, by return mail, not only to agencies considering giving relief but to prospective employers, landlords, banks, and even the police. (Under Seth Low, the Brooklyn Bureau of Charities set up a similar master index to weed out welfare cheats.)

COS tightened standards. "Gratuitous charity," Lowell said, "works evil rather than good." Authorizing assistance for a widow with infants might make her life easier, but then the mother might, "by being relieved of anxiety for them, lose her love for the children." Giving a handout to an unemployed man might get him through tough times but also teach "the dreadful lesson that it is easy to get a day's living without working for it." COS, accordingly, was quite selective in its help (far more stringent than the Department of Charities and Correction had been), and it turned down the majority of applicants after probing investigations revealed that character flaws underlay their poverty. Paupers, Lowell argued, should be discouraged from reproducing themselves: while "every person born into a civilized community has the right to live," the community had the right to see that "incompetent and dangerous persons shall not, so far as can be helped, be born to acquire this right to live upon others."

Lowell relied on volunteers, believing the AICP had lost touch with the poor after it switched to using salaried visitors in 1879. COS promoters believed the urban poor had degenerated morally in large part because they had been cut off from the elevating influence of their moral betters. The job of reknitting the urban fabric could best be undertaken (one charity expert argued) not by hired professionals but by "noble-hearted women of the wealthier class," who would bring the poor under "the firm though loving government of heroic women."

The volunteers—“friendly visitors”—who were urged to help their assigned charges depart the “ranks of idlers” by setting a personal example, by diffusing strength of character across class lines, by making the recipient more like the visitor: honest, thrifty, sober. “If we do not furnish the poor with elevating influences,” the COS argued, “they will rule us by degrading ones.” The proto-caseworkers were urged to avoid soft-heartedness. “All charity must tend to raise and elevate the moral nature,” Lowell reminded her troops, “even if the process be as painful as plucking out an eye or cutting off a limb.”

The return of hard times in the mid 1880s brought renewed demands for aid to the unemployed, presenting the COS with its first major challenge. It succeeded in keeping charitable relief to a bare minimum, though Lowell’s efforts in 1883 to convince the Board of Apportionment “that they can safely cut off the City coal and trust to private charity to make up any necessary claims” were blocked in part due to objections by Tammany-connected coal merchants. It did establish a wood yard on East 24th Street in 1884, but the organization made clear this was not done “with any idea of providing work at fair prices for the unemployed, but purely as a means by which to test the good faith of those seeking relief under the plea of inability to procure work.” Tickets were printed up and sold to charitable persons, who in turn could give them to street beggars in lieu of cash. Each entitled a man to a “day’s work” cutting wood. When finished he would be given fifty cents or, if homeless, two meals and a night’s lodging.

To ensure the poor did not escape its stern concern by panhandling, COS established a Committee on Mendicancy, which hired “Special Agents” who were empowered by the city to arrest beggars. In 1885 they hauled seven hundred before the police justices, then stayed to make sure they were punished under the vagrancy statutes. The police notified COS when such miscreants were released from the Blackwell’s Island Workhouse, and it published a bulletin listing the names and aliases of all known street beggars at large. COS offered as well to investigate and deal with all “Begging-Letter Writers”—the unemployed having gotten into the habit of sending their former employers pleading missives.

COS inveighed too against the city’s policy of providing emergency housing in verminous police station basements, lest encouraging the shiftless in their idleness set the working poor a bad example. Lowell’s

group was never able to choke off the practice altogether—Tammany police were unwilling to give up their supply of voters—but it did get the legislature, in 1886, to authorize establishment of a Municipal Lodging House (on First Avenue) which would give food and a night's lodging (no more than three times in any one month) in return for labor in the COS wood yard. As a corollary, police stations within one mile of the house were forbidden to provide shelter.

“The task of dealing with the poor and degraded has become a science,” said Lowell with some satisfaction—but problems remained. There was the ongoing sniping from those who called COS the “Society for the Suppression of Benevolence.” There was the contradiction between their goal, of restoring the poor to independence, and their method, of granting relief only to those who did as they were told. There was also a dismaying lack of heroic women volunteers—the requirement of being both loving friend and prying investigator put some people off—forcing the COS to resort to paid agents. The biggest problem, however, lay in dealing with the children of the “poor and degraded.”

SAVE THE CHILDREN

More than ever—given the new “scientific” literature on the heritability of crime, poverty, insanity, and drunkenness—the Protestant welfare establishment was determined to prevent poor and working-class parents from passing on their lax morals and distaste for work to their offspring. “To keep such families together,” wrote charity reformer Charles Hoyt, “is contrary to sound policy; the sooner they can be separated and broken up, the better it will be for the children and for society at large”—a view endorsed officially by the Protestant female reformers of the State Charities Aid Association (SCAA) in 1879.

Charles Loring Brace and his Children's Aid Society (CAS) had continued doing their best in this regard. By the mid-1890s Brace had dispatched over ninety thousand poor children to Protestant homes in the Midwest so American women could raise them in proper surroundings. CAS surveys reported these children were happily growing into independent adulthood—though in fact a disturbing number seemed to be wending their way back to New York and reestablishing relations with their families.

The Society for the Prevention of Cruelty to Children (SPCC) was empowered to take more definitive action than Brace's group could. A spinoff of Henry Bergh's old American Society for the Prevention of Cruelty to Animals, the SPCC had been established in 1874 by ASPCA lawyer Elbridge Gerry. An all-male, all-elite, and overwhelmingly Protestant organization, it searched out children deemed neglected or abused, prosecuted the parents, and turned the youths over to an appropriate agency (after 1881 it was given actual law enforcement power).

The problem lay in finding an appropriate agency. In the old days, such youths would have been consigned to an institution like the almshouse or the House of Refuge, but asylums had fallen out of favor. Rather than educating and redeeming their youthful charges, they were now believed to expose them to further degradation. Indeed, in 1875 the SCAA had won passage of a Children's Act removing all two-to-sixteen-year-olds from poorhouses. In large measure the law was aimed at parents who, after public outdoor relief was terminated, began entering poorhouses with their children, thus maintaining their negative influence. The new legislation required parents entering poorhouses to surrender their children, who would then be transferred to orphanages, from which they could be passed on to decent foster homes.

Unfortunately for this schema, the male Irish Catholics who had just assumed control of Tammany Hall under Honest John Kelly proved newly powerful enough to insist that the law require children be placed only in institutions controlled by persons of the same religious faith. Catholic nuns moved swiftly to turn their convents into refuges from Protestant child savers, and did so with public money. Within a year, the number of children in orphanages and asylums nearly doubled. Soon thousands of poor Catholic parents, who had been loathe, even in extremis, to send their children to hated Protestant institutions, were turning to the new Catholic ones, treating them as free and temporary boarding schools. Such families knew that the sisters believed poverty a misfortune to be alleviated, not a condition to be reformed, and while they might resent the nuns for requiring compulsory attendance at Mass, they knew that once they were back on their feet, the sisters would funnel their children home to them again.

By 1885 nuns were rearing over 80 percent of the city's dependent youths and had won effective control of the metropolitan child care system.

Josephine Shaw Lowell and her COS and CAS colleagues were appalled. For all their professions of nonsectarianism, anti-Catholicism ran deep in the childsaving movement; the Children's Aid Society refused to place Catholic or Jewish children with Catholic or Jewish families, as they weren't proper homes.

The nuns, moreover, had successfully challenged the hard-won right of Protestant women to mother the children of the immigrant poor, which in turn had justified their own entry into public life. The SCAA fought hard in the mid-1880s to dismantle the convent-based system, arguing it led to child abuse or sowed the seed of "pauper poison." But Tammany and the archdiocese backed the nuns. So did such powerful Protestant male groups as Gerry's SPCC, because the women religious were unquestionably efficient, and cheap—having taken a vow of poverty—which meant a saving of tax dollars.

THE WAR ON SIN

Protestant reformers were deeply disturbed by the wide-open wickedness of New York's teeming entertainment quarters. Saloons were everywhere—the city seemed awash in liquor—and one Methodist speaker at the 1888 Chickering Hall conference noted that where there was but one Protestant church for every 4,464 inhabitants, the saloon-to-inhabitant ratio was one to 150. What was particularly galling to genteel opponents was the de facto legalized status of commercialized vice. The *National Police Gazette* reported regularly on the fancy life of theaters, gambling dens, and bordellos, and a new generation of sunshine-and-shadow writers provided salacious details on dives and opium dens.

The refusal to pay even decent tribute to the opinions of the respectable drove conservative feminists and cultivated gentlemen ("upright men and virtuous women" in the terminology of the day) into banding together to purify New York City. Rejecting laissez-faire in the moral realm as others were discarding it in the sphere of economics, purity reformers called for greater public regulation of private behavior.

The New York Committee for the Suppression of Legalized Vice, a key organization of the purity movement, was generated by Aaron Macy Powell and Abigail Hopper Gibbons, two old veterans of the abolitionist crusade

(Powell had been an editor of the *Anti-Slavery Standard*). They set out to free their “fallen sisters” from a “white slavery” as evil as the black slavery that preceded it.

In this they took their cues from England, where since the 1870s a coalition of middle-class nonconformists, feminists, and radical workingmen had been calling for repeal of Britain’s Contagious Diseases Act (1864), which effectively legalized and regulated commercial sex. The British movement received an enormous boost in 1885 with the publication, in the *Pall Mall Gazette*, of a series by W. T. Stead entitled “The Maiden Tribute of Modern Babylon.” Stead had investigated the traffic in young girls in London’s vice emporiums and claimed to have actually bought a virgin on the black market. His accounts were inflammatory, prurient, and factually dubious but, coming on top of a decade of moral mobilization, touched off a popular uproar.

The New York Committee, for its part, forced the American Medical Association to drop its plan for municipal regulation of prostitution. Instead the physicians agreed to advocate chastity as the best, indeed the only, defense against venereal disease. The New York Committee also launched petition campaigns demanding the age of consent be increased from ten, a figure that had come to seem shockingly low to the middle classes, whose members increasingly deferred the age of matrimony. Upward revision would also block brothels from legally recruiting scarcely adolescent girls, leading many working-class fathers along with the Knights of Labor to back the campaign. New York State raised the age of consent from ten to sixteen in 1889 and upped it again to eighteen in 1895—the only eastern state to do so. Now sexual behavior once merely improper was illegal.

For a short time, during the administrations of Mayors Grace and Hewitt—at the height of the transatlantic excitement over the Stead expose—purity crusaders also succeeded in getting the municipality to wage limited war on prostitution and gambling. In October 1886 Mayor Grace authorized police raids on leading concert saloons and on the West 27th Street brothels, even those under the protection of police Captain Alexander “Clubber” Williams. Mayor Hewitt continued the campaigns and drove many prostitutes out of the concert saloons, leading them to set up operations in tenements around the city.

But these efforts were of limited reach and effectiveness. They had no impact at all on brothels outside the Tenderloin, and within it the primary consequence of raids—which reformers called “shake-ups” and madams called “shake-downs”—was to increase the price of doing business, thus funneling additional funds to the Tammany machine.

To surmount such obstacles, purity reformers, like their charity counterparts, began gathering law enforcement into their own hands, establishing private preventive societies to ride herd on lax public officials. “In some degree,” the *New York Times* observed, “our voluntary associations for the prevention of various evils resemble vigilance committees, regulators, or lynch policemen.”

Anthony Comstock’s Society for the Suppression of Vice (SSV) served as censorship squad. Armed with federal authority and the backing of Morris Jessup, J. P. Morgan, and other members of the Chamber of Commerce, Comstock patrolled library bookshelves, scrutinized the city’s printed pages for anything that might corrupt youthful morals, and kept would-be purveyors of birth control information in line.

Steadily expanding his definition of obscenity, Comstock began attacking art he deemed unfit for the public eye. “Nude paintings and statues,” he cautioned, “are the decoration of infamous resorts, and the law-abiding American will never admit them to the sacred confines of his home.” Lest passers-by be tempted by lascivious statuary in art gallery windows, Comstock warned dealers not to display naked pictures where the public could see them. In 1887, however, when he raided the Herman Knoedler Art Gallery on Fifth Avenue for violating this dictate, he was sharply rebuked by the *Times* and warned not to become “a social nuisance almost as pestilent as that which he exists to abate.” Comstock shrugged off such protests and pressed ahead. In 1890 he invaded the shop of Eugene Caret, a new art dealer on Broadway, and insisted he remove a photograph of an offending Rodin statue; the frightened dealer sold off his stock and left on the next boat.

Comstock’s SSV, along with Elbridge Gerry’s SPCC and Presbyterian minister Howard Crosby’s SPC (the Society for the Prevention of Crime he founded in 1878), also arranged raids on concert saloons, dance halls, brothels, rat pits, and Coney Island’s Gut in a determined—but largely unsuccessful—effort to suppress “immoral behavior.” Comstock became

an early pioneer in the repression of “fairies,” “mollie coddles,” and “androgynes,” in the parlance of the day. But while the growing attention of vice reformers did lead to an increase in sodomy prosecutions in the 1880s and 1890s and to a shutdown of the Slide in 1892, for the most part same-sex hangouts like Paresis Hall continued to receive (and pay for) the protection of the police.

The reformers’ war on gambling garnered only modest victories. In 1877 the state legislature had banned the old auction pool betting system, but succeeded mainly in promoting bookmaking, a system in which bettors selected a horse at publicly posted odds. Now neighborhood bookies sprang up, offering their services to gamblers who couldn’t afford a trip to the track, at such male bastions as newsstands, barbershops, saloons, and “poolrooms” (off-track betting parlors). Results were received immediately throughout the city via Western Union, which in 1890 paid sixteen hundred dollars a day to each New York track for the exclusive right to transmit results. Despite this overhead Western Union’s racing department became the most profitable part of the company.

In 1887 the Rev. Thomas de Witt Talmage, minister of the Central Presbyterian Church of Brooklyn, teamed up with Comstock (along with New York racetrack interests) in winning passage of the Ives Anti-Poolroom Law, which forbade off-track betting but authorized thirty days of wagering at tracks each year. Despite the Ives law, and the Saxton Act of 1893, which made keeping poolrooms a felony, they continued to operate with virtual impunity. Comstock managed to instigate the occasional police raid, but poolroom clerks were usually forewarned of such events and, if caught, usually acquitted by Tammany judges. Indeed, by the mid-1890s Big Tim Sullivan and other Tammany honchos ran organized bookmaker and poolroom syndicates.

Those out to purify civic life made more headway against boxing. Influence and payoffs enabled “exhibition” bouts in the early 1880s—John L. Sullivan began fighting in such events at Madison Square Garden in 1882—but in 1884 and 1885 reformers got police to break up Sullivan’s fights there, local promoters gave up the business, and the sport’s locus shifted to New Orleans. In the early 1890s, however, local prizefighting revived, mainly at Coney Island, under the auspices of boss John Y. McKane. The Gravesend politico also owned the Coney Island Athletic

Club (organized in May 1892 by Kings County machine politicians), which became the leading boxing club in the United States (though in 1893 public pressure did force it to cancel a world championship heavyweight bout between Jim Corbett and Charley Mitchell).

Efforts to ban alcohol made limited progress, despite the emergence of the Women's Christian Temperance Union (WCTU). In the 1880s the WCTU employed a missionary evangelist to meet immigrants as they landed in New York City and distribute temperance literature in sixteen languages. But despite some local strength in Brooklyn, the WCTU's attitude toward immigrants—Willard in the 1890s advocated immigration restriction to block the “influx into our land of more of the scum of the Old World, until we have educated those who are here”—foreclosed support in New York's ethnic wards. Teddy Roosevelt's old City Reform Club—down by 1887 to a dozen active members, including Henry Stimson—struggled to enforce a law requiring saloons within two hundred feet of polling places be closed on election day, with minimal success. Liquor interests were deeply imbricated in local politics, and vice versa: of the 1,002 political meetings held in New York City on the local level in 1886, nearly eight hundred were held in saloons. The best reformers could manage was passage of a Temperance Education Law that provided for compulsory drug education in the schools.

Balked in extending their moral mantle over the public at large, some Protestant reformers concentrated on protecting their coreligionists' ranks. Benjamin DeCosta, a New York Episcopal minister, met with purity reformers, including Stead, on a visit to England. Their work seized his imagination, particularly the efforts of the White Cross Society, newly established by the Church of England. This organization had already converted thousands of respectable workingmen to the cause of a single standard—chastity for both sexes—and DeCosta hurried home to establish the White Cross Army in New York. The organization recruited young people, who pledged themselves to sexual abstinence before marriage. Once enrolled—and a single White Cross meeting in 1888 attracted a thousand members—participants were sent out (often in tandem with YMCA cadre) to disseminate purity literature to other youth groups in the city. White Cross counselors also provided sex education, which consisted chiefly in assisting young men to refrain from illicit activities.

Refuges that provided alternatives to commercial culture were central to this strategy. In January 1887 the YWCA began to offer home-havens in the dangerous city. The first Y, at 7 East 15th Street, provided educational classes, a free lending library, and wholesome entertainments. The Children's Aid Society expanded its program of lodging houses for newsboys and industrial schools for working-class boys and girls.

In 1884 Grace Hoadley Dodge, wealthy young philanthropist and Sunday School teacher, organized the 38th Street Working Girls Society to isolate members from exposure to the street, cheap dance halls, theaters, and, in general, male cupidity. Adopting the model of the burgeoning women's club movement, Dodge provided clubhouses—nineteen of them within ten years—salted with moral education (emphasizing “purity of life, dutifulness to parents, faithfulness to employers and thrift”) and peppered by exposure to the “refined influences” of ladies of her class. These retreats also provided more tangible benefits: libraries, entertainment, doctors, insurance, and classes in cooking, sewing, hygiene, childrearing, and household management. The clubs attracted mainly American-born women—carpet and silk factory workers, salesgirls and dressmakers, telegraph operators and stenographers—who were more open than the immigrants to the Anglo-American ideals of the reformers.

DECENTEST NATION

For many in the Protestant middle class, Culture itself came to constitute a refuge—albeit a somewhat secularized one—especially after Matthew Arnold came to visit in 1883. The celebrated English poet and essayist was well known in the city for his 1869 indictment, in *Culture and Anarchy*, of Britain's fragmentation into selfish class fractions. English workers, Arnold had said, threatened social chaos by demanding greater power, as did aristocrats by their complacent defense of a privileged status quo. The British middle class, which should have been a stabilizing force, had abandoned the public good for an individualistic and spiritually impoverished pursuit of riches. Chaos might yet be forestalled, Arnold argued, if Anarchy were combated by Culture—the pursuit of beauty and intelligence, “sweetness and light.”

Arnold brought a similar warning and appeal to New York, beginning with a lecture in Chickering Hall. As the New World was even more

complacent, philistine, and anarchic than the Old, it was the duty of America's saving remnant—its cultivated gentlefolk—to promote the “elevated and beautiful” and to ennoble the public by transforming “the administration, the tribunals, the theatre, the arts.” When Arnold took this message on the national lecture circuit, he would be condemned as just another snooty Englishman disparaging American manners. But many of New York's genteel intellectuals received him warmly, for they saw his prescriptions as legitimating a mission they had already embraced: ennobling, elevating, and purifying the metropolitan literary scene.

One of Arnold's many admirers was Richard Watson Gilder, editor of the *Century* magazine. Gilder, a minister's son from New Jersey, had come to New York in 1870 to work on the old *Scribner's*. Under his editorship it became independent of the publishing firm and changed its name to the *Century*. By the mid-eighties, the finely printed, beautifully illustrated journal circulated to 250,000, chiefly among the nation's middle classes, and it had established a reputation as perhaps the best-edited magazine in the world.

And among the prissiest. Gilder's method of raising public standards of taste and morality required the production of bloodless pages. As custodian of genteel culture he sought out the delicate and the refined and stood guard against the vulgar and the vernacular. Walt Whitman, though a personal friend, was banned from the *Century's* pages; a bit of Mark Twain's *Huckleberry Finn* snuck in, but only after Gilder deleted references to nakedness, blasphemy, and smells and emended all improper phraseology (changing “in a sweat” to “worrying”). To those who accused him, and Americans, of prudishness, Gilder replied: “It may be that this accusation is well-founded. If so, we can only say that this is the price we pay for being, on the whole, the decentest nation on the face of the globe.”

Gilder's values and ambitions were widely shared by the editors of New York's (and Boston's) genteel monthly magazines. Champions of convention and restraint, grace and serenity, they fed their readers a stately diet of English fiction, biography, travel, and cozy columns addressed to the “gentle reader” from the “Editor's easy chair”—a mix popular since Washington Irving's day. A similar tone marked the output of the leading publishing houses, notably that of Charles Scribner's Sons, under the literary control of William Crary Brownell.

Brownell, born in 1851 to a comfortable Episcopalian family, was a devout Arnoldian disciple who feared New York City was disintegrating into anarchy. Brownell advanced this thesis most forcefully in 1884 after returning from France, which he applauded as a model of an integrated public culture. There the institutions and architecture of public life imposed discipline and constraint on individuals. By comparison, America's metropolis was chaotic. Paris made people Parisians. New York generated only a "characterless individualism," a "noisy diversity" with no "effect or ensemble."

From 1888 on Brownell made the House of Scribners into a fortress of Culture, seeking out writers who combined "strength" and "refinement," whose fiction and poetry reflected and espoused morality, truth, and beauty. Other great publishing houses joined him, with editors and publishers circulating in a Manhattan milieu that encompassed not only professional writers and critics but also a larger and highly sociable circle embracing amateur authors, artists, architects, cultivated businessmen, polished professionals, and learned university professors and administrators. These gentlemen, and a few ladies, gathered together to dine, talk, and listen in an interlocking network of clubs and institutions.

Genteel women remained the bulwark of Culture and the market for decent literature they had been for decades. Convinced they had a biological affinity for the beautiful and the uplifting, they took up their Arnoldian assignment of promoting art, culture, and Protestantism as redemptive antidotes to the centrifugal tendencies of a male-dominated economy. In the 1880s and 1890s the women's club movement started by Sorosis burgeoned, developing self-improvement salons, islands of refined sociability for discussion of literature and art. In 1890 Jane Cunningham Croly and the New York Sorosis women linked literary clubs with alumnae associations, civic reform societies, mothers' groups, and needlework guilds into a national network of female organizations, the General Federation of Women's Clubs.

Editors of "family journals" and leading publishers were extremely sensitive to the wishes of this enormous and ever more organized reading public. They kept their content "innocent as milk" partly out of the conviction that ladies would brook no deviation from genteel standards, and indeed when editors did transgress, they were swiftly brought to task. Even

Gilder's carefully expurgated version of *Huckleberry Finn* brought protests, and when *Harper's* published du Maurier's *Trilby* in January 1893 it produced a storm of criticism and canceled subscriptions.

Restrictions on subject matter hastened an ossification of genteel culture. In a collective averting of eyes from indelicate matters, those who dealt with everyday city life or wrote in the vernacular were dismissed as vulgarians. When the Anglo-Saxon literati did deign to focus on immigrant working people, it saw them through picturesque or sentimental lenses.

This policing of the cultural landscape, by producers and consumers alike, was not exactly what Arnold had had in mind. For all his tendencies toward elitist snobbery, he had challenged an array of comfortable middle class convictions. But in the hands of the metropolitan gentility, Culture was transformed from critique to possession, ownership of which served as a credential of class standing.

“HEY, WHISKERS!”

On February 14, 1892, at the Madison Square Presbyterian Church, the Rev. Charles Parkhurst gave a most unusual Sunday sermon. The tall, slender, bewhiskered minister launched a vitriolic attack on Mayor Grant and his Tammany cohorts. They were, Parkhurst thundered, nothing more than a pack of “polluted harpies that, under the pretense of governing this city, are feeding day and night on its quivering vitals. They are a lying, perjured, rum-soaked and libidinous lot.” The mayor, Parkhurst continued, together with District Attorney De Lancy Nicoll and the entire police department, were pillars of organized crime, linked in an “official and administrative criminality that is filthifying our entire municipal life, making New York a very hotbed of knavery, debauchery and bestiality.” Frustrated by the purity crusade's setbacks—Parkhurst was a vigorous supporter of Comstock's SSV—he declared that apparently “every effort to make men respectable, honest, temperate, and sexually clean is a direct blow between the eyes of the Mayor and his whole gang of drunken and lecherous subordinates.”

Mayor Grant challenged Parkhurst to prove his charges. DA Nicoll hauled him before a grand jury and demanded to see his evidence. Parkhurst was forced to admit he had none, apart from newspaper clippings of journalistic exposes. The jury then formally denied his charges of police

complicity and rebuked him for character assassination. Most of the press denounced Parkhurst as a vulgarian, and Pulitzer's *World* cautioned him about "the bearing of false witness."

The humiliated minister now set out to assemble evidence that would stand up in court. He would descend into the city's lower depths so he could himself serve as a firsthand witness to New York's degradation. In Parkhurst's person, gentility would go toeto-toe with vice; culture would meet anarchy head on.

Parkhurst, of course, was treading a well-beaten path. Dickens, Brace, and a host of sunshine-and-shadow journalists had long been prowling New York's nether regions. There was even precedent for nocturnal meanderings by men of the cloth. Parkhurst's fellow Presbyterian, Brooklyn's Rev. Talmage, had been touring the nighttime metropolis ever since he had read Charles Loring Brace's *Dangerous Classes* and decided that "I, as a minister of religion, felt I had *a divine commission to explore the iniquities of our cities*." Talmage had policemen pilot him around brothels and saloons. He then recounted his findings in vivid (and racy) talks that drew as many as five thousand to the vast Brooklyn Tabernacle. These sensational sermons were then reprinted in newspapers and collected in books like *The Night Sides of City Life* (1878) and *The Masque Torn Off* (1880).

Parkhurst was no mere sensationalist, and he set about his task methodically. Now president of the Society for the Prevention of Crime, he turned to his righteous and wealthy membership for funds and legal advice. Then, with a zealous young parishioner, John Langdon Erving, he engaged Charles Gardner, a private detective, as guide to New York's underworld (for six dollars a night plus expenses). The bemused Gardner disguised the pair. He eliminated Parkhurst's "aroma of the pulpit" by soaping his hair and dressing him as a tough. He gave similar treatment to Erving, a dandy whose initial notion of deep cover was to put on last year's suit. Then the trio boarded the Third Avenue El at 18th Street and rode it down—literally and figuratively—to Franklin Square.

The slumming party soon made its way to a Cherry Street dance hall filled with sailors and laborers where a nineteen-year-old girl's greeting to Parkhurst was "Hey, whiskers, going to ball me off?" Nothing daunted, Parkhurst and company pressed on. During the rest of the evening, and over

several succeeding nights, the trio took in a five-cent Park Row lodging house, a whiskey saloon, an opium den in Chinatown, a stale beer dive in the Italian section, and other horrors. Always Parkhurst pressed bravely ahead, demanding to be shown “something worse.” They stopped in at a dance hall. “Coarseness was everywhere. The girls sat upon the laps of men, and in no way rejected any advance, no matter how vile it was.”

On to Nigger Johnson’s colored dance house, where white girls waltzed with blacks and black girls cavorted lasciviously with whites (accompanied by piano, harp, violin, and piccolo). In a Tenderloin house, five girls stripped and did a “dance of nature.” (At one point, Gardner later testified, the girls played leapfrog. “Did you join in this leapfrog business?” he was asked. “Yes,” he answered, “I was the frog.” This gave rise to a popular concert hall ditty, borrowing from a current song hit, that went: “Dr. Parkhurst on the floor / Playing leapfrog with a whore / Ta-ra-ra-Boom-de-ay / Ta-rara-Boom-de-ay.”)

“Show me something worse,” Parkhurst commanded. Finally the minister had his circuits completely blown at Scotch Ann’s Golden Rule Pleasure Club on West 3rd. Descending to the basement, they found it subdivided by partitions into cubicles, each furnished with a table and two chairs, in one of which sat a boy with a painted face, a high falsetto, and the airs of a young girl. At this the good doctor turned on his heel and fled at top speed, gasping: “Why, I wouldn’t stay in that house for all the money in the world.”

On March 13, 1892, Parkhurst ascended his pulpit and described to a jammed church the nature of life in the “disgusting depths of this Tammany-debauched town”—“rotten with a rottenness that is unspeakable and indescribable.” In addition to his own evidence he now waved affidavits gathered by Gardner’s private detectives attesting to the fact that at least 254 Manhattan saloons and thirty brothels had been doing business on the previous Lord’s Day.

At first, many ministers, papers, and politicians professed greater dismay at the impropriety of Parkhurst’s expedition than at his findings. But soon a grand jury indicted two brothel keepers and summoned Police Board members on the carpet. Though it concluded the officials were merely incompetent rather than legally culpable, the police were sufficiently alarmed to promote the highly regarded Chief Inspector Thomas F. Byrnes

to superintendent. Promising a crackdown on vice, Byrnes soon shifted police captains around and began closing saloons on Sundays. Paresis Hall was forced to close.

Pressing ahead, Parkhurst called a mass meeting in May 1892 and organized the City Vigilance League, modeled on the Manchester City Vigilance League. Its goal—the “perfection of municipal government”—was to be achieved by establishing a massive grass-roots surveillance operation. In each Assembly district a vigilance group would monitor its neighborhood for violations of sanitary, excise, or morals regulations.

Parkhurst was neither bigot nor fundamentalist—a believer in evolution, he favored a liberal interpretation of the Bible—and he strove to make the Vigilance League a collective effort of Protestants, Catholics, and Jews who “mingle harmoniously in its councils, and co-operate in its work.” (When Theodore Seligman was blackballed from the Union League Club that year, Parkhurst said the group would doubtless have excluded Moses.) But if Parkhurst was not bigoted, other crusaders certainly were. In any event, the demand for blue laws dismayed the immigrants, the Germans in particular, and made allies hard to come by.

Even Parkhurst’s short-term hopes were blasted when yet another Tammanyite, Thomas F. Gilroy, was elected mayor in 1892. It was clear that barring extraordinary circumstances—or the formation of a wider political coalition—New York’s government, and thus its moral landscape, would remain unpurified.

66

Social Gospel

To a growing number of middle-class Protestant reformers, neither Parkhurst, Comstock, the Charity Organization Society nor the Salvation Army was attuned to the scale or complexity of New York's problems. All these activists, in one way or another, focused on promoting personal salvation or constraining individual behavior, when what was really needed was a theological perspective that confronted issues at a societal level—a "social gospel" that rejected the inevitability of snarling conflict between capital and labor, spurned an inhumane laissez-faire acceptance of urban immiserization, and rejected competitive selfishness as the path to progress. Nothing less would reverse working people's disaffection from the civic status quo or forestall their adoption of radical solutions for metropolitan ills.

Social gospel sentiments emerged in most Protestant denominations, though most Presbyterians and Methodists stuck to fostering individual redemption through prayer, frugality, temperance, and hard work. Baptists, still largely a rural sect, were slow to take up urban problems, though in New York City men like Walter Rauschenbusch began coming to grips with metropolitan realities. Before he came to New York in 1886 as pastor of the Second German Baptist Church, Rauschenbusch later recalled, he had "had no idea of social questions." But in New York, "among the working people, my social education began." In Hell's Kitchen, "when I began to apply my previous religious ideas to the conditions I found, I discovered they didn't fit." Laissez-faire came to seem heartless and selfish, Rauschenbusch became a strong Henry George supporter, and he would go on to formulate a theology of social reform.

Congregationalist Lyman Abbott, who also took part in the George campaign, succeeded to the prestigious pulpit of Brooklyn's Plymouth Church after Henry Ward Beecher died in 1887. Abbott also assumed editorship of the *Christian Union*, a leading religious weekly, which became *the Outlook* in 1893. Abbott signaled a major change in his denomination's approach when he argued that "individualism is the characteristic of simple barbarism, not of republican civilization," and that

“with all the good that competition has wrought, the principle is now a destructive one.”

It was the Episcopal Church, however, a sect that to all appearances was more interested in Society than in a social gospel, that took the lead in jettisoning laissez-faire ethics and tackling the city’s social problems. Henry Codman Potter, rector of fashionable Grace Church since 1868 and bishop of the Diocese of New York since 1887, had long been known as the favorite clergyman of the smart set, and he had devoted much of his attention to a sumptuous church building and beautification program. Despite some complacent clubbiness, however, churches in the Anglican communion had a long track record of taking seriously the obligations of the rich to the poor, a tendency nourished by New York Episcopalians’ ongoing connections to British Anglicans, who had never completely abandoned the old medieval dream of a society guided and led by their Church. When the mid-1880s depression had led to massive demonstrations in Britain and the growth there of a socialist movement (thanks in part to Henry George’s speaking tours), English church leaders responded by turning to a more social Christianity.

In New York, moreover, many Episcopalian laymen were drawn from the ranks of the emerging corporate elite—the very bankers and businessmen who were rejecting laissez-faire ethics in the economic marketplace. Nowhere were the consequences of this connection exemplified more dramatically than at St. George’s Church. Erected in 1848 on then-exclusive Stuyvesant Square (and rebuilt there after it burned down in 1865), by the 1880s the brownstone Romanesque Revival church was in trouble. Its Protestant parishioners had dwindled away, leaving it adrift in a sea of Catholics and Jews, facing empty pews and mounting debts. Trinity could survive without a constituency by living off its tenement rent rolls, but St. George’s had either to reach out or move on. Digging in their heels, the remaining vestrymen—led by Senior Warden John Pierpont Morgan—named the Rev. William Stephen Rainsford as the new rector in 1883.

The thirty-three-year-old Rainsford, a Dublin native with a Cambridge education, had worked in urban ministries since the 1870s and developed strong views on the crisis of urban Protestantism. It was, he said, essential to confront the fact that “the whole aspect of the modern Protestant churches, in our large cities at least, is repellent to the poor man.” When

interviewed for the position at St. George's, Rainsford had proposed to Morgan that the church deemphasize doctrine and open itself up to the poor by abolishing pew rentals and offering a variety of secular programs. "Done," said Morgan, who agreed to make up any resulting deficits. The vestry poured resources into recreational and educational facilities, including choirs, an industrial school, a boys' club, and a Girls' Friendly Society. These activities, together with Rainsford's vigorous social preaching, attracted over seven thousand people to one or another program by the end of the decade.

CHRISTIAN RADICALS

St. George's was an outstanding example of an "Institutional Church" designed to "reach the masses," but there were more radical departures afoot within New York Episcopalianism. Some proposed the church go beyond providing social services to working-class parishioners, to forging an alliance with working-class activists dedicated to restructuring capital-labor relations.

In 1881 the Rev. James Otis Huntington had founded the Order of the Holy Cross, a semimonastic organization, and settled on the Lower East Side. Though a Harvard graduate from an elite background, Father Huntington startled his colleagues by joining the Knights of Labor and becoming an ardent supporter of Henry George. He began reporting on union meetings for the Episcopal press and promoting George's single tax in church circles. In 1884 the semiofficial but prestigious Church Congress invited George to talk on the topic "Is our Civilization Just to Workingmen." In the 1886 campaign, Father Huntington addressed street crowds from the back of trucks while wearing his priestly robes; he was second only to Father McGlynn in providing clerical assistance.

Other church leaders now began to address the issues Huntington raised. Bishop Potter himself had been dissatisfied for some time with the rabid antilabor ferocity of many theologians. He had said, apropos of the repression of the Great Strike of 1877, that "we shall not finally silence the heresies of the communist with the bullets of the militia." In 1886 he issued a pastoral letter that, while denouncing boycotts, admitted the justice of workingmen's demands. He particularly rejected the laissez-faire argument

that labor was a commodity “to be bought and sold, employed or dismissed, paid or underpaid, as the market shall decree.”

Reminding his clerics that “in New York centers the capital that controls the traffic, and largely the manufactures, of this new world,” Potter pointed out that “in your congregations are many of those who control that capital.” It was their duty to make clear to those who employed labor and reaped its benefits that “wealth brings with it a definite responsibility. . . that luxury has its decent limits. . . that class-churches and class-distinctions of kindred kinds have nearly destroyed in the hearts of many of the poor all faith in the genuineness of a Religion.”

The bishop’s letter provoked widespread discussion among New York’s Episcopal clergy and laity and led, the following year, to formation of the Church Association for the Advancement of the Interests of Labor (CAIL). With Potter, Huntington, and thirty-eight other bishops serving as vice-presidents, CAIL became the first powerful Protestant group to actively defend labor’s right to organize. More, it declared solidarity with labor’s struggle against slums, sweatshops, and child labor. Starting in 1891 Trinity held an annual celebration called Labor Sunday, tied to the new Labor Day, to which the Knights of Labor were invited to send delegates, and in which a red flag was borne in procession. Perhaps more impressive, given the vestry’s traditional tight-fistedness, was the decision of the diocese that same year to allocate church printing only to firms that paid union rates. In 1893 CAIL established a Board of Arbitration, with coequal representatives from capital, labor, and the public, to help settle strikes.

Others adopted still more radical stances. William Dwight Porter Bliss, a Boston Episcopalian clergyman, member of the Knights, and enthusiastic follower of Henry George, formed, in 1889, the Society of Christian Socialists, which soon started a chapter in New York City. The Bliss group advocated the eight-hour day, free technical education for workers, higher education for women, public employment of the unemployed, a municipal program of public housing and slum clearance, municipal ownership of public utilities, and national ownership of railroads, telegraphs, and mines.

There was in many of these initiatives a somewhat facile optimism, a reluctance to confront hard realities of power, a comforting conviction that there were no opponents to be overcome but only misguided adversaries to be enlightened. Nevertheless the Episcopalians’ pleas for social solidarity

constituted a dramatic break with the bleak tooth-and-claw approach to which other Protestants had and still adhered.

CREED INTO DEED

If not all Protestants were social gospelites, neither were all social gospelites Protestant. The reform wing of Judaism—which assembled in Pittsburgh in 1885—expressed its concern about the “evils of the present organization of society.” But the forefront of the Jewish movement was occupied by a small number of highly assimilated activists, among whom the most preeminent was Felix Adler.

Adler, born in Germany in 1851, was brought to New York in 1857 when his father, Samuel Adler, was called to the rabbinate of Temple Emanu-El. The family settled near Stuyvesant Square, where his father raised him in the emerging Reform tradition, and his mother involved him in her work with such Jewish charities as the Hebrew Orphan Asylum. Felix was disappointed with Columbia College, finding it mired in Christian parochialism, and much preferred his graduate work at the Universities of Berlin and Heidelberg, where he was exposed to the problems of industrial society and a variety of proposed solutions.

Back in New York, Adler scotched expectations he would succeed his father in the Emanu-El pulpit when, in 1873, he preached a sermon called “The Judaism of the Future.” In it he embraced a secular, activist, and universalistic philosophy, rejecting prayer, ritual, and theology. Beginning in 1876 the austere Dr. Adler delivered Sunday morning lectures in Standard Hall on the need to translate “creed into deed” by struggling for social justice. The following year, the Society for Ethical Culture was incorporated, with Adler as its “lecturer”; its board, chaired by Joseph Seligman, included trustees ranging from Henry Morgenthau Sr. to Samuel Gompers.

Over the next decade, the Ethical Culture Society initiated a series of social innovations, including a free kindergarten, a district nursing program, and a Workingman’s School. Adler also fought political corruption, advanced the cause of progressive education, and, most notably, took up the issue of tenement house reform.

In 1884 Adler called for revision of the badly flawed 1879 Tenement House Law. This piece of legislation had emerged from an 1878 architectural competition to design a tenement, twenty-five by one hundred feet, that would maximize both investor profits and tenant satisfaction. The judges (who included Dr. Potter) awarded first prize to James Ware's "dumbbell" design. Ware's wasp-waisted building had front and rear wings, connected by a narrow hall containing the stairways, an arrangement that allowed light to filter dimly into the stairwell through airshafts on either side.

As the 1879 housing legislation required that every tenement bedroom have a window opening directly onto a street, a yard, or an acceptable substitute—like the airshaft of the Ware design—the law quickly made the dumbbell tenement a terrible reality for hundreds of thousands of tenants. Landlords packed four families into each of the five or six floors, with each family (plus boarders) squashed into a three-or four-room apartment, the "bedrooms" of which measured seven by eight and a half feet. The airshafts—noisy with the quarrels of twenty-plus families and noisome from the cooking odors of twenty-plus kitchens—became garbage dumps and firetraps, which shot flames up from one story to the next.

In his 1884 lecture "The Helping Hand of Government," Adler called for state intervention against such substandard housing. As workers could not build tenements for themselves, "the law of morality and common decency binds the Government to see to it that these houses shall not prove fatal to the lives and morality of the inmates." If houses were overcrowded, the state "must compel a reduction of the number of inmates, enforce renovation at the expense of the landlord, and where that is no longer possible, must dismantle the houses and remove them from existence."

Adler nevertheless believed that the private market could provide affordable and decent housing for working people, if philanthropic investors would agree to settle for profit margins lower than the market rate. Here he followed Brooklyn housing reformer Alfred Tredway White, who in 1877-79 had erected the low-rent Home Buildings and Tower Buildings along Hicks and Baltic streets using plans similar to Sir Sidney Waterlow's 1863 Industrial Dwellings Company of London: blocks of sunlit, well-ventilated apartments with a courtyard in the center.

White hoped his limited dividend project had demonstrated that private capital could solve the housing crisis, and Adler's 1885 effort—he helped found the Tenement House Building Company of New York—was intended to spur the model housing movement along. The company restricted profits to 4 percent and constructed six tenements on Cherry Street. When the 108 two- or three-room apartments opened in December 1887, many Russian Jews were attracted by the moderate rents, as well as the separate toilets for each two apartments, nine free baths, kindergarten room, roof playground, common laundry room, and superintendent.

Neither these nor other model tenements that followed, however, would usher in a new housing order, as these investment schemes failed to challenge the basic economic arrangements shaping land use in New York City. Inflated land costs remained high, and the small capitalists who dominated the building industry were not able or willing to settle for 4 or 5 percent when they could get a 15 percent rate of return. The dumbbells would continue to constitute the overwhelming majority of new working-class housing; by 1900 there would be 13,600 of them below 14th Street, twenty-eight thousand above.

SUPPING SORROW WITH THE POOR

In 1886 Stanton Coit, an Episcopalian turned Ethical Culturalist, spent three months in England living at the recently founded Toynbee Hall, which he soon decided was an exemplary application of Adler's creed-into-deed philosophy. Since the 1870s a stream of wealthy young Oxford men had been residing in London's East End during vacation periods to "sup sorrow with the poor." After publication in 1882 of *The Bitter Cry of Outcast London*, an expose of slum life, sporadic visits no longer seemed sufficient, and a new Universities Settlement Association (1884) opened Toynbee Hall. To it flocked students inspired by Matthew Arnold's faith in the redeeming influence of culture. Through clubs, classes, lectures, and concerts they would uplift the laboring man. Through investigations of neighborhood conditions, they would improve his material lot.

Returning to Manhattan just as the 1886 mayoral campaign was gearing up, Coit prevailed on Adler's Ethical Culture Society to help establish the New York Neighborhood Guild. In a four-room tenement apartment at 146 Forsyth Street, in a mixed German, Irish, and Jewish neighborhood, Coit

worked to provide private services to the poor and to organize the poor themselves to demand better public ones. Coit was soon joined by Charles B. Stover, a social gospel man par excellence. A graduate of the Union Theological Seminary, Stover had been a mission worker on the Bowery, directed the Ethical Culture Society's model tenement house, and helped organize the Society of Christian Socialists. When Coit departed in 1888 to accept a ministerial position in London, Stover became head of what would be renamed the University Settlement.

Soon idealistic and well-bred young men were flocking to the slums. In 1891 a group of Episcopalian laymen—backed financially by Robert Fulton Cutting, J. P. Morgan, and Cornelius Vanderbilt—established East Side House at 76th Street and the East River in an Irish and German neighborhood. In 1892 the Educational Alliance opened its doors, with support from Jacob Schiff, Isaac Seligman, and Isidor Straus. In 1895 alumni of the Union Theological Seminary began the Union Settlement in a tenement at 202 East 96th. Brooklyn joined the movement in 1889, when Maxwell House was established on Concord Street by members of the Second Unitarian Church. These and other groups established kindergartens, libraries, clubs, classes, concerts, gyms, and playgrounds and helped organize neighborhoods to press for public baths, parks, and cooperative stores.

At first the settlements were all-male enterprises, but in 1889 Vida Scudder, an impassioned young Wellesley instructor who had visited Oxford and been inspired by English developments, joined with alumnae from Wellesley, Smith, Vassar, and Bryn Mawr to establish the College Settlement at 95 Rivington Street, in a predominantly Jewish neighborhood. For well-bred females to live among the poor was unprecedented. The first visitor was a policeman who, convinced the women were opening a whorehouse, promised to leave them alone if they paid him the customary contribution. The press sneered at the project. "Seven Lilies have been dropped in the mud," one paper observed, "and the mud does not seem particularly pleased."

Widespread disapproval didn't stop over eighty college women from applying for residency. The settlement house movement was made to order for this first generation of female graduates, who, having stepped outside restrictive domesticity, found it hard to step back into it. Settlement houses

offered a means to live outside the bourgeois home and to extend the freedom and comradeship of student years. The Rivington Street women, who furnished their building with pictures, books, and a piano, noted that “upstairs, in our rooms, it seemed as if we were back in college again.”

For all their challenges to bourgeois gender roles, settlement house women insisted on their place in the genteel world. They were, after all, embarked on an unimpeachably proper project—the purveying of elite culture to their plebeian neighbors—and early programs had a distinctly Arnoldian aspect. Art exhibitions diffused a sense of beauty; a Good Seed Club for girls taught about flowers; a Hero Club for boys showed how the Knights of the Round Table had learned to be “chivalrous and true.” Some classes taught the art of serving tea from a silver service or accepting calling cards on a tray, prompting Thorstein Veblen to remark caustically that settlement workers seemed intent on the “incubation, by precept and example, of certain punctilios of upper-class propriety in manners and customs.”

Soon enough, however, they were providing more vital services, no one more so than Lillian Wald, who in 1893 convinced Sophia Loeb and Jacob Schiff to underwrite a visiting nurse service. Wald, raised in a comfortable bourgeois Rochester family, came to study at New York Hospital’s School of Nursing in 1889. After graduating in 1891 she worked for a year at an orphan asylum, enrolled for a time in Elizabeth Blackwell’s Women’s Medical College, then taught a course in home nursing at an East Side program run by Mrs. Loeb.

Stunned by the suffering and poverty, Wald decided to move there permanently. Charles Stover of the University Settlement guided Wald around the neighborhood; she joined a Social Reform Club discussion group that included Felix Adler; she stayed for a time at the College Settlement on Rivington Street; then she won Schiff’s backing for establishing the visiting nurse service with Mary Brewster, a friend from nursing school, out of a fifth-floor apartment on Jefferson Street. Called the Nurses’ Settlement, it would be renamed the Henry Street Settlement when it relocated in 1895.

Wald and Brewster were by no means the first women to offer medical services to poor communities. Catholic nuns had long been in the field, and in the years after Father McGlynn founded the Anti-Poverty Society in

1887—an organization that merged Christian morality with secular reform in much the way Protestant social gospelers did—the number of hospitals under Catholic auspices steadily increased. (Mother Frances Xavier Cabrini’s Columbus Hospital for Italian immigrants opened in 1892.) What the Nurses’ Settlement offered was nonsectarian care—Wald originated the term “public health nurse”—and the women provided it in patients’ homes, a service for which they charged next to nothing, or nothing at all. Wald and Brewster were pioneers, as well, in searching out tuberculosis victims, supplying them with sputum cups and disinfectant, and teaching them how to protect others from infection.

Daily life in the slums nudged Wald—and most other settlement workers—toward an ever more sympathetic and sophisticated understanding of the roots of poverty. Like social gospelers generally, they began to jettison moralistic explanations of poverty in favor of sociological ones. They shed as well the nativism and maternalism/paternalism that had characterized previous generations of genteel reformers. Increasingly, they got caught up in workplace and trade union struggles. In time, settlement workers would take the lead in campaigns for sanitation, industrial regulation, public education, better housing, parks and playgrounds, gyms and camps, and women’s rights. From being missionaries *to* the poor they became advocates *for* the poor.

THE WHITE LIST

The changing character of genteel reform in New York—its new willingness to see poverty as a social rather than individual problem and its preference for engaged activism over pious exhortation—was registered with unusual clarity in the metamorphosis of Josephine Shaw Lowell. From being a chilling anticharity crusader in the 1860s and 1870s, she blossomed in the 1880s and 1890s into a warm advocate of social reform.

What appears to have started her down the road from Auntie Scrooge to militant activist was eloquent denunciations of her Charity Organization Society issuing from the social gospel ranks, notably from the Rev. Dr. B. F. DeCosta, Episcopal minister of the Church of St. John the Evangelist, a founder of CALL, and a close friend of Father Huntington. COS, said DeCosta in 1884, was “the meanest humbug in the city of New York” and was engaged in a “heartless oppression of the unfortunate.” “While the rich

are allowed systematically to rob the poor,” he charged, “we have a Society carried on at a large cost to prevent the poor from robbing the rich.” COS closed ranks against DeCosta and other critics, but the charges rankled, fostering grave internal dissension among board members who felt uncomfortable about the prominence of “repressive and disciplinary work.”

Lowell would also be deeply influenced by Henry George, though in her case the connection was an intensely personal one. Before her father, Francis George Shaw, died in 1882, the old Fourierist and radical abolitionist found his moral energies rekindled by George’s writings, so much so that he funded the printing of a thousand copies of *Progress and Poverty* for distribution to libraries. Shaw became George’s financial angel and made him virtually a member of the family. Josephine found George’s views to be far closer to the compassionate and religious values that had drawn her into the antislavery movement than were the secular Darwinian beliefs held by the men with whom she worked in the charity movement. By 1885 George’s explication of the connections between unemployment and poverty had so colored her thinking that in a speech at the Congregational Club, pointedly entitled “The Bitter Cry of the Poor in New York,” Lowell declared that “if the working people had all they ought to have we should not have the paupers and criminals.”

Lowell’s rethinking was furthered by a belated recognition of just how difficult it was for young working women to survive in New York City. This insight was pressed upon her by a nineteen-year-old labor organizer named Leonora O’Reilly, whose background was light-years removed from the genteel Mrs. Lowell’s. O’Reilly grew up on the Lower East Side in the 1870s and 1880s in a household of Irish rebels. As a child she was enchanted by the reminiscences of family friend Victor Drury, who was an acquaintance of Marx, had fought with Mazzini for Italian independence, and had survived the Paris Commune. In 1881, aged eleven, she went to work in a collar factory; in 1886, aged sixteen, she was recruited into the Knights of Labor by another Commune fighter and O’Reilly family friend, Jean Baptiste Hubert.

Soon O’Reilly helped organize a Working Women’s Society to investigate and expose conditions in the clothing trades. They leveled a litany of charges at manufacturers, ranging from locked doors in tenement

house sweatshops to unsanitary working conditions. But what touched off a public uproar was their description of life in the great department stores.

The picture was indeed a pathetic one. Within a decade of the founding of Macy's, the retail sales trade was relying on women—chiefly young girls—for 80 percent of its labor force. Managers liked them because lady customers could discuss intimate apparel with them, because they seemed more demure and less dishonest, but mainly because they could be paid less than men. The shopgirls (as they were known despite their desire to be called salesladies) typically made five to six dollars a week (cash girls might take home \$1.50). Layoffs were common. One New York store regularly fired women after five years' satisfactory service to forestall demands for increased salary. Discipline was harsh and arbitrary. At Macy's sitting was forbidden while at work (and work, in busy seasons, could fill a sixteen-hour day). Lateness was fined. "Unnecessary conversations" could lead to instant dismissal. Facilities were squalid.

O'Reilly and the Working Women's Society took these facts to several middle-class women, including Helen Campbell, whose 1882 book *The Problem of the Poor* had described her work in a waterfront mission where she discovered that working-class women's wages were simply too low to qualify as a livelihood. Campbell, daughter of a New York attorney, had followed up with an influential 1886 series in the *Tribune* giving a first-person account of a bitter woman garment worker. Next year she produced a book, *Prisoners of Poverty: Women Wage-Earners, Their Trades and Their Lives*, that used vivid, indeed sensationalist, prose and the new methods of social science to expose, in telling and documented detail, conditions in the needle trades and department stores; it also attacked hard-hearted clergymen for ascribing the resulting poverty to vice.

O'Reilly also turned to Josephine Shaw Lowell for help. Lowell and Campbell arranged a mass meeting at which the young activist and others presented their case, and Father Huntington exhorted the middle-class audience to help "correct the social evil that permits their unfortunate sisters to be so frightfully overworked and badly paid." By 1889 Lowell was so won over—what the "poor want is fair wages and not little doles of food," she wrote her sister-in-law—that she resigned from the State Board of Charities and threw all her formidable energies into supporting the Working Women's Society. She had decided that helping the "five hundred thousand

wage earners in this city, 200,000 of them women and 75,000 of those working under dreadful conditions or for starvation wages,” was more important than harrying the twenty-five thousand dependents of the city’s charities.

In 1891 she, Campbell, and Dr. Mary Putnam Jacobi organized the New York City Consumers’ League. Lowell became its first president, the board met in her home, and its offices were established in the United Charities Building. Taking a leaf out of the Central Labor Union’s book, the women proposed boycotting department stores and retail shops that did not treat employees properly. Lowell argued that just as “most decent people object to buying stolen goods, even though they get them very cheap,” so in the case of products of sweated labor, the “time and strength of the people who made them have been virtually stolen, even though under the forms of law.” During the abolitionist crusade women shoppers had given up slave-made cotton and sugar; now they should forgo goods identified by the league as made by exploited women.

Rather than promulgate a blacklist of stores to avoid, the league drew up a White List of stores to patronize. Only eight of the large department stores were included as dealing fairly with their employees. The White List was published in the papers, printed on postal cards and mailed to four thousand names taken from the *Social Register*, and placed in the ladies’ parlors of the twenty largest hotels.

As with the settlement house organizers, the Consumers’ League women’s analysis and programs grew steadily more sophisticated. Soon they would be involved in campaigns seeking state intervention to ensure adequate health and safety and to regulate maximum hours and minimum wages. Lowell began denouncing capitalists’ “arbitrary and tyrannical way toward the workers,” encouraging workers to form unions, and defending strikes as legitimate. In 1893 she joined Bishop Potter and Felix Adler on CAIL’s Board of Arbitration.

Despite her new insights, Lowell remained committed to the premise that direct aid to the poor was “evil.” Awareness of the structural roots of poverty only deepened her animosity, now reinforced by a conviction that charity handouts allowed employers to underpay workers, thus hindering efforts to attain a living wage. Lowell had, nevertheless, traveled far enough from her earlier stance to declare at an 1895 charities conference that “if the

charity organization societies of the country are going to take the position of defenders of the rich against the poor which I do think is the danger which stands before us, then I shall be very sorry that I ever had anything to do with the work.”

REALISTS

In the literary world, too, dissatisfaction with reigning genteel conventions produced some startling defections, none more so than that of William Dean Howells, who until the mid-1880s had been a pillar of authorial propriety, an outsider turned ultimate insider. As a self-educated country boy in rural Ohio, Howells had adulated from afar the literary elite of genteel Boston—Emerson, Longfellow, Lowell—and just after the Civil War he came east to join their ranks. Hired as assistant editor of the prestigious *Atlantic* magazine, Howells became its editor by 1871; after a successful decade, he resigned to devote full time to writing novels and critical essays.

Most of Howells’s early work mirrored his Boston Brahmin colleagues’ in its sunny and genial optimism. As late as 1886, in a review of Dostoevsky, Howells invited his fellow novelists “to concern themselves with the more smiling aspects of life, which are the more American.” As prudish as any of the genteel elite, he was uncomfortable with Zola and “bad French morality” and argued that novels should “make the race better and kinder.” He had, however, become discomfited with the moralizing prettiness of much contemporary fiction and was attracted, like his good friend Henry James, to Turgenev. Making tentative gestures toward “realism,” he began dwelling to an unusual degree on matters of everyday life.

He also began spending more and more time in New York City, where, he wrote his father, there was “more for me to see and learn.” He published much of his new work (like *The Rise of Silas Lapham*) in the *Century* and, in 1885, agreed to author a regular “Editor’s Study” column in *Harper’s*. But it was the events of 1886-87 that converted Howells into a self-conscious renegade from the ranks of the proper. In the latter year he broke ranks with his genteel colleagues to speak out on behalf of the condemned Haymarket anarchists, the only leading American man of letters to do so, and he was subjected to scathing attack and shunned by friends. His interest in social issues ripened, he read Tolstoy, William Morris, and the Fabian

socialists and grew increasingly estranged from laissez-faire orthodoxy and “our competitive civilization.” In 1888, at the age of fifty, he left Boston and moved to Manhattan.

After settling in at 330 East 17th Street (just across Stuyvesant Square from St. George’s Episcopal Church and a short walk from the Lower East Side), he began exploring the city by foot and train. Howells was exhilarated by its noisy ebullience. “At the bottom of our wicked hearts,” he wrote James in London, “we all like New York,” and he confided his intention “to use some of its vast, gay, shapeless life in my fiction.” He got his chance almost immediately when his new publisher, J. W. Harper, asked him for “a powerful presentation of the life of our great metropolis, social, educational, economical, political,” one that would treat “the rich & the poor, the idler & the worker,” and “command the interest of all classes.” Howells’s response was *A Hazard of New Fortunes*, serialized in *Harper’s* beginning March 2, 1889. *Hazard*, the first novel to present a fully rendered portrait of the metropolis, was, Howells wrote, the “first fruit of my New York life.”

Hazard broadened the boundaries of the permissible in fiction as Pulitzer’s *World* had in news. Its panorama of city life included German Marxists, striking workingmen, natural gas millionaires, Christian socialists, advertising experts, and restaurateurs. But the central figures were a genteel middle-class couple—the Howells-like Basil March and his wife Isabel—who throughout the novel, in confrontation with the giant metropolis, come to realize the limits of their genteel worldview.

The Marches, like Howells, move from Boston to New York, where Basil is to work on a new literary magazine. Once ensconced in a Manhattan apartment, the Marches venture out, on foot and elevated, into nongenteel parts of the city—voyages they find “unfailingly entertaining.” In Washington Square and the Lower East Side, they encounter a vast and “picturesque” hive of “nationalities, conditions, and characters.”

Their fascination with metropolitan bustle, however, is a superficial and condescending one, Howells suggests, as if the ragged poverty of Italian immigrants “existed for their appreciation.” Glints of other ways of seeing flit through March’s mind—“he had read that they are worked and fed and housed like beasts”—but like most of respectable society, March didn’t much trouble himself about “what these poor people were thinking, hoping,

fearing, enjoying, suffering; just where and how they lived; who and what they individually were.”

The remainder of the novel recounts March’s awakening to social and civic consciousness, an evolution paralleling Howells’s own. He is exposed to Conrad Dryfoos, an Episcopalian social worker (modeled on Father Huntington) who in helping the poor in their tenement houses has provided for the Church a “way back to the early ideals of Christian brotherhood.” March comes to see New York as a “lawless, Godless” society, whose planless “play of energies” yields only a “fierce struggle for survival” in which the stronger preside over “the mutilation, the destruction, the decay, of the weaker.” The novel swirls to a violent denouement—set against a streetcar strike modeled on the real ones of 1886—in which March is forced to acknowledge his connectedness to, and complicity in, a world of which he had hitherto been only a spectator.

HOW THE OTHER HALF LIVED

The following year saw the arrival of another realistic book dedicated to probing life in New York City, this one the product of Jacob Riis, who had arrived in New York in 1870 as a hopeful twenty-one-year-old Danish immigrant, only to plunge, with the metropolis, into the great depression. Despite his cultivated background and his acquired skills as a carpenter, Riis had lived from job to job, often from hand to mouth. Some nights found him sleeping in the doorways and ashbins of Mulberry Bend and the Five Points. Once he was rolled in a Church Street police station men’s shelter. For a time, with dismal appropriateness, he survived by selling copies of Charles Dickens’s *Hard Times* door to door.

Finally, in 1877, Riis had landed a position at the *New York Tribune*, soon becoming its police reporter. For the next eleven years he worked out of an office across from the Mulberry Street Police Headquarters. He wrote Pulitzerian-type pieces on the people of the slums, articles that tugged at readers’ heartstrings, made them smile, taught them moral lessons. But for all his portrayal of the miseries of slum life, and his growing contacts with genteel reform-minded people, Riis—now a self-made man—had little patience with or sympathy for most slum dwellers. In the early 1880s, he publicly hailed Josephine Shaw Lowell’s COS; in an 1883 article about tramps, wrote severely: “As to the man who will not work, let him starve.”

Privately, however, he was coming to think the COS approach harsh, cold, and patronizing and to wonder if collective prevention was not as necessary as individual cures. This rethinking was spurred when, in 1884, he covered Felix Adler's lectures on the housing crisis, and as the 1880s wore on, Riis's critiques of urban injustice grew sharper. He wrote a column called "Gotham Doings" for a Wisconsin newspaper in which he wrote mockingly about Mrs. Astor's Patriarch's Balls. He expressed admiration for Henry George and published pieces in the United Labor Party campaign newspaper, though in the end he voted for Teddy Roosevelt. He applauded the emergence of the settlement movement. And in 1888, after accompanying a sanitary inspector on a dreadful slum tour, he decided he must present the facts of slum life to a wider audience than Adler had been able to reach. He had seen sights, he wrote, that "gripped my heart until I felt that I must tell of them, or burst, or turn anarchist."

To reach out more effectively, the new convert to the social gospel seized upon two recent technological developments. In 1885 George Eastman had invented the handheld "detective" camera, which could be carried about in a valise, and some Germans had invented a flashgun that burned magnesium powder, creating a brilliant (if dangerous) flare. Together, the two instruments allowed Riis to take pictures indoors, making it possible to hurl javelins of artificial sunshine into the darkest shadows. He began making nocturnal patrols around the city. Accompanied by the police, he would burst into the haunts of the poor and explode his flash in their faces, then vanish—as he explained to the *Sun* in 1888—before the photographees "could collect their scattered thoughts."

The photographs garnered in this fashion broke sharply with genteel pictorial conventions. The predominant images of street children were typified by the sentimental paintings of New York artist J. G. Brown, picturesque portraits of cuddly scrubbed urchins—the subjects often posed in the studio. Riis's pictures of street children or down-and-out lodgers, in bold contrast, were less image than evidence, very different from the Byron Company's photographic celebrations of property and from the guidebook photographs that touted city treasures. He got behind the fashionable dwelling fronts to disclose the internal partitions and rear houses installed by rackrenting landlords.

In January 1888 Riis gave a two-hour lecture at the Society of Amateur Photographers, illustrated with a hundred lantern slides of homeless people, street children, and crowded tenements, ending with images of Bellevue Hospital, the New York Morgue, and the pauper graveyard on Hart's Island. He spoke again in February at the Broadway Tabernacle, and among the deeply impressed audience was the Rev. Parkhurst, who helped Riis to other engagements at churches in Manhattan, Brooklyn, and Jamaica. In May, Lyman Abbott asked him to contribute two articles to the *Christian Union*.

In 1889 Riis began writing more pieces that played on the theme of two New Yorks, one prosperous and respectable, the other "uneasy, suffering, threatening anarchy and revolt." He named one such essay in *Scribner's* "How the Other Half Lives," a phrase often used before, notably by Dr. Griscom back in 1845. The following year, he bundled the pieces together into an illustrated book of the same title. *Hove the Other Half Lives* (1890) was an instant success, so much so that Riis abandoned regular newspaper work and became a free-lance journalist, reformer, and lecturer.

Part of the book's popularity was fortuitous: it appeared the same year as Ward McCallister's *Society as I Have Found It*, which touted the Four Hundred's opulence and was compared, devastatingly, with Riis's work by many reviewers. The *Other Half* also fit neatly into the established sunshine-and-shadow tradition; indeed Riis's literary strategy came straight from Dickens's *American Notes*, one of his favorite books. The narrator offers the reader an armchair guided tour of the underworld.

"Leaving the Elevated Railroad where it dives under the Brooklyn Bridge at Franklin Square," Riis wrote, "scarce a dozen steps will take you where we wish to go. . . . We have turned the corner from prosperity to poverty." Suppose we look into a Cherry Street tenement, he continued. "Be a little careful, please! The hall is dark and you might stumble over the children pitching pennies back there. Not that it would hurt them; kicks and cuffs are their daily diet. They have little else. Here where the hall turns and dives into utter darkness is a step, and another, another. . . . Here is a door. Listen! That short hacking cough, that tiny, helpless wail—what do they mean?" (A dying infant, of course). "With half a chance it might have lived but it had none. That dark bedroom killed it." The slum was death to virtue as well, though Riis was always amazed at finding "sweet and innocent

girls” there; he theorized they survived only because “inherent purity revolts instinctively from the naked brutality of vice as seen in the slums.”

To a critical Christianity, Riis married the progressive scientism of photographic proof and statistical data. An *Other Halftenement* room was never just stiflingly hot; it was 115 degrees. The Elizabeth Street lodging station had enough cubic air space for ten men but crammed in forty-eight. Where sixteen or seventeen people out of every thousand died from cholera in the uptown wards, 195 per thousand so perished in the slums. Over nine thousand homeless young men lodged nightly along Chatham Street and the Bowery, between City Hall and Cooper Union. One of every ten New Yorkers ended up in the potter’s field.

Riis’s book obviously sympathized with the poor, but he never tumbled over into too alarming (or too radical) an identification with his subjects. He remained a detached gentleman, someone with whom genteel readers could identify, and he presented the poor as victims—worthy of pity but not respect. The photographs underlined the distance between guide and local denizen by their flash-and-run quality. Spotlit in the sudden glare, Riis’s subjects tended to register fright and surprise, creating a victim-esque aura of helplessness about them. He was far less pleased with daytime shoots of forewarned subjects: smiling at the camera, they appeared at ease in surroundings Riis declared intolerable.

If his photographs were sometimes presumptuous, his prose was often contemptuous. Slum dwellers were “shiftless, destructive, and stupid, in a word they are what the tenements made them.” He accepted the genteel premise that working people were incapable of “aspiration above the mere wants of the body.” The tenement houses, he believed, “have no aesthetic resources. If any are to be brought to bear on them, they must come from the outside.” Fundamental change would require that the immigrants be Americanized, as *he* had been: the tide of his autobiography would be *The Making of an American*. One of the worst aspects of the slums was that they slowed this process by encouraging a clannish defensiveness.

When Riis surveyed the Lower East Side neighborhoods—that “queer conglomerate mass of heterogeneous elements”—he often deployed stereotypes or slurs. The Italians were “gay, light-hearted”; African Americans were sensual and superstitious; and as to Russian Jews—who were still “where the new day that dawned on Calvary left them standing,

stubbornly refusing to see the light”—“money is their God,” and their attachment to “thrift” was at once the community’s “cardinal virtue and its foul disgrace.” The Chinese “in their very exclusiveness and reserve . . . are a constant and terrible menace to society”: he ridiculed their customs unmercifully, expressing particular horror at white girls’ submission to Chinamen’s lusts. Only one group seemed more threatening, Lincoln Steffens reported, recalling his deeply pious friend’s response when an assistant brought news of a police raid on a resort of fairies. ” ‘Fairies!’ Riis shouted, suspicious. ‘What are fairies?’ And when Max began to define the word Riis rose up in a rage. ‘Not so,’ he cried. ‘There are no such creatures in this world.’ He threw down his pencil and rushed out of the office.”

For all his country man’s recoil from metropolitan cosmopolitanism, Riis had absorbed more than a touch of Henry George’s values and analysis. In the *Other Half*, he rejected explanations of immigrant viciousness that looked to intemperance or individual moral failings; instead he insisted that environment in general, and bad housing in particular, was the determining factor in their moral fall.

Riis lit into landlords with Georgian fervor. He argued that the horrors they perpetuated “come near to making the name of landlord as odious in New York as it has become in Ireland.” The tenement mess was the “evil offspring of public neglect and private greed.” He called on his genteel readers to help rectify the situation, if not from love of their fellow man, than from fear of him. One of the most striking images in *How the Other Half Lives* is the account of a poor ragged man standing on Fifth Avenue and 14th Street. He builds up a head of rage at the fashionable driving by in their carriages, oblivious to “those little ones crying for bread around the cold and cheerless hearth.” All at once, the man “sprang into the throng and slashed around him with a knife, blindly seeking to kill, to revenge.”

Very much in the vein of the era’s apocalyptic novels, Riis warned the propertied classes that their neglect had bred “a proletariat ready and able to avenge the wrongs of their crowds.” The restless, pent-up multitudes “hold within their clutch the wealth and business of New York, hold them at their mercy in the day of mob-rule and wrath.” “The sea of a mighty population, held in galling fetters, heaves uneasily in the tenements,” he cried, and “if it rise once more, no human power may avail to check it.” How to forestall

such an explosion? At points Riis argued in social gospel fashion for rejecting laissez-faire and asserting the public good.

In the end, however, Riis backed away from state-centric proposals and called on the real estate industry itself to remedy the situation. “The greed of capital that wrought the evil must itself undo it.” Landlords must be shown that building better housing for the poor was both the Christian thing to do and in their own economic interest. The safest way forward, Riis argued, was Alfred Tredway White’s proposal that “the intelligent and wealthy portion of the community” provide homes for the working classes.

“STRIKE AT A GIVEN SIGNAL”

In large measure, Riis’s reluctance to resort to state power was based on the fact that government was in the grip of Tammany Hall. Many in the social gospel movement shared his conviction—as did the purity crusaders under Parkhurst—that existing city and state administrations were problems, not solutions. By the early 1890s, therefore, both wings of genteel reform seemed equally stymied. There was a widespread readiness to support state initiatives on both moral and economic fronts—even the new American Economic Association (1886) denounced “laissez-faire as an excuse for doing nothing while people starve” and called government “an educational and ethical agency whose positive aid is an indispensable condition of human progress”—but the state seemed out of reach.

In 1891 Walter Vrooman, a reporter for the *New York World*, urged formation of a Union for Concerted Moral Effort. “Only by *union*” wrote Vrooman, “can the moral forces of society defend themselves against aggressive evil.” Disparate reformers had to link up—allowing “myriads of hammers” to “strike all at a given signal”—and act together “according to intelligent plan.” It was in this spirit that the City Club was incorporated, in April 1892, to take up the work of Theodore Roosevelt’s all but dormant City Reform Club in pressing for honest, efficient government. City Club trustees included August Belmont, Robert Fulton Cutting, Richard Watson Gilder, John Jacob Astor, J. P. Morgan, Cornelius Vanderbilt, and assorted Roosevelts, Stuyvesants, Jays, Grinnells, and Lows. Over half were in the *Social Register*, many were Union League, Century, or University club members; and all could afford annual dues stiff enough to maintain a

magnificent clubhouse on Fifth Avenue, large enough to accommodate all of the several hundred members.

The City Club also set out to establish more broadly based nuclei throughout the city, around which to mobilize reform strength and disseminate reform ideas. Within two years, there was at least one Good Government Club in nearly every Assembly district. With headquarters and outposts thus established, the forces of Good Government—embracing the moral reform wing under Parkhurst and the social reform wing of social gospelers and settlement workers—were ready to mount a unified campaign to wrest political power from Tammany Hall. In their diversity, Good Government men and women (dubbed “goo-goos” by irreverent opponents) bore remarkable resemblance to the working-class confederation that had rallied around Henry George almost a decade earlier. Unlike George, however, this set of reformers would triumph, thanks in part to their formidable assets but even more to the fact that, at just this juncture, the great economic wheel of fortune took another downturn.

Good Government

The Panic of 1893—unlike those of 1873, 1857, and 1837—did not come as a sudden shock. Americans had seen it brewing since 1890 when Baring Brothers, England's (and the world's) mightiest banking house, had crumpled, the victim of overoptimistic loans to Argentina. The Baring crisis had punctured the late 1880s boom and brought hard times to Western Europe. Americans watched anxiously for signs the financial storm was striking out across the Atlantic—rather as they had once scanned the horizon for cholera epidemics.

For three years, European crop failures buoyed up the U.S. economy, as America's wheat farmers reaped bumper profits from overseas sales. But prosperity didn't last. Hard-pressed Europeans cut back investments in American industry, and when their agriculture revived, the balance of payments reversed course. U.S. gold reserves began draining away, and the resulting capital stringency put intolerable pressure on an already vulnerable economy, which now began to crack at its weakest points.

In February 1893 the Philadelphia and Reading Railroad failed, a victim of reckless empire building. Its demise heightened fears that the entire overbuilt and shoddily financed rail network might topple too. In May the National Cordage Company went under. Known colloquially as the Twine Trust, its collapse exposed the precariousness of even the biggest American enterprises.

In June the credit system seized up. Over the summer stock prices scudded downward, drawing crowds to brokerage houses to watch their fortunes melt away. Banks, mainly in the South and West, began to founder. Calling home their reserves on deposit in New York City, they created near-insolvency in the nation's money center. Before the summer was out 141 national banks had failed, and hundreds more state banks, private banks, savings banks, and loan, trust, or mortgage companies soon followed them into oblivion.

The sharp credit contraction sent debt-ridden or cash-strapped transportation and industrial corporations over the edge. During 1893

companies crashed with terrifying frequency. By year's end nearly sixteen thousand businesses had gone belly-up, the worst-ever toll in U.S. history. Among the felled firms were institutions that controlled over a third of the nation's rail system. J. P. Morgan and his fellow financiers worked mightily, and profitably, reorganizing failed lines and bringing them under banker control. Virtually every bankrupt road east of the Mississippi was eventually "Morganized," and by decade's end most of the country's trackage would be combined into six huge systems controlled by Wall Streeters.

The panic raised the curtain on a five-year depression. Foreign and domestic investors sat on their funds, and the economy languished accordingly. With roughly 20 percent of the nonagricultural work force unemployed, class warfare broke out as some corporations sought worker givebacks and others seized the opportunity to crush unions altogether. Federal troops and state militias battled miners and railroad workers in uprisings spanning a score of states and involving hundreds of thousands.

In New York City, layoffs commenced during the summer of 1893 and reached fearsome levels during the freezing winter months. In January 1894 Mayor Thomas F. Gilroy ordered police to make a house-to-house canvass. They found about seventy thousand unemployed, of whom about 25 percent were female. An additional twentyfive thousand were reported down and out in Brooklyn. Destitution among African Americans was particularly terrible, and the Colored Mission reported people "were found actually dying of want." The disaster was only partly mitigated by a collapse in prices—sensational ads proclaimed "slaughtered" prices and "sacrificed" goods—though deflation brought no joy to tradesmen or manufacturers.

The mayor's report found that twenty thousand were homeless as well as jobless. People piled up in parks and squares, in the Salvation Army Hall, on Blackwell's Island, and in Bowery lodging houses. In February 1894 Stephen Crane, impersonating a tramp, spent a night in a Bowery flophouse and reported, in "An Experiment in Misery," on the men who lay there "in death-like silence, or heaving and snoring with tremendous effort, like stabbed fish."

Some charitable and business groups estimated a lower total unemployment figure, some settlement houses a higher one, but few disputed the mayor's conclusions that there were an "unprecedentedly large

number of people unable to secure employment” and that “distressing destitution and hardship are imminent in thousands of homes among those worthy and willing to work.”

DEALING WITH HARD TIMES

As early as August 1893, angry socialists and unionists (especially cigarmakers, carpenters, typographical workers, and the United Hebrew Trades) began collecting food, establishing soup kitchens, and organizing “hunger demonstrations” on the East Side and in Union Square. In addition, the Socialist Labor Party, the Central Labor Union, Gompers’s American Federation of Labor (AFL), and Barondess’s cloakmakers all petitioned the state and city to provide direct emergency relief and set up public works projects. “When the private employer cannot or will not give work, the municipality, state, or nation must,” the AFL declared.

Anarchists favored more direct action. During one August demonstration, Emma Goldman told a crowd of thousands that rather than tamely petitioning the authorities, they should march by the homes of the wealthy and demand relief. On another occasion she addressed a jobless audience (in German) at the Golden Rule Hall. According to one witness she told them: “If you are hungry and need bread, go and get it. The shops are plentiful and the doors are open.”

Such militancy provoked hysteria among the respectable. The *New York Times*, which preferred to leave depression relief to traditional charities, was terrified by the effect “the appalling nonsense of creatures like Goldman” had on the “hatchet-faced, pimply, sallow-cheeked, rat-eyed young men of the Russian-Jew colony.” The paper called for an immediate suspension of immigration (which they failed to get) and the immediate incarceration of Emma Goldman (which followed hard upon their demand). As usual, muzzling created a martyr. While in the Tombs awaiting trial, Goldman gave an interview to Nellie Bly of Pulitzer’s *World*. The anarchist leader’s sincerity and conviction enchanted Bly, who presented her to readers as a “little Joan of Arc.” This didn’t help Goldman at her October trial—she was found guilty of inciting a riot, which all agreed hadn’t happened—but after ten months in Blackwell’s Island Penitentiary, she was welcomed back to the Lower East Side by a crowd of thousands, besieged by reporters, and swamped with nationwide invitations to lecture.

The city, as per reigning policy, did next to nothing. The Department of Charities and Correction gave aid to the blind and free coal to the poor but

ceased doling out food and clothing as the result of pressure from groups like the Charity Organization Society. The COS and the Association for Improving the Condition of the Poor were, however, shocked by the magnitude of the crisis, and admitted what they had denied in previous downturns: that the unemployed were not shiftless louts but simply unable to support themselves. Josephine Shaw Lowell now agreed that the plight of the poor was “not due usually to moral or intellectual defects on their own part, but to economic causes over which they could have had no control, and which were as much beyond their power to avert as if they had been natural calamities of fire, flood or storm.”

Lowell, aided by Lillian Wald and Jacob Ms, set up the East Side Relief Committee in cooperation with COS, settlement workers, unions, churches, and the St. Vincent de Paul Society. The committee, headquartered in the College Settlement on Rivington Street, established a “relief-by-work” program. Work tickets were given to trade unions, churches, and charities for distribution to known heads of families.

Under the supervision of trained social workers, recipients were given “continuous, hard and underpaid” work. Men received a dollar for a seven-hour day spent cleaning streets, removing garbage and carcasses from stables, lofts, and yards, and cleaning and whitewashing tenements. Women got seventy cents for eight hours of sewing clothes for the Red Cross. Nevertheless, demand for relief-work from desperate East Siders far exceeded the supply. Seldom were more than a thousand aided at any given time; and by the following spring no more than five thousand men and women had been helped, less than 10 percent of the unemployed.

The COS also chartered a Provident Loan Society, which made loans to the needy (when secured by personal property) at *i* percent a month, better terms than were available from pawn shops or moneylenders. And its Wayfarer’s Lodge on West 28th Street allowed the homeless to stay in facilities superior to Bowery flophouses for up to a week, in exchange for a stint of woodchopping.

Yet for all these new departures, Lowell and her COS colleagues were not prepared to abandon their opposition to public works or soup kitchen handouts. Such policies would only foster dependency in the recipients —“their souls must not be sacrificed in the efforts to save their bodies”— and the charity establishment feared attracting “an army of vagrants” to the

city. There was, in fact, no sign of New York's becoming a mendicant Mecca. Quite the opposite: as in most depressions, word spread swiftly in Europe that America and its leading metropolis were poor job prospects. Immigration plummeted from sixty-five thousand in 1892 to twenty-five thousand in 1893 to thirteen thousand in 1897—and among some groups more people left than arrived.

The Charity Organization Society's stringent policy of giving direct aid only after rigorous investigation had weeded out "indolent vagrants" from worthy unemployed generated tremendous public animosity. One woman, enraged at the treatment given her mother, wrote asking, "When you get to the gates of Heaven how will you feel when God will say go down to hell for a week until the committee meets to see if you . . . are worthy enough to enter Heaven." St. Vincent de Paul and the United Hebrew Charities rejected strict scrutiny of disaster-overwhelmed applicants as mean-spirited and gave relief on what the COS considered an indiscriminate basis. Indeed New Yorkers of various stripes, from a variety of motives, raised and distributed over three million dollars' worth of "irresponsible relief," making the metropolis the most generous of all U.S. cities in responding to the harsh depression.

Many businessmen gave unstintingly during the crisis—out of decency, Christian or Jewish conviction, a sense of *richesse oblige*, or a prudent desire to prevent a potentially explosive situation from deteriorating further. J. P. Morgan was particularly active. He served as treasurer of the forthrightly named Committee of Prominent and Wealthy Citizens and joined with others in forming a Business Men's Relief Committee.

Nathan Straus, co-owner of Macy's with his brother Isidor, was also partner with Abraham Abraham in Abraham and Straus, the largest dry-goods store in the city. The German-Jewish philanthropist established several depots where fuel and foodstuffs were bagged in bundles and sold, below cost, at five cents each. He also opened three apartment buildings that provided accommodations at five cents a night and established restaurants that offered five-cent meals.

The “breadline” at Fleischmann’s Model Vienna Bakery, Broadway at 9th Street, from E. Idell Zeisloft, *The New Metropolis* (1899). (© Collection of The New-York Historical Society)

Yeast manufacturer Louis Fleischmann sold sweet rolls and coffee (by day) at his Model Vienna Bakery next to Grace Church on Broadway. At midnight, Fleischmann’s distributed a third of a loaf of bread to all comers—giving popular currency to the term “breadline.” Stephen Crane spent a night on the breadline during a blizzard in preparation for writing his classic story “Men in the Storm,” which *Arena* published in October 1894.

Businessmen’s generosity was spurred in part by the emergence of a new and competitive source of charity: the popular press, self-proclaimed tribunes of the people. In August 1893 Joseph Pulitzer’s *World* declared a well-publicized war on hunger. It established a Free Bread Fund, which sent

wagons—emblazoned with the paper's logo—rumbling through the tenement streets. These gave away free loaves (one and a quarter million by winter's end) to long lines of the hungry, which formed each day—handing them out with no investigation whatever: "That you are hungry is credential enough." To pay for the program, the *World* turned to the public, as it had during the Statue of Liberty fund drive. Pulitzer yoked sensational stories of individual distress with sentimental appeals for funds, and contributions rolled in from individuals, clubs, theater and ballgame benefits, and Bread Fund Boxes left on store counters. Colorful follow-up accounts (from a roving Nellie Bly, among others) recounted for readers the impact of their donations on recipients.

Not to be outdone, the *Herald*, in December, announced a Free Clothing Fund, and on New Year's Day the *Tribune*, the city's highest-priced and most conservative paper, established a Coal and Food Fund. *Tribune* editor Whitelaw Reid did assure his wealthy readers that his fund, unlike its profligate competitors, would work closely with existing charities and carefully investigate all recipients to be sure they were sober, devout, and thoroughly destitute (had pawned all their available household effects).

Mrs. Lowell, dismayed by the efforts of businessmen, was incensed at the philanthropy of the press (the *Tribune*'s effort excepted). Handing out "something for nothing" was bad enough, but far worse was the papers' calculated commercialism, the way "a desire to help those in distress was blended with the advertising indulged in at their expense." Lowell denounced the publicizing of recipients' names as "a further degradation, a moral stripping naked of the suffering of the poor, which was cruel in the extreme." The *World*, in rebuttal, chided the COS for its niggardly inhumaneness and bureaucratic pettifoggery and claimed the Bread Fund was the "most direct, simple, and useful of charities."

While philanthropists squabbled, politicians heeded the demands of the distressed and established a program of public works—though with considerable reluctance and considerable debate. Democrats, longtime supporters of laissez-faire, backed away from the issue. Despite Mayor Gilroy's call for a government jobs program, his administration did no more than solicit funds from municipal employees and saloonkeepers for distribution to traditional charities. During the first depression winter, Big Tim Sullivan—appointed District Leader of the Bowery area by Boss

Crocker in 1892—began a tradition of feeding thousands of poor people a free Christmas dinner (turkey, ham, stuffing, potatoes, bread, beer, pie, and coffee). As many as five thousand, mostly single men from neighborhood lodging houses, were feted at his Comanche Clubhouse headquarters, while local vaudeville singers offered entertainment.

At the state level, however, Democratic Governor Roswell P. Flower, a Wall Street banker in civilian life, flat-out rejected demands for public works. “It is not the province of the government to support the people,” he declared. That way lay “corruption, socialism, and anarchy.” In Washington, the Democratic Congress similarly ignored calls by Gompers’s AFL to hire the unemployed to construct a canal across Nicaragua, improve the Mississippi, and irrigate arid western lands. Democratic President Grover Cleveland concurred with Governor Flower that “while the people should support their Government its functions do not include the support of the people.”

But Flower came under tremendous pressure from the Central Labor Union and from social gospel reformers; twenty thousand attended a Madison Square Garden conference at which Felix Adler, William Rainsford, and Sam Gompers, among others, called for public works projects. Finally, facing looming electoral disaster—Republicans had capitalized on depression distress to capture the legislature in 1893—Governor Flower grudgingly signed a bill in February 1894 that authorized New York City’s Parks Department to spend up to one million dollars on public improvements. Soon hundreds of men were at work along Cathedral Parkway, in Morningside and Riverside parks, and at Manhattan Square, though the CLU complained that work tickets had been cornered by Tammany politicians and were being sold at a profit. Squabbles over patronage kept over half the funds from being expended.

With the return of good weather in spring 1894, nearly all the funds, relief programs, and work projects were dismantled, and for the remainder of the depression of the 1890s, New York City’s unemployed were left to the attentions of churches, conventional charities, and official public agencies.

REVOLT OF THE PRIVILEGED

The depression gave the heretofore stymied coalition of moral and political reformers its chance to win power. Democrats paid the traditional penalty of incumbency during hard times, and Republicans, in fusion with dissident Democrats, swept into office. Their sequence of triumphs began in 1893 in Brooklyn, where rebellious lawyers, professionals, and businessmen challenged Boss Hugh McLaughlin, still running the city and county from the back of Kerrigan's Auction Rooms on Willoughby Street.

Peppery attorney and gadfly William Jay Gaynor took the lead. Of Irish and English descent, Gaynor had studied for the priesthood at De la Salle Institute and taught with the Christian Brothers but left the Church before taking his vows. Turning to the law, he was admitted to the bar in 1871 and got his start in Flatbush, where he represented with equal fervor the saloonkeepers of East New York and the bluenose opponents of roadhouses that catered to weekenders en route to Coney Island. By the mid-1880s, Gaynor's firm, now housed in Montague Street near City Hall, was representing far more influential Brooklynites, like Abraham Abraham, whom he helped to set up Abraham and Straus, and William Ziegler, who ran the multimillion-dollar Baking Powder Trust. By 1886, worth nearly a million himself, the blue- and cold-eyed lawyer who parted his reddish-brown hair in the middle was comfortably ensconced in a Park Slope brownstone.

Though a Democrat, the cantankerous Gaynor had been repeatedly riled by Boss McLaughlin's shadier activities. Backed by Ziegler's zeal and money, Gaynor battled the padding of public payrolls and brought a variety of taxpayers' suits to block giveaways of franchises for elevateds and streetcars. As the personification of honest government, Gaynor became an extremely popular man with Brooklyn's respectable classes.

In the 1893 mayoral campaign, McLaughlin renominated the scandal-tainted David A. Boody for a second term. Gaynor, together with other dissident Democrats like Edward Shepard, endorsed the Republican candidate, businessman Charles A. Schieren, who was popular with the city's Germans and the brewing interests, and Gaynor himself became a fusion candidate for justice of the state supreme court.

In the course of campaigning, Gaynor called attention to the fraudulent electoral practices of McLaughlin henchman John Y. McKane, boss of the independent town of Gravesend and its appendage, Coney Island. McKane

routinely registered Coney's large summertime population—cooks, waiters, barkeepers, stableboys—as permanent residents, then cast their votes for them. Out of a total Gravesend population of 8,418, 6,218 were registered to vote when, as Gaynor argued, the figure, after subtracting women and minors, should have been closer to 1,628. With the election less than two weeks away, Gaynor sent a crew of clerks to copy the registration books so the names could be checked. McKane denied them access. With five days to go, Gaynor got a writ ordering the list be made available, but when his representatives stepped off the train at Gravesend they were pounced on by a posse (led by the barrel-chested McKane himself), roughed up, and booked as vagrants. Finally, on election day, Gaynor sent six carriages' worth of inspectors to monitor the vote counting, only to be knocked down by armed police and locked up in the jail's privy, while McKane maintained a tight cordon around the town's sole polling place all day.

A firestorm of outrage, fanned by the press of both cities, helped sweep fusion candidates Schieren and Gaynor into office. The overwhelming victory—though due as much to hard times as to boss rule—spelled the beginning of the end for McLaughlin's reign. Within weeks of Schieren's accession it was noted that Remsen Street, where McLaughlin lived, had gone from being the cleanest street in Brooklyn to the one least visited by sanitation men. McKane suffered a far harsher fate. His enemies compelled Governor Flower to bypass the Kings County DA and appoint two special prosecutors (Edward Shepard and Benjamin F. Tracy, leaders of the Brooklyn bar), and in January 1894 McKane was convicted of election fraud and sentenced to six years' hard labor in Sing Sing. To complete the overthrow of ring rule, the dissidents pushed for and won, in May 1894, the annexation of Gravesend by Brooklyn, transferring to central authorities control over its patronage and police—and jurisdiction over Coney Island, which reformers like St. Clair McKelway, editor of the *Brooklyn Daily Eagle*, believed would bring an end to the “wholesale licensing of every form of bestial immorality.”

In Manhattan, too, machine Democrats would be driven from office by a Republican-dominated reform coalition, with an investigation of the New York City police department serving as the springboard to victory. Tammany had assumed that the Rev. Parkhurst's spectacular challenge had been effectively squelched back in 1892. However, the dogged vice

reformer, with the aid of powerful Chamber of Commerce supporters, got Republican party boss Thomas Platt (a regular attendant at Parkhurst's Madison Square church) to launch a probe into Democratic municipal corruption. The work of the investigating committee, chaired by Republican State Senator Clarence Lexow of Nyack, was momentarily foiled when Tammanyite Governor Flower vetoed its funding appropriation, but the Chamber of Commerce rescued the inquiry by agreeing to cover its costs.

By March 1894 the Lexow Committee, operating out of the Tweed Courthouse on Chambers Street, was poring over evidence accumulated by Parkhurst's City Vigilance League. It went on to dig up a good deal more dirt over the course of nearly a year's rooting about in the city's underworld. Eventually 10,576 pages of testimony compiled from 678 witnesses made clear the price Tammany had exacted for protecting outlawed interests. Politicians and police officers had been systematically shaking down saloons, brothels, abortionists, and gambling dens. Some policemen justified the practice as a way of making back the money they had been forced to ante up to buy their jobs in the first place. Others, like Clubber Williams, pointed to prevailing upper-class mores, cheerfully admitting he had made no attempt to close disorderly houses in the Tenderloin because, "well, they were fashionable." Williams also admitted to having a halfdozen large bank accounts, a yacht, and a Cos Cob, Connecticut, estate; he told Lexow he'd made his money speculating in building lots in Japan. Not all police witnesses were so chattily cooperative. One police captain, the soon-to-be-notorious William S. Devery, turned aside most questions with the insouciant assertion that "touchin' on and appertainin' to that matter, I disremember."

Police corruption was matched by police lawlessness: investigators turned up evidence of involvement in counterfeiting and confidence scams, pervasive election frauds, voter intimidation, and the systematic brutalizing of newer immigrants: clubbings of Eastern and Southern Europeans in Irish-American-dominated police stations were so routine they were known colloquially as "slaughterhouses." The poor suffered additionally from police collaboration with landlords, strikebreaking employers, and assorted racketeers. The Lexow exposures received nationwide press coverage, sharing headlines with depression-era strikes and marches of the unemployed.

Parkhurst, who attended every session, was thrilled by his vindication. Now he longed to go farther and overthrow Tammany itself. He was seconded in this ambition by the mercantile and financial titans of the Chamber of Commerce. These gentlemen saw in the police scandals and the depression an opportunity to rid themselves of Tammany rule and take back control of the city.

In September, at a Madison Square Garden meeting called by the Council of Good Government Clubs, a constellation of Chamber of Commerce luminaries—including J. P. Morgan, Cornelius Vanderbilt, William E. Dodge, Abram Hewitt, Jacob Schiff, James Speyer, Morris K. Jesup, Gustav Schwab, and Elihu Root—engineered the formation of a Committee of Seventy (so named to evoke the group that had toppled Tweed).

Under its banner the Committee of Seventy established a formidable campaign operation, run out of the Chamber of Commerce building, on behalf of their mayoral candidate, William L. Strong. A millionaire dry-goods merchant turned banker, Strong was a longtime member of the Union League Club and former president of the Business Men's Republican Club. His inner core of supporters were similarly wealthy Yankee Protestant Republicans, most of whom were active in the City Club, Good Government Clubs, Civil Service Reform Association, and various moral reform agencies. In addition, Josephine Shaw Lowell, at Parkhurst's suggestion, organized a Women's Municipal League, which drew in the wives of many prominent reformers. University Settlement workers carried Strong's campaign into immigrant and Tammany strongholds. The one hundred constituent organizations of the German American Reform Union signed on too, angered by the numerically inferior Irish Americans' grip on Tammany.

Tammany countered by nominating German-Jewish dry-goods merchant Nathan Straus, philanthropic hero of the previous depression winter. But the reformers drove Straus from the field, threatening him with social ostracism for his disreputable affiliation with Boss Croker: nine days after his nomination he withdrew and embarked on an extended vacation to Europe. A desperate Tammany drafted former mayor Hugh Grant, a reluctant candidate, having been himself badly tarred by the Lexow exposes. Grant would run an apathetic campaign.

The reformers, on the other hand, launched an energetic effort built around their twin themes of moral and political reform. The Rev. Parkhurst bore the standard for purification. Hurling denunciations at Tammany's Lexow-exposed connivance in vice and corruption, he summoned supporters to "fight the devil" with the "incisive edge of bare-bladed righteousness." Parkhurst's calls to reject cultural *laissez-faire* and embrace moral unity—or impose it, if necessary—rallied some but repelled others. Alarmed Catholics scented a revived nativism, and several priests would condemn the fusion ticket at preelection masses, echoing, albeit from a different perspective, the Church's anti-George efforts of 1886.

Businessmen concentrated more on secular concerns. They promised a reform administration that would run the city government "solely in the interests of efficiency and economy." Proponents of a "businessmen's administration" stressed that ending extravagance and corruption would diminish the tax burden on property owners. They also offered inducements to working-class voters. A reformed city would be a cleaner city (with improved street sweeping, garbage disposal, and public baths), a pleasanter city (more small parks), a smarter city (more public schools), a healthier city (more TB prevention programs and a vigilant health board), and an efficient city (more use of experts, better rapid transit, an expanded civil service).

In November 1894 New Yorkers voted at sites monitored by the over two thousand poll watchers put in the field by the now twenty-four Good Government Clubs. Strong won decisively, reaping nearly three votes for every two cast for Grant. The bulk of his support came from uptown silk-stocking wards and from the Yorkville, Harlem, and Upper West Side preserves of middle-class Germans. Strong also made some inroads in downtown, depression-disaffected, working-class districts, racking up substantial backing from Jewish voters (though many Jewish protest votes went to socialist candidates). The bulk of the Irish stayed loyal to Tammany. On the state level, Republican Levi Morton (a millionaire Manhattan banker) won the governorship, and Republicans completed their sweep, begun the previous year, of the legislature and virtually all state elective offices. The same electoral upheaval cost Democrats control of both houses of Congress.

Announcing he would run the city on purely “business principles,” Strong embarked on a three-year term that would span the remainder of the depression. The twin goals of the new mayor’s reform administration—efficiency and moral order—were soon apparent in the work of his appointees.

COLONEL WARING CLEANS THE STREETS

Strong handed command of the Department of Street Cleaning to Colonel George Edwin Waring Jr., a Civil War veteran. It was a brilliant choice. Waring was a sanitation engineer of high repute; he had directed the drainage of Central Park and had helped design and construct sewer systems in cities all over the United States. Waring was also of impeccable social standing, well known in the clubs and social circles of New York and Newport. Finally, he had long evidenced a steely determination that appealed to the new administration.

Waring inherited a department notorious for its inefficiency. Created in 1881, it had coped poorly with dirt, ashes, garbage, snow, and the 2.5 million pounds of manure and sixty thousand gallons of urine the city’s horses deposited each and every day along New York’s 250-plus miles of paved streets. Its problems stemmed from insufficient funding, inadequate authority, and intermittent public cooperation. It didn’t help that sweepers were primarily Tammany patronage appointees—hired and fired on the whims of politicians—and reportedly spent much of their workday in saloons.

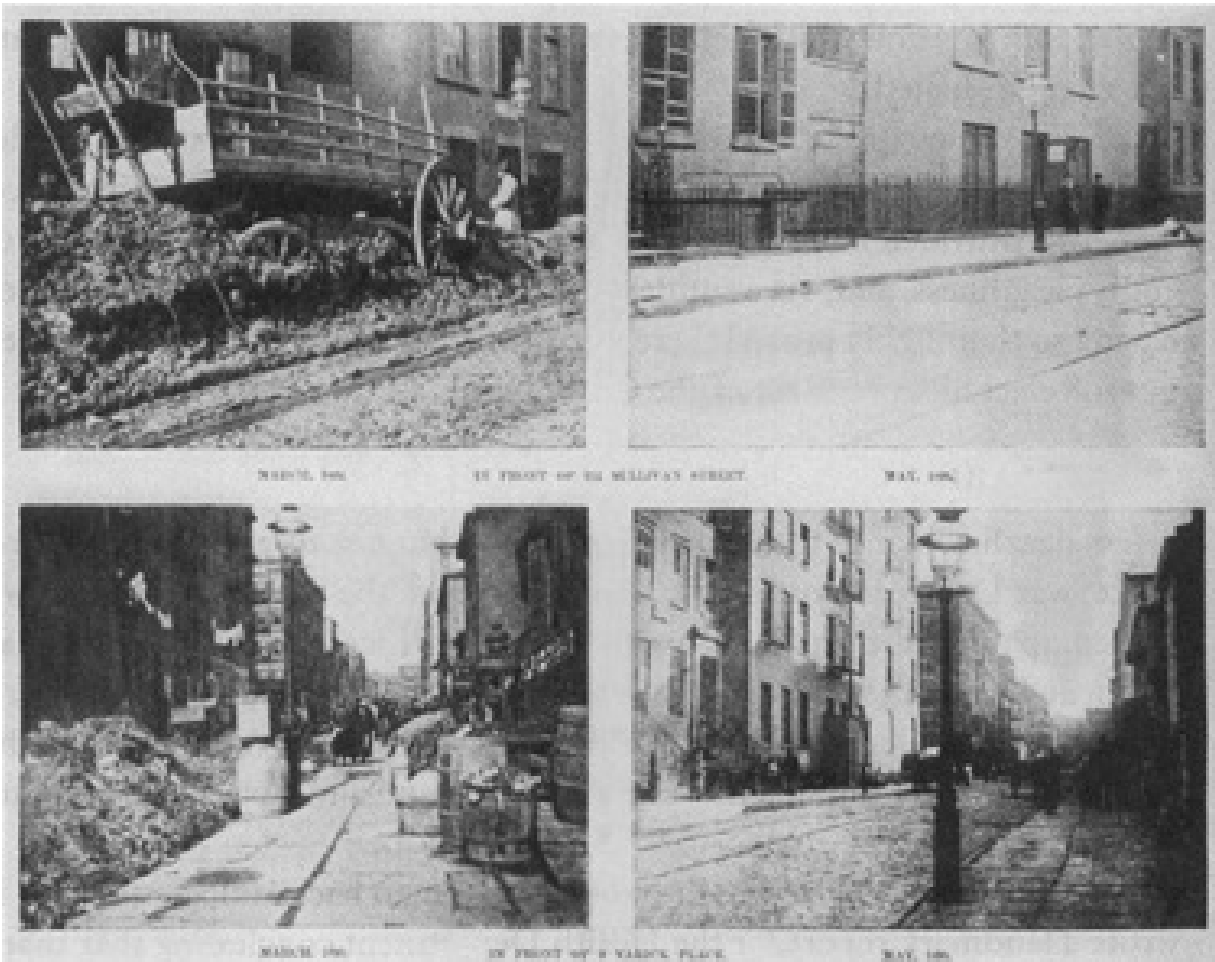

Waring decided that before cleaning the streets he would clean up his men. A longtime devotee of martial virtues, Waring insisted employees purchase and don white duck uniforms and caps. He then paraded them down Fifth Avenue, twenty-seven hundred strong, in strict military order, their new commissioner prancing ahead on horseback. Waring posted rigorous new regulations—no entering saloons, no foul language, no neglecting of horses—and carried out personal inspection tours to see they were obeyed. He rallied his troops, honoring them as “soldiers of the public” who were “defending the health of the whole people,” then led them into battle.

Not all troopers were thrilled. Some sanitation workers denounced their uniforms as badges of servitude; it was embarrassing to be caricatured as a “Waring White Angel.” More to the point, they resented Waring’s arbitrary and dictatorial ways, notably his wage cuts. One of his earliest acts was to chop sweepers’ annual salaries from \$720 to \$600 a year, feasible enough given that Italian laborers were readily available in the open market for \$350 a year. (Waring marveled at how well suited Italians were for garbage work, calling them “a race with a genius for rag-and-bone-picking and for subsisting on rejected trifles of food.”) Nor were workers pleased by his ruthless suppression of Knights of Labor resistance to such cuts. (“Strikes will not be tolerated for one moment.”) But Waring’s war on Tammany also brought workers benefits: they no longer had to contribute time, labor, and money to the machine. And Waring established an arbitration scheme—a joint management-labor board—which, though clearly an antiunion device, worked to the reasonable satisfaction of most employees.

The results were spectacular. Obstructions, particularly unharnessed vehicles, were briskly removed. Waring forced city trucking firms to stop leaving wagons on the streets for days or weeks; he objected to them because “thieves and highwaymen made them their dens, toughs caroused in them, both sexes resorted to them, and they were used for the vilest purposes.” Streets were scoured—those on the East Side as well as Fifth Avenue. Violators of the sanitary code were promptly arrested. Snow, once left to pile into mountains of grunge, was shoveled away. *Harper’s* proudly published before-and-after photos.

Waring also imposed a recycling program, something hitherto sabotaged by municipal lethargy and political corruption. Since 1882 the garbage collected by cartmen had been taken to riverside dumps, where it was loaded or “trimmed” on scows by private operators who paid for the privilege of picking out old shoes, carpets, paper, rugs, rags, and bones, which they sorted, baled, and sold—rags and paper to paper mills, bones to soda makers, iron to junk dealers and on to foundries. The remainder was hauled out into the harbor and dumped. Since 1871, it had been against state law to offload into the Harlem or East rivers or the Upper Bay, but south of the Narrows was still acceptable. By the late 1880s, however, ocean-dumped garbage was killing oyster and clam beds and drifting back to beaches. Redirecting the refuse to Hiker’s Island’s landfills brought furious

complaints from Queens, Manhattan, and Bronx residents sickened by the terrible odors.

“Specimens of Colonel Waring’s splendid work in street cleaning, before and after he began, 1898-95,” *Harper’s Weekly*, June 22, 1896. (© Collection of The New-York Historical Society)

To solve all these problems at once, Waring in 1896 required that householders put out their ashes, their garbage (organic animal and vegetable wastes), and their rubbish (drystuffs such as paper, cardboard, tin cans, bottles, shoes, carpets) in separate containers. Mayor Strong assigned him forty policemen to ensure compliance. Department employees then sent ashes—along with street sweepings (mainly dirt)—to be dumped at Riker’s Island rather than at sea, along with rubbish, once it had been scavenged by scow trimmers for salable items. Finally, Waring contracted with the New

York Sanitary Utilization Company to pick up garbage and take it to a plant on Barren Island in Jamaica Bay. There “digestors” cooked and stewed it until oil and grease were separated out for sale to manufacturers, and the residue was dried and ground into fertilizer.

Though ocean dumping was thus cut to a minimum, Waring did nothing to tackle the growing problem of industrial pollution. Hunter’s Point chemical plants continued to pour toxic by-products into Dutch Kills and Newtown Creek. Oil leaks and spills created a constant danger of petroleum vapor conflagration there, and in Newark Bay as well, but as one Queens newspaper noted, “the petroleum industry is of such overwhelming magnitude and importance and is operated by such heavy combinations of capital that it is doubtful whether even by an appeal to the State Legislature” the practice could be halted.

Nevertheless, reformers adored Waring: he was their first star. He demonstrated that despite Tammany taunts about goo-goo ineffectiveness, reformers could *deliver*. The man provided businesslike nonpolitical efficiency, fostered civic pride, advanced a godly cleanliness, and, via a ruthless paternalism, kept labor in line and productive. For having so thoroughly proved there were viable alternatives to machine rule, they would in 1898 elect him president of the City Club.

GERM WARFARE

A less dazzling star in the reform firmament, but one of arguably even greater importance, was Dr. Hermann Biggs, a holdover from the Tammany regime whom Strong and company had the good sense to retain and encourage. Biggs, who had studied at Bellevue Hospital Medical College and in German laboratories, was by 1885 running Bellevue’s new Carnegie Lab, working as the hospital’s (and city’s) pathologist, and serving as visiting physician at the workhouse and almshouse while maintaining a sizable private practice.

In 1889, after reviewing the work of German bacteriologist Robert Koch, Biggs wrote a landmark report for the Health Department concluding that tuberculosis was communicable and thus preventable. As the disease was acquired by direct transmission of bacilli, usually by dried and pulverized sputum floating dustlike in air, regular disinfection of wards and houses

with tubercular patients, as well as rigorous inspections of the city's meat and milk supply, might make serious inroads against a disease that killed more than six thousand New Yorkers each year but was largely ignored because it was endemic rather than epidemic. Many doctors resisted this view, however, and by the early 1890s virtually the only health workers acting on the theory were the women at the Nurses' Settlement.

Biggs hammered away at the idea that given Koch's and French chemist Louis Pasteur's breakthroughs in microbiology, and the new ability to isolate infectious organisms, "public health is purchasable." The city could, within natural limits, determine its own death rate. New York authorities were slow to react until the summer of 1892, when cholera again stalked its way westward from Persia and Russia to the ports of Europe. By August it reached Hamburg, killing thousands. On August 30 the steamship *Moravia* arrived in New York. Twenty-two passengers had died en route. Ten days later another steamer reported thirty-two deaths at sea.

Now—in addition to imposing a rigorous quarantine, readying a floating hospital, and placing a corps of physicians and nurses on alert—the Health Department established a Division of Pathology, Bacteriology, and Disinfection under the direction of Dr. Biggs. When the disease struck, his laboratory examined the feces of suspected infectees for traces of the cholera spirillum, confirming or denying questionable diagnoses. Once a case was confirmed in the lab, Health Department crews were dispatched to the lodgings of the stricken, which were scrubbed and fumigated, and the patient's clothes and bedding treated or burned. The department also marched a small army into the tenement districts to clean streets and vacant lots, scour thirty-nine thousand tenements, flush water pipes with disinfectant, and pass out circulars on prevention and treatment in English, German, French, Spanish, Italian, and Yiddish.

Only nine people died. The epidemic—which had killed twenty-five hundred *a day* in Russia for weeks at a time—had been completely defeated. Never again would this particular scourge gain a foothold in New York City. But the mobilization was even more significant for what it kicked off: a series of pioneering municipal efforts at preventive medicine.

Biggs declared war on diphtheria, a massive child killer whose victims often died a lingering death from suffocation. Using new methods of diagnosis he proved that nearly half the cases thought to be diphtheria

weren't—a crucial discovery, because quarantining such patients with the really diseased could kill them. Biggs now established a system of mass diagnosis. The division supplied culture tubes free and picked them up by messenger each evening; doctors could phone the lab next day for results.

In 1894 Biggs, while in Europe, learned of a new diphtheria antitoxin. Using first his own money, then proceeds from a *Herald* fund drive, and finally a substantial appropriation from the Board of Estimate, Biggs began producing the antitoxin from horses; he was the first to do so outside Europe. In 1895 the antitoxin halted an epidemic at the New York Infant Asylum. Biggs began giving it away free to doctors for use with poor patients and sold the surplus to drugstores to fund continued research. The serum brought an immediate and sharp decline in mortality rates, gaining an international reputation for New York City's Health Department.

Biggs also won acceptance for a more aggressive campaign against tuberculosis. The Health Department put out multilingual educational leaflets. It launched an antispitting campaign, instituted inspections for tubercular meat, and required dispensaries and public institutions to report the names of patients with TB (and requested doctors do so voluntarily). It was the beginning of a drive that in ensuing years would eliminate the “great white plague” as a major cause of death in New York City.

The city made great gains against typhoid, too, after investigations confirmed that a major culprit was the city's milk supply. Since the anti-swill milk campaigns of the 1850s and 1860s, producers and wholesalers had invented more subtle ways to adulterate their product. Filthy conditions, warm temperatures, and the lengthy trip from cow to consumer rendered the product lethal. In the 1890s, philanthropist Nathan Straus halved the death rate in the city's infant asylum on Randall's Island by using pasteurized milk. He and the Henry Street Settlement went on to establish pure milk stations for needy infants, further helping bring down the whopping infant mortality rate. After 1893, the city also experimented with chlorinating the water supply, a procedure that would slowly win favor in coming decades.

The Strong administration took steps as well to implement the establishment of public baths, for which reformers had long been calling. In 1888 the Department of Public Works's fifteen outdoor baths were tremendously popular with the poor, drawing an average 2.5 million males

and 1.5 million females during the limited season (June 10—October 1) they were open. The baths afforded youthful patrons recreational relief from broiling summers, though as the city's goal was promotion of cleanliness it imposed a twentyminute time limit on their use, leading boys to travel from one to the other, dirtying themselves on the way to gain access. But as river water grew ever more polluted by sewage—despite Waring's garbage reforms, liquid effluvia was still channeled into surrounding waterways—and as the baths were hi any event closed most of the year, calls were raised for indoor, all-weather washing facilities stocked with filtered and purified water.

The most vigorous proponent of public baths was Simon Baruch (father of Bernard)—a German immigrant, surgeon, and professor of hydrotherapy at the College of Physicians and Surgeons. After visiting the impressive German municipal bath systems in the late 1880s, Baruch began a campaign stressing that baths, in addition to benefiting the poor and helping create “civic civilization” out of “urban barbarism,” were in the interest of “the better situated classes”: no longer unwashed, the employees, servants, laborers, and tradespeople next to whom they sat on crowded cars would not carry so many deadly germs. At Baruch's urging, the AICP, long interested in such programs, erected a People's Baths in 1891, charging a five-cent fee for use of the twentythree showers and three bathtubs (the Colgate Company donated free soap samples). Though the program was well patronized, Tammany governments proved uninterested in expanding it. It was not until 1895 that the state legislature mandated a campaign, and Mayor Strong constituted a committee to press ahead.

HOUSING FRONT

In housing, the reform administration moved to enact recommendations of a stateestablished Tenement House Committee chaired by *Century* editor Richard Watson Gilder. During 1894, with Gilder's close friend Jacob Riis serving as unofficial adviser and settlement house workers acting as investigators, the committee examined dwelling places and took public testimony from housing experts, health inspectors, landlords, and residents. They discovered that over 70 percent of the city's population of roughly 1,800,000 now lived in multifamily domiciles, four-fifths of which were tenement houses, vast numbers of which were experiencing the familiar

litany of housing ills, including high rates of disease, terrific overcrowding, and a lack of accessible parks and playgrounds.

The Gilder Committee debated a variety of potential solutions. Felix Adler, picking up where Henry George had left off, recommended the municipality purchase lowcost land in still undeveloped outlying areas, then lease it cheaply to individuals or companies, who would in turn provide low-income housing. European cities were moving in this direction, as the researches of Elgin Ralston Lovell Gould made clear. Gould, a professor of political science at Columbia, made a thorough survey of domestic and overseas approaches (which he would publish in 1895 as *The Housing of the Working People*). Gould reported that many English, Scottish, German, and Belgian cities were either building low-cost worker housing themselves or providing loans to cooperatives pledged to do so. Some cities, like Frankfurt, had planned their own deconcentration by buying up undeveloped peripheral land to forestall its acquisition by speculators.

Gould himself rejected such efforts as “bad principle and worse policy.” The state should set standards below which no housing could fall but leave its provision to market forces. Chairman Gilder agreed that municipal housing initiatives would be an “unjustifiable interference with private enterprise,” as did Jacob Riis, who was also squarely in the entrepreneurial tradition. Gilder did embrace a policy of reform through demolition, urging that bad buildings, especially rear tenements, be destroyed, thus creating open spaces for neighborhood parks. Felix Adler counterargued that the committee was focusing too much on destruction and not enough on building new housing, without which slum clearance would amount to depriving poor people of desperately needed shelter. In addition, the value of new parks would be swiftly neutralized by crowding spawned by new tenements.

Gilder’s approach dominated the committee’s report of January 1895, as well as the Tenement House Act of 1895, passed to implement its proposals. The new law increased the Board of Health’s power to vacate and demolish and streamlined the process for implementing condemnation orders. When the board actually attempted a campaign against rear tenements, however, landlords and developers challenged its new powers and won court decisions affirming that renters had no right to light and air.

Demolition too made little headway. The 1895 law authorized the razing of tenements and the issuance of three million dollars in bonds toward building parks and playgrounds in their stead. But only in the case of Mulberry Bend—thanks to Jacob Riis’s impassioned and persistent denunciation of it as “the foul core of New York’s slums”—did Mayor Strong order buildings vacated and destroyed (their owners were paid a total of \$1.5 million). Even then it took two more years of Riis’s nudging before Columbus Park opened on the site.

Mayor Strong did put the Building Department in charge of a professional architect, Stevenson Constable, who began subjecting plans of builders and contractors to thorough examination before issuing permits. Under Tammany, the department had been a plum for party faithful, as building tradesmen routinely paid inspectors bribes to get around vexing requirements. Constable, like Waring, demanded inspectors don uniforms, stay out of saloons during working hours, and crack down on slipshod construction methods. Wrathful builders, architects, and contractors managed to bog down the campaign, and the results proved negligible.

Public approaches floundered in part because housing reformers, pursuant to their analysis and inclinations, put most of their energy into private programs. Made aware, from the limited follow-up to model housing initiatives like those of White and Adler, that small builders were unlikely ever to house the poor and laboring classes, many in the Strong administration believed that corporate philanthropy was the answer. Concentrated capital could work on the grand scale required and could afford to settle for moderate profits.

In 1896, accordingly, an independent Committee on Improved Housing was set up—with Richard Watson Gilder as chair—to sponsor an architectural competition for structures covering large lots (two hundred by four hundred feet, rather than the tiny twenty-five by a hundred specified in the dumbbell competition). Then a City and Suburban Homes Company was established to provide wage-earners with “improved, wholesome homes at current rates.” It counted among its directors and officers both leading housing activists (such as Gould, Gilder, Riis, Adler, White, and Rainsford) and wealthy philanthropists (among them Cornelius Vanderbilt II, Isaac N. Seligman, Darius Ogden Mills, and the brothers W. Bayard

Cutting and Robert Fulton Cutting), and received additional financial support from the Astor, Low, Morgan, Rockefeller, and Schiff families.

City and Suburban Homes was capitalized at a million dollars (J. P. Morgan helped issue its stock), and its dividends were limited to 5 percent. For its first venture the company had architect Ernest Flagg design the Clark Estate, a complex of six-story buildings on a site given by Mrs. Alfred Corning Clark, heir to the Singer fortune, in exchange for shares in the company. When completed in 1898, its 373 apartments, at West End Avenue and Amsterdam between 68th and 69th streets, each had its own toilet, laundry, and tubs.

Yet where City and Suburban led, few followed, as big capital had many investment outlets far less troublesome and more lucrative than low-rent housing. By the end of the 1890s the model tenement movement had built only two thousand units, which housed no more than ten thousand people. In the same period, the housing industry built twenty thousand units into which 750,000 people were crammed.

ROOSEVELT CRACKS DOWN

Mayor Strong's police commissioner, Theodore Roosevelt, would achieve a notoriety that equalled Waring's, but his accomplishments would be more problematic. Since his defeat in the 1886 mayoral election, Roosevelt had kept busy. He toured Europe with his new wife, Edith, then came home to set up his Sagamore Hill estate at Oyster Bay. He took up duties as a federal civil service commissioner. He wrote history prolifically, turning out a celebratory volume entitled *The Winning of the West*, a biography of Gouverneur Morris, and, in 1891, a *History of New York City*.

Roosevelt's municipal biography, a scholarly potboiler, was enlivened by enthusiastic "bullys" for historic virtue and stern condemnations of historic vice (the "unscrupulous rich" and the "vicious and ignorant poor" garnering almost equal opprobrium). He applauded with particular vigor the efforts of the police and troops who had attacked the Civil War draft rioters "with the most wholesome desire to do them harm," professing his delight that "over 1200 rioters were slain—an admirable object lesson to the remainder."

In 1895 Roosevelt added a late-breaking postscript to the second edition of his city history hailing the resurgence of the reform movement he had

helped foster. If this was his way of indicating a desire to return to the metropolitan fray, his wish was swiftly granted. Mayor Strong, determined to put a strong hand at the police department tiller, summoned Roosevelt back from his long exile. He would never leave the spotlight again.

Roosevelt soon discovered his authority was nowhere near as clear-cut as Waring's. The major legislative upshot of the Lexow exposes had been a Platt-dictated law requiring the four-man Police Board to be composed equally of Democrats and Republicans (giving Platt assured access to police patronage and the election machinery). Roosevelt was thus only one of four commissioners, though his colleagues promptly elected him president. To the public eye, however, Roosevelt seemed totally in charge, an impression the publicity-conscious politician eagerly cultivated.

Roosevelt lunged into action. First he arranged for the resignation of Lexow-disgraced Superintendent Byrnes and Inspector "Clubber" Williams. (Byrnes would launch a detective agency on Wall Street; Clubber entered the insurance business and would die a multimillionaire). Roosevelt and his colleagues established a merit system for appointments and promotions and added two thousand new recruits to the force—many from out of town, few of them Irish Catholics. In 1897 he would announce—prematurely, as it turned out—that "the old system of blackmail and corruption has been almost entirely broken up." Roosevelt also raised morale and encouraged excellence by handing out medals for heroism and partially modernizing the department: telephone call boxes on streets allowed cops to communicate with station houses; a Bicycle Squad added mobility.

Like Waring, TR set out to exercise personal authority over a refractory workforce. He delighted in making surreptitious nocturnal tours of the city, accompanied only by his friend (and publicist) Jacob Riis (whom Roosevelt had sought out after reading his *Other Half*). Dressed in black cloaks and wide-brimmed hats, the duo crept up on errant bluecoats sneaking beers in saloons, nabbing them while their mustaches were still drenched with incriminating foam.

In 1896 Roosevelt ordered an investigation of the decades-old practice of police stations offering shelter to the homeless—urged on by Riis, who had unpleasant memories of his experiences in them when still a penniless immigrant. The filthy condition of the lodgings was apparent. And his chief of police swore that 98 percent of the more than sixty thousand homeless

people who had resorted to them during the past year were the “lazy, dissipated, filthy, vermin-covered, disease-breeding and disease-scattering scum of the city’s population.” So Roosevelt adopted the Charity Organization Society’s long-standing position that the lodgings were “a fruitful encouragement to vagrancy” and shut them down. After the pitching of thousands into homelessness in mid-depression generated cartoons in the popular press of hearthless men shivering outside closed police stations, the city set up a Municipal Lodging House in a rented factory, but it sheltered only two hundred men. In the meantime, Roosevelt had established “tramp and beggar squads” to harry habitual mendicants.

Roosevelt also kept a close rein on labor activists as part of his determination to “keep in order the turbulent portion of the population.” Lincoln Steffens reported on “brutal clubbings of East Side strikers,” and Roosevelt himself applauded his police for “clubbing right and left” in the course of breaking up a horsecar strike. Compared to Byrnes-era attacks on strikers, however, the Strong regime was relatively mild. TR was willing to hold discussions with labor leaders, an openness that won him points.

Roosevelt and Strong’s comparative evenhandedness was glaringly underscored by the actions of the reform regime across the East River, where Mayor Schieren presided over the most violent labor conflict in Brooklyn’s history, the closest the metropolitan area came to such gunslinging affairs as Homestead, Pullman, and Coeur d’Alene.

Brooklyn’s notorious trolley companies had long imposed execrable pay and working conditions, in part to wring out enough profits to pay dividends on mountains of watered stock, in part to recoup the massive investments they’d made converting from horsepower to electricity. Finally, in January 1895, Knights of Labor motormen and conductors walked out, bringing passenger service to a complete halt. The companies advertised for replacement workers in cities across the country. Soon men made desperate for work by hard times flocked to Brooklyn, and a few cars began running. Now thousands of strike supporters in working-class communities came forward—the trolley firms were widely hated—and crowds began sabotaging the newly vulnerable electric lines. The mayor deployed the police, who protected scabs and raided union headquarters, but they didn’t act quickly enough to suit the companies, in part because many policemen

sympathized with the Knights, in part because protecting the far-flung operations stretched them thin.

Strike supporters went to court to demand the companies be required to resume full service, on pain of having their charters revoked. Judge Gaynor, who had often denounced the trolley firms for greed and corruption, issued the requested writ. Public service corporations, he ruled, had a duty to the people that transcended their obligation to stockholders. “If they can not get labor to perform those duties at what they offer to pay, then they must pay more, and as much as is necessary to get it.” The strikers were overjoyed; the *New York Times* denounced Gaynor’s decision as “anarchistic”; and the Brooklyn City Council moved to revoke the charters. But Mayor Schieren—whose company, it was noted, supplied the trolleys with electric belts—vetoed the measure.

He also called in the militia, for the first time in Brooklyn’s history, and then drew in the First Brigade from New York City, amassing seventy-five hundred soldiers in all. Confronted by angry stone-throwing crowds, the militiamen responded with bayonet charges in which at least two civilians were killed and many wounded. In February the strike was called off. Many clergymen bitterly denounced calling out the militia—including William Rainsford, despite J. P. Morgan’s heavy investments in trolley companies.

Commissioner Roosevelt won plaudits for avoiding such ferocity, but he drew furious condemnation for his efforts at enforcing Parkhurstian levels of social purity. Convinced, appropriately enough, that the core of police corruption lay in the system of extorting payments from illicit entrepreneurs for the privilege of noninterference, Roosevelt, though not himself a prohibitionist, declared war on Sunday sin. Beginning in June 1895, saloons, brothels, and gambling dens doing business on the Lord’s Day were raided, shut down, boarded up. Sabbatarians, whose campaigns since the 1850s had come to nought, were thrilled, and the Parkhurst-led wing of the Strong coalition cheered Roosevelt on.

But the campaign incensed the German community. They had not voted for Good Government to have their “Continental Sunday” afternoons—spent in beer gardens listening to Strauss waltzes—branded as immoral and banned. Labor unions noted pointedly that while there were over eight thousand arrests annually for excise violadons, only 104 violators of the factory laws were hauled off to jail in 1895, shrinking to twenty-one in

1896. The popular press, meanwhile, complained of Roosevelt's shutting off the poor man's recreation while allowing champagne suppers at the Union League Club. Teddy delighted in facing down "the wrath of the asinine herd." On one occasion, having accepted an invitation to personally review a mammoth protest parade of outraged Germans, he bantered good-naturedly with the marching legions, who shook empty beer steins at him as they passed by.

Strong's Jewish supporters were also outraged. Strict enforcement of blue laws penalized the thousands of sabbath observers who chose to work on Sundays, and Roosevelt's insistence on cracking down on those who violated anti-pushcart laws generated much talk of abandoning reform and going back to corruptible Tammanyites.

The person most dismayed by TR's vigorous efforts was Mayor Strong. Never an ardent moralist, he had led the city's liquor dealers to believe he would accept a halfdry Sunday as a compromise. Now, fearing the destruction of his electoral coalition, Strong tried to rein in his appointee, only to find Roosevelt had the bit firmly between his formidable teeth. The best Strong could do, given the then-limited authority of a mayor, was to distance himself publicly from his rogue commissioner. "I found," he told one gathering, "that the Dutchman whom I had appointed meant to turn all New Yorkers into Puritans." Roosevelt's response was to raid Sherry's, a watering hole of the wealthy, thus alienating the rich as well as the poor.

In the end, the courts (deliberately) and the legislature (inadvertently) rode to the rescue of Sunday drinkers. Magistrates began interpreting very broadly indeed a statute that allowed liquor to be served if it accompanied a meal; one judge ruled that seventeen beers and a pretzel satisfied the law. The legislature, intent on shutting down this loophole, opened up a far bigger one. Senator John W. Raines achieved passage in 1896 of a bill that permitted Sunday sale of liquor with meals, but only in "hotels," defined as establishments with at least ten bedrooms. Saloons swiftly added the requisite number of rooms and then, to cover remodeling costs, rented the cubicles out to prostitutes or unmarried couples. Roosevelt, indirectly, had managed to engineer a quantum leap forward in the city's quotient of sin.

Denounced now from all sides—apart from the loyal Parkhurst—with a forced removal from office in the offing, the ever practical Roosevelt decided it was time to move on. In April 1897 he gratefully accepted the

offer of an assistant secretaryship of the navy from newly elected President William McKinley, and bounded off to glory.

POPULISTS AND GOLDBUGS

TR's job switch was made possible by the Republican Party's having emerged victorious from a titanic struggle with populism, a triumph that owed much to Teddy and his New York City colleagues.

The depression had provided an opportunity for Republicans to take on the regnant Democratic administration of Grover Cleveland. But the presidential election of 1896 proved to be far more than a conventional political contest. To contemporaries it seemed a cosmic clash, worthy of the Book of Revelation, pitting West against East, silver against gold, and populists against plutocrats in a battle for the soul of the republic.

Over the previous decade, as the world marketplace flooded with agricultural products, farmers in the South and West found that wheat, which had sold for a dollar a bushel in 1870, now fetched anywhere from sixty cents to a dime. Loath to blame the market itself, they attacked those they believed took unfair advantage of them: the great railroad companies, mercantile middlemen, land speculators, commodity brokers, local bankers, and behind and above all these the "Money Kings of Wall Street" who controlled the nation's credit and currency systems.

In the 1880s and early 1890s, agriculturalists in the cotton South and wheatfield Midwest established a cooperative movement—the Farmers Alliance—dedicated to bypassing the corporate world headquartered in New York City. Pushing to develop alternative systems of distribution, credit, and exchange, the farmers called for government ownership of the railroads, granaries, banks, and telegraph companies and demanded that government regulate privately owned companies to outlaw monopoly, collusion, and price-fixing. Seeking nothing less than to transform the United States into a "cooperative commonwealth," the mass movement entered politics in 1892 and organized the People's Party (becoming known as "populists").

In response, the western wing of the Democratic Party, while sidestepping most People's Party demands as too radical, fastened on one small piece of the populists' currency program: the call for "free silver." A

global shortage of gold, coupled with a rising demand for its use, had driven up its value and that of currencies pegged to it. This forced borrowers to repay loans in ever more valuable currency. Debtors reasoned that if silver were made an official U.S. currency alongside gold and coined in unlimited quantities, the resulting inflation would raise depressed prices and profits. Rocky Mountain silver-mine owners liked this idea and backed Democratic politicians who promoted it—men like the silver-tongued Nebraskan William Jennings Bryan.

New York City became the stronghold of the opposing “goldbug” forces. When the Panic of 1893 led holders of greenbacks and bonds to cash in their paper for gold, draining the federal government’s specie reserves, Wall Streeters got newly reelected President Cleveland, whose campaign J. P. Morgan and others had funded, to replenish the federal strongbox by repeatedly selling bonds for fresh supplies of gold. Syndicates organized by Morgan and August Belmont Jr. sold the bonds to European investors (notably the English Rothschilds) and to local capitalists (notably New York banks, trust companies, and life insurance companies). In each case, however, the treasury’s gold swiftly flowed right back out again, sometimes to be used again in the next round of bond purchases, a highly profitable loop.

Populists and western Democrats denounced the bond sales as short-term ripoffs—“A Wicked Deal. Rothschilds, Morgan, and Belmont Skin the Country,” squawked the *Atlanta Constitution*—and as part of a long-term conspiracy to prop up the gold standard. At the 1896 Democratic convention in Chicago, silverites challenged New York goldbug control of the party. Bryan denounced the attempt to crucify Americans on a cross of gold and issued his famous antiurban philippic: “You come to us and tell us that the great cities are in favor of the gold standard; we reply that the great cities rest upon our broad and fertile prairies. Burn down your cities and leave our farms, and your cities will spring up again as if by magic; but destroy our farms and the grass will grow in the streets of every city in the country.” Delegates cheered, Cleveland and his New York backers were overthrown, and the Democratic Party rallied behind Bryan and free silver. The People’s Party, despite concerns that Bryan was insufficiently radical, backed the Democrats, and a grand climactic showdown between “the People” and “Wall Street” got underway.

Wealthy New Yorkers too saw 1896 as an electoral Armageddon. From their perspective, the inflationary proposals of agrarian primitives, antimodern provincials, crackpot economists, and hayseed cranks were dangerous, immoral, little short of theft. Currency panaceas took no account of the realities of life in a gold-standard world—only Latin Americans and other backward peoples used silver—and thus imperiled international trade. Worse, by striking at the heart of the credit superstructure, they threatened to abort modern capitalism—and with it, modern civilization.

Hatred of Bryan and silver reached acrid levels. The Rev. Parkhurst called on the “solid intelligent integrity of the country” to “grind its heel relentlessly and unpitifully into the viperous head that is lifting itself up in venomous antagonism not only to this Government, but in venomous antagonism to all government.”

Horried by the silver hordes sweeping in out of the West, Wall Street erected golden barricades. Abandoning the Democrats, they piled into the Republican Party and met candidate William McKinley’s campaign manager with open wallets. Morgan dined with him on board the *Corsair* and pledged a quarter-million dollars. Standard Oil matched this, and contributions from New York-based corporations and insurance companies helped swell the GOP’s war chest to an unprecedented and astronomical three-million-plus dollars (Bryan managed a mere three hundred thousand).

The Republican millions bankrolled a political advertising campaign that sent hundreds of speakers into the field, coordinated the work of metropolitan papers and churches, and printed and distributed millions of pamphlets, broadsides, and booklets. Employers formed sound-money clubs and pressured workers into attending “educational” meetings. Republicans wrapped themselves in the flag too. On the Saturday before the November election, New York was swathed in patriotic bunting and festooned with Old Glories. While 750,000 looked on, a huge column of a hundred thousand professionals, businessmen, and their employees (volunteered or dragooned), each holding aloft a flag, marched in a monster parade organized by the Sound Money Association. Children, their chests covered with badges attesting allegiance to the gold standard, sang derisive songs about greenbacks.

Bryan carried the fight to the temple of the moneychangers. Though he was reviled from press and pulpit with unprecedented ferocity, working

people packed Madison Square Garden hoping to hear the great orator give a stem-winding speech. Bryan disappointed them, reading a prepared, “statesmanlike,” two-hour address to the packed and sweltering house; many in the audience melted away.

Bryan’s problems went beyond the heat. The populist vision of a republic of small freeholders had little to offer the mass of metropolitan wage-laborers in the mid-1890s. German and Jewish socialists and anarchists were put off by the populists’ evangelical convictions and prohibitionist culture. Unionists like Gompers reasoned that the farmers were themselves employers of wage-labor and so unworthy of support. Tammany did endorse the national ticket and turned out such (largely Irish working-class) support as Bryan got. Gold Democrats of course bolted the party; even Pulitzer’s *World* refused to back the Nebraskan.

Bryan lost both New York and Brooklyn, the first Democratic presidential candidate to do so since 1848. So thorough was McKinley’s triumph that the greenback critique of finance capitalism dropped out of the national discourse (aided by the discovery of gold in the Yukon and South Africa, which increased the money supply and relieved the currency stringency). Once in power, the Republicans passed a tariff, wrote the gold standard into law, and gathered Theodore Roosevelt to their collective bosom.

FUSION DEFUSED

What McKinley’s victory did not do was restore prosperity. The depression dragged on. So did class tensions, as was evidenced in the winter of 1897 when Mrs. Bradley Martin, having read of the sufferings of the poor, decided to throw a ball “to give an impetus to trade.” With colossal symbolic ineptitude—and at a cost of \$370,000—the Bradley Martins rented the ballroom of the Waldorf Hotel and transformed it into a replica of Versailles. Mr. Bradley Martin dressed up as Louis XV, and Mrs. Bradley Martin—attired as Mary Queen of Scots (replete with a massive ruby necklace once worn by Marie Antoinette)—perched herself on a throne while liveried lackeys announced the seven hundred moneyed guests who incautiously flocked to the affair. With anarchists rumored to be planting bombs, the windows were boarded up, and the police kept massed spectators at bay. Editors, clergymen, college debating societies, and

Democratic politicians denounced the heartless extravagance. New York authorities doubled the Bradley Martins' tax assessment. Hounded out of town by the storm of notoriety, the couple moved permanently to England after receiving a sendoff by a dinner of unrepentant multimillionaires.

The Bradley Martin fiasco helped usher New York City Republicans out of power, though the problems confronting the Good Government coalition in 1897 were manifold. Just as the Henry George coalition, having failed to win office in 1886, had flown apart in 1887, the reformers discovered that victory could be equally problematic, and their alliance fissured into its component parts.

Roosevelt's liquor policy drove the Germans back to the Democrats, and his rigorous Sabbatarianism alienated Jewish supporters. Strong's disbursal of patronage to Republicans enraged purist nonpartisans, and his handouts to independent Democrats enraged Boss Platt. The former sat out the 1897 campaign in high-minded disgust. The latter decided to run as the Republican candidate, fatally splitting the anti-Tammany forces (possibly in collusion with Boss Croker, as they had a mutual interest in getting rid of pesky reformers). Mayor Strong himself declined a bid for reelection; his own business having failed, he was eager to refurbish his private affairs.

The reform enterprise did not disintegrate completely, however. With the upcoming mayoral election as spur, the hard core of the coalition decided to build a permanent third party devoted to the pursuit of municipal power. They named their vehicle the Citizens Union. The new organization included the leaders of organized charity, with Robert Fulton Cutting as the party's chair. Businessmen and professionals occupied leadership and financial backer positions, with Morgan, Speyer, Dodge, Schiff, and Hewitt, and such luminaries of the Bar as Joseph Choate and Elihu Root, in prominent positions. The Good Government Clubs were converted into Citizens Union district headquarters. And around this nucleus clustered crucial auxiliaries: Protestant clergymen, reform-minded women, and settlement house workers, with James Reynolds of University Settlement serving as executive director.

For a standard bearer the Citizens Union chose Seth Low. The stout and stolid burgher—a former two-term mayor of Brooklyn and currently president of Columbia University—seemed an ideal choice. Low took a leaf from George's 1886 campaign and demanded the Citizens Union gather a

convincing number of preelection pledges of support. This done, he accepted the nomination, as had George, at a Cooper Union rally, only in this case the frock-coated candidate was escorted to the podium by the president of the Bar Association, and his audience consisted of wealthy, respectable, and welleducated bankers and lawyers, merchants and professionals, ladies and clergymen.

To their central plank of opposition to bossism, Citizens Union leaders, aware of the need for outreach, held out an olive branch to respectable laborers (a group its City Club predecessors had ignored in 1894) by gingerly supporting an eight-hour law for city workers and for employees in private businesses with city contracts. Low was chosen in part for his work with the Church Association for the Advancement of the Interests of Labor—he had won plaudits as a labor mediator—and his chairmanship of the board of trustees of the University Settlement Society, which had developed close connections with East Side labor organizations.

The Citizens Union's chances were given an unexpected lift by the startling return to politics of Henry George. Nominated by a coalition of dissident Democrats, union leaders, single taxers, and social reformers, the old warrior, despite a recent heart attack, launched a wrathful campaign, promising to throw Croker in jail if he won. Low's backers were thrilled, thinking the maverick effort might siphon off Tammany support; George himself admitted he would be satisfied if he threw the election to Low.

This possibility was torpedoed by George's death. With less than a week to go in the campaign, the fragile reformer had maintained a strenuous pace. One night he spoke four times; the next day he succumbed to a stroke. One hundred thousand filed past his bier in Grand Central Palace, while an equal number thronged outside. The *World* described the massive crowds as comparable only to those for Lincoln. Father McGlynn gave the eulogy, to tumultuous applause, and then a catafalque drawn by sixteen blackdraped horses drew the coffin down Madison Avenue to City Hall, over the Brooklyn Bridge, and on to burial in Green-Wood Cemetery. Over him would be erected, by popular subscription, a granite monument engraved with a quote from *Progress and Poverty*. George's son picked up his father's fallen banner, but he lacked dynamism and would garner few votes.

Labor had nowhere to turn but to Tammany, and Boss Croker made it easy for them. He nudged the Democratic Party slightly to the left, pledging

not to use the police or courts against strikers, agreeing to grant the eight-hour day to city workers, promising fair treatment for municipal employees (in lieu of Waring's paternalism), and guaranteeing opportunities for local boys to work their way up in city jobs (unlike TR's reliance on out-of-towners). Croker also affirmed the Democrats' long-standing commitment to moral laissez-faire and proclaimed the common people's ability to run New York City without the aid of the "better element."

As its candidate, Tammany chose Robert A. Van Wyck, an obscure municipal court judge. With no independent base, no money, no personal pizzazz, indeed nothing much more going for him than a venerable city name, Van Wyck was a perfect Croker creature. District leaders rallied their troops behind him at a rousing ratification meeting to fireworks and the strains of a band booming out "There'll Be a Hot Time in the Old Town Tonight."

Tammany swept Van Wyck into office, outpolling the other three candidates combined. Still, Low and the Citizens Union did creditably well on the Upper East and West sides and in Central Harlem. Low remained hopeful about the future. "If 10 righteous men could save Sodom," he argued, the thousands in his corner "will yet bring about good government in the City of New York." For now, however, the day belonged, as it had back in 1886, to Tammany Hall, and its partisans marched through the streets joyously chanting, "Well, well, well, Reform has gone to Hell!"

Splendid Little War

“This country needs a war,” proclaimed Theodore Roosevelt in 1895 as, against a background of unrelenting depression, he and others among the New York elite began clamoring for imperial expansion. Though war was touted as a way to end unemployment, it was emphasized even more as a way to scour away the barnacles of corruption and money-grubbing that had corroded the American spirit. War would toughen the nineties’ generation as the Civil War had toughened its parents’—that bloodbath having taken on a nostalgic glow, especially to those who hadn’t fought it, after the passage of thirty years.

The notion that Empire would revive the sterner virtues of the Founding Fathers appealed to upper-class males who felt cooped up in enervating offices by day and confined in stifling parlors by night, who feared that, deprived of opportunities for manly heroism, they were growing effete, even effeminate—a dangerous development, surrounded as they were by anarchists, ruffians, immigrants, strikers, and criminals. Literary fashions reflected these fears, first the 1880s cult of the cowboy (of which TR had been an early disciple), then the 1890s fancy for medieval knights, the new rough riders on the plains of bourgeois fantasy. Bookstores and genteel magazines like *Harper’s*, *Scribner’s*, and *Century* were flooded with historical romances about Saxon warriors and chivalric aristocrats.

Armchair activism was complemented by a vogue of physical vigor, as TR counseled his enfeebled upper-class-mates to adopt a more strenuous life. Sports—the “modern chivalry”—would toughen up a “delicate, indoor genteel race” by providing a “saving touch of honest, old-fashioned barbarism.” Others urged youth to enlist in the proliferating Protestant boys’ groups, which drilled martial virtues into the next generation.

But the best antidote to civilization was imperialism. Jingoistic New Yorkers craved the psychic satisfactions of Empire, reveling in the potential glory of conquering exotic territories and ruling over dusky races with pomp and panoply. Imperialism would allow simultaneously for the exercise of a restorative barbarism and the refurbishment of republican

virtue. America had moral responsibilities abroad, said Josiah Strong, secretary of the Congregational Home Missionary Society. The American Anglo-Saxon had an inherited genius for imperial exploits; he was “divinely commissioned to be, in a peculiar sense, his brother’s keeper”; it was the *duty* of the fittest “race” to bring civilization, Christianity, and the rule of law to backward peoples.

In prior generations, such values had been given expression in the course of exercising the country’s Manifest Destiny to govern the continent—a saga Roosevelt limned in his *Winning of the West* (1889)—but with the trans-Mississippi frontier closing down, the rejuvenating benefits of conquest could only be achieved overseas. Expansionists, accordingly, applauded each step in this direction, particularly the thrilling actions of President Cleveland in 1895, when he confronted Britain over Venezuela and put some muscle back in the Monroe Doctrine.

The Venezuelan crisis did, however, foreshadow serious divisions within New York’s upper classes over imperialism. Where Roosevelt was ecstatic and hoped the confrontation with Britain might lead farther—perhaps to the conquest of Canada—Joseph Pulitzer organized a “peace crusade” against “jingoes” (Roosevelt itched to put him in jail). Some Wall Streeters, too, deprecated war with Britain, leading the *New York Times* to snarl at such “patriots of the ticker.” “If they were heeded,” the *Times* said, “American civilization would degenerate to the level of the Digger Indians, who eat dirt all their lives and appear to like it.”

There were those on Wall Street who argued that a selfless pursuit of Anglo-Saxon duty could be combined with the restoration of sagging profit margins. Many believed “overproduction” responsible for the great slump. U.S. capitalism’s ability to supply goods seemed to have outraced the American market’s ability to consume them, leading some to look overseas for adequate outlets for their products. Several New York City companies had demonstrated a correlation between economic health and foreign sales: Standard Oil of New York supplied over 70 percent of the world’s kerosene, Duke’s Tobacco Trust rolled cigarettes for the global millions, and Singer sent sewing machines to factories and sweatshops the world over.

New Yorkers were also exporting money. In the 1880s bankers and industries had begun to make loans to foreign governments, invest in overseas ventures, and set up branches abroad. The 1890s depression, in

diminishing domestic opportunities, spurred calls to accelerate the process, and Americans increased their investments abroad by almost \$250 million during hard times. In the course of expanding their export of capital and commodities, however, New Yorkers kept running up against entrenched Europeans. In the Far East, a conglomerate of American oil, rail, sugar, steel, and banking interests (with participation by Harriman, Schiff, Carnegie, and Rockefeller) put together a million-dollar American China Development Corporation in 1895, but it lagged far behind the British and was threatened by expanding German interests.

In Latin America, New Yorkers were in a stronger position. The city had long imported substantial quantities of Caribbean and Central and South American goods, carried northward by generations of shippers from the Griswolds to Grace. By the end of the century, metropolitan families were consuming one pound of coffee per week, bananas had become a customary delicacy, and the city's parlors and Palm Rooms were festooned with tropical products.

Dictator Porfirio Diaz had thrown Mexico open to New York capital; his agents hosted a dinner at Delmonico's and successfully enlisted railroad investments from the likes of Collis P. Huntington, Grenville M. Dodge, Russell Sage, and Jay Gould. J. P. Morgan's firm made loans to Peru and participated in Argentine development; William R. Grace engaged in banking and shipping operations in South America; William Rockefeller of Standard Oil had interests in Brazil.

A New York syndicate had bought up the Dominican Republic's debt in 1892, taken control of its finances, and launched the San Domingo Improvement Company. In Cuba the great Yankee metropolis, long intimately involved in the island's commercial affairs, had increased its presence after the last great upheaval against Spanish rule. The Ten Years War of 1868-78 had bankrupted many Cuban planters and opened the way to substantial investment by wealthy New Yorkers, including Henry Havemeyer's Sugar Trust. By the mid-1890s, American investment in Cuba alone surpassed 50 million dollars, ten million more than Carnegie's annual profit from steel. And by 1898 U.S. capitalists had sunk \$350 million into the Caribbean and Central America.

Nevertheless, Europeans still dominated the hemisphere's markets and supplied the bulk of its credit requirements, and in the depression years

some New Yorkers cast hungry eyes southward. If “we could wrest the South American markets from Germany and England and permanently hold them,” wrote the *Bankers’ Magazine* in 1894, “this would be indeed a conquest worth perhaps a heavy sacrifice.”

Increasingly, Roosevelt and others demanded that the U.S. government play rough on behalf of its entrepreneurs. Europe had inaugurated a new age of imperialism—the word itself first became current in the 1890s—and in the last quarter of the nineteenth century had swallowed up a fifth of the earth’s surface, including most of Africa and much of the Far East. The United States must get into the great game and compete vigorously or risk being cut off from markets and raw materials in a world increasingly carved up into colonies or protectionist blocs. The global economy was a dog-eat-dog world, and America should concentrate on biting.

Fortunately the country had developed some teeth since the 1880s, when an antiquated navy left the country at the mercy of foreign fleets, and a Spanish or Chilean armada, *Leslie’s Weekly* noted, could have anchored off Coney Island and bombed Madison Square. In the late 1880s and early 1890s, two New Yorkers had helped oversee creation of a powerful American fleet. The initiatives of financier William Whitney, secretary of the navy in Cleveland’s first administration, had been carried on by his successor in Harrison’s Republican administration, Benjamin Franklin Tracy. A leading lawyer (and friend and ally of Tom Platt), Tracy believed the Gulf of Mexico and the Pacific were the coming theaters of naval action, and he promoted construction of armored steel battleships as American interests there were “too important to be left longer unprotected.” When the first naval squadron departed for Europe from New York harbor in 1889, Tracy invited Whitney to attend in a show of bipartisan support.

By 1897, this apparatus was to some degree under the control of Assistant Secretary of the Navy Theodore Roosevelt, and jingoists had high hopes that President McKinley would surpass his predecessors in boldness, perhaps by securing a base in the Philippines and making Manila an American Hong Kong. Hawaii was another leading candidate for imperial enterprise. The *Tribune*, under the editorial helmsmanship of Whitelaw Reid (who had been Republican vice-presidential nominee on the losing 1892 ticket), declared that “the necessity for new markets is now upon us”

and urged attaining sovereignty over Hawaii for its sugar, rice, and usefulness as a naval base and coaling station.

All that was missing was a war.

PRO PATRIA

The most likely venue for a military joust was Cuba—once again in rebellion against Spain. Not only was it a mere ninety miles from America's shores, but the revolution itself, conveniently enough, was being run out of New York City.

After the upheavals of the 1870s, many Cuban rebels had fled to exile in Manhattan, where they joined Irish, German, and Russian immigrants in plotting the overthrow of their respective home-country governments. Since his arrival in 1880, the leader of the Cuban exile community had been poet and writer Jose Martí. Taking up quarters in a boardinghouse at 51 West 29th Street, Martí supported himself as a journalist—filing insightful copy on *norteamericano* culture and politics, especially New York City's, to various Latin American newspapers.

Martí also built a revolutionary movement based on the growing Cuban cigarworker communities in U.S. cities, particularly New York, where the cigar trade was booming. By 1894 its three thousand factories (five hundred of them owned by Hispanics) provided jobs for the Cuban immigrants who settled into Yorkville and Chelsea boardinghouses. Many of these workers joined Martí's Partido Revolucionario Cubano, bought its newspaper *Patria*, and flocked to Clarendon Hall to listen to the eloquent apostle and his colleagues.

Martí also drew support from New York's small but growing Puerto Rican community. A tiny *colonia* had grown up in the city in the eighteenth century; by 1830 a Sociedad Benefica Cubana y Puertorriquena, composed of merchants from the islands, promoted trade exchanges. They did well. By 1897 roughly two-thirds of Puerto Rico's sugar exports came to the United States and only about one-third went to Spain. With the sugar came the sons and daughters of the island's mercantile and creole *hacendado* class—as students, exiles, and fomenters of separation from Spain.

Puerto Rico had also planned a rebellion in 1868. Directed from New York by Ramón Emeterio Betances and others, the rising was discovered

and swiftly snuffed out. In the ensuing decades exile leaders like the fiery Eugenio María de Hostos established organizations and newspapers (including the evanescent *La Voz de Puerto Rico*) to carry on the struggle among immigrant cigarmakers, artisans, and laborers. Many joined the Puerto Rican branch of Martí's party and organized their own political-cultural clubs. One such activist was Arthur Schomburg, newly arrived in the city in 1891 at age seventeen. Schomburg earned a living as an elevator operator, bellhop, porter, and printer, took night classes at Manhattan Central High, and helped organize Las Dos Antillas (the Two Islands), a club on Third Avenue that collected money, weapons, and medical supplies for an armed struggle.

In January 1895 Martí issued the order for an uprising, smuggling it down to Havana rolled inside a cigar. Although he was frail and ill, Martí himself headed south, ending his long New York exile, and was killed in action that May. Despite this and other setbacks, the rebellion soon established itself in Santiago Province. It launched an effective guerrilla campaign that torched mills, ranches, and plantations, some of them American owned. The Spanish empire struck back by herding farm families off the land into concentration camps and cities, where thousands died of disease and malnutrition.

Back in New York City, the insurgent government established a junta to generate U.S. support for the war effort. It was led by Tomas Estrada Palma, who worked out of the Wall Street-area office of a sympathetic and prominent New York lawyer. The junta organized mass meetings (including a week-long Cuban-American Fair at Madison Square Garden in May 1896). It cultivated contacts with investors, merchants, and politicians. And it issued news releases, many of which prettified the struggle for American readers or fabricated guerrilla triumphs out of thin air. To raise money for the war, the New York leadership also set up a Cuban League for local supporters. Militants like Teddy Roosevelt and Charles A. Dana of the *Sun* were members; so were conservative businessmen like J. Edward Simmons, former president of the New York Stock Exchange, railroad chief Chauncey M. Depew, and John Jacob Astor.

Americans were receptive to the junta's message. Schoolbook accounts of inquisitors and conquistadors had convinced many of the inherent

depravity of Spaniards. Others equated the Cuban struggle for freedom with the USA's own War of Independence.

Particular interests had particular reasons for urging American involvement. The AFL, led by Gompers's Cigarmakers Union, called for support short of war. Metropolitan sugar and shipping interests, appalled at the damage to their property and disruption of their business, sought to end the fighting, either by pressuring Spain into conceding autonomy or by annexing the island outright. Leading Wall Streeter Frederick R. Coudert admitted that "it makes the water come to my mouth when I think of the state of Cuba as one in our family." Yet many metropolitan businessmen remained wary of being pulled into war.

"BLOOD, BLOOD, BLOOD!"

Those still on the fence about Cuba found it increasingly hard to stay there, given the blasts of prorebel publicity emanating from the New York City press. Joseph Pulitzer had counseled moderation during Cleveland's saber-rattling over Venezuela in 1895, but he favored Cuban self-government and steered the *World* toward support of the rebellion. His relatively temperate campaign was soon outdone by one of typhoon proportions issuing from a competing New York newspaper under the control of William Randolph Hearst.

Hearst, born in San Francisco in the midst of the Civil War, had been fortunate in his parents. George Hearst had accumulated a fortune in silver and copper mining, as well as the proceeds from a million-acre ranch in Porfirio Diaz's Mexico, and Phoebe Hearst provided a disciplined Episcopalian upbringing. After an aborted Harvard education he headed to New York City, beelined his way to the World Building, and spent a year there apprenticing in journalism. Then he returned home, turned the *San Francisco Examiner* into a profitable reform sheet, and, in 1895, decided to run a newspaper in New York City. His mother, who had inherited her husband's estate in 1891, sold off \$7.5 million of her shares of Anaconda Copper and turned the proceeds over to William.

Hearst moved to Manhattan, took up quarters in Madison Square, and bought the *Morning Journal*, a paper operating out of the Tribune Building on Park Row. The *Journal*, once a scandal sheet known informally as the

“chambermaids’ delight,” had now, under more proper but less profitable management, sunk to a circulation of seventyseven thousand (the *World’s* was 450,000). Hearst dropped the *Jour nafs* price to a penny, expanded its size, imitated the *World’s* format, and stole away its reporters by offering fabulous salaries and byline credits. Hearst adopted Pulitzer’s social and political stances and went them one better. When Pulitzer gave away free bread to the unemployed, the *Journal* set up a soup kitchen and passed out free sweaters. Pulitzer was a power in the Democratic Party; Hearst replaced him in 1896 by backing Bryan.

Pulitzer riled New York society, but Hearst appalled it, and backs turned when the blond, racily dressed six-footer strode into the Metropolitan Club. He didn’t care. Nor did his phenomenal expenses trouble him overly, his pockets being far deeper than his debts. Besides, the *Journal’s* circulation shot up to 430,000 within a year, leaping past the *Herald*, *Sun*, *Tribune*, and *Times*. The vigorous young Hearst, who worked in his office late into the evening, was clearly gaining on Pulitzer, now a half-blind nervous wreck, running his operations from his yacht while cruising the world in a search for quiet harbors.

Much of the *Journal’s* success stemmed from Hearst’s support for the Cuban rebellion—like Pulitzer’s, a mix of conviction and calculation—and his campaign slipped steadily away from conventional standards of truth in journalism. Hearst stirred fact with fiction and poured the resulting prose into a mold of pure melodrama, one that played explosively with the gender conventions of his culture. For *the Journal*, the heart of the matter was that villainous Spaniards were brutalizing noble Cubans, and the *heart* of the heart of the matter was that lustful Spanish brutes were ravishing pure Cuban women.

In February 1897 Richard Harding Davis, a romantic-fiction writer turned war correspondent, filed a dispatch reporting that Spanish police had boarded a U.S. vessel bound from Havana to Tampa and strip-searched three female Cuban passengers thought to be carrying messages to insurgent leaders in New York City. Next to this inflammatory text Hearst placed an incendiary image: a half-page drawing, done in distant Manhattan by Frederic Remington, showing one of the women, naked, surrounded by Spanish officers. A five-column screamer headline demanded: “Does Our Flag Protect Women?” The issue sold nearly a million copies. That the

women had in fact been searched by matrons, as the *World* soon discovered and trumpeted, did nothing to still the uproar.

Next Hearst claimed that an imprisoned eighteen-year-old Cuban girl, Evangelina Cosío y Cisneros (known as Miss Cisneros in the States), had been jailed for trying to defend her honor against the advances of “a beast in uniform.” Hearst launched a campaign to free Evangelina from jail, where the molested maiden with her “white face, young, pure and beautiful,” languished “among the most depraved Negresses of Havana.” (Few Americans realized that in some areas four-fifths of the guerrilla forces were of African descent, and the yellow press did little to enlighten them.)

Hearst arranged a jailbreak, brought Cisneros to New York, met her in the harbor on his steam launch, introduced her to hundreds of dignitaries at a Delmonico’s reception, and presented her to the masses at Madison Square Garden, accompanied by searchlights, fireworks, and bands. The affair was so compellingly staged that the president, who had canceled his *Journal* subscription in disgust at its reportage, felt obliged to invite the Cuban Joan of Arc to the White House.

Faced with Hearst’s triumphs, Pulitzer abandoned restraint. *World* reporters began recounting ghastly horror stories—some true, many fraudulent. (“Blood on the roadsides, blood in the fields, blood on the doorsteps, blood, blood, blood!”) The two papers whipped themselves into a competitive frenzy—matching the fervor of the old railroad wars, with text, not trackage, the product—and the Associated Press carried the copy to the country. Increasingly both editors began to push for war.

War eluded them, in part because the president, unlike armchair warriors Hearst and Roosevelt, was old enough to remember the carnage of the Qvil War. When Spain made conciliatory gestures, McKinley responded positively (to the fury of Roosevelt, who declared the president had the backbone of a chocolate éclair). In addition, the official goal of the New York-based Cubans was not war but American recognition of the Cuban belligerency, a crucial step toward acknowledging independence. Some, like Estrada Palma, leaned toward American military intervention, believing it would keep more radical elements in the liberation army from taking power and “give confidence to American capitalists, who may lend

us the money necessary for the reconstruction of the country.” But others feared war would lead to annexation, not independence.

Wall Street also still favored peace. Most businessmen feared war would interrupt trade, endanger currency stability, and torpedo a fledgling recovery. Their reluctance generated nationwide opprobrium. Roosevelt denounced the “craven fear and brutal selfishness of the mere money-makers.” Some Democrats joined in the baying, claiming that New York money-men, by putting profits over people, were blocking a humanitarian crusade. The clamor reached such dimensions that Elihu Root advised McKinley not to “retard the enormous momentum of the people bent upon war” lest he bring the silverites to power.

McKinley and the metropolitan community held firm until the pressure of events overwhelmed them. An indiscreet letter from a Spanish diplomat was passed to Hearst, who ran it under banner headlines. A week later the battleship *Maine* (a product of the Brooklyn Navy Yard) was blown up in Havana’s harbor, and the papers screamed for war. When a Spanish cruiser paid New York a courtesy call, the *World* warned of treachery, claiming “her shells will explode on the Harlem River and in the suburbs of Brooklyn.” Circulations soared, *the Journal* passing the million mark.

The clamor and instability convinced many businessmen that peace was proving as debilitating as war. Leading figures like John Jacob Astor, William Rockefeller, Stuyvesant Fish, and Thomas Fortune Ryan adopted a more belligerent stance. In late March J. P. Morgan declared nothing further could be obtained from arbitration. Many others were converted, reported the *Wall Street Journal*, after the moderate Senator Proctor assured them that the terrible conditions in Cuba were not just the imaginings of the yellow press and that it was not inevitable that Cubans—the Spanish once removed—would be revolutionary. On March 25 a leading New York journalist and McKinley adviser sent him a telegram arguing that “big corporations here now believe we will have war. Believe all would welcome it as relief to suspense.” Two days later, the president presented an ultimatum to Spain; on April 11 he sent a message to Congress asking for “forcible intervention”; on April 25 the United States formally declared war.

As in the Civil War, the city immediately shed ambivalence and donned patriotic bunting. Regiments formed up and marched down Fifth Avenue,

crowds cheering, flags flapping, bands playing Sousa marches. Harbor defenses were bolstered to ward off a feared invasion by the Spanish fleet. New York bankers organized popular loan drives to fund the war effort. New York newspapers, whose communication systems were superior to Washington's, relayed information to the military: the secretary of the navy first learned of Commodore George Dewey's victory at Manila Bay from the *World*.

Watching the Bulletin-Boards on Park Row at the Time of Dewey's Great Battle of Manila Bay, from E. Idell Zeisloft, The New Metropolis (1899). (General Research. The New York Public Library. Astor, Lenox and Tilden Foundations)

Volunteer troops so clogged the transport system that rival regiments had to elbow their way toward the front lines. Teddy embarked for Havana with

his Rough Riders—a collection of cowboys and clubmen—with six spare sets of glasses sewn to his uniform and one inside his hat.

Each of the two yellow press contenders was now printing 1,250,000 issues a day. Hearst chartered a steamship, sailed a reportorial regiment into Cuban waters, and filed his own copy. The *World* sent a crack squadron of investigators, including Stephen Crane, but the novelist's forthright realism got Pulitzer into trouble. When the author of *The Red Badge of Courage* filed a critique that mentioned the shaky conduct of some New York volunteers, *the Journal* charged slander ("Slurs on the Bravery of the Boys of the 71st") and forced the *World* to back down.

Still, Cuba provided some with a chance for heroics. Roosevelt led his men up Kettle Hill, a small outcropping below the principal enemy fortifications on San Juan Ridge, and shot a Spanish officer with his pistol. Even Hearst—barred by McKinley from military status—managed to capture prisoners.

Within weeks the war was over, both Cuba and Puerto Rico taken. New Yorkers went wild over America's emergence as an imperial power. The metropolis offered now Admiral Dewey, the war's greatest hero, a homecoming on a scale not seen since its greeting to Lafayette. The artistic community collaborated in creating a mammoth triumphal arch (out of lath and plaster) at Madison Square, the city's reigning civic center. When the North Atlantic Squadron steamed into New York harbor on September 29, 1899—its progress upriver marked by a *Journal* balloon that released showers of colorcoded confetti over Grant's Tomb—it touched off two days of frenzied adulation. The spectacle hailed the emergence of America as a new Roman Empire, and underscored New York's position as its de facto capital.

Sampson and Schley Leading the Fleet into New York Harbor, August 20, 1898, painting by Fred Pausing. On July 3, two days after Roosevelt and the Rough Riders captured San Juan Hill, the U.S. naval forces under Rear Admiral William T. Sampson and Commodore Winfield S. Schley destroyed the Spanish fleet off Santiago. Their triumphant return to New York—here they fire a salute while steaming up the Hudson past Grant's Tomb—was only a dress rehearsal, however, for the adulation showered on Admiral Dewey himself a year later. WINNERS AND LOSERS

Like all wars, the struggle with Spain had its winners and losers. The losers, apart from the 379 killed and sixteen hundred wounded in action, included the more than five thousand soldiers who had died from yellow fever, malaria, or typhoid and the enormous number still suffering from such diseases. Twenty thousand such casualties were ensconced in a great hospital camp at Montauk Point, where they were ministered to by New York matrons, young girls, and such nurses as could be spared from Bellevue, Roosevelt, Presbyterian, and other hospitals, themselves packed with casualties.

Some were victims of badly preserved beef. One such was Achille La Guardia who would later die of it, leaving his son Fiorello enraged at corporate malfeasance. Other casualties included Stephen Crane—his

Cuban stint had broken his health, and he would die in 1900 from TB—and George Waring, who went to Cuba to deal with yellow fever, contracted it himself, and died shortly after returning to New York City.

Topping the winners' list was Teddy Roosevelt. The Rough Rider wrote up his war memoirs (which Mr. Dooley—the fictional commentator created by Finley Peter Dunne—remarked should have been titled *Alone in Cuba*). In 1898 Roosevelt stumped for the governorship as a war hero, won, served two years, irritated state Republican boss Platt no end, and was accordingly bounced upstairs to serve as McKinley's running mate in the successful 1900 campaign. When McKinley was assassinated the following year, TR assumed the office, completing a run-up from police commissioner of New York City to president of the United States in four and a half years flat.

Among the other big winners was a potpourri of New York City businessmen. With Cuba an unofficial American protectorate, the Sugar Trust expanded operations, aided by Elihu Root, longtime legal counsel to the Havemeyers; now, as newly appointed secretary of war, he oversaw the island's military occupation and worked to lower U.S. tariffs on Cuban sugar. Low tariffs, coupled with America's asserted right of military intervention, its possession of a naval base on the island, and its eagerness to improve Cuba's roads and public health, unleashed a torrent of U.S. investment. The Sugar Trust and its competitors bought up vast tracts of the best land and erected million-dollar mills. In a decade the Havemeyer-dominated Cuban-American Sugar Company had created the largest sugar plantation in the world.

Other New York City companies also steamed down to the Caribbean. The Tobacco Trust built the world's largest factory in Havana, and its affiliate, the American Cigar Company, soon dominated 90 percent of the export trade in Havana cigars. A group of New York capitalists took over manganese mining. The Cuba Company, a syndicate formed in 1900, had the Cuba Central Railroad up and running by 1902. Another Wall Street syndicate won control of the Havana Street Railway. And Manhattan's North American Trust Company was appointed the occupying government's fiscal agent; in time, it evolved into the Banco Nacional de Cuba, which would dominate the island's financial system. The Yankee invasion had a tremendous impact on Cuba's society as well as its economy: the elite was cut in, the rural middle classes were wiped out, and

the peasantry was reduced to seasonal wage-work. Protests were suppressed by the marines.

Puerto Rico was made an official American colony, and its residents were granted limited local participation in government. U.S.-dominated sugar and tobacco production supplanted the old coffee-based agronomy and pumped profits off-island, perpetuating or worsening poverty. Within a decade of the occupation, four U.S. corporations produced 50 percent of all sugar cultivated in Puerto Rico, and the island's inclusion in the Coastwise Shipping Act had given the United States a monopoly over Puerto Rican commerce. When Samuel Gompers returned from a 1904 visit, he told a New York press conference: "In all my life I have never witnessed such misery, sickness, and suffering." In 1917 Puerto Ricans would be made citizens—a step of great significance for the future of New York City, as, dislodged from the land, earning some of the lowest wages in the world in exchange for ten- to twelve-hour days, some of these new citizens would begin to migrate from the edge of America's new empire to its center.

America's war with Spain provided one final benefit: it helped boost the country out of depression. The initial upward shove had come in 1897 when simultaneous crop disasters in Europe, Asia, and South America drove the price of American wheat to a dollar a bushel. Ecstatic farmers paid off burdensome mortgages and started a round of heavy purchases. Agricultural traffic boosted railroad earnings and spurred the iron and steel industry. The next year brought not only wartime government spending but discoveries of gold in South Africa and the Yukon. The combination of stimuli jolted the economy into action. Factories started up, the stock market reached its highest level in years, the unemployed began trooping back to work, and the country clambered its way toward prosperity.

69

Imperial City

On New Year's Eve, with 1897 turning into 1898, thousands of New Yorkers cascaded into lower Manhattan's streets despite a cold and driving rain. Soaked but celebratory, they were gearing up for one of the greatest Festivals of Connection in the city's history. This time they would not be hailing New York's insertion into some larger grid—as they had on completion of the Erie Canal or the Atlantic Cable—but rather the city's new internal linkages, its own municipal consolidation. At midnight, the nation's first- and fourth-largest cities would merge into a supercity—Greater New York—that would encompass not only Manhattan and Brooklyn, but Queens, Staten Island, and the Bronx as well. Other metropolises had been engaging in similar combinations, but New York's would be the grandest—a municipal counterpart of the giant corporations busily being born.

The master of ceremonies, oddly, was not Mayor Strong. The lame-duck reformer had grumpily suggested holding a funeral service for the old city rather than a jamboree for the new one. When this met with widespread derision, William Randolph Hearst had stepped forward to volunteer as producer and ringmaster. The publisher raised funds (mostly from his own pocket), purchased fireworks by the cartload, enlisted military and civic groups and marching and singing societies, and arranged for a spectacular parade. An immense crowd formed up in Union Square, umbrellas aloft, well fortified by visits to local saloons, and prepared to accompany the long line of brilliantly illuminated floats down to City Hall, itself bedecked with hundreds of electric lights.

For all the rejoicing, mutters and imprecations could be heard in many quarters. The road to Consolidation Eve had not been an easy one. Some Brooklynites felt like victims of an imperial expansion they had tried and failed to halt. Tammany Hall was exceedingly ambivalent, despite the fact that Croker and company would control the new colossus, thanks to Van Wyck's triumph in the recent mayoral election; the pols couldn't help being suspicious of an enterprise so largely engineered by their Republican and reformer enemies. And even consolidation's sponsors, the businessmen and

professionals over at the Chamber of Commerce and the Citizens Union, were lukewarm about their creation and apprehensive about the future. This melange of mixed feelings was the legacy not only of the previous decade of struggle but of two centuries of interurban rivalry.

ANNEXATION AND ITS ENEMIES

Manhattan had first gained dominance over Brooklyn when the Dongan Charter (1686) and Montgomerie Charter (1730) granted it domain over the East River and its ferry traffic, effectively depriving Brooklyn of control over its own waterfront. When Brooklyn pursued city status in the early 1830s, New York resisted, to maintain its lucrative privileges and because (as Manhattan officials argued) constituting a “distinct and rival commercial community” would lead to “contentions, inconvenience and other calamities.” Besides, Brooklyn was obviously destined to be folded into the larger and wealthier city, and making it a separate polity would only impede the inevitable. Brooklyn community leaders successfully demanded independence, insisting that “between New York and Brooklyn, there is nothing in common, either in object, interest, or feeling—nothing that even apparently tends to their connexion.”

In 1857 the two cities were subjected to something of a shotgun wedding when the state combined their police, fire, and health departments into joint metropolitan boards. There were those who hoped the merger of functions might evolve into a more thoroughgoing consolidation, and indeed it was from one of these supra-boards that conglomeration’s strongest champion emerged. It was in the course of pursuing Haussmannesque authority for the Central Park Commission—allowing it to plan and develop bridges, roads, and sewers on both sides of the Harlem River—that Andrew Haswell Green first developed the arguments he would promote for the next forty years. And it was in the course of convincing uptown and Westchester property owners that comprehensive development was in their mutual interest that Green began to assemble a constituency powerful enough to translate his ideas into action.

In 1868, when Green was proposing that Manhattan should annex the portion of the mainland just across the Harlem River, he alluded to what for him was the obvious end point of such an initiative: formation of a metropolitan totality out of the discrete political entities grouped around the

harbor. It was, he asserted, desirable to bring “the City of New York and the County of Kings, a part of Westchester County and a part of Queens and Richmond, including the various suburbs of the City, under one common municipal government, to be arranged in departments under a single executive head.”

In 1870 Green’s plans seemed to have been short-circuited by Tweed’s city charter, which abolished the state boards and deprived Green of his power base. But Tweed, in his own way, was a master planner too. Following Green’s logic, he gave his new Department of Public Parks the power to expand street mapping into Morrisania and West Farms and eastward to the Bronx River. Meanwhile powerful Westchester residents like Colonel Richard M. Hoe and Lewis G. Morris, whose interests were entwined with those of Manhattan, had taken up Green’s cry for full-scale annexation. They wanted New York to build connecting bridges and perhaps even deepen the Harlem River into a viable link between the Jersey railheads and Long Island Sound, thus making Port Morris a major transportation hub.

Manhattanites were divided about annexation. Using arguments that would be recycled repeatedly during the next decades of debate, downtowners balked at underwriting Bronx-based competitors, though their objections were partly alleviated when local property owners agreed to shoulder half the improvement costs. They also protested the notion of paying to enhance the quality of life for suburban commuters who deserted the city each night. Proponents countered that annexation would corral the fleeing middle class back into the taxpaying fold, provide room for downtown to expand, and boost upper Manhattan's real estate values. Put to the electoral test in November 1873, annexation passed overwhelmingly, and on January 1, 1874, the city's territory jumped from fourteen thousand

to twenty-one thousand acres, its thirty to forty thousand new citizens assembled in two new wards.

Not coincidentally, consolidation sentiment surfaced in Brooklyn that year. In 1874 a cohort of property owners, developers, and businessmen (including such potentates as J. S. T. Stranahan, D. D. Litchfield, and A. A. Low) formed the Municipal Union Society of the City of Brooklyn and the County of Kings. These gentlemen sought a merger between the two great cities and the five county towns. Union, they argued, would enhance property values, sustain the area's commercial supremacy, and end boundary disputes. But even after they pointed out the benefits achieved by annexationist movements in Paris, London, Boston, and Philadelphia, public response in Brooklyn remained unenthusiastic, and consolidation, though it passed the Assembly, was defeated in the Senate.

Further such efforts were derailed by the depression of the 1870s. Andrew Haswell Green busied himself with estate management and with projects that secured de facto if not de jure linkages. Green was one of the original commissioners of the Brooklyn Bridge—as was Stranahan, who on opening day in 1883 prophesied that its bonds of steel would usher in political union. Green also helped get a bridge thrown across the Harlem River at 183rd Street in 1886 and was appointed in 1890 to a commission charged with planning a railroad bridge across the Hudson.

In the meantime, the harbor's constituent communities had undergone such a degree of interlacing that the editor of the 1880 census's volumes on social statistics suggested that a greater city had in effect already come into being. The population was separated "by physical and political lines," he said, but as these "have had little influence on the character of the people, their industries, or their modes of life," it "seemed proper" to consolidate the data on them under "the one head of 'The Metropolis' which they constitute."

"IMPERIAL DESTINY"

A statistical consolidation had been wrought, but it was only after the Henry George campaign that Manhattan elites, jolted by the challenge of the radical and labor movements to their vision and command of New York

City, wholeheartedly joined Green's campaign, and his project began to rumble toward realization.

In 1887 the New York Chamber of Commerce officially urged that Brooklyn be added to New York. The assembled merchants expressed concern that the port was losing ground to the more efficient facilities of New Orleans, Baltimore, Boston, and Philadelphia—and between 1880 and 1890 New York did indeed suffer an absolute and relative decline in its percentage of the country's exports and imports. The slovenly state of metropolitan infrastructure—decaying docks, clogged streets, and turtle-paced transit systems—was costing the city its competitive edge. But efforts to coordinate port administration, build new bridges, and improve city services were thwarted by divided political jurisdictions. The chamber considered competition between the area's municipalities to be annoyingly irrational, much as big businessmen were rethinking the virtues of economic competition. As an aid to planning piers, wharves, warehouses, and transportation, the chamber urged putting "New York and its environs under one general scheme of municipal rule."

In 1888 the *Real Estate Record and Builders' Guide*, organ of New York's propertied interests, also came out for consolidation. Only a centralized authority, it argued, could push through the improvements that would boost land values and provide insurance companies, savings banks, and estate trustees with profitable investment opportunities.

That same year Mayor Hewitt, himself a Chamber of Commerce stalwart, issued a proposal for a vast and coordinated program of public improvements and sketched a grand vision of New York's future. "With its noble harbor protected from injury, and the channels of its approach straightened and deepened"; with its wharves and docks improved and its streets paved and cleansed; with "cheap and rapid transit throughout its length and breadth" and "salubrious and attractive parks" sprinkled throughout the area; and with a system of taxation "so modified that the capital of the world may be as free to come and go as the air of heaven"—then, Hewitt said, "the imagination can place no bounds to the future growth of this city in business, wealth, and the blessings of civilization." Indeed New York's "imperial destiny as the greatest city in the world is assured by natural causes, which cannot be thwarted except by the folly and neglect of its inhabitants."

For all its upbeat energy, this “imperial” urban vision—like those of nationalist jingoes, railroad magnates, and corporate financiers—was also fueled by fear. Inaction might leave the field to rival empire builders, which in New York’s case meant Chicago. In 1889 Chicago swallowed up 133 square miles of suburban terrain, and when the 1890 census was tallied, the results showed the midwestern metropolis (population 1,100,000) gaining fast on Manhattan (1,515,000).
